"People like to see a nice display of this kind," said Mr. Hunt. "They like to come into a shop where the premises are kept clean and attractive and make a selection. It pays to carry a stock that will enable them to make a choice without having only one or two lines to pick from. We try by our arrangement of the fixtures and plumbing goods to give them an exact idea of how the goods will appear if installed in their own homes. This is a big help in selling. It often gives them ideas that they had not thought about, and they can see how they can alter what they had in mind and make their home better or more attractive. People appreciate suggestions of this kind and also the service that we are able to give them in the way of suggestions about the goods that are best suited to their individual requirements. We always try to get people to buy the best and we find a pretty good response. When we show them a stock such as we carry and show them why a certain line of goods will give them better results, even though it costs a little more to instal than some other line we usually find that they are willing to listen to our recommendations and that they value our advice because we know from experience the results obtained."

Pays to Advertise

"We advertise regularly in the local newspapers, and spend about $700 a year with them. It is money well spent and brings us in a lot of business. We keep our advertising matter changed regularly and always try to keep it interesting. We use illustrations in a great many of the advertisements, usually something bearing directly upon our work or whatever points we are emphasizing in our ads. Good advertising, I think is a most important feature of business, especially where there is goods to be sold such as we handle."

"I regard location as a most important matter. I have changed my place of business several times but have always been on a main street. A good location to my mind is just as important as carrying a good stock and doing good advertising. The man who is in business and has the right kind of a stock cannot get too much publicity. One way of letting people know about the stock is to be located on a street where as many people as possible will see the store and window displays."

People Like Service

In the shop where the plumbing work is done Mr. Hunt has just as much system as in the store. He carries a stock of fittings, pipe, etc., that is ample to meet all requirements. The shop itself is kept clean and orderly, and the tools and the stock are kept in their places, where they can be found at once if required. System of this kind means a lot Mr. Hunt says in saving time which means money as well, especially when one has to meet keen competition.

In spite of the fact that there is an association in London there is a great deal of price-cutting, and nearly everyone in the trade there will tell you that it is one of the worst features of the business to-day. Efforts have been and are being made, with more or less indifferent success, to eliminate this destructive force. It is realized thoroughly by the men in the trade that price-cutting is bad bad business every way it is looked at, not only for the individual who gets a contract by this method but for its effects on the whole trade.

A Patriotic Record

Before the war Mr. Hunt had thirty-one men working for him. When the call came for men for enlistment it was answered by eleven of the staff, and of these four made the supreme sacrifice in Flanders.

Water Meters a Boon to Plumbers

Small Leaks Effect Big Waste Unless Checked—Meter Rates Versus Flat Rates—How Plan is Worked—The Automatic Sprinkler—Avoid Handling Unsatisfactory Meters

THE following article has been contributed by A. E. Beecraft of the Toronto staff of Drummond, McCall & Co., Limited. Mr. Beecraft is a firm believer in the adoption of the water meter plan in all communities as will be noted by the views he expresses herewith. Members of the trade may be more than casually interested in this subject and we would be glad to have any comments from our readers.—EDITOR'S NOTE.

HOW often is a plumber called in to remedy a leaky tap? If your town is metered it may be safe to state, "quite often," as the cautious citizen who has a metered service will see to it that his pipes and faucets do not continue to leak. If the service is not metered, the citizen is liable to say, "Well, let it leak, it isn't costing me anything, as I am charged on the flat rate."

The average citizen does not seem to realize that a round orifice 1-32 inch in diameter (about the size of a darning needle) will pass 345 Imperial gallons of water in twenty-four hours under a pressure of 60 pounds. Once a water meter is put on his service and the careless citizen receives his water bill, he soon wakens up to the fact that the best thing to do would be to call the plumber and have him locate the leak, as many citizens profess not to know where the leak is on their service. It may be an overflowing closet, a leaky tap, or even a crack in the service pipes. So the plumber gets a job which he otherwise might not have secured.

An orifice 1-16 inch in diameter will pass, under 30 pounds pressure, approximately 700 Imperial gallons in twenty-four hours, but when the pressure is raised to 60 pounds the daily leak reaches 1,020 gallons, or enough water is wasted to supply a small hotel. A faucet which is openly spluttering with a leak equivalent to ⅛ inch, will get away with approximately 3,750 Imperial gallons at 60 pounds pressure in twenty-four hours, enough to supply an orphan asylum.

The water leak is unnecessary, and the reliable plumber is the man who knows how to stop this constant waste. If the faucet is so worn it cannot be fixed with an ordinary washer, or by regrinding, here is your opportunity to sell a new tap, as the citizen whose service is guarded by a water meter for twenty-four hours every day is not going to allow this waste to continue uninterrupted if it can be avoided. It is far cheaper to call the plumber and have new equipment installed.

A good water meter is the emblem of honesty, both to the citizen and to your town. When the services are metered the municipality gets paid for the leaks, and the water user is compelled to be honest by keeping his faucets from leaking, or he must pay for his negligence out of his own pocket.

Meter Rates vs Flat Rates

Many municipalities have two rates of charges, the flat rate and the meter rate. The flat rate is rather unfair to the citizen who owns a larger property than his neighbor, as under this system it is difficult to devise any other means of charging for water than by levying a water tax on each and every faucet, bath, closet, laundry tub, hose, sprinkler, lawn hydrant, etc., which may be on the service. This citizen is a greater financial asset to his city, and the flat rate penalizes him for some other person's neglect, notwithstanding the fact that he also pays more taxes on his premises. All the water passing into a city must be paid for, and where the water is pumped it requires motive power according to the quantity used.

The flat rate has a tendency to persuade the citizen not to install many conveniences which he otherwise would, in consequence of which the sales of plumbing equipment are not as large as they might be under meter rates.

How Plan is Worked

In some municipalities the citizen is permitted to purchase his own water meter, which, after being tested for accuracy is then installed by the water works department. Many citizens are not aware of this fact although their neighbor may be protected from high water charges by a water meter. Perhaps this condition prevails in your town and you may be able to purchase water meters through your own waterworks department, or through some agency selling water meters.

It can be well understood that the resident who is served by a single tap may be responsible for a larger percentage of water waste than the resident who can afford a more expensive habitation, as a single tap, being used oftener than each tap on the 10 or 12-tap service, naturally wear out much more quickly, and unless you have a very alert and diligent inspector connected with your waterworks department, this waste may go on for days, perhaps, weeks and months, without detection by your civic authorities.

The resident of the small house must not be blamed for all the leaks, not by any means. Many occupants of larger residences are careless and allow the faucets to leak, but where the service is metered the municipality gets paid for this waste until it is stopped. It quite often occurs that person in larger residence receives a high bill on the meter rates, which, of course, he is really entitled to pay if the water has passed through his pipes. Had the plumber been called in to inspect the service this high

The Automatic Sprinkler

Many citizens prefer, for their convenience, to have an automatic sprinkler for watering their lawns, but the charge on the flat rate often persuades the citizen from purchasing this appliance. The municipality cannot take a chance under the flat rate and must charge accordingly for an automatic sprinkler, not knowing whether the citizen will forget to shut off this appliance, since it is not held by hand. After a water meter is installed the city gets paid for the water no matter if the citizen allows the sprinkler to run for hours at a time, although when a water meter is placed on the service this is not very liable to happen.

Unsatisfactory Meters

While there are many different water meters manufactured, several are considered unsatisfactory by the officials of some of our waterworks departments. An unsatisfactory meter is a nuisance, and is unjust to both the municipality and the citizen. Great care, therefore, should be exercised in the purchase of water meters to see that a satisfactory meter is secured.

Due to the extreme cold of our Canadian winters, several makers of water meters have of recent years found it necessary to perfect their product to guarantee the working parts from destruction by frost. It can readily be understood that once the service pipes are frozen they are liable to crack, and this is also liable to happen to the meter unless duly protected. The most up-to-date manufacturers of water meters, however, have equipped their meters so that in case they are frozen the damage done to the meter is negligible and can be repaired in a very few minutes at a minimum of expense. The meter, however, is not liable to freeze unless the service pipe is also frozen, it being impossible to place the same inside the cellar of the water user.

Directors Urge Greater Co-operation

By Organizing and Working Together Tremendous Results Can be Obtained, Says President Minnes—Series of Meetings Will be Held at Various Points in the District

A NEW plan which promises excellent results is being tried out by the recently-elected Board of Directors of the Ontario Society of Domestic Sanitary and Heating Engineers. In future the board will meet in a different city or town each month, and after the official meeting the directors plan to visit the local organization and discuss with the members such important matters as organization work, business problems, and similar questions. By this plan they will be enabled at minimum expense to get in close touch with a great many local points. The directors will be glad to consider invitations from towns or cities in Ontario and will be only too glad to help the men in the trade in those towns or cities in any way they can.

Opened at Hamilton

The first meeting of the directors was held at Hamilton in the Royal Connaught Hotel and was attended by Thomas J. Minnes of Brantford, president; George E. B. Crinyer of Guelph, vice-president; Frank R. Maxwell of Toronto, past president, and Secretary Garrett Frankland of Toronto. It is likely that the next meeting will be held at Niagara Falls.

After their meeting in Hamilton the directors spent the evening with the members of the local association. There were more than twenty-five of the Hamilton operators present. James H. Cunningham, the Hamilton president, was in the chair, and during the evening special addresses were given by the members of the executive. President Minnes took as his subject the importance of organization and pointed out the very great need that there is for it in the trade to-day.

To Get Results

He emphasized the point that if results are ever to be obtained it will be through co-operation and not through the individual members trying single-handed to accomplish things. It is impossible, no matter how hard an individual works personally, he said, to get the results that are obtainable when a great number of men in the same trade and with a common interest, co-operate. By working together the members of the craft in Ontario can solve the many problems which need solution. By working together they will not only help themselves but everyone else in the business. Get together on a broader basis of understanding and find out that, after all, the other fellow whom very often they have been regarding more or less askance is not such a bad fellow. President Minnes told of the work that has been done in Brantford in the way of organization and of the good results that have followed. There is no reason, he pointed out, why the plumbers all over the Province, all over the Dominion also, cannot work together for the common good just as effectively as those in any one town. It is by pulling together, he said, that results will come, and the more members there are to do the pulling the quicker things will be accomplished. Every man in any trade, he pointed out, has a duty towards that trade, and if he does not perform it he is acting selfishly and directly against his own interests as well as of all the others.

Has Been Prevalent

There has been too much of this keeping to oneself, Mr. Minnes pointed out, and it was responsible for a great deal of the troubles that are to be found in the trade to-day. Such evils as price cutting would be unknown if the proper spirit of co-operation existed as it should. Instead of keeping to themselves and working only for themselves, President Minnes urged those present to get a broader viewpoint and work for the good of the trade, and in doing this they would benefit equally.

Vice-president George E. B. Grinyer of Guelph gave a splendid talk about the importance of having proper business methods and especially of keeping books.

Cannot Make Money

He pointed out that while a man might, by good luck, make money by following a haphazard system or no system at all in his business, it left him continually open to all kinds of troubles. The merchant or business man to-day who did not keep books and carry on his business in a business-like way was certain to lose a lot of money and have endless work and worry. Lack of proper system, he pointed out, inevitably made for confusion, and in the plumbing trade generally there was great need for the inauguration of business methods. Without these, he pointed out, it was impossible to get the results that should be obtained.

Tells of Overhead

Secretary Garrett Frankland dealt at some length with the business side of the plumbing trade, emphasizing the importance of knowing just where one stands. Without a thorough knowledge of the cost of doing business, buying costs, overhead and so on, he pointed out, it is impossible for a plumber or any other man engaged in business to figure intelligently on work, on his expense, or to know whether he is really making money or not. Scores of men in the plumbing trade, he declared, have worked and worked very hard for years, and at the end of fifteen or twenty years discover that they have not made any money. They have not got results that they were entitled to, or their work

WHAT ONE SIGNBOARD CONCEALS

A rear view of a signboard that stands within a hundred yards of the general post office, the municipal centre and one of the largest hotels in a leading Canadian city. It screens a confused pile o inflammable rubbish, mixed with decaying vegetable matter and other waste products. The civic authorities are said to have permitted the existence of this dangerous and disease producing condition more or less continuously for several years. What are the sanitary inspectors doing.—From May issue "Conservation."

and their skill, Mr. Frankland said, because they had no appreciation of the principles of business. One of the greatest faults in the trade to-day, and one that must be remedied, is lack of business knowledge.

Will Be Forced

Conditions generally and the competition that is so keen are forcing men to do business in a businesslike way or to go out of business. A man is entitled to a reasonable profit on all his work, but too many of the plumbers, through lack of business knowledge, have been putting in long hours and doing all kinds of hard work and making little or no money. The trouble was that they were trained entirely as plumbers, and no attention whatever was given to the business side of the question. He pointed out the different position in which the plumbers who have adopted business methods find themselves from the men who have not. The firms who know all about their costs, their expenses, their selling costs, and every detail about shop costs, time, labor, advertising, store upkeep and general overhead have a tremendous advantage over the man who is working without this knowledge. Not only in figuring contracts but in every phase of the business they have the man who is working without proper business methods at a disadvantage. The final result is shown in the fact that when a job is completed they have made a profit and have money in the bank, while the other man has put in all his time and hard work for nothing.

Gave Them Facts

Mr. Frankland gave many facts to substantiate fully the claims he made and showed how plumbing firms which had been making little or no money, by putting their business on a proper basis, had not only made money but built up a steadily growing business. There was no need of men in the plumbing or any other trade working for nothing, he said. People were willing to pay for the work they had done, and it was the plumbers' own fault if, through lack of proper business methods they did not charge enough to cover all overhead and allow for a fair profit.

Secretary Frankland also spoke of the good results to be obtained from co-operation and organization, and urged every member to help in every way possible. If everyone works together, he said, conditions can be completely changed and the whole trade put on a better basis.

District Meetings

In connection with the organization work that is being done the directors, besides holding their regular monthly meetings in various places in the district, are co-operating with Secretary Frankland by attending frequently gatherings at which he speaks. Recently Mr. Frankland paid a visit to the local organization at Guelph. He was accompanied by President Minnes of Brantford and C. D. Henderson, also of Brantford. The meeting was presided over by H. Mahoney and the addresses on organization, business, and co-operation by the visitors were listened to with keen interest.

Another meeting that also aroused much interest was held at Kitchener, when Mr. Frankland addressed the members of the Twin Cities Association, members from both Waterloo and Kitchener being present. H. Haas, the chairman of the local association presided, and during the evening addresses were given by Vice-president George E. B. Grinyer of Guelph, H. Mahoney, also of Guelph, and Secretary Frankland. At this gathering Vice-president Grinyer particularly emphasized the importance of the members out in the towns and cities of Ontario co-operating fully with the Ontario Association.

Many Others Planned

A number of other meetings are planned in various parts of the province, and every effort is being made by the executive to get every member of the trade working with them in their efforts.

Displays and Their Value to Dealer

IN this and recent issues of SANITARY ENGINEER, illustrations have appeared of store interiors and windows, which plumbers in towns, large and small, are using as a means of attracting trade. The method of display being employed reveals how carefully these dealers are studying, not only the goods they are handling, but the trade to whom they are catering. In short, the plumber is getting away from the mere fact that he fixes taps, and extending his activities to merchandising the goods that he is handling.

There is no getting away from the fact that one of the first requisites of satisfactory merchandising is a neat display room. It doesn't need to be so extensive, but the goods displayed should be arranged in such a manner as to attract favorable attention. Too often is it the case, not alone in plumbing stores, but in other lines as well, that the entrance is cluttered up with boxes. Customers can scarcely approach a counter without scraping their shins against some unnecessary projection. The real comfort and enjoyment of the shopper is not catered to as it should be.

There are some who take no enjoyment out of shopping, it may be said, and this is even true, conditions such as above, no doubt, contributing to this attitude. However, the average buyer can see pleasure in shopping where cleanliness and neatness of display are hand in hand. And there is just a point that might be emphasized in the display which the plumbing store adopts—it should be kept clean.

Perhaps few classes of goods lend themselves to such a bright, attractive appearance as those handled by the plumber. The bath, washstand, mirror, or bathroom fittings are naturally cleanly and it is by endeavoring to further the function of these in their relations to the individual that the plumber should adopt his methods of display.

The real value can scarcely be estimated; an impression must be made on the customer by a real neat display, and the extent of how favorable it is depends on the seller. One thing which can be played up more reasonably when the display is a worthy one is the quality of the work which you can do, and that quality talk is a good one to adopt and put into your work as well. It is one way to get away from a cheap class of job, which proves unsatisfactory to the customer and unworthy of the best efforts of the trade.

Another section of the display which can be worked to advantage is that of the window. Many there are to-day who do not change their display as frequently as they might, who allow dust to accumulate, and the windows to become streaked with dirt. This attitude of neglect is one which is keeping these dealers from securing the maximum of results.

A bath tub is not alone a bath tub—it may represent the difference between good health and poor health; the wash basin lends an air of satisfaction in the uses for which it is adopted. Every individual part of the complete bathroom has its function, and in making a good display arrangement and employing convincing sales talks, the dealer will largely increase the business he is now doing.

Sees Huge Export Trade Ahead For British Firms in Markets of the World

"BRITISH manufacturers are fully prepared to more than hold their own in the world markets. They are not asleep; they are reaching out and getting in all parts of the globe markets which the Germans and Austrians have been forced to relinquish."

This was the view expressed by T. A. McIntyre, director of the firm of Shanks & Co., Ltd., Barrhead, Scotland, who is paying a business visit to their Eastern Canadian representatives, W. H. Cunningham & Co., 183 Church Street, Toronto, when talking to SANITARY ENGINEER. Mr. McIntyre, who is manager of the firm's branch in London, England, is on his way around the world and is spending three weeks in Canada before leaving for Australia and New Zealand. From there he goes to China and then on to India.

Sees Huge Business

"There are huge markets now open," he said, "and we hope to get our share of the business. In the short time I have been in Canada I have been able to get in touch with a lot of good business and size up the situation so that we will know exactly what to do. One of the things the British manufacturer has learned is to adapt himself and his goods to the market. Prior to the war many British firms, when entering a market did not endeavor to meet the views of the buyer. For instance, if a buyer wanted an article made light and the British goods were manufactured heavy, the tendency was for the buyer either to take the heavy goods or buy somewhere else. British firms are now adapting their goods to the demands of the purchasers and they will get a lot of business in this way that they would not get otherwise.

"The great thing about most lines of British made goods has been their unquestioned quality," stated Mr. McIntyre. "The high standard that has been set in the past will be fully maintained. The Germans unconsciously paid some remarkable tributes to British made goods in their imitations. They made the most barefaced efforts to capture business by making inferior articles which in appearance were like the British goods, even to forged Government marks. They were absolutely unscrupulous about their methods. Our firm had an instance that one would hardly believe until it was proven. Our agent in Germany found that he could do a big business in our goods. While accepting money from us for looking after our interests he deliberately started in on his own hook to produce a cheap grade article that looked like ours. He used our name and marks and naturally sold a lot before we found out what he was up to. When the case was put up to him he not only admitted it but was rather proud of what he had been doing. It is difficult for the British manufacturer to understand tactics of this kind, but since the war we have learned a lot about what the Huns were capable of doing.

Tremendous Possibilities

Mr. McIntyre sees tremendous possibilities for export business in China and South America. There will, he says, be business all over the world, but China and South America he regards as two of the very richest fields. He looks for British firms to develop an enormous business.

"We are preparing to take care of a huge business," he said. "Since the war many British firms have extended their plants greatly and are capable of much larger production than formerly. In spite of the fact that we are facing reconstruction problems, everyone is looking forward with the greatest optimism to the future. Our own case is typical of what is happening. For nearly forty years we have been steadily adding to our plant and selling all that we can produce. We now have 1,100 men, and at our annual meeting the question came up of what we were to do in regard to reconstruction. Everyone was unanimous that we must be prepared for larger business. It was decided to start work at once on a big new plant that will treble our capacity. The work is now under way. We are after business all over the world and I think there is no doubt at all that we will get our share."

Sometimes Misjudged

Sometimes in the past British firms have been misjudged, and in some quarters people got the idea they were slow because they did not go after certain markets. One thing was lost sight of entirely and that was that the Britishers often had a choice of several markets open to them and invariably chose the ones in which the most money was to be made. Many British firms for years have been in the happy position of being able to sell more than they could produce. Now they have increased their production capacity, and with the world's markets open, are going after the larger fields."

Mr. McIntyre referred to another phase of the question which is going to be a big factor in helping the British manufacturer to get results and that is the new spirit brought about by the war. "There never was closer co-operation between capital and labor than now," he said. "Some trouble occurred at first and it was caused largely by such elements as the Socialists and Bolsheviks. The average British workman is too level-headed to stand much of that kind of thing. For a time in Glasgow we had about as rough a time as anybody could want, but the arrival of the men who had been at the front soon ended the trouble. The soldiers were doubly angered also with the trouble makers, whom they regarded as men who had stayed at home when they should have been at the front. The soldiers were doubly angered because by the trouble these men were making they were keeping them from being demobilized and getting home. They were just aching to get a chance at the trouble makers, and when the Bolshevists and others saw what was coming the bottom soon dropped out of the strike.

Co-operating Closely

There is a new spirit between capital and labor, and it should work wonders. The men in the past undoubtedly had grievances. Many employers regarded them as chattels and disregarded their rights. Since the war they have learned differently. The men on their side have learned something of the difficulties that capital has to contend with. Now, under the Whitley councils, any questions that come up are speedily and satisfactorily adjusted. I think capital and labor in England are working more closely together now than ever before and will continue to work together."

Mr. McIntyre expects there will be some splendid openings in England for Canadian products and looks for a steadily growing trade between the Dominion and the Motherland. He also looks for a large emigration to Canada.

"From what I hear among our own men," he said, "we are likely to lose many of the younger men. They are talking a great deal about coming to Canada. This idea is general. One sees in the papers every day advertisements from men who formerly held indoor positions wanting outdoor work. They will never go back to the old work again. One hears a great deal about Canada everywhere and it will undoubtedly attract a large number of those who want to get away from the old conditions."

Says Small Town Plumbers Are Passing Up Fine Opportunity for a Lot of Good Business

Every Farm Home Without Modern Conveniences Offers a Real Prospect That is Easy to Land, Declares Manufacturer —Says Methods of Sewing Machine Men and Piano Salesmen Should be Copied

THAT there is a tremendous field for business for the plumber in the small town who goes after the trade in the farm homes was the view expressed to SANITARY ENGINEER by a leading manufacturer. The whole matter in his opinion centres around the plumber going out after business aggressively and in using good salesmanship. The salesmanship end of the business will come with a little experience, he declared.

"What every plumber who wants more work should do," he declared, "is to familiarize himself with every home in his territory. He should know what homes have no bathroom, what homes need a water system, what homes have no conveniences, and in what homes new equipment is needed. It is not hard to get these facts."

Get in Touch

A call at any of the homes is easily made if the plumber is not already in possession of the information. Most plumbers could name off a long list of people right off the reel who are prospects. They know that John Smith ought to have a bathroom in his home, that he is quite able to afford it and so on, but they never go after him and show him just what he is missing by not having one, or how little it would cost him. There are scores of such prospects in every community, and if they were gotten after by a live plumber who was able to give them all the information they would buy. The trouble is that too many plumbers wait for the farmer to come in and ask about the work he has in mind. All over the country there are prosperous farmers who would buy if they were approached and shown this or that line of goods, and given prices and details. The plumber, if only he realized it, has the best chance of all in talking to the farmer and his wife right in their own house. They are at home there and are not fussed up or nervous as they very often are if they come into a store to ask about something they want.

Needs Salesmanship

A little salesmanship is all that is needed to get them interested and close a deal. The plumbers, in my opinion, might with advantage take a leaf out of the book of the sewing machine agents or the piano salesmen. These chaps don't wait for the people in the country to come into their stores and ask them about the goods. They would not sell a quarter of the machines and pianos that they do if they waited for business to come to them. They make it their business to find out what homes need a piano or a sewing machine and then they go right out and see the prospect. It is no trouble in a very large percentage of the visits made to close a deal. It is no harder, in fact not so hard to sell a nice bathroom outfit or some other line that is going to make the home really better and give years and years of comfort and service, as to sell a piano, which after all is more or less of a luxury. The plumber has ten real sales talking points right at his fingers ends to one that the piano salesman has, but because he does not try he does not get the business.

Many sewing machine agents take a machine right along with them to let the farmer's wife see how it will work. The plumber does not need to take a bath tub or a pump with him. He can take a splendidly printed catalogue supplied by the manufacturer and can show the prospective buyer a dozen different sizes and styles. In a home where there is no bath tub, or conveniences, or where they have to depend for water supplies on a well, the plumber has got a whole string of real arguments right at hand. The farmer who is without these things knows absolutely that he ought to have them because they will make his home better and save him time and work and trouble. All he needs is a little aggressive sales talk to sell him, but it is surprising how few plumbers will go after business in this way, and they are losing one of the finest opportunities they ever had to make a lot of easy money."

A TIMELY TIP
TO THE
FARMER'S WIFE

—Make life worth living— investigate the merits of

THE NEW HYDRO PNEUMATIC WATER SYSTEM

Operated by hand or electricity.

Water in your own home without an effort for bath, cooking and drinking purposes, upstairs and downstairs, and utilizing your present sewerage disposal system. Come in or phone and have our representative call on you and explain its merits, price, etc.

Gasoline engines, pumps, water closets, baths, lavatories, sinks, laundry trays, pipe and fittings, overhead irrigation systems, rural electric lighting systems.

Tinsmithing and Sheet Metal Work Neatly and Cheaply Executed.

There is no one better able than the farmer to make improvements. This is indeed a "Timely Tip." Are you catering to the farmers' trade too?

TO CONTINUE STUDIES ON METAL PROBLEMS

That the Montreal Metallurgical Association, founded in 1915 in order to secure a greater degree of efficiency in the methods of the munitions plants, will continue its activities on a permanent basis was the decision of members of the council of that body who met at the Macdonald chemistry building at McGill University.

Dr. A. Stansfield, the founder of the association, has retired from the presidency, and G. Percy Cole has been elected to that office. The association now has a membership of 245. The program for the coming year will include the reading of papers by experts on iron, steel, brass, foundry work and commercial problems of the iron and steel industry. During the summer excursions to metallurgical plants in Montreal and the surrounding districts have been planned.

Officers elected were: President, G. P. Cole; vice-president, H. J. Roast; secretary, Capt. J. G. Ross; members of council elected for first time, W. K. Gillespie, J. D. Paxton, E. M. Seale; members of council re-elected G. P. Cole, G. R. Kendall, H. J. Roast, Prof. J. Haynes, E. C. Kirkpatrick, W. G. Dauncey, F. G. Gardner, B. A. McFarlane, and T. R. Davidson.

BRITISH CONCRETE BRICK INVENTION

LONDON, ENG.—It is reported that a super-concrete brick has been invented which is thoroughly damp proof. The brick is described as being hard as blue bath stone, and very difficult to cut after it has been in the walls for a few weeks. Its cost is about a third of that of the ordinary brick, and it can be marketed at ten dollars per thousand. A machine has been designed for which it is claimed that it will turn out nine-inch concrete bricks at the rate of from eight thousand to ten thousand per day. They can be used in constructional work the day after they have been made.

What Others in the Trade Are Doing

There Are Many Suggestions Here That You May Adapt Not Only in Arranging Your Own Advertising, But in Keeping Seasonable Lines Before People—Many Firms Using Illustrations in Their Ads

"Wiring Time" is the heading of an ad. which occupies two columns of space, nine inches deep, of A. E. Wrigglesworth, sanitary and heating engineer and electrical dealer, Shelburne, Ont. Below the heading the ad. reads: "Special attention to house wiring for electric lights. I have on hand a large stock of wiring material, fittings, etc., and with a practical experience of twenty-four years, wiring being a part of it for the past fifteen years. Those entrusting me with work are assured of especially good service."

The Hunt Plumbing Co., London, Ont., heads its advertisement, "A Modern Bathroom," in display type. This heading is followed by "A modern bathroom is considered one of the best rooms in a home. Let us quote you prices." The Hunt Co. nearly always uses an illustration with its ads., and accompanying the one described above is a cut showing the workmen installing a handsome tub in a tiled bathroom.

C. H. Marshall, Caledonia, Ont., advertises a special line of pumps for wells and cisterns; also force pumps, brass or iron cylinders, and a complete stock of all repairs. "Estimates are freely given on all plumbing, heating, gas piping and eavestroughing work," the ad. says. He also features some specials in tinware and graniteware.

Livingston & Moodie, Barrie, Ont., plumbers and electricians, advertise as follows: "We are the sole agents for the famous —— electric vacuum cleaner. Now is house-cleaning time and everybody wants carpets, rugs, walls, curtains, etc., cleaned. Anywhere dust collects we can get it, even to the picture molding, pictures, shelves, etc. We will ren our machines by the day at $1.25, or we will go and work it ourselves for $1 an hour.

Mainer & Bartindale, Orillia, Ont., advertise "Plumbing" in large type, below is an illustration of a housewife showing a plumber about some repair work, and the ad. reads on. "For a first class sanitary job, with absolutely quality material, call us. Electric work of all kinds, motors repaired, house wiring, all new materials. Furnaces for a warm house with our guarantee, at the best price. Come to us."

Weldon Carter, Summerland, B.C., says in his advertisement, "Weldon Carter, plumber and heating engineer (in display type) with a larger stock of supplies and material and more help, I am now in a much better position than ever before to attend to your orders for plumbing and heating.

A. E. Law, Leamington, Ont., in an ad. eleven inches deep and two columns wide, has his name in large type and then says, "For plumbing, heating and electric wiring" (in display). Then follows, "All kinds of electric appliances. Agent for —— electric power and light plants."

H. G Solomon, Grand Valley, Ont., in his announcement, two columns wide and two inches deep, says: "Classy plumbing and heating. We are now ready to do all kinds of plumbing, furnace work, eavestroughing and general repairing."

Sanderson and Robertson, Orangeville, Ont., head their advertisement, "Electric Wiring," in large type, and then say: "If you are thinking of having your house rewired this summer, you should let us figure on the job right away. Indications are that there will be a great deal of work wanted this year, and it is only prudent to place your order early. What about that bath you were thinking of putting in as soon as the war was over? This work is right in our line, and we rather pride ourselves on the tasty, well-finished jobs our experience enables us to give our patrons. If you are going to instal a new furnace, we advise you to get estimates right away. There is nothing to be gained by leaving this work until fall and then having it done in a rush. Plumbing, steam fitting, tinsmithing."

Dennis Howe, Ingersoll, Ont., heads his announcement with "Rip out that old tub," and then advances arguments why every home should have "a fine up-to-date bathroom."

J. C. Stewart, Weyburn, Sask., under the heading, "For your new home," emphasizes his ability to instal hot water or steam heating, and also to look after all plumbing work. "Prompt service, moderate prices and satisfaction are guaranteed," concludes the announcement.

H. H. Rouse, of St. John, N.B., features "Plumbing, heating and metal work" in the heading of his advertisement. Another feature that is emphasized is a motor service to facilitate all work, especially that in the suburbs.

D. N. Flander, Ingersoll, Ont., is making a seasonable appeal based on a line of gas ranges at $22 and up. Stoves are featured all through the advertisement, and Mr. Flander announces that he is willing to accept Victory Bonds in payment of purchases.

J. J. Nealands, Barrie, Ont., features —— stoves and ranges and below this heading says "Call and get our prices before buying your new range. We do all kinds of plumbing, heating and tinsmithing work. Sole agents for ———— furnaces. Repair work promptly attended to.

Andrew Sheret, Victoria, B.C., under the caption in display type "Plumbing and Heating," says "High grade bath tubs cost the same with us as the standard grade. We only stock the best, but our prices are equal to the price of cheap grade goods you will find on the market to-day. All we ask of you is to examine the articles in our store before deciding on your purchase."

Noble & Rich, London, Ont., using a space five inches deep and two columns wide in an Ingersoll, Ont. paper illustrate a handsome bath tub with shower and curtain. Under the caption "A Nice Bathroom" they say "A nice bathroom and equipment is a good feature of any house. It enhances the value and makes life a pleasure for its occupants. The cut shows you a shower bath suspended over the tub. This shower is a beautiful piece of plumbing. To take a shower when you rise in the morning will send you down stairs three steps at a time ready for the chores, breakfast and work. Write us to-day for particulars. We are always pleased to let you have prices and information."

Cutting Down the Overhead

Strathroy Merchant Solves Problem of Keeping Himself and His Equipment Busy All Year Round—Merchandises Bicycles and Auto Accessories and Makes Repairs—Finds These Lines Profitable

Based on an interview by C. E. Parsons, of Sanitary Engineer, with Howard Statham, of Strathroy, Ont.

HOW to keep himself and his shop equipment busy or twelve months in the year was the problem that Howard Statham of Strathroy, Ont., had to figure out.

"There is not enough plumbing work in the town to keep me going for twelve months in the year," said Mr. Statham to SANITARY ENGINEER. "I found out, however, that my shop and store rent, and my general overhead went on just the same though whether I was busy or whether I wasn't. It was up to me to do something, so as I have always been pretty handy at repair work I started in to repair bicycles and pumps and baby carriages, in fact almost everything in the way of equipment. It wasn't very long before I had all I could look after. A lot of people who brought bicycles to be repaired wanted new ones, and a lot of other people who didn't have bicycles often came in to see if I could sell them either a new or second-hand machine or tell them where they could get one. I saw a chance for getting into this business and as it carries a good margin of profit I certainly have not been sorry I made the venture."

Success From Start

"It has been a success right from the start. I would buy fifty second-hand bicycles right now if you can tell me where to pick them up, and I will sell every one of them during this season, probably many more. My sales of brand new bicycles during the past year were 25 and I expect to handle more this season. I find that bicycles are a seasonable line. During April, May and June I clear all bath tubs and other plumbing goods displays out of the front part of the shop and fill it with new bicycles. I find it pays to carry enough stock to show people a variety. It is not necessary though to carry a big stock as I can get a new wheel of any model from the factory in a few hours and customers are always willing to wait for a day. I do both a cash and credit business. If I know the party is allright and that I am sure of getting my money I do not mind letting him have a bicycle by paying so much down and so much a week or a month. It is often easier, especially for a boy who is working, to buy a machine in this way."

Other Business Too

"I find that the bicycle and repair business is starting me into other lines. For intsance there is a good sale not only for bicycle accessories but for auto accessories. I find this business steadily growing and as it is easy to handle and shows a good profit it is just like so much found money in connection with my plumbing store. I would have to keep the shop going anyway, and by stocking the accessories I not only have the goods required to make quick repairs but those which people call for very often."

Mr. Statham not only has a store display of bicycles and plumbing goods but also keeps them before the public by means of his two windows. The windows are not particularly adapted for making a good display but Mr. Statham does the best he can with them.

Knows All About Them

Through handling bicycles and making repairs Mr. Statham has learned thoroughly all about them.

"I find this a tremendous help not only in making sales," he said, "but in making exchanges for an old machine for a new one. I can quickly size up an old wheel and tell the prospective buyer just how much it is worth to me and why. I can also tell him all about the improvements that are on the new wheel and explain how they work and their full value and so on. This is a big help. I like the work and the business also. The experience has been of real value to me as it has solved the problem for me of how to keep busy all the year round and has taught me a lot about business that I can apply in the plumbing trade."

Does Not Interfere

Mr. Statham does not find that his bicycle and accessory business interferes with his plumbing trade. On the contrary it has helped it. It has brought him into contact with many persons with whom he would not have come in contact ordinarily. They come in for auto accessories, or bicycle accessories, or for repairs, and when they have any plumbing work to do they do not forget him.

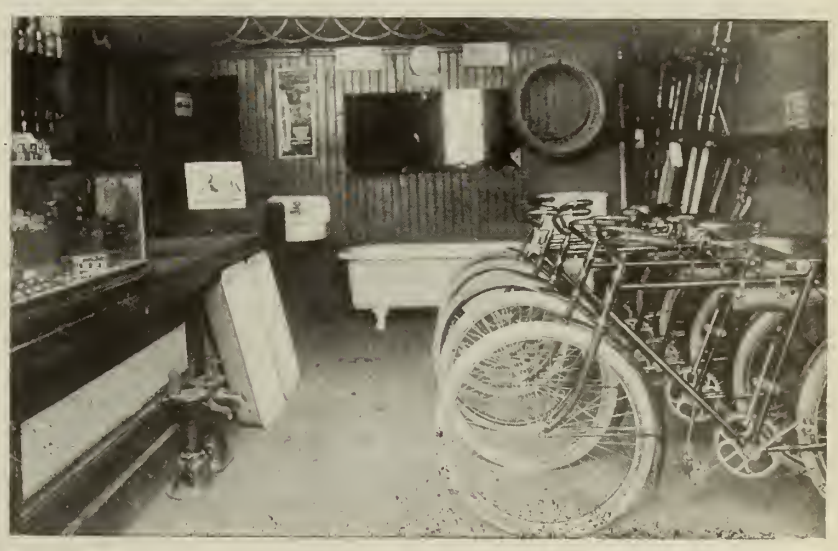
Satisfactory work, whether in bicycle repairs or in plumbing, is insisted upon by Mr. Statham. He wants his customers to be thoroughly satisfied. That means, he says, that they will always come back and also that they will tell their friends.

Whenever he is called upon to do any plumbing repairs Mr. Statham looks carefully over the work and if, as is usually the case, he finds it better to put in a new part than to repair the old he advises the owner.

Advice Appreciated

"People appreciate this," he said. "A man who pays several dollars for a repair job and then has to have it done all over again in a few weeks or a month is not likely to be in a good humor over it. It would have been better for him to pay only a little more and get a new part. Then he will get satisfaction perhaps for years and appreciates the advice of the plumber and will come to him again when he has other work."

(Continued on page 25.)



Many plumbers in the smaller towns sometimes complain that they are unable to create enough business to keep them engaged all the time. Howard Statham of Strathroy, Ont., had the same problem to face and he has undertaken the merchandising of bicycles and automobile accessories. He has found these lines a splendid business addition and the above view of his display room gives some idea of the space he is devoting to this line. His own views on the subject are expressed in the accompanying article.

EDITORIAL COMMENT

WHAT IS BELOW SURFACE?

ARE the demands being put forth by labor to-day engineered by those who realize that their interests are linked up with the industrial welfare of the country as a whole or is it just a concerted move on the part of extremists to fight constituted authority? The better elements of labor are expressing themselves as satisfied with conditions generally prevailing and capital is very largely endeavoring to inaugurate reforms which will eliminate the evils prevalent not so many years ago.

Where then is all the present unrest originating? Who is responsible for the general strikes in Western cities which threaten to extend to Eastern points as well? Is the move for forty-four hour week and increased pay just a blind to cover up some more insidious move? How is the employer to be assured that in granting these shorter hours and increased pay he can go ahead and make his plans accordingly?

In Winnipeg, union after union have utterly disregarded their agreements, have thrown them aside as mere "scraps of paper." The question is then, how to guarantee against a recurrence of such an attitude in respect to any new agreements. Surely the man employing labor, who has the pay roll to meet, should be given some consideration. It is not our contention that all employers of labor are ideal bosses, that they have the interest of their employees at heart, but then again the extremists in labor are no better in the radical views they hold.

It is generally admitted that trade unionism has done much to improve the conditions under which labor has been employed and manufacturers as a whole recognize the principles of the unions. It is by co-operation between capital and labor that most idealistic relations for all concerned can be secured. There is admittedly a red flag element in labor no less than a Prussian element in capital. The two should be suppressed and the better elements get together to work out a solution which will prove fair to all concerned.

CHEAPENING THE HOUSING SCHEME

WHILE it has been a long time developing, the plan of the Ontario Housing Commission to relieve the shortage of dwellings is beginning to materialize. Tenders are now being called in several places for dwellings in considerable numbers. Other tenders will be called very shortly and indications are that before the summer is very far advanced there will be a lot of building under way. As pointed out in former issues of SANITARY ENGINEER there is a splendid opportunity here for the plumbing dealers not only to round up a lot of good business but to render real service to their community in making suggestions that will prevent the erection of homes that will not be satisfactory. In some places there has been a tendency to cut things rather too fine. For instance, in one municipality the type of bath tub that has been selected has caused criticism in some quarters for the reason that no matter how attractive the bathroom may be made by design and finishing the bath tub will always look cheap because it is cheap. For a very little more, it is stated, by those who object to the tub specified, a tub that would have been much more attractive is obtainable. There is perhaps a lot in this argument and its full force will become apparent after the house has been in use for some time and the house begins to need repairs or the owner begins to compare the equipment in his dwelling with that in some other. Economy of this kind is often very dear in the long run. The same applies to cheap plumbing goods, hardware, cheap paints, in fact cheap anything. Eventually, they make for dissatisfaction because they not only look badly but do not give the service expected. Now is the time, while the plans are being talked over or prepared, to make suggestions that will save trouble and dissatisfaction later.

UNPARALLELED ELECTRIC OUTLOOK

REQUESTS for new power lines and extensions to existing power lines are pouring in to the power companies in numbers that show unmistakably the hold electricity has upon the public. It has gained this hold because of the real service, convenience and economy it has proven. Imagine what the average city home would be without electric lights, an electric washer, an electric sweeper or a dozen more utilities people have come to regard as part of their everyday comfort. And yet only a few years ago these devices were unknown. Because the farm-

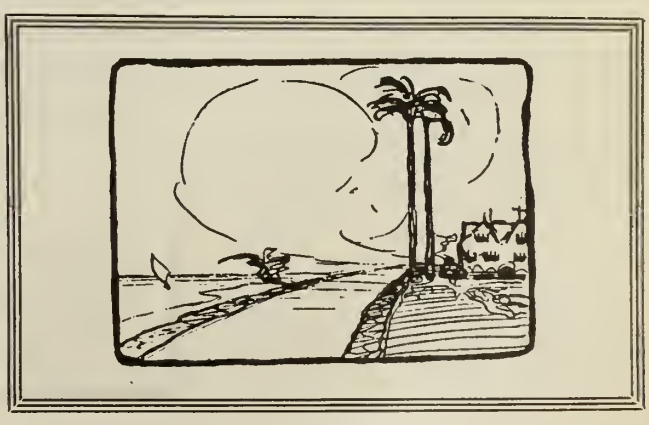
ers have learned from the city dwellers what electricity means they are clamoring for power lines, and they are getting them. Many millions of dollars are to be spent in the next few months in extending power lines into the rural districts. More millions are to be expended in providing for the additional power requirements of the cities. It is an ever growing business and it opens to the hardware dealer a field that is at once profitable and easily handled. Very few of the goods in his store will lend themselves more readily to display than the electric lines. Many of them practically sell themselves. Dealer after dealer will tell with real enthusiasm what good results have followed the taking on of electrical goods. When it is remembered that electrical development, vast as it has been, is still only in its infancy and that Canada is a land whose waterfalls contain boundless stores of electric energy, much of which is as yet untouched, some idea may be gained of what the electrical business of the future is going to be.

ONE OF THE BIGGEST BUYERS

THERE is every indication that from a purchasing standpoint the farmers of Canada this year will break all records. With the markets that have been open to them for some time and the prices that have prevailed and are still effective the agriculturists are now to be reckoned in the very best class of buyers in the Dominion. They were always one of the largest buyers, but now they are one of the best. They have the money and they want the goods. Dealer after dealer has commented to SANITARY ENGINEER upon the insistence shown by the farmers in demanding the best there is, regardless of price. There are some big opportunities open to the plumbing men as a result of this situation and many of them are making the most of their chances to sell big bills of goods to the farmers. Anything that will make the home better or more comfortable, or that will make his work easier or more quickly performed is of special interest to the man on the farm. In your class of business are many lines carried that meet these demands as readily as can be found in any business. No class of merchants come into more direct personal contact with the farmer than plumbing dealers. The question of getting the big business that is offering centres around the ability of the merchant to lay in a stock that is going to be needed by his trade and then of letting the trade know that he has it. Merchants should always bear in mind that the auto has in a great many sections of the country eliminated distance and that if a farmer finds he cannot get what he would like at the town store he will think nothing of motoring fifty or more miles to some other store where he can get such a selection of goods as he desires. On trips of this kind he usually takes his wife and family along also, and they have needs also that offer prospects for much good trade. Trips of this kind are unnecessary if the farmer and his family know that the home dealer has the goods and that he is prepared to give them service.

MAKING GOOD PROGRESS

IT is gratifying to learn from those in close touch with the matter that splendid progress is being made in Toronto by the "Ender" clubs, in regard to inculcating into the members the vital importance of business training. Special efforts have been centred on this branch of the work in the past two months and the results, it is stated, are more than encouraging. Talks by men thoroughly conversant with the details of business management, overhead and other questions are given at the regular meetings. These talks are aimed not to be loaded down with a lot of technical detail and high-sounding terms but are made as simple as possible, and an informal discussion always follows at which anyone may ask any questions desired. As a result of what they are learning many of the Toronto plumbers are making radical and important changes in their business methods. They are beginning to see that certain principles followed out will produce certain results, one of the principal being a fair profit on all work engaged in. This idea of promulgating business instruction among the trade is also being carried out by the Ontario Association. Reports regarding the way business is being carried on in many parts of the country indicate that there is a general need for more work of this sort. There is every indication that it is going to develop into a movement that will go a long way toward putting the entire trade in the position it is entitled to. It is just as easy to carry on a business by proper methods as to "run" it by any old plan, and when results are summed up in the shape of profits and growing trade there is no comparison in the results derived between the two plans. Education along business lines is one of the great needs of the trade to-day and it appears that a new era in this important matter is dawning.



How to Figure by Divisional Method

Practical Business Discussion at Meetings of the "Ender" Clubs in Toronto Show Many Members of the Trade Where They Have Been Making Wrong Estimates and Losing Money on Work

Written for Sanitary Engineer by C. E. PARSONS

THE Toronto branch of the Ontario Society of Domestic Sanitary and Heating Engineers has adopted the open price system of tendering. While it is too early yet to be able to make definite statements regarding results, there is no question at all that everything has been most satisfactory so far. Through the "Ender" Clubs and through special meetings every effort has been made to give the members all possible details regarding the working of the open price system and the divisional method of figuring profits on overhead and selling price.

The new idea that is being encouraged in the trade of Toronto, that is, of adopting business methods in regard to carrying on business, is being enthusiastically received. One of the best indications perhaps of just how strongly this has taken hold, may be gathered from the record attendance at the meetings of the "Enter" Clubs.

Coming Out Well

There has been such large attendance at these weekly meetings, and the numbers have been growing so steadily with each successive meeting that now the question has to be considered of securing larger quarters in which to hold the sessions. The interest that is being taken in the work is not alone manifested by the large attendance, but by the questions asked, which show as nothing else can, that those who hear the talks on business recognize many problems in their own shops which need adjusting, and that they are out to get the knowledge that will help them to do more business in a more efficient manner and make a fair profit on the work they do. Secretary Garrett Frankland, of the Ontario Association, is enthusiastic over the prospects and the way in which the members of the various organizations have taken hold.

Now is the Time

"Now is the time to make the change," he told the members of the North "Ender" Club at their meeting on Thursday evening last. "We are at the parting of the ways, not only for Toronto, but for the whole Dominion. Either we are going to go ahead and make some real progress by adopting the methods that have made for success in other lines of business, or we are going to go back. There is every indication that we are going to go ahead. All over the province I find an interest being taken in the movement to make things better that spells for success. By adopting business-like methods and by working together we can accomplish big results. There is nothing like co-operation, and the boys are beginning to understand the spirit of the thing and see the possibilities ahead."

How It Works Out

At this meeting as well as at other meetings of the "Ender" clubs held during the month, a practical address on "How to Figure by the Divisional Method" was given by Mr. Percy Mansell, of Toronto. By means of a blackboard he figured out for the members present actual problems with which they have been coming in contact every day. He explained fully the system of figuring and compared it with the old methods, showing why many of those in the trade have not been making the money they thought they were making because they were figuring by wrong methods.

To Find Selling Price

The table, which is reproduced, is the basis on which the whole system is worked. Mr. Mansell took the various problems presented to him by the members and worked them out, showing exactly what the selling price should be. He then proved them by working them backwards. He stated that too many men in the trade in figuring fail to in-

Table for Finding the Selling Price of any Article

COST TO DO BUSINESS	NET PER CENT PROFIT DESIRED																				
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	20	25	30	35	40	50

18%	81	80	79	78	77	76	75	74	73	72	71	70	69	68	67	62	57	52	47	42	32
19%	80	79	78	77	76	75	74	73	72	71	70	69	68	67	66	61	56	51	46	41	31
20%	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65	69	55	50	45	40	30
21%	78	77	76	75	74	73	72	71	70	69	68	67	66	65	64	59	54	49	44	39	29
22%	77	76	75	74	73	72	71	70	69	68	67	66	65	64	63	58	53	48	43	38	28
23%	76	75	74	73	72	71	70	69	68	67	66	65	64	63	62	57	52	47	42	37	27
24%	75	74	73	72	71	70	69	68	67	66	65	64	63	62	61	56	51	46	41	36	26
25%	74	73	72	71	70	69	68	67	66	65	64	63	62	61	60	55	50	45	40	35	25

RULE

Divide the cost (invoice price with freight added) by the figure in the column of "net rate per cent profit desired" on the line with per cent it cost you to do business.

Example

If a bath tub cost - -	$20.00
Freight and cartage - -	1.50
	$21.50
You desire to make a net profit of	25%
It costs you to do business -	15%

Take the figures in column 25 on line with 15 which is 60

60 | 21.50 | $35.83 = Selling price

180
350
300
500
480
200
180

The percentage of cost of doing business and profits are figured on selling price.

Example

If an estimate on a contract totals - $300.00 actual cost
You desire to make a net profit of 10%
It costs you to do business - 15%

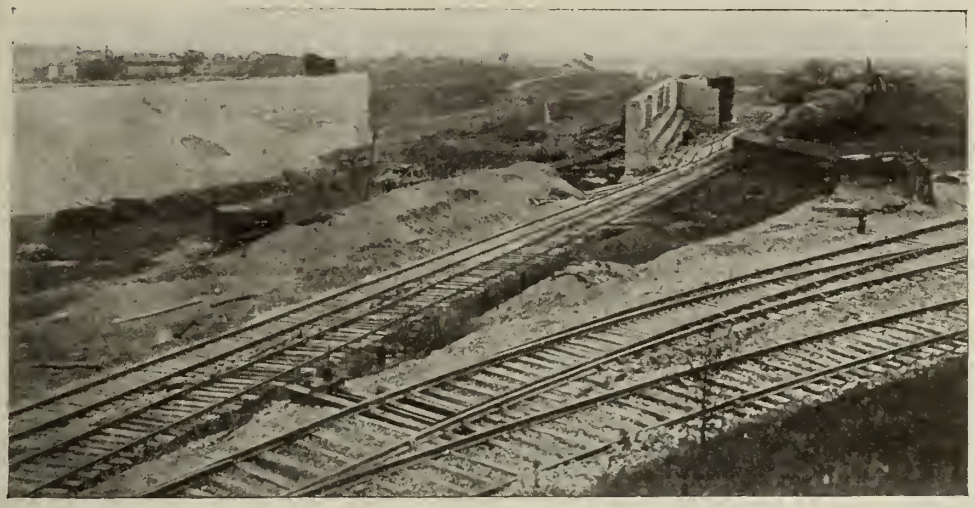
Take the figures in the column 10 on line with 15 which is 75

75 | 300.00 | $400.00 Amount of your proposal.

300
00

The percentage of cost of doing business and profits are figured on selling price.

Current Events in Photograph



NEW WELLAND CANAL

This shows the latest stage of the huge undertaking and also gives an idea of the magnitude of the work yet to be done. The view is taken looking from the head of the lock toward Lake Ontario. There is a stretch of the canal bed about 170 feet in width to be cut out of the solid rock.

clude enough for overhead, forgetting apparently many of the things that overhead includes, such as tools, equipment, compensation, their own salary, light, heat, and all expenses. As a result, they come out short. Taking 15 per cent. as a reasonable basis to allow for overhead, he based all his problems on that.

The following represents a typical problem and shows fully how the selling price and profit is arrived at:

First, find the cost of material and to it add your labor. You thus have at a glance the two important items. Add them together and secure the estimated total cost.

Material cost is	$225.00
Labor cost is	75.00
Estimated total cost L. & M. is	$300.00

This fills the first three lines of the open price sheet.

You now divide this sum by 75, thereby arriving at a selling price of $400.00.

The overhead allowance is 15 per cent. of your selling price, or in this case $60.00. This is entered on the fourth line. Your net cost, therefore, is $300.00 plus $60.00, or $360.00, which amount is entered on the fifth line.

Your desired profit is 10 per cent. of the selling price, or $40.00; this is placed on the sixth line and added to your net cost, thus giving the selling price of $400.00, or the amount arrived at by the 75 divisional method.

In cases where the cost is not in round figures, the selling price will be similar, or as an example: The cost of labor and material is $427.85. By the 75 divisional method, the selling price will be $427.85, divided by 75, equalling $574.66.

As a tender is usually submitted in round figures, the tender therefore will be either $574.00, or $575.00. This is the reason for the two bottom lines on the open price sheet.

The question came up as to whether 15 per cent. is enough to allow for overhead. This is a matter for the individual to decide, as sometimes conditions vary, but in ordinary cases it was thought that this was a fair figure. In Detroit, it is stated, a higher percentage is taken as a basis. Mr. Mansell figured on a job in three ways, by using the old method, by using the divisional method, and by taking the higher overhead figure adopted in Detroit. Taking $135 as the estimated cost of labor and material, he showed that under the old plan of figuring the plumber would get $148.50, by the divisional method of figuring the price would come to $180, and by using the higher figure for overhead adopted in Detroit the work would figure out to $225.

Don't Put It Too Low

Another point that came out in the discussion was that plumbers in figuring their own time should not base it at the rate of pay received by journeymen. The master plumber's time is much more valuable and should be figured at at least double that of the journeyman. Taking a time and material job involving material valued at $242 and twelve days' labor, Mr. Mansell figured that the net cost would be $358.12, allowing 15 per cent. for overhead and $62.40 as the figure for 12 days' labor. In case a higher figure than 15 per cent. is required for overhead allowance, the net cost is arrived at by dividing the total cost of labor and material by the difference between 100 and the desired figure for overhead. For instance, in the case he figured Mr. Mansell divided by 85 the difference between 100 and 85. Had he wanted to allow 20 per cent. for overhead, the divisor would have been 80 or 100 less 20.

Favor 16 Hours

The "Ender" clubs are taking an average cost on a six piece job, with a view of recommending to the Conference Board a standard time for doing this work. An estimate was obtained from each member and the average struck, and 16 hours was shown to be about the time per fixture. This will be sent to the Conference Board.

Some of the members predicted that the time is coming rapidly when plumbers will charge for their estimate instead of losing a lot of valuable time as they do now in figuring on jobs which they never get.

CUTTING DOWN THE OVERHEAD

(Continued from page 21.)

Mr. Statham is a thorough believer in not only getting in a stock sufficient to meet the requirements of his trade but in letting the people know that he has these goods. The best way of doing this, he says, is through the local newspapers, and he uses a space three columns wide and two inches deep to tell the people about whatever he is offering. His ads are changed regularly. Just now they feature bicycles, as that is the seasonable line he is pushing. He nearly always uses an attractive illustration of a bicycle while these goods are being featured. This is changed during the plumbing seasons to something appropriate for the house in connection with plumbing goods.

Brown and Hornsey were awarded the contract for the plumbing, heating and wiring at the new isolation hospital in Galt, Ont.

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

BUSINESS CHANGES

Campbellford, Ont.—The hardware and plumbing business, formerly conducted under the style of Morton & Owen, is now conducted by E. T. Morton.

TRADE NOTES

Metal Studios, Ltd., of Hamilton, Ont., manufacturers of lighting fixtures, have secured new premises at 21 Walnut St. North.

By a unanimous vote the plumbers and steamfitters who are members of the union at Saskatoon, Sask., passed a resolution against the One Big Union idea. They also turned down a proposal of a six-hour day and a strike to enforce it.

J. R. Blais, business agent of the United Association of Plumbers and Steamfitters, Local 144, has sent out a request to plumbers to not to go to Halifax. This has been prompted by the conditions there bringing on a strike. "Our plumbers should not interfere in this affair," said Mr. Blais.

E. S. Stephenson & Co., Ltd., have been incorporated under provincial charter to carry on business as electricians, machinists, founders, etc., with capital stock of $18,000 and head office in St. John. They have taken over the business formerly carried on by Edward S. Stephenson. The directors are E. S. Stephenson, Herbert A. Stephenson and Ralph S. Stephenson.

James Ballantyne, Nazareth Street, Montreal, have been the successful tenderers for plumbing and heating in the new Eaton building at Moncton, N.B., and which will cost, it is understood, about $600,000. Mr. Ballantyne is to be congratulated on securing this big work.

Conroy Bros., Montreal, are awarded the contract for the heating and plumbing in the premises of the Bleury Investment Co., Montreal.

M. Walsh and Co., Montreal, are awarded the contract for heating and plumbing in the Hays Building, Busy Lane.

INCORPORATIONS

Smith & Stone, Limited, capital $100,000, head office Toronto, plan to manufacture and deal in rubber, glass, metal, porcelain and electrical goods.

London Shipping Containers, Limited, capital $50,000, head office London, Ont., plans to manufacture and deal in metal, cardboard, wooden and paper containers.

Hamilton Lamp Company, head office, Hamilton, Ont., capital, $300,000, plans to manufacture and deal in electric lamps and fixtures of all kinds.

TENDERS

The town of Trenton will receive tenders up to June 10, for the erection of a four-room addition to a public school. Plans and specifications can be seen at the architect's office, S. B. Coon & Son, Excelsior Life Building, Toronto St., Toronto.

St. Catharines Public School Board ask for tenders for the erection and completion of two one-story school buildings. Plans and specifications can be seen at the office of the McLean Daily Reports, Ltd., Toronto, and at the office of A. E. Nicholson, architect, St. Catharines.

Tenders will be called shortly for the erection of a new medical school for the Western University, at London, Ont., to cost $25,000. Watt & Blackwell, Bank of Toronto, London, Ont., are the architects.

Sarnia Ont., ratepayers will take a vote shortly on the question of providing $350,000 for a new combination technical and high school.

A syndicate is being organized at Leamington, Ont., to arrange with W. McEachren & Sons, Royal Bank, Toronto, for the erection of a number of new dwellings.

The Hillcrest Housing Co., London, Ont., has commenced work on several new residences, and plans to erect in all fifty dwellings.

A four-room addition to the public school at Preston, Ont., will be erected during the summer.

Plans are being prepared for a new factory building to cost $250,000, for the Holeproof Hosiery Co., of London, Ont.

Architect W. G. Murray, Dominion Savings Buildings, London, Ont., is preparing plans for a new sixteen-roomed school, for the school board at Ingersoll, Ont., to cost $95,000.

A by-law was carried by St. Thomas ratepayers, to expend $8,000 on the erection of a new pavilion at Pinafore, and the installion of lavatory accommodation.

MOVE TO NEW PREMISES

Crane, Ltd., Montreal, have moved to their new premises at 1280 St. Patrick Street, Cote St. Paul, Montreal. The offices will also be there on and after May 30, and the new telephone number is Victoria 1409.

In speaking with Mr. E. C. Townsend, the manager, he intimated that the premises would shortly be completed. The new quarters will provide for a more expeditious handling of orders.

NEW TIMMINS FIRM

Alex. Simpson and G. Hicks, formerly of Haileybury, Ontario, but recently employed in the mechanical department of the Hollinger Gold Mine, have opened a new plumbing shop on Spruce Street, Timmins, Ontario. They intend to make a specialty of sheet metal work, plumbing and heating systems. Both Hicks and Simpson have seen service overseas.

ONTARIO DELEGATION TO MONTREAL

A special car has been secured to take the delegates from the Ontario Society of Domestic Sanitary and Heating Engineers from Toronto to Montreal for the Dominion convention. The delegates from points in the district will join the Toronto delegation at Toronto. A good attendance is expected. Among those who are going will be F. R. Maxwell; T. Ferguson, president of the Toronto branch; K. B. Allison, vice-president; T. Maxwell, treasurer; George Clapperton, E. Lewis LeGroh, Lou Calder, Charles Chapman, Ross Belyea, John Cracknell, and Garrett Frankland, of Toronto; President Thomas Minnes and C. D. Henderson, of Brantford; Vice-President George E. B. Grinyer, H. Mahoney, and A. Malcolm, of Guelph; E. H. Russell, A. Gibbons, Ben Noble and John Eggett, of London, Ont.; Dominion Vice-President C. R. Myers and Angus McDonald, of Stratford, Ont. There will also be delegates from Hamilton, Kitchener, and other points.

Who the new Dominion president will be is a matter of speculation. Among three of the best guesses are said to be Vice-President Clove R. Myers, of Stratford; Vice-President Garrett Frankland, of Toronto; and Frank R. Maxwell, past president of the Ontario Society.

Believing that there will never be a better opportunity than the present for organization work all over the Dominion President T. J. Minnes and Secretary G. F. Frankland plan to urge upon the convention the importance of undertaking this work and following it up energetically. They will also present reports from the Ontario Society showing what has been done and what it is planned to do.

A pressing invitation was extended to John W. Bruce to attend the Montreal meeting and give an address. Owing, however, to his duties in connection with

the Industrial Commission, which is now hearing evidence at various points in the Dominion, it is not likely that Mr. Bruce will be able to attend.

OTTAWA CONVENTION DELEGATES

Ottawa plans to send at least seven members to the Dominion meeting in Montreal, and it is expected that several others will go. Those who have signified their intention of attending are Messrs. Archambault, Gauthier, McKinley, Band, Blyth, Chapman and Chandler.

DRAUGHTSMEN'S ASSOCIATION GETTING UNDER WAY

At a meeting held in Sons of England Hall, Berti and Richmond streets, Toronto, further steps towards organization were made following the two previous meetings held recently.

The aim of the new association appears to be to organize the draughtsmen of Canada of every branch of industry into one association. At the last meeting Mr. Cranfield, of Peterborough, was present, with 10 names to be included in the membership. A motion was made that this association be called the "Draughtsmen's Association of Canada," but this was struck out, due to their intention to ultimately affiliate themselves with the American Association. It was brought out that a Draughtsmen's Association has already been formed in Montreal.

Mr. Lansing, in addressing the audience, gave his views, in which he exhorted those present to join this association, because of the position in which it would place them to obtain better working conditions from their employers.

Discussion of this point revealed a feeling that this should not be the principal aim, but rather to cement the draughtsmen into closer relations with each other. The following officers were elected:

Mr. Lansing, president; Mr. Pennington, vice-pres.; Mr. Goodwin, financial sec'y; Mr. Frank Brown, recording sec'y; Mr. Perry, treasurer; Mr. Patterson, sergeant-at-arms; Mr. Riggs. warden.

Executive:—President and financial secretary; also Mr. Leeming, electrical engineer; Mr. Browning, marine architect; Mr. Riggs, mechanical engineer; Mr. Pattison, heating and sanitary engineer; Mr. Beddell, civil engineer.

TIN PLATE MILL FOR TORONTO?

Negotiations have been carried on for some time past between Baldwins, Ltd., the Imperial Munitions Board, and the Harbor Commissioners relative to the purchase of the plant of the British Forgings at Toronto.

Baldwins, Ltd., will establish a large tin plate mill in Toronto if the negotiations come to a satisfactory conclusion and would use the electric furnace equipment of the present plant in the making of the steel ingots for tin plate.

The plant of the British Forgings, Ltd., Toronto, which is the largest electric furnace plant in the world, was erected in the spring of 1917 by the Imperial Munitions Board for the manufacture of shell forgings for the British and Allied Governments.

CONVENTION NOW IN PROGRESS

BY the time this issue of SANITARY ENGINEER reaches its readers, the convention of the Canadian Society of Domestic Sanitary and Heating Engineers being held on June 3 and 4, will be in full progress in Montreal. From all accounts there will be a very good attendance and it is the belief of the officers and executive that much good will be accomplished. The aims of the Society towards organization and co-operation are worthy the assistance of all members of the trade and great good should result from these get-together meetings. It is not only the Dominion body that is being pushed so aggressively, but the local organization in your own town is the ideal being sought by those in charge of the Society's affairs. A complete report of the proceedings will appear in the next, the June 15, issue of SANITARY ENGINEER.

APPOINTED EDITOR GAS JOURNAL

Geo. W. Allen, of Toronto, has been appointed editor of the Intercolonial Gas Journal of Canada, published at Hamilton. Mr. Allen's association with the electrical and gas trade began in Toronto some 18 years ago. From there he went to Brantford, Ont., where he went into the general and gas contracting business, superintending the installation of work on many public buildings and being one of the leaders in developing the use of natural gas in Western Ontario. Mr. Allen moved to Toronto in 1909 with the Consumers' Gas Company, moving up to the position of advertising manager and superintendent of employment. His many friends will join with SANITARY ENGINEER in wishing him success in his new field.

EXPORT BUSINESS DEVELOPING NICELY

With a view to further development of export business, H. C. Crow, sales manager of the Canada Metal Co., Toronto, is leaving shortly for England. While there he will go thoroughly into the situation.

"Our export business is getting to be something really big," said Mr. Crow, in discussing conditions with SANITARY ENGINEER. "We have had any number of inquiries and are still getting them, and a large percentage of them have developed into excellent trade. I am satisfied that there is lots of business to be had and that the way to get it is to go after it. While we look after any inquiries that come to us through the Trade Commission and similar sources we do not rely upon them for getting trade. We depend upon our own men for getting results both at home and overseas. The way to get business is to go after it either here or over there."

Mr. Crow stated that business is developing nicely in South Africa, New Zealand and other countries as well as in England, and he looks for it to grow steadily.

"Business in all lines is particularly good," he said, "and there seems to be a large demand for nails."

Discussing the general outlook, he gave it as his opinion that prices are going to be firmer.

BRITAIN TO DISPOSE OF STEEL IN STATES

Disposition of approximately 91,200 tons of rolled shell steel billets, owned by the British War Mission, in the United States at $34 per long ton, is planned by the British War Mission, the American War Department announces.

MAY REMODEL INSANITARY HOUSES

Controller Jutten, of the Hamilton, Ontario, City Council, is proposing that the rent of all houses unfit for habitation be collected by the city and that it be used to place the buildings in a habitable condition. As soon as the cost of the work, often very small, is covered, the rent would again be paid to the landlord. This would seem to be a way out of many difficulties regarding insanitary houses. The housing situation is acute and every house is needed.

FOUNDER OF TRADE POOLS IS DEAD

Edwin E. Jackson, Jr., who was well known some years ago as an organizer of business combinations and trade agreements and pools, died this week at his home in Brooklyn at the age of 52. Mr. Jackson, while a member of the law firm of Noble, Jackson & Hubbard, put through a pool agreement to control both the output and price of wire, but in 1911 all the members of the association were found guilty of violating the Sherman Anti-Trust Law and were forced to dissolve the pool and, in addition, had to pay heavy fines to the Government. In this case, Mr. Jackson was fined $5,000

on each of nine counts, or a total of $45,000.

Mr. Jackson also organized the so-called "Bath Tub Trust" and the "Electrical Trust," which were also forced to dissolve in 1911 as a result of the suits which were brought by Attorney-General Wickersham under the Sherman Act. It is said that at one time Mr. Jackson and his associates managed no less than 50 different trade pools which in the main were designed to create monopolies and do away with all outside competition, but owing to the firm stand taken by the Government, they were all abandoned.

The Waterbury copper average is one of the few trade innovations introduced by Mr. Jackson, which has survived, but this is still issued each month and continues to be used quite extensively as a settling basis on copper products.

VENTILATING THE MODERN SCHOOL

(Continued from page 32.)

70 degrees Fahr. above. These calculations are figured for a pressure of 5 pounds at the steam gauge.

When arranging to lay out these heaters due regard must be paid the provision of sufficient free area for the passage of air through these heaters with the minimum of friction. The velocity of air being 314 feet, a free-way of 4 square feet should be provided between the heater sections. This four square feet might seem to be inadequate when compared with the 6 square feet of the flue area, but one must consider that as the weather grows warmer and the air velocity through the heater becomes correspondingly less, the higher temperature affected results in the opening of the by-pass shown on the sectional drawing, thus resulting in providing a full free-way of 6 square feet from the heater chamber.

We are now in possession of sufficient data to lay out the fresh air flues together with the indirect radiators.

The foul air flues in this school are to be built up to, and through the roof, and if our design called for the connecting of these flues into a common outlet it would be necessary to instal equalizing those on the less side. The ventilalting flues so that those on the windward side of the building might "draw" as well as thouse on the lee side. The ventilating flues take the air from the class-rooms at the floor line and on the same side of the room as the fresh air flue makes entry. All ventilating flues should be fitted with dampers for the purpose of closing the flue when the class is not in session.

When installing a gravity system of ventilation it is advisable to provide for the summer use of the system by leaving an opening in each vent flue close to the ceiling, this opening being closed by a damper during winter months.

1. Always provide more than one cold air inlet to each heater chamber. These inlets should be set in such positions that either may be used as required by the direction of the outer air currents. Thev should be fitted with the back draft dampers so that a blow down will not drive the air back up through the cold air inlets.

2. The tops of the indirect radiators must not be set within one foot of the ceiling of the heater chamber.

3. The vent flues must be fitted with dampers, and in some cases with "back draft" checks.

4. The bottom of indirect radiators must be at least 24 in. above the water line of the boiler (more if possible) and their returns must be fitted with swing checks.

5. All air passages must have clean-out doors or other means of access so that these chambers may be readily inspected.

6. Where sufficient funds are available automatic temperature control should be included in the specification for a system of this description, and be sure that the automatic control covers everything required, including the operation of the tempering dampers in the fresh air flues.

SYSTEMS

(Continued from page 30.)

that a chimney will pull sufficient vacuum to draw vapor through a system of piping. He knows that it is a pretty strong chimney that pulls more than two-tenths of an inch of water, and that a pull of that strength will not go very far in a heating system.

The thoughtful engineer pauses to investigate everything that may come his way in the nature of his business, but while keeping his mind open for new things he is not carried away by innovations to such an extent that in practice he becomes a faddist. He listens with patience to a salesman extolling the particular virtues of his wares and weighs with care his somewhat extravagant assertions.

Happily for the public most men engaged in the installation of heating materials have kept clear of entangling alliances with manufacturers, and as a result there are very few cases where the men installing heating systems have an entirely mercenary object in advocating any one type of system for all kinds of buildings.

A few apprentices have graduated into the ranks of journeymen without ever learning the fundamental principles underlying the practice of their trade. They know that for a certain class of work fittings are always installed in a certain way, but their understanding of the reason is very vague. They have been taught that pipes should run in the most direct way from boiler to radiators, and when they come to make an installation where the plans have been laid out with a regard to equalizing the circulation at some particular part of the building, they can only believe that a mistake has been made, as certain radiators close to the boiler are set so as to be taken off the end of the main. When these men once grasp the principle of the design of that type of system they hesitate a long time before taking liberties with the engineer's layout.

Two of the things the fitter must keep forever in mind when installing any system of steam piping is that provision must be made for the drainage of condensation and for the expansion and contraction of pipes. Be sure to keep your lines free from condensation or air pockets and your water lines free from traps. Remember water will not flow uphill; it must be pulled up or lifted.

When your lines are all properly graded see that they are properly supported so that the grades established may be always maintained.

The adoption by many industrial firms of a first aid department presents an opportunity for business for the aggressive sanitary engineer. This is a view showing a portion of the first aid department of the firm of Massey-Harris Co. of Brantford, Ont. This is in charge of Miss Slee, who reports an average of 30 cases per day passing through her hands. Everything is finished in white and the room contains all the necessary plumbing equipment, medicine cabinets, etc., which form a part of such a department.

NATURAL VACUUM SYSTEM

Question:—A friend of mine is contemplating the installation in his building of what he claims to be a vacuum system of heating. Any vacuum systems that I have worked on had a pump pulling on the returns. The plans my friend has do not show a pump, and it looks to me as though he is only getting an ordinary two pipe system with a vent on the end of the dry returns. Will you please explain how this system can be a vacuum system?

Answer:—The system you refer to has been designed on a principle that can best be explained by the use of the following illustration: Imagine a steam boiler set up in the basement and this boiler connected to one radiator on the ground floor. The piping connections are a feed to the top of the radiator and a return at the bottom. The air vent opening for the purpose of this experiment has a pet cock in place of the ordinary air vent, and a compound pressure and vacuum gauge is connected to some part of the radiator. Now when steam is generated in the boiler it passes up and into the radiator, drawing the air out ahead of it through the opened pet cock in the air vent. When steam begins to flow freely through the open pet cock the pet cock is closed, and if the fire is kept burning in the boiler the pressure gauge registers in pounds the steam that is being developed. If the fire is checked at the boiler the steam pressure begins to drop and the indicator on the gauge turns back until it has passed the zero mark and registers, on the vacuum side, the number of inches pulled. It may go back to 10 or 12 inches and the radiator be still hot. If the pet cock had been opened at the time the fire had been checked no vacuum would have been registered and the radiator would have been cold when the gauge registered at the zero mark. Now that is the principle of the system that your friend intends installing. The whole secret in the establishing of the vacuum is in the air vent closing against the return of the air.

The plans supplied must be rigidly adhered to as valves graduated in size to suit certain radiators are used. A system of that kind requires great care in the installation and selection of materials, and if you instal the system be sure that you have sufficient grade in all of your pipe lines.

BOOKS ON PLUMBING

Arthur F. Betts, Fredericton, N.B.—Please give names of books which you can supply dealing with plumbing and heating. I have a returned soldier with me who is being given an eight months' course in plumbing and heating by the military authorities. I am anxious to help him as much as possible.

Following books may be secured through the technical book department:

Plumbing and Heating, Practical Wrinkles for the Plumber, $1; Plumbing, $1.50; Country Plumbing Practice; $2; External Plumbing Work, $2.50; Cont. and Estimate Record Book for Steam and Hot Water Heating, $1; Plumbing Plans and Specifications, $3; Practical Plumbers' Work, 75c; Five Hundred Questions and Answers on Steam Fitting, $1; Gray's Plumbing Design, $4; A Successful Way to Operate a Heating Plant, 50c; Record Furnace Handbox, $4; Steam Boilers. $4; Sanitary Sewerage of Building, $1.50; Sanitation in the Modern Home, $2; Hot Water Manual, $3.50; Steam Boilers, $1.

We would also suggest that if you are not already receiving two copies of SANITARY ENGINEER you subscribe for an additional copy for this young man. In this way he will be able to keep right up to the minute regarding what is going on in the trade. He will also be practically interested in the present series of articles by Mr. Kearns, which are being widely commented upon by the best men in the trade.

NEED MANY HOUSES

LONDON, ENGLAND—The Government has ordered 800,000,000 bricks for the housing scheme, and it is reported that there are now more than enough bricks on hand to meet all existing demands. Explanatory pamphlets are going to be issued by the Local Government Board, illustrating how the best advantage may be taken of the scheme by the general public and local authorities. But no houses have as yet been built.

A speaker addressing a public meeting the other day said if people are foolish enough to pay $1,000 for army huts which cost $300, they may be able to get them.

MARKET CONDITIONS AND TENDENCIES

(Continued from page 36.)

here are now ranging from 6½ to 7c per pound.

ANTIMONY.—A recreation upward is noted in this metal also this week, quotations now ranging from 8½c to 9c per pound. There is a better demand, and this is being met from ample stocks, though supplies here are not considered heavy and reports from primary points reveal no excess stocks.

ALUMINUM.—There are some grades of aluminum that are reported scarce at primary points, and it has taken very little of a buying movement to make this fact apparent. There is only a nominal interest being shown as yet in this metal locally, with quotations ranging around 40c per pound.

PIG IRON.—A distinctly better feeling is apparent since the United States Government discarded its price-fixing plans and buying is assuming better proportions. Some factors predict a bull market when Government buying for the railways begins again, which they claim it must do at an early date.

Heating and Ventilating

SYSTEMS

Fifth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the fifth of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on the "Systems" a most interesting and illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the designs for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The sixth article of the series will appear in the next issue.

It is almost with a feeling akin to hesitancy that we approach the subject of piping for steam and hot water heating plants. We believe that some of the statements that we find necessary to make may involve us in a controversy with some reader who believes that one and only one system of piping is the best for any and all conditions, without regard to circumstances.

A picture comes before us of a fitter asserting that some engineer knows nothing of his business because that engineer had made a specification for a two-pipe steam job. In the opinion of that fitter the only sensible system to instal is the one pipe. This man certainly has some wonderful results with the one-pipe system as his knowledge of the details cover every requirement. He is, in fact, a specialist in that class of work and has knowledge of no other.

Another man comes along and swears by the two-pipe system. In it goes, in big buildings, little buildings, schools and churches, warehouses and convents, green houses and sanitariums. no matter what he is called upon to do the two pipe system is forever in his mind.

Many men look askance at the use of pumps or any mechanical device in connection with heating systems. Others cling to these pumps as to a life preserver. One man claims that no supply pipe should be run overhead, another that they should not be run in any other place.

Forced hot water heating systems have their partisans, and also those who condemn them in the most vigorous language.

If one did not know that the assured assertiveness of these men came from the conscientious belief of their superior knowledge an effort might be made to enter into argument with them, but as they are never ready to grant that one differing from them may have, at least, a little intelligence, it is extremely difficult to get anything more from them than a violent expression of their opinion.

I believe that the engineer with a thorough knowledge of his business would instal heating plants in the various types of buildings thus:

(1) In residences he would prefer to instal hot water systems. He would pipe a small, square building where the boiler may set approximately in the centre of the basement, in such a way that he could use individual mains for ground floor radiators and the risers, On the other hand, if the building was long and narrow, with the boiler set at one end of it, it is likely that he would prefer the system of piping where the radiators and riser branches are fitted to the flow and return mains in such a manner as to equalize the circulating effect.

(2) In a small greenhouse he would instal a gravity system of hot water heating, using large pipes as radiating surfaces. In a large building of the same nature he might instal a forced hot water heating system. But before advocating any system he would make it a point of finding out just what kind of plants were to be grown, as it might be advisable, under certain conditions, to have a steam heating system installed. Greenhouse heating is one of the most difficult problems with which the heating engineer has to deal, and one of the safe rules to follow is to be sure that the heating system of a large greenhouse is kept separate and distinct from that of any other type of building.

(3) In a church he might advocate a forced blast system of heating. This would also apply to theatres and all other auditoriums with the exception of those used for moving picture plays.

(4) In hospitals he would instal a vacuum steam system plant or a hot water heating system, preferably piped for forced circulation, and if a steam boiler was used therein for heating the coils in the ventilating chamber, or for any other purposes, he would use a reheater or a converter, thereby utilizing steam to heat the water circulated in the direct radiators.

(5) It is likely that he would recommend a vacuum circulating system of steam heating in a factory building of fairly large dimensions, and he would use an electric pump in preference to that of any other type. Small factories he would pipe for either one or two pipe gravity systems as the circumstances demanded. If the use of coils were advisable the two-pipe system would be necessary. If a number of small radiators were to be used a one-pipe system would be that advocated. If the building was fairly high and he was using a one-pipe system, he would certainly drip the risers.

(6) His belief is that the system best adapted to office buildings is that of a two-pipe mechanically induced vacuum.

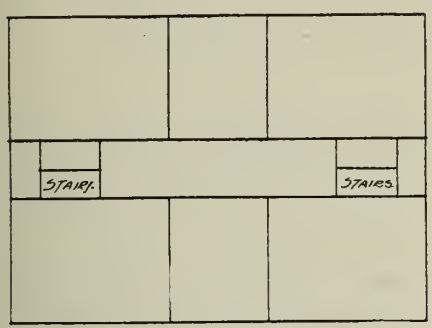
(7) When he uses air vents and connects them to an air line his judgment does not prompt him to connect the air line to the chimney. He does not believe

(Continued on page 28)

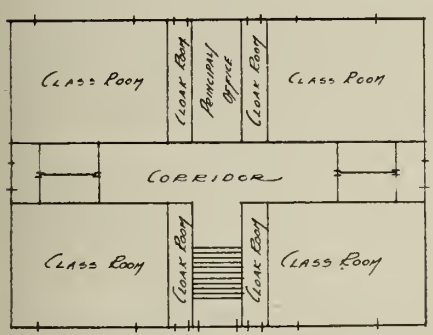
Ventilating the Modern School

Fourth Article of Series Written Especially For "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

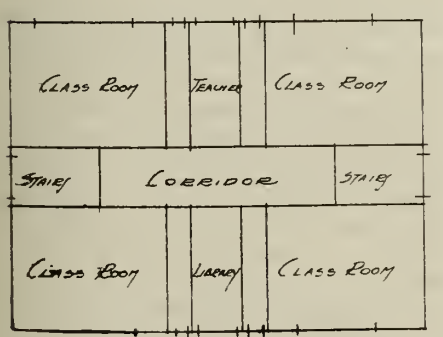
WE are now ready to lay out the ventilating system for a school building, and for our first example take the problem of a school with eight class rooms. The system to be installed is for gravity circulation, using indirect radiation for heating the air for ventilation. The plan first comes to our attention in the shape of a rough diagram, thus:



BASEMENT



GROUND FLOOR



FIRST FLOOR.

It will be noted that the architect has not indicated the position of the boiler room nor the location of any of the ventilating flues; this he has left for the consideration of the heating and ventilating engineer, and in doing so he has mentioned that the roof of the building is flat and surrounded by a parapet wall 4 feet high. The information regarding the type of roof is quite necessary, as in the absence of such the ventilating flues might be run in a location that would interfere with the constructional details, or the architectural design of the building. In this connection it might be stated that in many school buildings the ventilating stacks have been made the dominant note in the architectural composition. This is especially the case where pitched roofs are used. Some designers group these flues in such a way that they seem to be absolutely necessary to the rounding out of the design, and where flues are designed in this manner architectural skill of the highest degree is manifested. Some styles of architecture demand as a feature a roof with a cupola or other ornamental tower, and in such cases these ornamental features may often be turned to good account as termination for the vent flues.

The plan we are considering indicates a flat roof, and therefore we do not have to give much thought to the appearance of these flues above the roof, other than to see that where showing above the parapet walls that they are set far enough back in the roof so as not to mar the appearance of the building.

Some reader may question the fitness of the subject of architectural design entering into and confusing the problem of the ventilating engineer. A question of this kind is almost sure to arise in the mind of that man who worships only at the shrine of utility, and who considers that so long as his work serves the purpose of usefulness he has fulfilled all of his obligations, but even men of that type must grant that people as a whole seem to have some appreciation for the appearance of good work, and therefore they, in doing their own work, strive to do it with a certain amount of neatness, yet these same men when they get hold of an architect's drawings for a building, instead of exercising their abilities in an effort to find some way of fitting their work to the architect's design, they, without a thought of the labor, time and study spent by others, rip the very bowels out of the building in an endeavor to have the only system that they know anything about installed.

The reader must not assume that when practising as a heating engineer he is to usurp the architect's function, but rather that he is to avail himself of every opportunity of consultation with the architect when laying out the main features of the ventilating design.

The greatest need of the average man is an open mind. In many cases it is the general disposition to incline favorably only to those things with which we are familiar, and one of the symptoms of this disposition is an unhealthy desire to keep the mind closed against the introduction of anything new; another symptom is the belief that when a man cannot appreciate one's point of view that he must be entirely ignorant of the subject under discussion. When one comes with an open mind to the consideration of the ventilating system for almost any class of a building he will find that as a rule it is not difficult to design such a system without interfering to any great extent in the architect's lay-out. And when there are occasions where we must ask the architect for some modification in his design so as to permit of the satisfactory solution of the problem of ventilation, it is likely that our requirements will be such that the very necessity of providing for them will open the way to some feature that may be incorporated in the architectural design. For example, we may take the fresh air inlet, which is to be situated at the front of the building and above the dust line; here is a case where the utilitarian would run up a square flue at any place convenient without regard to appearance, while the thoughtful designer would make that very emergency an opportunity for architectural expression.

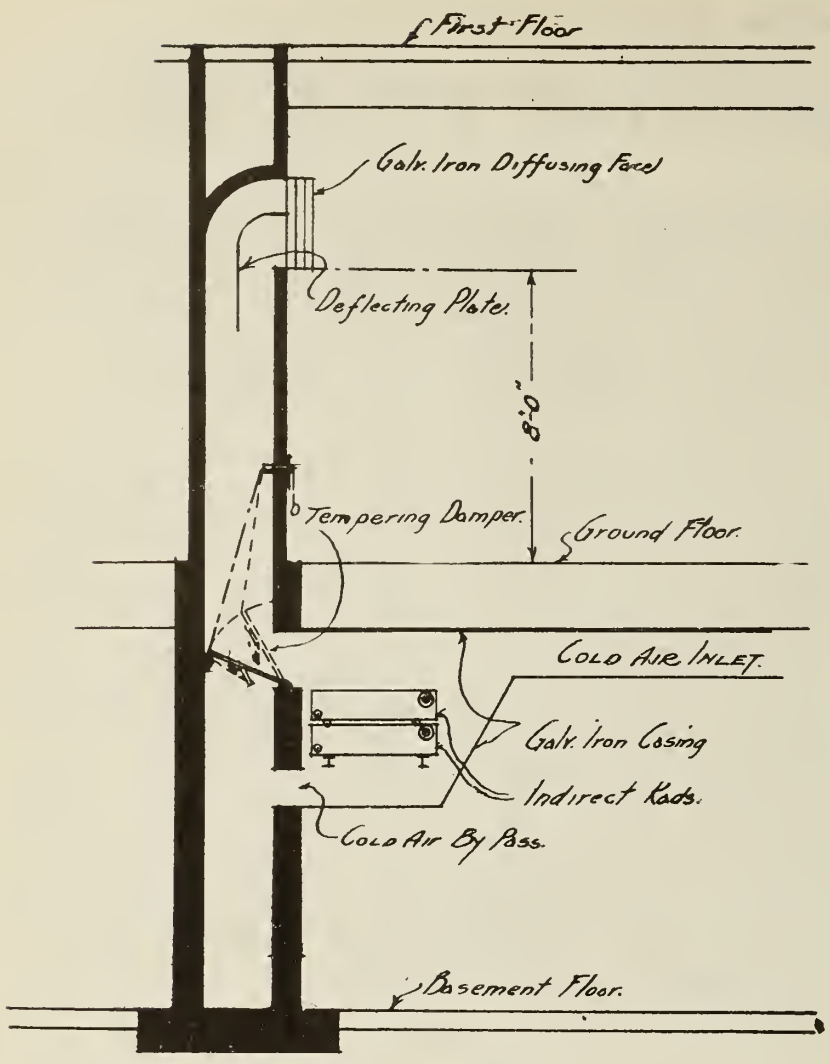
To return to the ventilating design for the building; we find that, in referring to the plans, the storey heights are given in the dimensions from floors to ceilings, thus:

Basement	10 ft. 6 in.
Ground floor	12 ft. 6 in.
First floor	12 ft. 6 in.

All rooms are 32 ft. long by 25 ft. wide. The windows are massed in each class room along the left-hand side of the pupils. The seating capacity of each class-room is for forty pupils and one teacher.

Now the first thing we are to take up is the size of the flues, and to ascertain the size of the flues we will make use of the data we have presented in former articles of this series. Referring back to one of these articles we find that 30 cubic feet of fresh air per pupil was set as a standard. There are forty-one occupants of each class-room so we estimate that the total amount of air required per minute is 1,230 cubic feet per class-room.

When we refer to the table (presented in the third article of this series) giving the velocities of air traveling in flues, we find that the capacities of flues vary with the temperature difference of the air in the flues and the external atmosphere, and also with the heights of the flues. So first we must decide on the flue heights. We refer to the architect's sketch and find that the vent flues may be made 40 ft. in height, this height being measured from the level of the top of the heating chambers in basement to the lowest point of the vent opening above roof. Next we decide on the air temperatures, and here is where judgment must be used in striking an average temperature condition as a basis for our calculations. The table gives the air velocities for temperature differences ranging from 10 to 100 degrees. Now if the flues should be proportioned for extremely cold weather they would be too small for adequate ventilation during warmer days, or if we used figures for a very slight temperature difference the



FRESH AIR FLUE.

flues would be extravagantly large. We may assume that as surely as there is a warm day during the winter the teachers in each of these class-rooms will raise the windows so as to effect the ventilation by this means rather than by using the ventilating system. It is altogether likely, therefore, that when there is a temperature difference of less than 15 degrees between the inner and outer atmosphere the windows will be opened, so for our purpose we assume a maximum ventilation requirement for nothing less than a temperature difference of 15 degrees. The table indicated that a flue 40 ft. high with a temperature difference of 15 degrees gave a velocity of 265 feet per minute. The flues are not continuous through the full height; there is a break in the height of the flues where they turn into the class-rooms before venting to the stack. There is also a change in the temperature condition and for these two reasons we must deduct about 25 per cent. from the rated efficiency. This makes the estimate of the flue velocity as being 204 feet per minute. The air requirement is 1,230 cubic feet per flue per minute, and when we divide the 1,230 by 204 the flue area required is found to be 6 square feet.

There are many schools where gravity ventilating systems are installed, not having flues nearly as large as these recommended here, but the writer knows from actual experience that a flue smaller than 6 square feet is not large enough for adequate ventilation with a gravity system. Remember that we are basing our figures on the assumption that the fresh air is to be delivered into the class rooms at a temperature never exceeding 72 degrees Fahr.

A flue 6 square feet, being the size required for fairly warm weather conditions, is too large for use in cold weather, so we place throttling dampers in the vents for the purpose of keeping the flow of air within normal limits. The throttling dampers are usually controlled from the fresh air rooms in the basement. The reader must bear in mind that different conditions require different details of design and that circumstances often warrant the building of flues having areas greater or less than those based on the rules given in these articles. Once again we may state that judgment must be exercised in designing these flues, but when a person deviates from any set of rules he must be in a position to state clearly why he is doing so, otherwise he cannot expect to inspire much confidence in the mind of his client. Any of the rules given in these articles are well within a margin of safety, and unless the reader has had a great deal of experience in this class of work he should stay with the sizes that have been recommended.

The next thing to decide upon is the amount of indirect radiation required in heating the fresh air.

The problem is to heat 1,230 cubic feet of fresh air per minute from 10 degrees Fahr. so we multiply the E.G.S. of 1,419 above. The heat required for this per hour is as follows: 1,230 cubic feet multiplied by 60 equals 73.800 cubic feet to be heated per hour. (The figure 60 represents minutes). The temperature of the air coming in from outdoors is assumed to be 10 degrees below zero, and it is to be raised to 70 degrees above. Therefore, the average temperature of this air is 30 degrees above zero. The quantity of heat given out by one B.t.u. to air at this temperature is sufficient to raise 52 cubic feet of air one degree Fahr. so we divide the 73,800 cubic feet of air by 52 and find that this is equal to an equivalent glass area of 1,419 square feet (the function of the equivalent glass area and heat loss calculations was described in detail in the first article of the series on heating, under the heading of, "The What, the Why, and the How of the B.t.u.").

The temperature range is 80 degrees Fahr. so we multiply the E.G.S. of 1,419 by 80 and find a total requirement of 113,520 B.t.u.'s for heating the fresh air for each class-room.

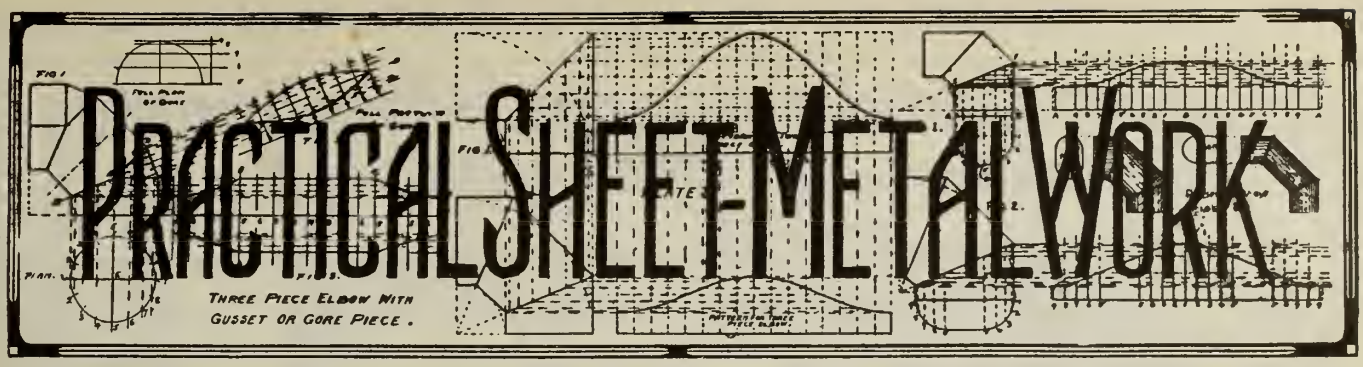
The next thing to do is to find the efficiency of the radiating surface, and to do this we will refer to the guaranteed ratings as given in the catalogues of manufacturers making radiators for this class of work.

As we have already learned the velocity of the air through the heaters has a bearing on the efficiency of these surfaces, we must establish a rate for that in estimating the heating area required. We have already based the flue velocities at 206 feet per minute, but that was for a temperature range of 15 degrees Fahr., and as the indirect radiation is to be figured for a temperature range of 80 degrees, reference to our table shows that this velocity is about 419 feet. deducting 25 per cent. from these figures on account of the break in the flue we assume the velocity as being about 314 feet.

The air is not to be heated to a temperature above 72 degrees Fahr., so the indirect heaters must not be more than 20 in. deep, if it should be made less than this, say 10 in. deep, the air would only be heated to a temperature of 40 degrees above zero instead of the 72 required.

The air passing over two sections of "vento" radiators at this velocity will take up 800 B.t.u. per hour, and in dividing 113,520 B.t.u. by 800 we find that 142 square feet of indirect radiation is required to heat 1.230 cubic feet of air per minute from 10 degrees below to

(Continued on page 28.)



BY THOMAS STANSFIELD

THE accompanying plate shows quite a variety of seams, locks and joints that can be made in the construction of square or rectangular ducts. Some will require the use of a brake, while others can be neatly made without.

Of course, any of these would look neater if machine turned. Fig. 1 shows a rectangle pipe with one lock only, Fig. 2 one with two locks, which would add strength to the pipe.

Fig 3 type of pipe or duct is generally made in this way when heavy gauge material is required. A shows an enlarged section of a finished corner. It will be seen that the sides are turned over after being riveted.

Fig. 4, too, is a type generally made up of heavy iron, with corners made of angle iron. Sometimes this type of duct is made of light sheet metal, and the angle iron is used not only to make the corner of, but also to stiffen the whole duct.

This is another article of the series on Sheet Metal Work by Thomas Stansfield, which have been widely appreciated by the trade. Next issue will contain the concluding article.

Fig. 5 is a simple type of duct easy to make in either light or heavy sheet metal when rivets are used, or even stove bolts.

Fig. 6 is a duct describing a very simple yet strong double lock, which when complete, and the raised double edge turned over and soldered, makes a neat job. A shows an enlarged section of the finished seam.

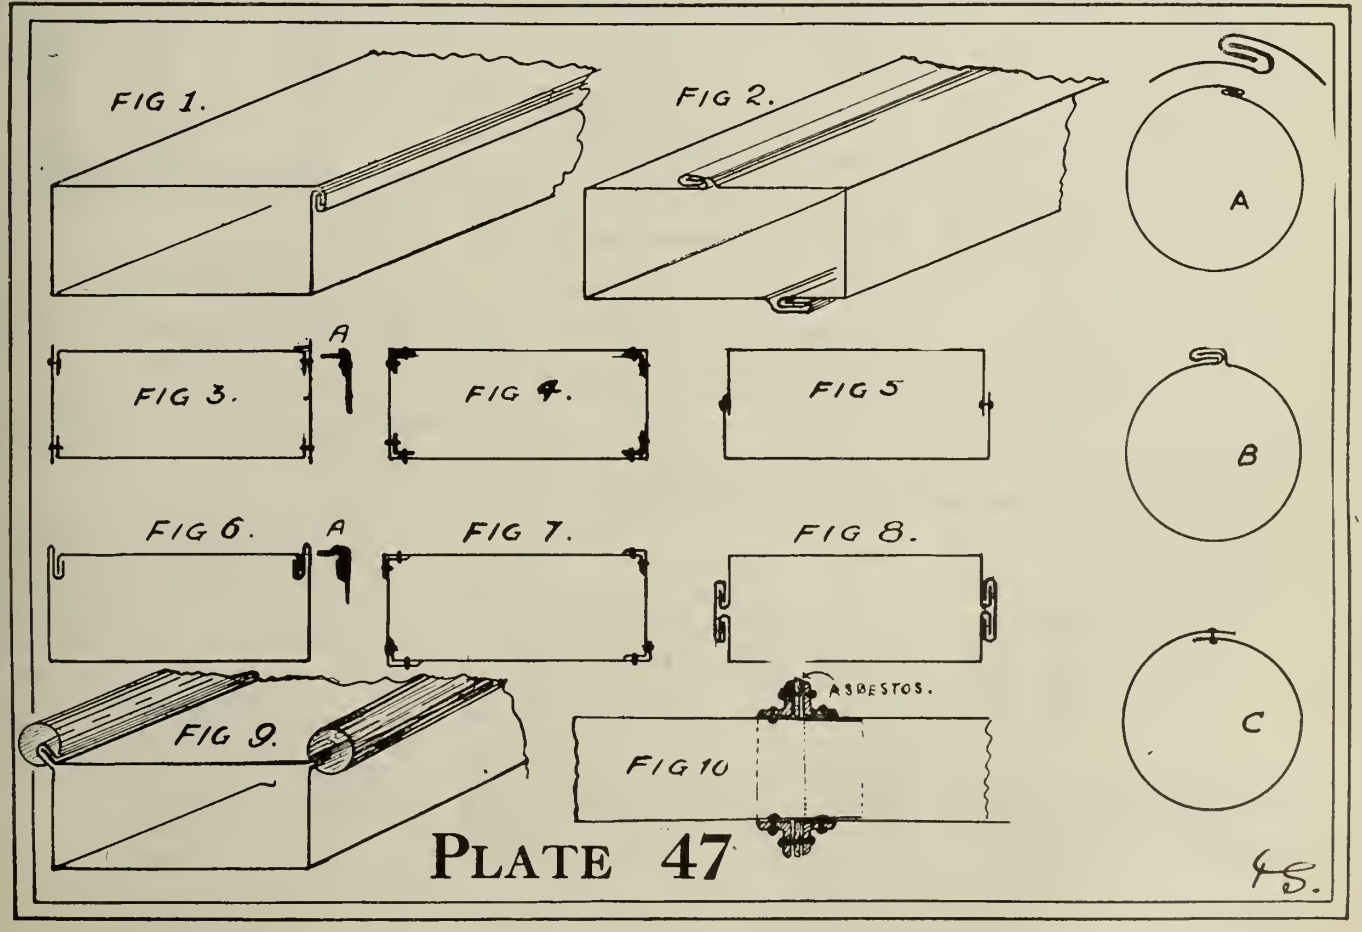
Fig. 7 is another type of duct generally made on heavy material and riveted; the joints can be made very rigid, and stand in place by using angle iron.

Fig. 8 is a rather uncommon type of duct; the joints are made by using a turned slip piece, which holds the two sections together. The joints can be staggered if required, and short pieces of material can be used.

Fig. 9 shows a style that can be used very advantageously where a warm air duct has to pass up through a room on the outside of a wall. There are no joints visible, the corners being made of round tube.

Fig. 10 shows how the joints of warm air heating or fan ducts can be connected together, a piece of asbestos or other material used that will tend to deaden the sound, as well as make the connections fairly well air tight.

(Continued in next issue).



Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

INTEREST is again becoming more centred around ingot metals than perhaps any other single item in the markets. A general reaction to higher levels has occurred, tin, lead, spelter and antimony all being affected. The advance on tin approximates 2c per pound, on lead and antimony ½c, and on spelter ¼c.

This follows on the heels of a resumption of buying, and the fact that buyers, besides specifying for spot deliveries, are in some metals placing orders for future shipment, would indicate that manufacturers' stocks are by no means large. Locally stocks are considered very good and the feeling prevails that even slightly higher prices may be realized during the next sixty days.

A decline of 25c per 100 pounds in blue annealed black sheets, 16 gauge and heavier, has been made this week. No revision on other gauges is reported and galvanized sheets have been maintained on a very steady basis. Jobbers report sales as very good with the outlook promising for a much increased turnover.

The situation in sheets seems to be firming up along with other steel and iron products and indications seem to be that any move in the future will be to higher levels.

Manufacturers of enamelware indicate that there has been no revision in prices and do not anticipate any in the immediate future. Production at the present time is at a pretty low ebb and until this can be speeded up very materially, it is indicated there can be no downward move.

The situation in range boilers may be affected by the developments in the United States, where competition has brought about a lowering of values, although it is thought this is only a flurry which will not continue. In the meantime there is no change in the market here.

Business generally shows improvement, though the uncertainty in the labor situation is tending towards restricted buying until atmosphere is cleared somewhat.

TORONTO, May 29.—Ingot metals are the chief item of interest in the markets since last issue, with many lines showing an upward trend. Black steel sheets, 16 ga., and heavier, are down slightly, but tendency in the market is towards higher levels. A little interest developed in scrap metals last week, but not enough yet to provide for a real optimistic feeling. Range boilers may reflect the decline registered on the other side of the line, though there has been no change yet. Business is improving and outlook considered encouraging.

No Changes Shown In Range Boilers

RANGE BOILERS.—While there has been a change made by American firms to slightly lower levels in range boiler prices, this is regarded merely as a temporary condition that will not affect the Canadian quotations. Business has been coming in nicely and many inquiries indicate that market is likely to remain steady. The quotations are:

Range Boilers	Standard	Extra Heavy
30-gallon	$12 25	$14 50
35-gallon	15 00	17 00
40-gallon	18 00	20 00
52-gallon	24 00	28 00
66-gallon	33 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00

Enamelware Lines All Holding Firm

ENAMELWARE. — Predictions in some quarters that enamelware lines were likely to be revised to slightly lower prices have so far failed to materialize. Increased activity in the business is being shown with prospects that there will be a very fair season. One of the big factors which is operating to keep prices firm, is that manufacturers are working at limited capacity. Until business is such that they can materially increase their output and lower their production cost, little change is expected. The quotations on a few well-known lines are:

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 14 x 15 in.	6 45

Do., 18 x 30	5 62 5 50
Do., 18 x 24	5 12 5 00
Do., 16 x 24	4 92 4 80
Do., 14 x 20	4 25 ....
Closets, oak tank and seat	25 50
Do., enamel iron or white vitro tank	27 50

Soil Pipe Prices May Be Advanced

SOIL PIPE, FITTINGS.—Owing to general conditions that may result from demands of labor for shorter hours and increased wages, there seems to be every indication that prices will be increased. While there is a fair stock in many lines, others are becoming so short now that dealers are unable to fill orders and do not know where or when they will get the goods required. They report that a large volume of business is offering and that if present labor troubles are cleared up soon the season should be a good one. Quotations are as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	20%
Medium and extra heavy soil pipe, 4 in.	25%
Medium and extra heavy soil pipe, 2 in. to 6 in.	35%

Brass Steam Goods Are Holding Steady

VALVES.—Conditions in many parts of the Dominion have resulted in business being a little quiet in steam goods, and until matters get straightened away no noticeable improvement in orders is looked for. Business in the lines required in marine work has been showing steady improvement. Quotations are unchanged.

MUELLER

Water, Gas and Brass Plumbing Goods

CANADA'S BEST

We wish to direct your attention to the fact that there is nothing in water, plumbing or gas brass goods practice that we do not manufacture. The test of over 60 years of producing nothing but the very best in these lines conclusively proves that we are the masters of such manufacture.

We are illustrating a few of our various lines and wish to direct your attention to the fact that—

Our 1919 Catalog A is ready for distribution.

WE MAKE:

1—Tapping Machines
2—Corporation Cocks
3—Goose Neck Connections
4—Ground Key Curb Cocks
5—Rapidac Bath Cocks
6—Rapidac Basin Cocks
7—Globe Valves
8—Drilling Machines
9—Regulating Valves
10—Meter Testers
11—Bath Supplies
12—Service Boxes
13—Basin Combinations and many other articles of highest quality.

Wrought Pipe Prices Remain Unchanged

WROUGHT PIPE. — Orders for wrought pipe have been coming through in increasing volume and prospects are that quite a nice season's business will be handled. Quotations remain unchanged and are as follows:

WROUGHT PIPE

Price List No. 39, April 3, 1919

Standard Buttweld

	Steel Blk.	Steel Gal.	Gen. Wrot. Iron Blk.	Gen. Wrot. Iron Gal.

Boiler Tubes Maintain Position

BOILER TUBES—With a fair volume of business being handled there are no price changes noted and none are in immediate prospect. If anything, the market for the future will be inclined to be firm. Present quotations are:

BOILER TUBES—	Seamless	Lapweld
1¼ inch	$27 00	$.....
1½ inch	28 00	.....
1¾ inch	30 00	26 00
2 inch	30 00	26 00
2¼ inch	33 00	28 00
2½ inch	40 00	32 00
3 inch	46 00	38 00
3¼ inch	.....	45 00
3½ inch	56 00	42 00
4 inch	70 00	54 00

Waste Holds Steadily; Oakum, Too

WASTE, OAKUM.—The reaction in the market on cotton to higher levels is providing the waste market with a very strong undertone. This has not been reflected as yet in any price change upwards, and manufacturers as a whole are hopeful that it will not be necessary to revise quotations to a higher level again. However, indications are that present values are good in view of the situation in the cotton market, and whereas buying as yet is along rather restricted lines, there seems to be a somewhat better feeling in the placing of orders.

There have been no new developments in regard to oakum, and trade as yet is along rather narrow lines. Figures shown herewith are well maintained.

	Per 100 lbs.	
Best American	$21 00	$22 00
Clipper, spun	.....	21 00
Do., unspun	.....	10 50
Plumbers' spun	.....	9 50

Heavy Black Sheets Decline 25 Cents

SHEETS, PLATES. — Lower prices have been established in some quarters on blue annealed black sheets, 16 gauge and heavier, the decline amounting to 25c per 100 lbs. The present range of quotations is shown below.

Jobbers report a very good volume of business on all lines of sheets being done and indications are that this will continue and even increase if present enquiries develop into orders.

Sheet copper is being quoted for delivery from the mills at 24½c and from stock here at 27c per lb.

BLACK SHEETS—	Per 100 lbs.	
10 gauge	$4 75	$5 45
12 gauge	4 80	5 50
14 gauge	4 85	5 10
16 gauge	4 95	5 20
18-20 gauge	....	5 80
22-24 gauge	....	5 85
26 gauge	....	5 90
28 gauge	....	6 00
3-16 inch plate	4 90	6 25
¼-inch boiler plate	4 50	5 80

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—		
10¾ oz.	$7 80	$8 10
U.S. 28	7 40	7 70
U.S. 26	7 10	7 40
22 and 24	6 95	7 25
18 and 20	6 80	7 10
16	6 65	6 95
12 and 14	6 50	6 80

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Solder Holds At Advance; Firm

LEAD AND ZINC PRODUCTS.—There have been no changes this week in any portion of the list, prices being very well maintained and a fair amount of business being transacted. Manufacturers intimate that with present labor troubles adjusted the orders should come tumbling in in great style. Quotations ruling are:

Lead pipe, lb.		$0 11½
Lead waste pipe, lb.		0 12½
Lead traps and bends		15%
Lead wool, lb.		0 14
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 10¼	0 12
Solder, guaranteed, lb.	$0 35	$0 39
Solder, strictly, lb.	0 33	0 35
Solder, commercial, lb.	0 30	0 33
Solder, wiping, lb.	0 29½	0 32
Solder, wire, lb.	0 36	0 42
Zinc sheets, per lb.	....	0 17

Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.

Some Brass Figures Revised Upward

OLD MATERIALS.—There is a better feeling in metals which has been reflected here and a somewhat optimistic note is sounded by the dealers, though this is not very pronounced as yet. There have been some slight advances made in buying prices on brass, which will be shown in figures below. There seems to be a little business doing, but as yet this is rather restricted. Range of quotations for the week are:

Dealers' Buying Prices—		
Tea lead	....	0 03
Heavy lead pipe	....	0 04
Pipe scrap	....	8 00
Stove plate, per ton	....	10 00
No. 2 busheling	....	8 00
Yellow brass	....	0 07
Red brass	....	0 10
Light brass	....	0 05½
Scrap zinc	....	0 04½
Heavy copper	....	0 15
Wrought iron, No. 1, per gr. ton	....	15 00
No. 1 machinery cast	....	14 00
Heavy melting steel	....	9 00

Ingot Metals Reach Higher Levels

INGOT METALS. — Practically all along the line advances have been recorded, tin, lead, spelter and antimony recording slight advances. This is generally considered the result of a buying movement in progress, and not due to any depletion of stocks, which seem to be ample. Business in all metals seem much improved.

COPPER.—Primary points after recording some further slight advances as a result of an improved demand have eased away again. This has not yet affected the situation locally, but a slight reaction to higher levels seems possible. Quotations here are being made at 18c per pound.

TIN. — An advance has occurred locally, quotations ranging from 60c to 62c per pound. Stocks here are very good, and latest reports from United States points indicate that supplies in Government hands are much larger than anticipated. This will probably react against higher prices, although immediate declines are not anticipated.

SPELTER.—There is still only a fair demand for this metal, but a better feeling prevails as a result of the movement in the other lines. Prices locally show a range of from 8¼ to 8½c per pound, an advance of ¼c per pound.

LEAD.—At United States points an advance of $5.00 per ton has been recorded within the past week, and the movement upward is stimulated by the action of buyers coming into the market for fair spot quantities and specifying for even later delivery. This would indicate that stocks in manufacturers' hands are by no means heavy, though there is lots of lead available. Prices

(Continued on poge 29.)

A High Quality Hardware Line—

"Morrison" Brass Valves

They always satisfy the purchaser. The dealer experiences no come backs. Morrison Valves are made to last and when lasting work.

They are renewable disc valves, with heavy bodies, spindles and valves, and fitted with gland follower in packing nut.

You can sell Morrison Brass Valves in the full assurance of handling a quality product that will sustain the good reputation of your store.

The James Morrison Brass Mfg. Co. Limited

93-97 Adelaide St. West, Toronto, Ont.

"Anthes" Syphons Are Infallible

IT IS MADE IN ONE PIECE AND WILL NOT CORRODE

Write Us For Blue Prints Of Disposal Systems.

This type of syphon is endorsed by every sanitary engineer in the world. It is the only kind of flushing device known that operates under natural law. No moving parts to get out of order.

We Carry a Full Line of Soil Pipe and Fittings

ready for prompt shipments. Your jobber can supply you on short notice if he handles the **Anthes** line. Every order of goods shipped the day it is received.

Specify Anthes Soil Pipe, Fittings, and Syphons every time and you will procure both quality and service.

Pipe Fittings

Made in Canada

The Brand that has the Quality

M Brand Pipe Fittings, etc., give a service and satisfaction that will invariably get you re-orders and much new business as well.

A trial of the goods will prove this claim.

CAST IRON FITTINGS

With this brand mean fittings made with iron of high tensile strength—proper proportions and correct tappings.

RECESSED DRAINAGE FITTINGS

MALLEABLE FITTINGS

With this brand mean fittings made of Air Furnace Refined Iron, reamed and tapped to gauge with perfect threads

Standard and Extra Heavy Flanged Fittings and Flanges. Galvanizing Malleable and Gray Iron Castings of all Kinds.

International Malleable Iron Co., Limited, Guelph, Ontario, Canada

Why Jenkins Bros'. Valves Are Superior

Fig. 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

Fig. 114

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

Catalogue No. 8 sent free on request.

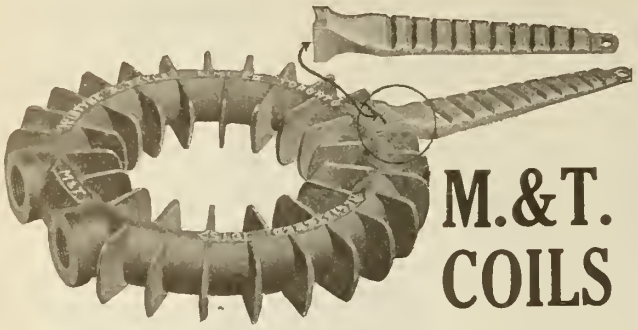
No Waste Circulation

THE SANITARY ENGINEER, PLUMBER AND STEAMFITTER OF CANADA was established in 1907. The subscribers represent the most progressive members of the sanitary plumbing and heating trade in Canada. The paper is issued twice monthly, on the first and fifteenth of the month. Circulates in all Provinces of Canada as well as Newfoundland. There is no waste circulation on SANITARY ENGINEER, because subscribers buy the paper for business. The advertising pages are read closely by the largest buyers of sanitary and heating goods in Canada. These men buy for business as well as for private consumption and, therefore, represent the best class of readers. When you advertise in the SANITARY ENGINEER you are assured of an attentive audience, who are looking for information about your goods and your methods of doing business. Cost of advertising is very moderate, indeed, and we will gladly supply detailed information regarding rates and circulation.



M.&T. COILS

FOR domestic installations a light, compact coil is required and is easily installed. It will do all the work expected of it.

Our No. 15 Boiler Coil fills all these requirements and is only 13 inches in extreme diameter. It has a large heating surface which allows the maximum of efficiency and added to that it will be very durable.

Ask your jobber, or write us direct. We can ship on short notice from stock.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

"STERLING"

HACK SAW BLADES

The cut on this page represents a Hack Saw Blade particularly adapted for the use of plumbers and steamfitters. These blades have 24 and 32 teeth to each inch. The teeth are of peculiar construction and do rapid and accurate work, standing up under the heaviest kind of treatment.

The fine teeth blades under the brand of "STERLING" are really in a class by themselves for plumbers and gasfitters, also electrical workers, for cutting pipe, conduits and sheet metal of all kinds and gauges.

These blades are manufactured in the all hard, also with the soft back, teeth only being hardened.

Ask your dealer for them.

"Dual" Mixer

A valve that really mixes Hot and Cold Water, and maintains a uniform mixture.

For ease of operation, simple construction and easy installation, it has set a new standard of efficiency.

Cold Water must be turned on first, no possibility of scalding.

Made in several forms for Showers, Sprays, Operating Rooms, etc.

At the well-known works of Messrs. Brunner, Mond & Co. these valves provide baths for 2,500 employees.

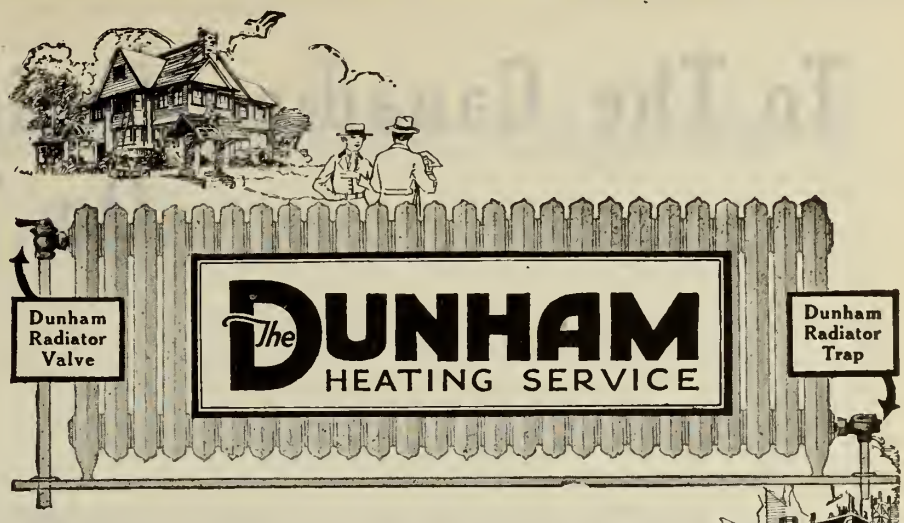
Let Us Help You



WHEN you are figuring your next heating contract make use of Dunham Heating Service. Remember, the public demands better and more efficient heating. It expects the maximum comfort at a minimum use of fuel.

What was considered first-class a few years ago is now considerably out of date. Dunham Heating is the most efficient and up-to-date method of heating. Anyone using or installing heating equipment should learn more about Dunham Heating Service. It is the product of 15 years specialized experience in heating. Write us for full information if you are interested in better heating. We will be only too pleased to help you in any way.

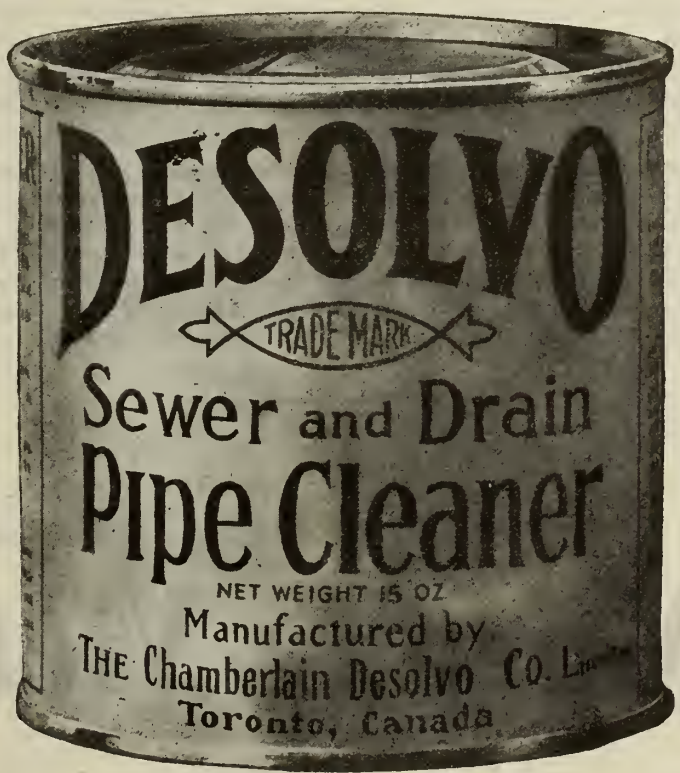
Give It

IF you have not tried Desolvo, you are not aware of the results you can procure when you have to clear blocked waste pipes. It is really wonderful.

We have had 10 years' experience in the chemical manufacturing industry, and we guarantee results if instructions are carried out.



A Trial

SOME of the largest concerns in Canada will vouch for the sterling worth of Desolvo. It saves time and accomplishes better results than any pipe cleanser on the market.

Desolvo mixes with cold water and generates a very high temperature; it will thaw out frozen rain water leaders, frozen drains and soil pipe stacks, without injuring the pipes or plumbing fixtures. It is handled by almost every jobber in Canada.

To The Canadian Society of Domes
On Their 22nd A
Gree

Gentlemen:—

I feel that I would be doing an injustice to the trade and to the public in general, if I, as president and managing director of the Murphy Victory Furnace Co., Ltd., allowed this opportunity to pass without bringing to your notice an important matter, connected with hot water heating.

I would like to explain as briefly as possible, an altogether new design of the Victory Hot Water Heater.

This Heater is designed for the heating of homes. It is intended to be placed in the most convenient place—the kitchen—where father or child, or even mother, can conveniently attend to the fire.

The Victory Hot Water Heater will:

Heat the room where it is installed,
All rooms (attached to the radiators),
Do light cooking.

The fire pot is constructed into three compartments, each of which can be fired separately.

It is well understood by all practical steam-fitters, that the Hot Air Furnace is doomed to pass out of existence (for sanitary reasons), leaving aside the great amount of space which is required for same in the basement of the house, leaving such basement useless for any other purpose.

Our new heater is designed for real home comfort. It saves the radiator in the kitchen, can be connected to the radiator in the other rooms, with pipe and fittings, one quarter the size used for ordinary furnaces, and will give better results. It will keep the air in the house pure for the reason that every cubic foot of air which passes through the furnace into the smoke chimney must be replaced with pure air from outside, and when we take into account the great volume of air required to consume coal, we must conclude that we have sufficient ventilation.

We Manufacture Special Types of Hot Water
We are glad to quote on your specifications,

The Murphy Victory Fu

HEAD OFFICE:

tic Sanitary and Heating Engineers
nnual Convention
ting

Provision is also made for humidity, for cooking naturally produces it, and if cooking is not being done a pan, pot or kettle of water may be placed on the fire holes of the heater, which will produce a continuous supply of humidity.

Now, Gentlemen, when we consider that the mother who must spend practically 24 hours of the day in the home, and almost half of that time in the kitchen, and when we know that the child, which is the mother, or the father of the next generation, is with the mother practically all of its time, you can readily understand how important it is to keep the air warm, pure and clear in the room where mother and child spend so much of their time.

Bear in mind that this type of hot water heater meets a long-felt need for the heating of workingmen's homes and flats; also for heating houses without basements, of which there are many thousands.

It will do the heating with less fuel, will do cooking, and is installed in the place where it can be looked after with the least amount of labor, it keeps the air pure and moist by compelling all suspended matter or dust to settle to the floor instead of being breathed into the lungs.

This heater can be installed for very little more than the cost of an ordinary hot air furnace, and many times less than the ordinary hot water furnace. It will save gas bills, save coal, give more comfort, and save lives.

Let us talk it over; you will be glad, your customer will be pleased, and altogether worth your while to see one working.

Yours faithfully,

The Murphy Victory Furnace Company, Limited,

R. A. Murphy

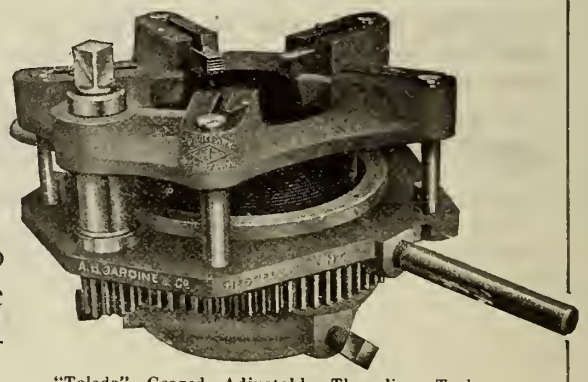
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity 2½ to 6 in. inclusive. Weight, 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

Grate burn outs— A preventative

IT'S just plain human nature for a man to get so stirred up over a grate, that he has to lug and tug on to shake, that he unconsciously, or otherwise, leaves the pit choked full of ashes, and if the drafts are left open long enough, the grate burns out.

So that's one of the reasons why we make Burnham Boiler grates shake half at a time, because then they shake half again easier.

Another thing in favor of half the grate shaking at a time you can run half the fire at a time.

Clinker doors are mostly cramped narrow slits. The Burnham has a wide-mouthed one—big enough to do what it's meant to do.

THE PLUMBER'S SPHERE OF INFLUENCE

Two men interested in the plumbing business were discussing the Master Plumber and his opportunities.

The first asserted that there is a good field for the Master Plumber who establishes himself in a good neighborhood, keeps inviting premises, has an attractive display of plumbing fixtures and model bath-rooms, together with side lines consisting of gas and electric ranges, electric fixtures, vacuum cleaners, small motors and other electric equipment.

Such a plumber, in his opinion, would soon develop into a merchant and be able to serve the community well. He could give good attention to the transient trade which would be attracted by his display, and would also be able to take care of the requirements of his regular customers.

The second said "NO," that the Master Plumber will serve himself and the community best by making a careful survey of the field in which he can best operate: by getting acquainted with his prospective customers, studying their requirements and making them interested in either the replacement of the old and worn-out plumbing, or by installing complete new outfits.

If he carried on business in that way he would be able to give his customers good advice, would have the advantage of being on the spot, noting the kind of fixtures which would best suit the position in which they were to be installed, could give an intelligent price on the work, could close the job at once through his personal interest, see that it was perfectly installed and would make a satisfied customer. He would be a real salesman inasmuch as he introduced the subject, made the proposition attractive, and closed the business.

The conversation did not end here, but the two opinions are presented as they furnish a subject for consideration, and could be profitably discussed at the meetings of the Master Plumbers' Association and through the columns of the plumbers' trade paper.

The writer does not venture an opinion further than to say that if every one of the twenty-five hundred reputable Master Plumbers in Canada were salesmen under the conditions noted by the second speaker, and devoted their attention to the sale of bath-rooms a ready market would be provided for all the enamelware which the manufacturer could make. The manufacturer is interested because all plumbing material is or should be distributed, through the plumber who does the work of installation. What is good for the manufacturer is good for the plumber, and the manufacturer is well pleased when the plumber enjoys a large and profitable business.

Dominion Convention a Great Success

Strong Discussion on Vital Problems Presages Forward Movement—Plumbers as Business Men—Co-operation Between Master and Mechanic—Education of Plumbers and Public—Strong Slate Officers Assures Bright Future — Toronto Next Convention Centre

Written for SANITARY ENGINEER by A. H. ILLSEY, Associate Editor.

THE keynote of the twenty-third annual convention of the Canadian Society of Domestic Sanitary and Heating Engineers, held in Montreal on June 3, 4 and 5, 1919, was that of co-operation and education. In the broadest sense of these terms there is far more than appears upon the surface, and it is safe to affirm that the long experience in the work of the society and in connection with the furtherance of the aims and objects of the provincial and local associations with which they have from time to time been connected, served to bring these features forward in the minds of those suggesting them as the only true and lasting basis upon which a broader, greater, successful Dominion society can continue to operate.

When Montreal sent forth its invitations to members of the craft residing in all parts of its wide and far-flung domain, it said nothing about weather conditions, and in this respect it was wise. But the weather man was on the job in earnest. If actual demonstration was required to convince delegates of his interest in the convention, then indeed, it must be assumed that he took this to be a convention of heating experts only; he supplied an unending, unwavering supply of such torrid atmosphere as few Montreal June months have ever recorded. But, to the credit of the delegates attending be it said, that they faced this condition well—were real stoics indeed, for they continued to burn the midnight oil until the gray dawn found them weary, though unworsted, when they turned in for a few short hours before the opening of subsequent sessions at the Convention Hall.

New Era Dawns

The official opening of the convention, according to schedule, took place on Tuesday afternoon, the 3rd. President Alex. Charette of Montreal, who has graced the presidential chair for the past three years, delivered a message of splendid and timely interest, calling upon members of the craft everywhere to stimulate interest and endeavor. In deference to the dual nature of the gathering, the president's message was delivered in both French and English, and the spirit of it was excellent. Particularly did the president express his gratitude to members of the executive for the co-operation they gave ungrudgingly that this convention might be the success he hoped it would be.

Particular welcome was extended the visiting delegates by J. E. Walsh, the Quebec provincial vice-president, on behalf of his associates. In a forceful, well-directed message, Mr. Walsh left no uncertainty as to the warmth of this welcome, even though the time-honored precedent of an official civic welcome was dispensed with. In this respect the speaker believed that it was best to extend a simple welcome, none the less genuine or sincere, and preserve to the visitors and all assembled the full time of the convention, for discussion of the questions for which they were now assembled. "Every service of the Montreal Association is at your command," he said, and this was borne out subsequently at every turn.

That a new era had dawned for the world, and that this is likewise applicable to the Canadian Society of Domestic Sanitary and Heating Engineers, was the gist of the report brought in by the resolution committee, and which sat early and late, that a real, progressive and worthy report might be recommended the convention as a whole.

Over and over again, members were admonished to get away from the old idea of holding themselves in limited esteem as an integral part of Canadian life. Several speakers reiterated the necessity of discerning their profession as a most important one, having in their hands, so to speak, the health of Canadian citizenship. The sanitary engineers' solemn task, it was pointed out, was that of preserving to citizens generally the most precious of gifts—continued health. It was only by accepting this vital responsibility in the foregoing light that the sanitary engineer could

realize and appreciate his importance in the true economy of Canadian citizenship.

Real Business Men

If there was any doubt as to the type of business man which the modern plumber and steamfitter is destined to be, this vanished before the close of the convention. And for those who may not have possessed a more complete grasp of a costing system, secretary Garrett Frankland's brief, illustrated talk at the close of the convention on "How to Make Money," provided an object lesson that struck right home. It is safe to say that the plumbers and heating engineers present will not tolerate any hit-or-miss estimating, and that there will be progress in this respect which will place this business on a plane quite as high as that pertaining to the modern business of any other business or professional man. And to the extent that this is accomplished, in just such measure will the craft attain success from a financial standpoint.

Vice-President C. R. Myers, of Stratford, suggested working from the close of the convention, keeping in touch with vital matters and then, if necessary, spurting up and putting on more speed later in the year and prior to the next convention. It was a mistake, he said, to let matters rest for many months and expect the best results to be obtained. "We too often look upon the work of the society as a pleasure and not as a matter, rather, of business," said Mr. Myers. And further, he would like to see Dominion, Provincial and local organization effectively carried out.

Vice-Presidents Vital

If the work of the Canadian Plumbers and Steamfitters is to be the greatest success, much responsibility rested upon the provincial vice-presidents, Thos. Maxwell of Toronto, thought. This officer, in Mr. Maxwell's opinion, could exert a great influence for the welfare of his own provincial section, and suggested greater activity upon the part of these officials. "The whole thing centres on organization," added Mr. Maxwell. The vice-presidents could be a mighty force if they would study the various situations and be a leading force for the membership under them.

THE CONVENTION PHOTOGRAPHS

SANITARY ENGINEER, desirous of making the report of the Convention's proceedings bright and attractive, engaged its own photographer to secure first-class photographs of the delegates and officers. It is because of this arrangement that it is possible to give readers far away and elsewhere who were denied the privileges of attending, a comprehensive story, not only of the proceedings but a glimpse into the faces of some of those who "carried on."

Dominion Secretary John Watson believed that many of the Provincial vice-presidents had been active, while others had been a source of disappointment, especially in their failure to answer correspondence. Mr. Watson had written repeatedly, in some cases, and had even then not been able to get response. He believed that it was best to be perfectly frank in denouncing this carelessness, for it was decidedly disappointing when important questions awaited solution. At the same time, Mr. Watson wished to go on record as appreciating the good material that came to light sometimes. It was a matter very often, he said, of a vice-president getting started. Many had eventually made excellent office-bearers.

Co-operation—Organization

Typical of every session, and characterizing some more particularly, were the themes of co-operation and organization, and—inseparable from the latter—education. This was that fine underlying spirit that contributed so largely in making the 1919 convention the decided success it was. The world is changing, the business methods of yesterday will not answer to-day, and for this reason the master plumber and the heating engineer must face the future in the confidence that he is a factor in the making of a new Canada of no small importance.

C. B. Henderson, Brantford, told of the great strides which had been made in connection with the Association of Electrical Contractors, with which he was associated, and believed that their experience would serve to encourage the Master Plumbers and Heating Engineers. In this association the plan of contributing fees for the promotion of their enterprises as an association, was followed. Contribution was made according to one's turnover and the appointment of the assessments so secured were distributed among the National, Provincial, and local organizations. Since this association had done more in two years under competent management for the welfare of the electrical contractors than it would accomplish ordinarily in fifteen, Mr. Henderson said that he would be willing to contribute any reasonable fee to the furtherance of a co-operative scheme among master plumbers and steamfitters. He believed it was good, sound, business policy.

Considerable discussion passed as to whether a proposal to contribute a fixed proportion of one's turnover toward the work of the Dominion association was in the best interests of the trade. Some favored a definite percentage ranging from one per cent. of one's annual turnover to one quarter of one per cent.

Thomas Maxwell, of Toronto, said that he believed an educational campaign was a great thing. It had been a wonderful success in Ontario, with which Provincial association he was connected, and specially successful in the city of Toronto. He favored a levy of, say, one quarter of one per cent. rather than a larger fee.

Another point made by Mr. Maxwell, was that of the advantage that had come to the Toronto association through examinations. This was a point that might illustrate the advantage of co-operation, for examinations were conducted in a very impartial way, contestants not even attaching their name to an examination paper, the same only being numbered. This eliminated all possibility of favoritism being accorded or a grudge being squared by an examiner, who might be prejudiced.

President Clifford Huot, of Quebec City, wanted to see organization in his native Province carried out in relative proportion at least to that of Ontario, as far as possible.

While the matter of definite assessment was not acted upon, the discussion was timely and effective.

"Figures won't lie," said President F. R. Maxwell, of Toronto. "When a plumber begins to get figures he becomes interested," continued Mr. Maxwell, and in the course of a very earnest and effective address spoke of the value of education in Toronto. Through the employment of an ordinary blackboard and chalk, plain, cold figures had induced the membership to see the possibilities of doing work on a business basis.

THE NEW PRESIDENT

To see and meet the new President, F. R. Maxwell, is to readily believe what his closer friends say of him, namely, that he is a worker. "F. R." admits that he can work, and committed himself to a program of progress in 1919, if he is given anything like the support a President should have. Watch her grow, boys!!! If the President-elect has his way—and he will—there'll be some Convention next year and some big attendance. SANITARY ENGINEER *doubts not that the wheels have already begun to hum. Here's great good luck to the President and his fellow-officers.*

THE NEW VICE-PRESIDENT

Harry Mahoncy, Vice-President-elect, comes from Guelph, Ont. The President will surely have no lack of support, for Mr. Mahoncy left no doubts at the Convention of his interest in doin' things, and doin' them well. Mr. Mahoney will be one of those whose efforts will bend strongly toward a large increase of membership.

Mr. Maxwell dwelt upon the value of master plumbers co-operating in getting other masters into the local association and also upon the value of reorganizing the workman and his rights.

A Permanent Secretary

Of the important appointments upon which the future of Dominion success will largely rest, none brought forth wider or more spirited discussion than that of the selection of a permanent, paid secretary. That all realized the importance of this decision was evinced in the care with which the matter was discussed. and it was not until the closing hours of the last session that the question was disposed of, resulting in the selection of Garrett Frankland, of Toronto, who, though saddled with onerous duties for his own Provincial Association, was considered to be well qualified by his long connection with active association work to sense the needs of the Dominion society.

In the various discussions there was a divided expression as to whether a secretary should be chosen whose whole time would be given to the formation of new locals throughout the country. or whether he would exercise more of a supervisory interest. Evident it was, that a suitable man could not be secured to devote his whole time to this work, travelling from coast to coast, and being provided perhaps, with a stenographer and permanent office, without an entailed expense of probably $10,000 per year. With no apparent or definite guarantee as to provision for this amount, it was concluded to not go too far, and the arrangement with the Ontario secretary, Mr. Frankland, seemed to meet with general approval. He will be granted a salary of $500 per annum at present, the new executive devising ways and means of raising the required amount.

In addition to this, Mr. Frankland was selected, amid applause, to represent the society at the big convention being held in Atlantic City in June.

Bulletins—Advertising

There was a general feeling that the work of the society could be greatly aided through the spreading of data from time to time that is of interest to every plumber and steamfitter. In this connection the suggestion of issuing a bulletin was made early in the convention and the matter was given consideration by the special committee on resolutions. There were various ways of issuing this, and the matter of printing a special bulletin, while recommending itself, had drawbacks. Finally it was decided to use the medium of the trade journals for this desired publicity, and representatives of the trade papers present signified their readiness and willingness to assist in publishing all the matter handed them which would be of interest to the trade and for whose benefit they existed. These representatives took occasion to ask that a co-operative attitude be extended in imparting such helpful news as members of the craft would enjoy reading.

E. H. Russell thought that all should secure the bulletin issued by the Federal Government relative to a better understanding on industrial relationships, for the workman of to-day, he said, is entitled to and must be shown consideration. In this Mr. Russell was strongly supported by F. R. Maxwell, and co-operation with builders' exchanges, where possible, was also advised by Mr. Maxwell.

Mr. Delaney, of Montreal, thought there was room for an educational campaign in Quebec, and would advocate a good stiff examination for plumbers. Many troubles, in his opinion, were local in character.

One of the suggestions which E. H. Russell would make to his association in London, he said, was that of using regular space in the local paper to advertise concertedly and collectively. He believed that at least a quarter page space might be taken to good purpose in educating the public as to the advantages of modern sanitation and installations. "We must co-operate with the press," said Mr. Russell, "if we are to attain the best results."

Some Excellent Reports

It was decidedly to be regretted that circumstances prevented representation coming from the distant provinces. Regret was expressed that no delegates attended from the Maritime Provinces. It is doubtful if circumstances will make possible the holding of a Dominion convention in this section of the country soon, and for this reason in particular delegates would have been warmly welcomed.

Reports came to hand from Prince Edward Island, New Brunswick, Saskatchewan and Alberta, and proxies were appointed by the convention to vote for the various provincial associations not represented personally.

The messages received from the various vice-presidents wished the 1919 convention real success and expressed regret that delegations could not be sent. They would look forward with great interest to the full report of proceedings, which they were, for various reasons, prevented from taking part in.

Before the close of the convention a telegram of greetings was received from the Border Cities Plumbers' Association, of Windsor, Ont., and advising that five memberships would be taken out in the Dominion society at once. This was read by the secretary amid applause.

All reports were referred to the resolutions committee and particular attention was drawn to that from the Provincial vice-president of New Brunswick, and upon which comment was made later in the report of the resolutions committee.

Reference was made to the excellent and extended work done by the retiring secretary, John Watson, of Montreal. As a tangible recognition of Mr. Watson's work, he was voted $200, and, contrary to a counter suggestion on his part that this be cut in two, the resolution was made unanimous. In addition, Mr. Watson was made the recipient of a fountain pen by Retiring President Charette. "John Watson has worn out a good many pen nibs in doing the work of this society, and I think it but right he should accept this pen," was the sentiment conveyed by the new president, F. R. Maxwell, speaking for Mr. Charette. To the tune of "Clementine" the whole assembly arose and sang two verses, concluding with "He's a Dandy." Then, as the new president, "F. R.," begged Mr. Watson to accept a huge bouquet. previously presented the new president by Past President Alex.

TORONTO NEXT CONVENTION CITY

The discussion introduced as to the next place of meeting was very brief. Toronto was chosen, and this seemed to accord with the wishes of all. It will possess the advantage of having within its confines, or within close reach, the officers chosen, and this is in definite accord with the expressed desire of some of the speakers who had given the matter consideration. It was practically agreed, once the recommendation was made by the committee. to accept unanimously its suggestion.

Charette, and which distance alone prevented his conveying the same to his "little woman," the cheers grew lustier as "three and a tiger" concluded a most appropriate break in the drier proceedings of law-making.

Questions arose as to reading reports in both French and English. The French-speaking delegates present waived the necessity of this being done with all reports, but where it was desired, Montreal President Telles Latourelle and Quebec Vice-President J. E. Walsh, made the necessary verbal translations.

Supply Men—Trade Papers

On Wednesday afternoon, the convention welcomed supply men and representatives of the manufacturers. The number attending was considerable, and general appreciation seemed to manifest itself on the part of both the delegates and the visitors. A welcome was extended by Dominion Vice-President Myers of Stratford, and he asked the supply men and trade paper representatives to introduce themselves.

Speaking for the supply men, W. L. Helliwell, Montreal manager of the Gurney-Massey Company, stated that it was the desire of the supply houses and the manufacturers, as far as he was concerned, to take care of and protect the legitimate trade. Other speakers followed and a very considerable amount of discussion took place. Subsequently the incoming executive committee was authorized to take up with the manufacturers and supply houses, any questions suggesting themselves for discussion or adjustment.

Representatives of the trade papers spoke very briefly, and expressed their pleasure at being present.

Secretary Garrett Frankland suggested, at this juncture, that it was a good plan, and, in his opinion, the keynote of future progress, to get together in round table conferences if progress was to be made.

Some discussion took place relative to the publishing of net prices in trade papers. This matter was referred to the executive for attention.

Election of Officers

Interest centred in the election of officers, naturally, in view of the forward steps which the convention felt it necessary to plan for, as hereinbefore referred to. The completed slate, as slightly revised when presented to the convention by the nominating committee, appears elsewhere, and was unanimously adopted.

Installation of the new office bearers brought committals from each that the work of the society would be given their best effort, and that they sincerely hoped another year would reveal the fact that real progress had been made. To this end, all voiced their determination to work hard, if need be, that this be accomplished. President-elect F. R. Maxwell left no doubt as to the benefits that might be derived from a man-to-man understanding as between employer and employee.

"On behalf of the officers-elect I would ask every member to do his best, answer communications, do things at the moment when they should be done and remember to co-operate," was the simple and direct message of Mr. Maxwell.

"We must hold the field or there will be 'ready-made' plumbing," said T. J. Minnes, the Ontario vice-president-elect. "This plumbing business of ours has a great future; there is great work ahead and we shall undertake it with energy."

The foregoing expressions contain much of the splendid spirit voiced by each of the officers chosen, and the 1919-20 officers were duly considered installed.

Votes of Thanks

In appreciation of the kindness of the trustees of the Caledonia Curling Club, a resolution was passed expressing thanks for the use of their club rooms as convention headquarters.

Votes of thanks were also tendered the Montreal Association for its kind entertainment accorded the visiting delgates, and another to the retiring officers. Special appreciation was expressed by various members of the service rendered by the trade papers, and a resolution was framed to convey this expression to the papers which had assisted in various ways to better the interests of the trade, and in also helping to make the convention a success.

WHAT THE CONVENTION DID

Centralized officers with view to frequent meetings.
Appointed Dominion paid secretary.
Appointed delegate to Atlantic City Convention.
Chose Toronto as next Convention city.
Decided on forward movement.
Recognized need of greater co-operation.
Urged closer reading trade papers.
Endorsed monthly bulletin scheme.
Recommended representation on Boards of Health.
Approved Whitely report and Goodwin plan, generally.
Tangibly recognized retiring secretary.
Suggested more round table conferences.

Illustrated Lecture

On Wednesday evening an illustrated lecture was delivered by A. J. Dickey of the C. A. Dunham Co., Toronto, on Modern Heating, assisted by A. Kastello, of Montreal. Owing to the excessive heat the attendance was not as large as it would otherwise have been, but the lecturer entertained and informed his hearers most acceptably. He curtailed his address somewhat out of consideration for his audience, who had withstood great discomfort from the heat for a long, trying session during the morning and afternoon. The lecture of Mr. Dickey was interesting and instructive, and those fortunate enough to attend were repaid for any sacrifices made. The lecture, illustrated, appears elsewhere in this issue.

The Lighter Vein

That Montreal is some convention city will not be denied by the visitors. If there were several sleepless nights, these were none the less entertaining, for provision in advance had been made for the entertainment of the delegates.

"Princess Theatre night" was a success from all accounts, and the social time spent there by the delegates, their wives and lady friends, served to drive away for a brief space of time, the thought of discomfort brought by midsummer heat, generated on the opening day of the convention. Tickets? ? ? Why, "Jim" Griffin, the genial chairman of the entertainment committee, simply said with all his heart, "Fellows, don't go without tickets, there are plenty of them; bring your ladies and as many as you like." Yes, there was entertainment for all, and without stint.

But this was only the beginning. Hard work in earnest was the lot of the assembled delegates on Wednesday and Thursday in particular. By dint of speedin' up, the proceedings came to a successful termination on Thursday at one o'clock, and after "a wee bit refreshment" the boys assembled on McGill University grounds to get "a' their pictures took." The ideal setting of these quaint old grounds was a delight, and following a brief sojourn here, waiting automobiles conveyed all to the corner of St. Catherine and Alexander Streets, whence a delightful electric car ride was taken about the city, and terminated an hour or so later at Dominion Park, the Summer watering place for Montrealers and their friends. Here at last, the weary and hard worked delegates and their friends, wives and sweethearts made free with one another, strolled about the spacious grounds, viewed the Plus Grand Boeuf, took in the scenic railway, gyroplane, mystic rill, the laughing gallery, victory ride, etc. Dizzy heads, some of them, but they were glad to indulge for a brief hour.

The grand conclusion to this whirl of entertainment came shortly after six p. m., when about one hundred delegates, with their wives and friends, sat down to a delightful dinner in the open dining hall of the big park, immediately overlooking the mighty St. Lawrence, and up and down which ocean-going and lake boats plied their way continuously. The feast reminded one of pre-war days, when caution was an unknown requisite in banquet preparation.

Surely the entertainment committee had its own reward in seeing the bevies of smiling delegates, wives and sweethearts, which left no doubt as to their decided pleasure and appreciation. The supply houses and manufacturers contributing to make this extensive entertainment possible, must indeed have been gratified with the success attending their efforts. It was complete.

Convention Smiles

"Pay As You Enter," motto of the Montreal Tramways Company, was not that of the Convention Entertainment Committee. There was nothing too good for the delegates and their friends, and Jim Griffin and B. J. Morris were ever on the job with free tickets to everything.

* * * * *

Retiring Vice-President C. R. Myers, of Stratford, declined the honor of accepting the Dominion Presidency. He left no doubts as to his interest in the work, and will be heard from again. "Cash, Confidence, Co-operation," was his motto.

* * * * *

John A. Gordon, Montreal, says that the Convention set a big pace for an ordinary individual to follow. One had neither time to eat or sleep—just for a good pipe and a wee drop o' —— occasionally.

* * * * *

Considering the fact that retiring secretary John Watson attended 17 meetings of the sub-executive committee within 18 months, it was remarkable the manner in which he provided for the ladies' comfort on Entertainment Day.

* * * * *

"Oh, you mosquito!" Now, Mr. Plumber, far away, don't smile over much. The Windsor and the Queen's are mighty accommodating hostelries, but they have not catered to heating engineer delegates for some time and the supply of fans was short. That's why the boys didn't turn in before 3 and 4 a.m.

* * * * *

Hot lead isn't in it with 95 in the shade in a Convention Hall. Ontario President T. J. Minnes set a fine example of defiance to the weather man when he dropped his collar and tie, rolled up his sleeves, and put up some hotter arguments that lent real ginger to discussions.

* * * * *

Past President Alex. Charette set the Convention Hall ringing when he presented incoming President Maxwell with a huge bouquet of beauty roses. The quick following of presentations to Secretary John Watson, culminated most happily when President-elect F. R. Maxwell passed the flowers on to "John." The singing of "See Him Smiling," was really great. Faithful John will surely remember this occasion as one of his greatest.

* * * * *

One would think the tables were turned back and that pre-war menus were even eclipsed. The dinner to delegates and their friends at Dominion Park Thursday night will long be remembered. And, mind you, Secretary B. J. Morris, once his eye rested on you, would permit of no delegate or accompanying friend paying for anything. It was a royal treatment, boys. You who are far away just missed the finest time ever.

Telles Latourelle, the Montreal president, calmly told the Convention that he sat up with some of his confreres until four a.m. discussing matters relative to the trade in Quebec. This looks like real work. There was a very serious attitude on the part of the Quebec delegations.

* * * * *

John Watson's pronunciation of Montreal in true French is perfect. Telles Latourelle said that John listened intently to the discussion above mentioned, but that he did not understand a word of it.

* * * * *

Harry Mahoney (at the Park dinner): "Please pass the Worcester Sauce; that 'extra dry' was super-extra."

* * * * *

Secretary Garret Frankland enjoyed the dinner, well, yes. Oh, for another platter of those "French-frieds."

* * * * *

J. P. Kennedy worked early and late to take the official minutes of the Convention. His services were surely appreciated by the boys, and stepping in at the eleventh hour, as he did, his work was the more appreciated.

* * * * *

"O, for one good ball game," said one enthusiast of the bat as we strolled up good old McGill grounds. It is wonderful what charm the proper setting has for an old baseball-plumber.

* * * * *

Jim Griffin and John A. Gordon divided honors in the refreshment section of the Convention Hall. Since this arrangement worked well there was no lack, but—Oh, how that cupboard suffered!

* * * * *

All jokes aside, this was said to be the dryest and hottest Convention on record. There was a remarkably good spirit, and a lot of hard work was put over.

* * * * *

Talk about beer—it just flowed, and then stood out in great beads on the forehead. But big, beaming smiles shone through, nevertheless.

* * * * *

Peter Ogilvie, as Sergeant-at-Arms, was in fine fettle. In conducting the newly-elected officers for installation, he was right at home, and performed never so gracefully.

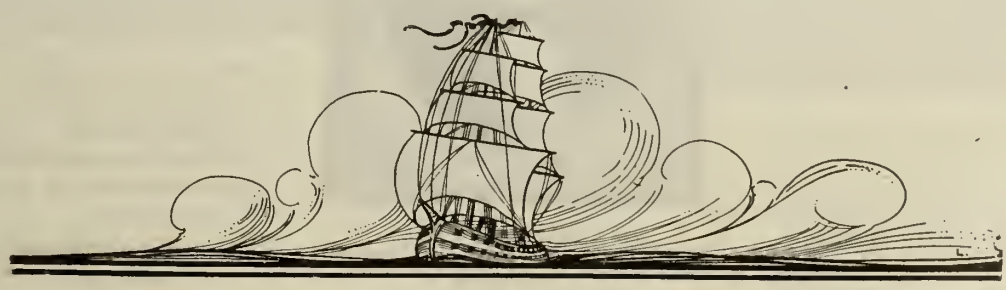
* * * * *

The Secretary: "A young lady reporter is at the door and seeks information."

A voice: "I propose that she be permitted to meet the president."

Another: "John Gordon, as the best looking man, should be chosen."

Finally a compromise was arranged and G. Delaney and John Gordon proceeded to the reporter's room as a "press" committee.



Reports From C S.D. & S.H.E. Officers

President's Report

Read by ALEX. CHARETTE, Montreal, Que.

"IT IS more than a pleasure for me to present you the following report as brief as possible of the twenty-second convention of our organization.

Since our last gathering in London, Ont., events of different importance have taken place, some of which have brought joy and happiness, while others developed sadness, changes, etc. The great conflict of democracy and autocracy has shaken humanity in its bases. Where is the man who has not borne his share of the burden to bring victory to our glorious cause? Members of our craft have given generously—their life, their sons, their time, and their money—and I take this opportunity of expressing my admiration as well as my deepest sympathy to all of them. Since we last had the pleasure of meeting many have fallen from the ranks and gone, but let us keep a good and hearty remembrance of them.

Now that peace is about to be declared, there is no reason not to unite and help to rebuild what the storm of war has damaged and to this effect allow me to submit for your consideration the following ideas:

1. Why not at this convention take up seriously the matter of a Federal Code for the craft? This matter has been discussed at previous conventions, but

simply ended in nice words and lengthy speeches.

2. I must also call to your attention the important factor of bettering conditions of trade with the manufacturers and supply houses. Much has already been done, but further steps should be taken regarding prices, terms, etc.

3. Another thing I should like to see ended altogether is the question of tendering "en bloc," which is antagonistic and contrary to the best interests of each and every one of us. A strong campaign should be started against this manner of awarding contracts. I think this would be a good point to discuss thoroughly.

To these brief suggestions allow me to add my most sincere thanks to the members of the executive and assure them of my hearty appreciation for all they have done to lessen my work and responsibility, which I feel I have accomplished to the best of my knowledge and with all the faculties I could bring to bear in the performance of my duties as president of your Association.

I am also glad indeed to thank the SANITARY ENGINEER, PLUMBER AND STEAMFITTER of Canada and its young companion, THE SANITARY AND HEATING JOURNAL, as well as the *Plumbers' Trade Journal* of New York, for the great part they have played in the development of good relations and fellowship between the members of the craft at large and in the name of the Canadian Society of Domestic, Sanitary and Heating Engineers. I would ask them to continue their good and effective work for the benefit of one and all.

PRESIDENT CHARETTE'S ADDRESS

MESSIEURS:—Il m'est agreable de vous soumettre le rapport suivant de la 22ieme. convention de notre societe.

Depuis la derniere convention tenue a Londres, bien des evenements se sont succedes, pour les uns les evenements ont ete heureux, pour les autres les evenements ont ete malheureux.

La guerre europeenne est venue smr la pertubation dans l'univers. Quelques-uns parmi nous ont eu a deplorer la perte d'etres cheris. A ceux-la j'offre mes sympathies les plus sinceres. Depuis la derniere convention de Londres, la mort est venue faire des victimes dans nos rangs. Ayons un pieux souvenir pour les confreres disparus.

Rejouissons-nous tous la paix a succede a la plus cruelle des guerres, maintenant envisageons l'avenir avec confiance et preparons nos armes pour l'apres-guerre et faisons en tous les efforts possibles pour attendre les buts que nous desirons.

Maintenant, messieurs, laissez-moi vous soumettre les quelques points suivants:—

1. Plus d'une fois il fut question d'un code federal pour tous les Plombiers du Dominion. L'idee est belle et je voudrais la voir se realiser. Jusqu'a ce jour il a fallu nous contenter de paroles, maintenant agissons et prenons les moyens voulus pour que le Gouvernement Federal etablisse ce Code, qui sera la regle a suivre pour tous les plombiers du Canada.

2. Une lacune qu'il faudrait compler. Presque toujours les soumissions sont demandees en bloc. Cette maniere de demander les soumissions nous cause du prejudice. Je me plais a reconnaitre qu'il y a eu du progres de fait sur ce point. La marge a remplir reste encore considerable.

CALER CHARETTE
Of Monteral Retiring President C. S. D. and S. H. E.

3. Nos relations d'affaires avec les fournisseurs se sont sensiblement ameliorees. Cependant il reste encore beaucoup de chemin a parcourir. Nous devrions reclamer tout ce qui nous est legitimement du. Je ne voudrais pas brusquer les choses. Si nous desirons une amelioration nouvelle touchant nos relations, faisons-en la demande aux fournisseurs et travaillons a les amener a la discussion, mais restons toujours unis. Convaincu suis-je que nous obtiendrons plus en faisant un bloc solide, qu'en se divisant. La devise des unions a parfois du bon:

"United we stand, divided we fall."

4. Avant de conclure ces quelques notes; je desire offrir mes remerciments bien sinceres a tous les officiers et a otus les membres qui ont bien voulu me venir en aide pendant mon long terme d'office. A tous, je dis un chaleureux merci.

5. Je dois aussi un tribut de reconnaissance au vaillant "Sanitary Engineer" ainsi qu'a son jeune frere le "Sanitary Heating Journal" et "Le Plumbers' Trade Journal," de New York, tous trois ont bien travaille et ils meritent non seulement la reconnaissance mais aussi l'encouragement de tous les membres de l'association.

Le tout humblement soumis.

President C.S. of D.S. & H.E.

Vice-President's Report

Read by C. R. MYERS, Stratford, Ont.

FELLOW Officers and Members: We are today gathered together to officiate on behalf of our craft in the interests of the Canadian Society of Domestic, Sanitary and Heating Engineers, and we all surely recognize the immense field of possibilities and opportunities that lie ahead of us, and especially to those who are to continue the work of this Canadian Society, if we as a craft are to secure the desirable conditions that are our just due.

Since last we met in London some two years ago the terrible conflict of might and right that had waged for over four years has now been brought to a successful conclusion as far as the actual field of battle is concerned, and it now rests in the hands of our worthy statesmen to get results that we hope will for all time assure the world of freedom from oppression.

Many of us have lost dear ones and our craft in general has suffered greatly in the loss of several of our members, all of them good and worthy members and a credit to any profession.

We have also had several of our members returned suffering from casualties of different kinds, which will in itself go to prove that our craft was well represented in the big show, and I feel sure the record of our members will stand second to none for valor and effort while in the ranks of the soldiers of our nation.

Generally speaking, I as your vice-president have no great record or program of accomplishments to set before you for the past two years, because as you are well aware we did not hold our annual convention last year on account of the war and therefore did not have a definite program mapped out ahead of us, and the officers of the previous year were requested to retain their offices and merely continue on as economically as possible until the war was brought to a successful conclusion.

Gentlemen, the time has now arrived, and we have come to Montreal today to place before you the absolute necessity of better organization in its most aggressive form, so that we may place our Society in a position of authority and trust for our whole craft throughout the Dominion of Canada.

The possibilities of today so far as organization is concerned are ideal and never in the history of our Dominion were they so essential as now because during this reconstruction period we are morally bound to protect our interests more so than ever in the history of our craft. To do this requires capital and an unlimited amount of energy on the part of all our members, as well as our officers, and it requires more confidence in the rights of our Society and its members in the eyes of the general public. Remember the three great essentials are cash, confidence and last, but by no means least, co-operation. By co-operation I do not merely mean co-operation among ourselves, but I also mean a broad platform of co-operation between ourselves and our employees.

Many indeed are the avenues open for improvement of methods of operation among our members in conducting their business in a modern way, and many indeed are the possibilities to be looked forward to and reasonably expected to bear fruit through the organized co-operation of the members of our craft and the organized co-operation of the members of the different labor organizations pertaining to our particular business.

I wish to draw your attention to the fact that during the last week of April and part of the first week of May a deputation composed of thirteen members of our craft from Toronto, two from Guelph, one from London and myself from Stratford spent five days in Detroit attending different club meetings of the Detroit Association of Master Plumbers and Steamfitters, and the information and instruction we received while there was certainly a wonderful revelation to us to see the harmony which exists there between the members of our craft and their employees, as well as between the members of our craft and the manufacturers and jobbers, and it certainly made us feel that there is a great future before us all when we get the same conditions here in Canada as exist at the present time in the U. S., and especially in the city of Detroit.

While there we also paid a visit to the Windsor, Ont., Master Plumbers' Association, and found them to be only about 50 per cent. efficient. However, before we left Windsor we had succeeded in instilling new life into that organization with the result that on the following Thursday, May 1st, the Windsor Club accompanied us to a meeting of the Detroit Central Association and were greatly impressed with the progress and interest manifested by the Detroit Association. Since returning from Detroit I may say that all the cities throughout Western Ontario have reorganized along the lines of the Detroit Association, beginning at Windsor, Chatham, London, Stratford, Kitchener, Guelph, Brantford, Hamilton and Toronto. All are now or will be in the near future working harmoniously together with the same end in view—better organization among our own members and a more friendly co-operation with organized labor.

HERE ARE SOME OF THE GOVERNORS

New officers of the Canadian Society Domestic Sanitary and Heating Engineers, photographed specially for SANITARY ENGINEER. *Left to right, the officers are:— D. A. Bethune, Montreal; Joint Chairman, Heating and Ventilating Committee, H. Mahoney, Guelph; Vice-President; Garret Frankland, Toronto; Secretary; E. H. Russell, London, Chairman Essay Committee; F. R. Maxwell, Toronto, President; Thos. E. Ferguson, Ottawa; T. J. Minnes, Brantford, Vice-President.*

SOME PAST PRESIDENTS

As snapped on McGill University Grounds for SANITARY ENGINEER. *Left to right:—J. E. Walsh, Montreal; Alex. Charette, Montreal; E. H. Russell, London; John Watson, Montreal; John A. Gordon, Montreal. Some happy, smiling boys, they will continue to watch the growth of the Society with interest.*

These same conditions are easily obtainable throughout Canada if we will only wake up to the fact that we must put more confidence and personal energy behind our Canadian and Provincial societies and simply go out to attain the same protection and co-operation among all the different interests concerned with our particular craft.

Just here allow me to make a suggestion which I feel is of great importance to the success of our Canadian Society.

That in order to obtain the desired results it is my opinion that the president, vice-president and secretary of the Canadian Society shall all either be residents of one city or at least should be centrally located, that is, be within a radius of 100 miles from the place of residence of the president, so as to facilitate matters whenever the president desires a conference with the other officers. The way it has been in the past where, for example, the president of today resides in Montreal and the vice-president in Stratford, over 400 miles apart, so you can readily see how difficult it has been or would be in the future under like conditions to obtain the best united efforts of the different officers. It is my firm conviction now with the greatest opportunities and possibilities directly ahead of us that our Society should exercise great care in electing new officers to have them located within easy reach of each other, because if we ever expect to obtain the desired results, the officers will be obliged to hold frequent conferences on Society matters and especially in connection with the co-operation to be obtained from the supply houses and also from organized labor.

In closing I desire once more to again mention the absolute necessity of greater organization for our craft in Canada first of a local nature, and secondly of a provincial nature, so that the desired benefits and results that should be and are justly ours may be forthcoming through our united efforts. It is for us to decide today on our future policy in this regard and I say unhesitatingly that all members should be up and alive to the future prospects or we as a body will be wiped off the map entirely. Now is our golden opportunity. Do it now. Put ourselves in the limelight and make all others feel that we are on the map of this Dominion, and on it to stay.

I wish to thank the members for the honor placed on me during the past two years and trust that my actions during that period, and that this report will meet with your approval.

Gentlemen, I almost forgot to mention our trade journals, and I now take this opportunity to express my deep appreciation of the good work our trade journals are doing for us, and I especially recommend to our society the advisability of lending our whole-hearted support to these journals

Secretary's Report

Read by JOHN WATSON, Montreal.

IN PRESENTING my report for the past eighteen months or since our president saw fit to appoint me as secretary of this society, with the very limited time

J. E. WALSH

Of Montreal, Secretary of the Canadian Society who read the Secretary's report at the Annual Convention in Montreal.

at my disposal, you will notice there are several changes made in your officers since the last convention in the city of London, Ont., four offices having been vacated during that time, and on account of the president endeavoring to secure substitutes was the cause of some delay during the year 1917.

However, I feel that our Society has made some progress, although we have had three troublesome years, our membership has increased slightly over 1917-18, and is once more in good shape to proceed with such business as may be brought to its attention. I regret that the officers and members have not seen fit to send in notice of motions or other documents pertaining to the work which is to come before this meeting. If this were carried out in accordance with article 18 of the by-law, every delegate would come to the convention fully posted on what is to come up and also have the benefit of the advice of his local organization.

The by-laws have been amended as authorized by the London convention and are now complete and up to date, but there is no annual report in book form this year, but the minutes of the last convention have been placed on file, although nothing special seems to arise out of those minutes to bring to the attention of this body. Every member seems to be on the best of terms with the supply houses, and there has not been a single case where a special grievance committee has been called for.

I wish to draw the attention of this meeting to the lack of interest taken by the Essay Committee, who are supposed to prepare papers to be read for discussion at all local meetings. This has never been done, and as a rule this Committee is never completed—the chairman is appointed at the annual meeting, and if he considers the matter at all it is only when he is called upon for his annual report.

There are two special matters that should be taken up at this meeting; one is in reference to the issue of a monthly bulletin; also the matter of the New Brunswick grievance and T. McAvity. The correspondence on this matter will be found on the file under the heading of R. E. Fitzgerald, W. J. Crawford, D. Shea and J. McKinley.

The incoming secretary will find on the file a sheet showing the standing of each local or provincial society; also the number of members in good standing for each year from 1916; also a list of plumbing firms throughout the Dominion.

The sub-committee held seventeen meetings during my term of office. There has been considerable correspondence and it is gratifying to know that I have received letters from all the officers and chairmen of the committees with the exception of three provincial vice-presidents and one chairman. However, I have great hopes of receiving word from these gentlemen before the close of the meeting.

We have received four new members into our society, all from the Province of Quebec—A. Blondin, St. Hyacinthe; R. J. Williams, St. Lambert; J. A. Landreville, Joliette, and E. G. Brousseau, Quebec. These gentlemen have not yet any local society in their towns, but we expect with their efforts we will soon have a thriving Master Plumbers 'Association in each place.

The thanks of the meeting are due Mr. N. B. Roantree, provincial vice-president for Saskatchewan, for the able manner he has organized the Provincial Society in Saskatchewan. His annual report will be found on file and is a credit not only to themselves, but to a much older society. Their returns show twenty-three members in good standing.

I cannot allow this occasion to pass without drawing the attention of this convention to the serious loss to this city and in fact the whole Dominion of Canada in the death of our esteemed member, Mr. W. R. J. Hughes. He was a friend to all who came in contact with him, always willing to lend a helping hand, absolutely upright and honest at all times. He was a member of the executive for a short time and was a serious loss to that committee.

Thanks are due our trade papers for their noble support and assistance and deserve the good will of this Society.

I wish to draw your attention to the letter of W. C. Miller, a returned soldier, and he should have the assistance of the trade.

In retiring from office I wish to thank the several officers for their excellent support and I must say they have been

1. *Retiring Vice-President C. H. Meyers, whose report was encouraging and whose advice on co-operation and education was appreciated by the Convention. Mr. Myers is very proud of his native city of Stratford and fully as proud of the Plumbing and Sanitary by-laws under which he and his brother plumbers are working. He placed a set of these by-laws on the table for the examination of those interested.*

2. *Edgar G. Brousseau of Quebec City. Mr. Brousseau is President of the Quebec Builders' Exchange and an ardent Master Plumber who is out to make his native city a big factor in Association matters. In speaking to* SANITARY ENGINEER, *Mr. Brousseau said that he was pleased with the proceedings "but I thought it was better to be a good listener the first time." he said. Great things are expected of Quebec.*

3. *"Jim" Griffin—Entertainer, Montreal Association genial entertainment Committee Chairman. There was nothing lacking in the generosity of these folk and due acknowledgment was expressed by the delegates before they dispersed. Mr. Griffin wore one great big smile for three whole days—yes, they were hot ones too.*

very patient with me for the past eighteen months. If I have been rather strong in some of my letters I wish to apologize, but at the same time the fault was not all mine, for when you write an officer five or six times and get no reply the chain tongs or something else has got to slip. Moreover, my endeavor is for the best interest of our Society, which I hope will thrive and prosper through the coming years, and the work of our retiring officers will not be all in vain.

Provincial Vice-Presidents Send Reports

Alberta Vice-President's Report

Read for JAMES MARR.

IT IS with feelings of thankfulness that I now indite this epistle to you that the war which has been ravaging the major portion of Europe for the past five years is almost at the close. Let us hope and pray that a settlement of all national troubles may soon be arrived at and that each and all will settle down to the building of broken and ruptured cities and towns, that domestic troubles may become nil when peace and prosperity may continue to flourish throughout the land.

Since my last report things in general have improved and prospects look brighter for the future. Only for this little cloud of the sympathetic strike we would be sailing along with a fair supply of work at a fair price. We have something like twenty-five members in our local society, with probably five others outside. These in a measure prevent the harmony that a full membership of all the shops would give, but I suppose friction is one of the great drawbacks to all machinery, but we must just keep oiling up to keep it down to a minimum. The meeting of the provincial members of which I wrote you some time ago has been productive of much good. A committee was appointed to wait on the Minister of Public Health with the object of amending the proposed new laws to the Provincial Health Code. The Committee was well received and I understand are now busy with suggestions for a future meeting with the Provincial Board of Health.

I hope to be able to report at a later date that the Associated Sanitary Engineers of the Province of Alberta have arrived at a fixed basis of charges with standard health laws as applied to domestic engineering and a rigid enforcement by and inspection of all installations by practical certificated engineers and inspectors, and this should redound to the credit of and make Alberta one of if not the healthiest province in the Dominion of Canada. With best wishes to all the members present and a profitable convention is the hope and wish of yours faithfully.

Saskatchewan Vice-President's Report

Read for N. B. ROANTREE.

IT IS with a great deal of regret that I am forced to write this report to the convention in place of being there in person. But conditions are such that it is impossible for us to get a delegate down for this year, but next year you can all count on our little Province being represented.

At our provincial convention this spring I brought up the matter of sending a delegate to Montreal, and it was thoroughly debated on, but the feeling was that it would be impossible to send a delegate this year, chiefly because it would cost such a large amount, and as you know, we have just organized and find so many things to do and they all cost money, so it was the feeling of our meeting that we would have to go slow, but next year we will be stronger and I hope you will see more action from Saskatchewan. I have asked our secretary to mail you a complete outline of our Provincial Society so you can see how we are getting along. We want you to feel that you have the Province of Saskatchewan with you and the officers will have our loyal support for the coming year.

The writer had fully intended up until a day or two ago to be in Montreal for the convention himself, but am doomed to disappointment, as it is impossible for me to get away for ten days or two weeks, but I will be with you next year wherever you may hold your convention.

Kindly remember me to all my good friends in Montreal, and wishing you one and all the best of luck, and I hope the convention in Montreal will be a real success.

Ontario Vice-President's Report

Read by GARRETT F. FRANKLAND.

AS YOUR Provincial Vice-President from Ontario during the past three years of our Canadian Society of Domestic Sanitary and Heating Engineers, I wish to report progress and trust that same will meet with your approval.

During the period of the war we were only marking time, but since the armsitice was signed, activity has been our first name and genuine results have been obtained to date in not only inquiries regarding membership, but an actual

JAMES MARR

Vice-President of the Alberta Association who sent in the report of that organization.

increase of 65 per cent. over our roster of 1918.

At our recent Ontario Society annual meeting held in Toronto on April 4th last, life was again instilled into our craft throughout Ontario and our aim and desire as far as Ontario is concerned is to see our craft throughout the Dominion assume its proper place in our national provincial and municipal affairs.

I also place before you several articles for your consideration and trust that good will ensue to all from same.

1. The adoption of the Goodwin plan in some regards by the Canadian Society would go a long way to improve the prevailing conditions in our business at the present time. I refer to the need of an active educational programme by all those engaged in our calling, along the proper methods of carrying on our business and as to the proper merchandising methods of our commodities. These are the duties of not only ourselves but to my mind are also the affairs of those who supply and make the material which we install.

Gentlemen, the above means co-operation and we need just that. First among ourselves, with our employees, second and thirdly between our manufacturers and wholesalers, for are we not all engaged in one enterprise that goes to ensure to our fellow citizens better sanitary and ventilating conditions in our homes and buildings and thereby perpetuate for our country a race of healthy, strong and able-minded people?

2. The idea of a central permanent office for our craft would be sustained, not forgotten, where constant touch would be kept with the trade and its doings throughout the whole Dominion and be an exchange for all information between the members.

3. The serious consideration of the open price plan or tender system is recommended to every local organization.

4. The great need of appointing officers who will officiate, and I trust that in the new officers to be appointed at this convention, workers only will receive the award of office, for if we are to attain results that count, everyone must be up and doing, officers as well as the rank and file.

5. I also wish to make mention of the one source that will give to us our future craftsmen, our apprentices, and wish to have all the members just think of what is going to happen to our business if proper attention is not given to the problem of our boys.

6. To our trade journals and those of our American neighbors the entire craft owe a debt that can only be repaid by tangible results, so subscribe to them all, say I, for knowledge is wealth and abundance of that is yours if you will but read the columns of our trade journals.

7. I must make mention of our brothers engaged in our calling throughout the United States. To them we can well afford to look for ideas, as they are greater in numbers and should necessarily attain improved conditions in a larger measure, and from my knowledge of their affairs they are progressing. At their coming convention in Atlantic City on June 17th and 18th and 19th next many important matters will come before their meeting, and I would advise that this society send a representative to attend their convention, having received an invitation to that effect from their president, who, believe me, gentlemen, is a live wire in every respect.

In conclusion, to our brother craftsmen in the sister province we extend greetings and a hearty invitation to the Society to hold their next convention in

ON McGILL CAMPUS

After completion of the Program delegates to the Annual Convention Canadian Society Domestic, Sanitary and Heating Engineers posed on the campus of old McGill University and were photographed especially for SANITARY ENGINEER.

Ontario at a point to be decided upon later.

Thanking you one and all for the honor placed in me as your Provincial Vice-President for Ontario, I am yours for co-operation.

Quebec Vice-President's Report

Read by J. E. WALSH.

YOUR Provincial Vice-President's report for the Province of Quebec covers a tenure of office of but three months' duration, and is, consequently, limited in the amount of ground covered. The present incumbent, the third since your last meeting, accepted the appointment principally out of respect for the memory of his predecessor, and with the wish to help complete the work the latter had begun. First of all it should be recorded that if any success has been achieved, it is due in the greatest measure to Messrs. Charette and Watson, your Canadian President and Secretary, respectively.

As a sub-executive we endeavored collectively to organize the province with the result that although we cannot definitely report the formation and addition of any new local, yet we were successful in securing individual members from the cities and towns of Quebec, St. Hyacinthe, St. Lambert and Joliette. Furthermore, we are still in communication with the splendid Quebec association and have not by any means abandoned hope of its ultimate affiliation with our Canadian body.

As in the past, the principal association work has been confined to Montreal. Since the last convention the outstanding features are four, viz.:

1. An energetic campaign for French-speaking members which resulted in the addition of several sterling firms to our list.

2. Conferences with representatives of supply firms, concluding with an increase of 5 per cent. in the trade discount on heating goods.

3. Framing of modern sanitary by-laws, which we understand will be put in force by the city administration on the first of the year.

4. Proposed collective membership in the Association of Montreal Building and Construction Industries on condition that the general contractors refrain from including in their tenders prices for the plumbing and heating work, or, in other words, that the plumbing and heating estimates be left exclusively to the Master Plumbers with the sole right of dealing directly with the owners, architects and engineers.

As your worthy secretary tells me that an officer's report is not complete unless it contains some suggestions tending to the improvement of the National body, I will respectfully suggest that the incoming secretary be instructed to read over the minutes of all the conventions held by this society during the past ten years and prepare therefrom for the incoming executive a list of all the excellent recommendations proposed and adopted, but in nearly every instance never put in force. A copy of these

N. B. ROANTREE

Of Swift Current, Sask., who sent in the report of the Provincial Association, Saskatchewan Sanitary and Heating Engineers, of which he is president.

resolutions could then be mailed to the different locals and should prove of material assistance to them.

It might prove a wise plan if at every future convention a few hours were allotted to the discussion of the best means to be adopted by the different locals to arouse enthusiasm among its members. An exchange of ideas with due allowance for local conditions should tend to the advancement of the main body through its branches. Our national association is diametrically opposed to most business concerns, inasmuch as it practically owes both its existence and maintenance to its branches. Is it not, therefore, our bounden duty to give our best thoughts to the parts which constitute the whole? Let the officers and delegates at the ensuing conventions come prepared to answer at least one of the following questions: Is your association in the rut, and if so for what reason? Did your association succeed before, and if so, by what means? How can your association if in the rut be placed on a substantial footing? I feel keenly that nothing should be left undone to make the locals as interesting and as productive as possible to their members. Suggestions should be received from the delegates of the different cities and the most logical and practical tabulated by the Secretary for our future guidance. By all means let every unit know and understand the practices which have been found to be of advantage and the pitfalls which are to be avoided. It should then be an easier matter to establish new locals and assure the success of the existing ones.

Since your last convention your society and principally the Montreal Association has suffered a great loss in three of its members—W. R. J. Hughes, Theophile Lessard and Eric Selkirk. In the last report I submitted at Calgary convention I can clearly remember I had the sad task of recording the death of the late W. J. Hughes. Little did I then imagine that so soon I would have to announce at another convention not only the loss of his distinguished son, Willie, as he was affectionately known to us all, but also the demise of two of our most prominent members. Again I can only say with the keenest of personal sorrow: They have gone to join the ranks of the great majority whilst our hearts beat with sincere sympathy for the loving relatives from whom they are parted.

In conclusion permit me to add my share of thanks to our official organ, THE SANITARY ENGINEER, and to the new "Sanitary and Heating Journal" for the valuable assistance rendered. In our official acknowledgment I should like to have specially mentioned the names of Mr. Edwin Newsome of Toronto and Mr. Hartwell Illsey of Montreal.

New Brunswick Vice-President's Report

Read for W. J. CRAWFORD.

IN PRESENTING my report to your society I wish to thank you for the honor you have conferred upon me in electing me to this important office.

I have appreciated your aims and efforts to fraternalize the trade from coast to coast and as your representative on the coast on the Bay of Fundy and the Province of New Brunswick I hereby submit the following reports of association and trade conditions in this section with a few of my personal recommendations for the uplifting and aggressiveness of our society in this our fair Dominion.

I also wish to thank your executive officers for their untiring efforts and also their kind letters and cards at Christmas and Easter season. Small remembrances like these create the proper spirit of fraternity. There is no use to make any comments of the conditions that we have gone through the last four years, but only now is the time for advancement and construction.

Well, gentlemen, I am very pleased to state that the Province of New Brunswick is still organized as a body and is very much alive. We have held our regular annual and semi-annual sessions and we have a live set of officers: G. S. Dorman, Moncton, president; R. E. Fitzgerald, St. John, vice-president, and H. W. Thorne, Fredericton, secretary-treasurer.

We have almost every sanitary and heating engineer in the province in sympathy with our aims and objects and I might also state that at our last semi-annual meeting held in St. John in January we passed a resolution that the

New Brunswick society will retain their membership in your Canadian Society, but at the same time I am sorry to state that no delegates were appointed, the feeling being that any who could or wished to attend would be given the necessary credentials, but would finance the same personally.

I also wish to state that the cities of Moncton, Fredericton and St. John have good, strong local organizations. St. John has thirty-three members holding meetings every second Monday of the month; also that we have strong representatives on our different health boards and having members on our boards and qualified plumbers as inspectors.

We are receiving numerous applications from those wishing to join our provincial and local societies, showing that by being organized must be an improvement over which we all use to practice, that is, as a whole we can accomplish much and individually nothing, besides the better feeling among all.

I would like to ask you gentlemen what becomes of your convention meetings. Reports and resolutions passed at your different sessions. I know they are printed and distributed, but I cannot see where any action is taken, where results are gained. I have been much interested in association matters this last ten years, and I must confess there has been a lot of waste time and paper.

I believe that we, the engineers of the Dominion, should have the same recognition as the national profession or if anything a higher personal respect. This is one of the things that no action is taken on. You meet and do your business and have entertainments and after that you go home and get back in the rut again. This is the reason why our profession is not advancing. What about the manufacturers, what about the jobbers? Do they meet and go into the rut? No. They come right along with an advance of price.

I have attended two of your conventions and I would like to see your committee not being afraid to tell the manufacturers what is in your mind; also have committees wait upon the Government and prove to them that we are not associated for personal privileges only, but for recognition of a profession that should be respected. We are the people who should be given recognition on our health boards throughout Canada. We should also be given the chance to tender to the Government individually on all Government contracts, not as sub-contractors, and take all the risks of the general contractor who is eager for the job, and in many cases figures too low, and the members of our trade have got to stand the loss with him.

I wish to recommend to your society that at this session your Ways and Means Committee take into consideration the cost of printing and distributing to each member who has paid his per capita tax a certificate along the line of the sample enclosed, which we use in the province, and which is issued each year in different colors with the president and secretary's signature and also the seal of the Society. I also wish that all travelers from all manufacturers and supply houses inquire for these certificates which should be placed in a frame and hung in a prominent place in our offices. You will be surprised at the results within a short time, and you will have inquiries of how to procure them and in this way our members will get interested. I have proven it in this province.

I am sorry to say I will not be able to attend this convention, but my mind will be there on June 3rd, 4th and 5th, and will watch proceedings through the press.

In closing, New Brunswick sends best wishes for a prosperous business convention.

THE RETIRING SECRETARY

John Watson, Montreal, was acclaimed a regular old war-horse, so often has he come to the fore when there was need of help to carry on the secretarial work. Mr. Watson is also a Past-President. Here he is in holiday mood as snapped for SANITARY ENGINEER. *He has just stepped down from a cab in which he and Mrs. Watson drove down for the afternoon entertainment on the closing day of the convention.*

P. E. I. Vice-President's Report

Read by JOHN WATSON.

I BEG to report as to the condition of our society in this province. During the past two years, owing to the war, very little interest has been taken with regard to association work, but I trust that during the summer more enthusiasm will be shown by the members.

We have practically all the firms in this province in the heating and plumbing business in our association so that in that way the duties of the vice-president are very light. I am sorry we have no representatives attending the convention, and I regret very much that I cannot be present myself. Hoping that you will have a very large and successful convention.

Committees Review the Year's Work

Sanitary Committee's Report

Read for ANGUS McDONALD.

IN PRESENTING the annual report as chairman of your Sanitary Committee I do so with a great deal of regret at my inability to present same in person, but my good friend, Mr. C. R. Myers, a valued member of your Committee, will perform this duty for me.

In the first place, let us congratulate ourselves that the great war is won by Great Britain and her allies, which means so much for ourselves and the British empire as a whole in assuring continuancy of freedom and democracy for all.

In taking a survey of the plumbing trade in general I am glad to report that steady progress is being made in respect to the materials used and the improved sanitary conditions which in many places are being adopted to insure better work as well as protecting the health of our citizens. Much can be accomplished by forming local committees in municipalities, who will persist in continually keeping before their various councils the desirability of passing by-laws that will protect health as well as improving and benefiting the plumbing trade in general. This should be followed up by having a qualified sanitary engineer to follow up this work, who at all times should be available for inspection and examination work.

To show the great need of such a man, let me cite a case that occurred in the city of Stratford previous to that city adopting plumbing by-laws and inspection. A merchant built a new home and shortly after moving in his wife and daughter were taken seriously ill with typhoid fever. Although the city was fairly free from the disease, the city water was analyzed for bacteria, but the trouble was not there. The medical doctor in attendance was at a loss to account for the presence of fever and finally called in a plumber, who discovered in ten minutes the source of the trouble. The plumber who installed the work left a T Y in the soil pipe just the right height for a cistern overflow. The tinsmith connected a piece of 4-inch conductor into the soil pipe T Y.

With a case like the above to cite your committee interviewed the city council, and after much hard work, we were successful in having one of the best plumbing by-laws of any city of our size in Canada. No doubt much opposition will

be met in some places in having such plumbing by-laws passed, but at the same time there should be no trouble in convincing the authorities that there are no ulterior or selfish motives on the plumber's part, other than a health insurance in the passing of such sanitary by-laws. Inspections and examinations should be carried out to insure the best results.

The guardianship of public health under the terms of the British North American Act is like our educational system of the provincial function. The public health department of the different provinces have always been under the complete control of the medical practitioners. All municipal public health officers are physicians of this school of medicine. Municipal boards of health are absolutely under the same control. Now, while most people agree that the honorable and conscientious practitioners of medicine are, according to their theory of treatment, well qualified to do and are doing every day valuable healing work for their patients. After all, this is the work for which they go through years of training to fit themselves, why should it seem strange that they do not seem able to successfully cope with a wholly different problem involved in the question of public health? Surely it must be clear to all that the medical practitioner does not study the question of drainage, ventilating, town planning, plumbing, heating, water supply, pure food supply and so forth, which is of no consideration in their training as a medical practitioner. The main business of the medical practitioner is to treat the individual disease by means of drugs, medicines, vaccinations and inoculations.

The work of the sanitary engineer, on the contrary, has nothing to do with healing of diseases as manifested by individuals. The work for which he is trained is the maintenance of a healthful and sanitary environment, which may be achieved not by the using of drugs, medicines, vaccines or serums, given or thrust upon the individual, but through the scientific application of the different phases of the sanitarian's activities already mentioned. The sanitary engineer especially tends to reduce the fear of disease.

It must surely be apparent to those who give this work any thought that the medical practitioner should be replaced, so far as his duties to plumbing, heating, drainage, ventilating, etc., are concerned, by a sanitary engineer whose training has fitted him for this particular branch of work. Also the desirability of having enacted a uniform federal law for the province. Surely the health of the nation is of some importance to the country and should receive the thoughtful consideration of every individual who has any connection with this line of work.

The vice-president, Mr. C. R. Myers, in commenting on this report gave some interesting details of the happenings of the Stratford law courts in regard to the enforcement of the civic health by-laws which resulted in a certain pipe fitter employed in the G. T. R. shops who was not a licensed journeyman who had installed a closet bowl on a Saturday afternoon was heavily fined not only by the court, but also by his local union.

Report Apprenticeship Committee

Read by P. C. Ogilvie

AS chairman, I beg leave to submit the report of your Apprentice Committee.

We regret to say that in the last ten years very few of our Canadian boys serve out the apprenticeship of five years. It seems to be the custom of many shops not to employ apprentices, but, instead, to employ helpers, who, after working for a short time, very often pose as mechanics. Some eventually take up other work, such as stationary engineering or firemen in factories, or other buildings, and in many cases make all the repairs to the plumbing and piping in and around the building.

AT DOMINION PARK

The retiring president speaking with E. G. Brosseau of Quebec, Que., and A. H. Illsey of SANITARY ENGINEER *at Dominion Park.*

Your committee feel that it is to the best interest of every master plumber to encourage boys serving a five-year apprenticeship. This is the only way we can get first class mechanics and save our boys from becoming just ordinary unskilled laborers. The hiring of helpers should be discouraged, as it has flooded the labor market with a lot of unskilled men. In Great Britain, where many of our first class mechanics come from, the boys have to serve an apprenticeship of from five to seven years, and as far as we know the only helpers are apprentices.

We hope that this brief report will have the effect of bringing out in the discussion that will follow many good suggestions, which will help to overcome the present apprenticeship troubles. The whole respectfully submitted by P. C. Ogilvie, chairman; J. Belisle, W. Ryan, J. Saunderson, and T. Latourelle.

Report Heating and Ventilating Committee

Read by H. LAVIGEUR, Montreal.

I BEG to submit for your approval my annual report as chairman of the Heating and Ventilating Committee of your association for the year 1918-1919. I regret very much not being able to report progress, but I can certainly assure you it was not through any lack of interest or effort on my part.

In the Province of Quebec we are improving more regarding hot water heating, and I would like to advise this convention that in the City of Montreal there are several offices who are laying out plans for proprietors and public works before the master plumber knows anything about them, and then we find difficulty in doing the work, because the individuals drawing the plans complain that the plumber does not follow the plan and the result is that the master plumber is responsible for the job not going satisfactorily, and at the end it is the master plumber who pays for the mistakes of the people making the plans.

Regarding ventilation, with reference to house problems, the plumber controls this, but on public school and factory building it is controlled by a special company.

Thanking you for the honor you have bestowed on me in the past, and wishing you all a pleasant and prosperous convention, I am, yours respectfully.

Nominating Committee Report

IN submitting the report of your Nominating Committee, we wish to present clearly to the meeting that our endeavors are solely to select members for the different offices who could accept the position and conscientiously carry out the work of the office.

Our nominations are, of course, not final, and are subject to your approval or rejection. It is, furthermore, the privilege of any member to make nominations from the floor. We should be pleased to have the members avail themselves of the privilege. We should also explain that as the next convention is to take place in Ontario, we have, therefore, chosen, as much as possible, the office bearers from that province.

We feel that our selections are in the best interests of your society and hav

much pleasure in submitting them as follows:

President—F. R. Maxwell, Toronto.

Vice-President—H. Mahoney, Guelph.

Secretary-Treasurer—G. F. Frankland, Toronto.

Vice-President for Quebec—H. Lavigueur, Montreal; Ontario, T. J. Minnes, Brantford; New Brunswick, W. J. Crawford, St. John; Nova Scotia, left to the Executive; P.E.I., Thos. Johnson, Summerside; Manitoba, left to the Executive; Saskatchewan, N. B. Roantree, Swift Current; Alberta, Jas. Marr, Calgary; British Columbia, left to the Executive.

Chairman of Sanitary Committee, John Wright, Toronto; Heating and Ventilation, T. Latourelle and D. A. Bethune, Montreal; Legislative, J. T. Blyth, Ottawa; Essay, E. H. Russell, London; Apprenticeship, Geo. Clapperton, Toronto.

(Signed) Thos. Ferguson, G. F. Frankland, J. T. Blyth, H. Mahoney, J. E. Walsh, chairman.

Moved by Geo. Delaney, Montreal, seconded by H. S. Brown, Brockville, that this report be received and accepted.—Carried.

Moved by Mr. J. E. Walsh, Montreal, and seconded by H. Mahoney, Guelph, that the nominations close.—Carried.

Special Convention Committees

Credential Committee—John Watson, Montreal; T. Latourelle, Montreal; J. A. Gordon, Montreal.

Select Committee—C. D. Henderson, Brantford, Ont.; A. E. Gibbons, London, Ont.; W. J. Cracknell, Toronto.

Nomination Committee—J. E. Walsh, Montreal; G. F. Frankland, Toronto; J. T. Blyth, Ottawa; O. A. Archambault, Hull; H. Mahoney, Guelph, Ont.

Resolution Committee—E. H. Russell, London, Ont.; G. B. Grinyer, Guelph; T. J. Minnes, Brantford; F. R. Maxwell, Toronto; D. A. Bethune, Montreal.

Audit Committee—Thos. Maxwell, Toronto; Jos. Belisle, Montreal; Geo. Ross, Brockville, Ont.

Sergeant at Arms—P. C. Ogilvie, Montreal.

Official Interpreter—T. Latourelle, Montreal.

Report of Select Committee

Read by C. D. HENDERSON.

THE report of the Select Committee was presented by the chairman, Mr. C. D. Henderson of Brantford, as follows:

"Your Select Committee appointed to go over the Secretary's files beg to report as follows: It is quite evident from the amount of interesting correspondence on file from the different trade papers that those publishers offer a helping hand at every corner to our members, and we strongly urge those who are not subscribers to sign up. The cost per year fades into insignificance compared to the benefits received. It is not enough that we should simply subscribe to these papers. There are many instructive and interesting articles appearing in their columns on business and practical lines which should command careful, thoughtful reading, and along those lines your committee suggest that each subscriber arrange fifteen minutes each day for the next 12 months for the purpose of reading their trade journals, and we think that at the end of that time they will have a much better grasp of their business in general and be in a position to discuss important matters coming up at meetings and yearly conventions.

Considering the enormous amount of work in connection with the duties of the secretary of the association, your committee were much impressed with the painstaking and forceful manner in which Mr. John Watson has answered the many and varied communications from all over Canada, and we suggest that a hearty vote of thanks be tendered him for his efforts. All of which is respectfully submitted. (Signed) C. D. Henderson, W. J. Cracknell.

Recommendations and Comments by Resolutions Committee on the Various Reports Submitted

The President's Report

Clause 1—

We would strongly recommend that each provincial association deal directly with the Provincial Board of Health and endeavor to secure one national code of sanitary by-laws.

THE BANQUET

Who wouldn't attend the next convention? This is just a small portion of the happy banqueters at Dominion Park, Montreal.

Re Manufacturers—

For your observation and further action, we recommend that your provincial association deal with any grievances which may arise with the manufacturers.

Another matter for your consideration: That inter-correspondence be arranged between the different provincial associations, informing of the firms who are unfair.

Clause 3—

Re Bulk Handling—

We heartily concur in the president's sentiments regarding tendering in block, and that we do not consider it in the best interests of our business. We feel that this is too wide a field to touch at present, and we would recommend that the individual and locals can handle the same.

Vice-President's Report

Clause 1—

Referring to our vice-president's report, re clause between master and employee. In our experience we find that, in every instance, where friendly trade relations exist, our business has been greatly improved, both by better workmanship and financial gain to the employers.

Clause 2—

Re co-operation of the building industry: We would advise that all builders and employees form a Joint Conference Board and work under a system known as the Whitley Scheme, as followed out in the Old Country.

Clause 3.—That, in order to obtain the desired results, it is my opinion that the president and vice-president and secretary of the Canadian Society shall all be either residents of one city, or, at least, should be centrally located, that is, within a radius of 100 miles from the place of residence of the president, wherever he may happen to be, so as to facilitate matters whenever the president desires a conference with the other officers.

Clause 4—

In reference to the above clause we believe that our official bulletin, inserted in the trade journals, will be the stepping-stone for the furtherance of this idea.

The Secretary's Report

Clause 1—

We would recommend that all information in reference to the benefit of our association be in the hands of the Executive Committee two months prior to the annual meeting, and, if possible, a copy be sent to each section of provincial associations, to be sent out one month previous.

Clause 2—

Re Monthly Bulletin.—This Executive Committee interviewed the trade journals with a view of having inserted monthly bulletins pertaining to association news.

Provincial Vice-President's Report

QUEBEC

Clause 1.—

Re Report Organization of the Province of Quebec.—That this matter be left entirely to the Quebec Association owing to the necessity of carrying on the work in two languages.

Discounts, Clause 2.—We recommend that the matter of discounts be left in abeyance on account of the peculiar trade situation.

Clause 3.—

We would recommend that, in reference to communications which have accumulated for the past ten years in view of the changed conditions that the world has created and started a new era, be it resolved that the Canadian Society of Domestic Sanitary and Heating Engineers also start a new era from this date. Have it understood that the officers elect will not be governed by any precedent. This, we wish to state, is no reflection whatever upon our past officials, but deem it advisable to give our officers-elect a clean sheet upon which to work, so that they may apply their own initiative without being encumbered with the unfinished work of preceding conventions.

ONTARIO

The Province of Ontario is to be congratulated on the strides that they have been making, and, it is to be hoped, and we feel confident that this stride will be continued, and that they will be blessed with the real live and effective organization. They also should be thanked for their accomplishments of the past.

Central Office.—We would recommend that a permanent secretary be obtained.

Delegate to Convention.—We would recommend that $100 be at the disposal of a delegate to be appointed by this convention to attend the meeting which will be held at Atlantic City, June 17th-19th.

Goodwin Plan.—We heartily recommend the Goodwin Plan to be inaugurated when our association is strong enough to apply it effectively. We would also recommend the local and provincial associations who are now in a position to adopt this plan as soon as they become able to apply it.

Clause 3—

From the above clause we would recommend that the president and secretary be located in one place, and that we would advise that, in selecting a vice-president, a special care be given in the selection of same. Very often he is to take up the unfinished business of the president.

NEW BRUNSWICK

Report on sheet on page one is already dealt with by the recommendation re Board of Health.

Clause 2—

We also refer the above clause to your recommendation re Board of Health, also clause re manufacturers.

Clause 3—

Same as above.

Clause 4—

Re Certificates.

This committee would recommend, re the suggestion regarding issuing of certificates, that it be placed in the hands of the Executive for the furtherance of compiling details.

Clause 5—

That this clause be left in abeyance to be taken up at a future date, when our membership will warrant the consideration it deserves with the parties interested.

Sanitary Committee's Report

Clause 1—

We recommend that each provincial secretary write to their local advising the necessity of having a sanitary engineer appointed to the Board of Health of their municipality. In the event of this not being possible, to endeavor to gain the confidence of their Board of Health with a view to creating better sanitary conditions.

Chairman Heating Committee's Report

Clause 1—

Re clause of Heating Manufacturers' and Jobbing Houses, drawing plans and specifications for prospective builders. We might also say that they are giving prices in connection with the above and we would advise that this matter be taken up with them to have same adjusted.

Apprenticeship Committee Report

Subject—Apprenticeship.

We recommend that a Special Committee be formed to take the matter of the apprenticeship question up with J. Bruce of the United Association of Plumbers and Fitters to solve this question, and the United Association to appoint a like committee.

Votes of Thanks

It was moved by Mr. A. Charette, seconded by Mr. Jos. Thibeault, that a hearty vote of thanks be tendered to the newspapers of the City of Montreal, as well as the trade journals, assisting at the convention.—Carried.

A vote of thanks was then made on the motion of Mr. J. P. Blyth, Ottawa, seconded by Mr. C. E. Myers, of Stratford, to the supply man who had furnished the entertainment for the delegates.

The secretary was then informed that the delegation from Ottawa consisted of Messrs. J. P. Blyth, J. McKinley, O. A. Archambault, J. P. Band, W. H. Chapman, A. Gauthier, and W. G. Edge.

It was then moved by Ben Noble of London, seconded by Geo. Delaney, Montreal, that this society pass a resolution of condolence and that letters be sent to the families of the late W. R. J. Hughes, Thos. Lessard and Eric Selkirk.—Carried unanimously.

Moved by Mr. T. J. Minnes of Brantford, seconded by A. E. Gibbons, London, that a hearty vote of thanks be tendered to the Entertainment Committee, consisting of Mr. James Griffin, chairman, and Messrs. Walter Ryan, F. Lepine, Geo. Delaney, A. Noel, and the member of the Montreal Association for the able way in which the delegates to the 22nd Annual Convention were taken care of.

A vote of thanks was then proposed to the retiring officers on the motion of Mr. Geo. Delaney, Montreal, seconded by Thos. Ferguson of Toronto.—Carried.

A hearty vote of thanks was then proposed to the trade journals by Mr. A. Charette, seconded by Mr. G. F. Frankland of Toronto.

It was then moved by Mr. Henderson of Brantford, seconded by G. Grinyer of Guelph, that the question of trade prices be left to the Grievance Committee.—Carried.

Credential List and Delegates

We beg to report having received and examined credentials from the following officers and delegates:

President—Alex. Charette, Montreal.

Vice-President—C. R. Myers, Stratford, Ont.

Sec.-Treas.—John Watson, Montreal.

Prov. V.P., Quebec—J. E. Walsh, Montreal.

Prov. V.P., Ontario—G. F. Frankland, Toronto.

Delegates—A. E. Gibbons, London; E. H. Russell, London; Ben Noble, London; C. R. Myers, Stratford; G. F. Frankland, Toronto; F. R. Maxwell, Toronto; Thos. M. Maxwell, Toronto; G. E. B. Grinyer, Guelph; H. Mahoney, Guelph; T. Latourelle, Montreal; J. Belisle, Montreal; H. Lavigueur, Montreal; J. Ballantyne, Montreal; D. A. Bethune, Montreal; P. C. Ogilvie, Montreal; J. A. Gordon, Montreal; T. J. Minnes, Brantford; C. D. Henderson, Brantford; H. S. Brown, Brockville; Geo. Ross, Brockville; W. J. Cracknell, Toronto; J. H. Doughty, Mimico; C. H. Chapman, Toronto; Thos. E. Ferguson, Toronto; John McKinley, Ottawa; J. T. Blyth, Ottawa; O. A. Archambault, Ottawa; P. Gingras, Quebec; H. Jobin, Quebec; Eugene Matte, Quebec; J. Cote, Quebec; J. C. Huot, Quebec; C. E. Montembrault, Quebec; A. Norsau, A. Huot, O. Picard, P. Noel, J. E. Rouillard, B. Paradis, E. G. Brousseau, J. B. Morin, S. A. Daughtry, Ottawa.

Signed—John Watson, John A. Gordon, T. Latourelle.

Moved by Mr. H. Mahoney, Guelph, and seconded by H. Lavigueur, Montreal, that this report be accepted and to add the names of any other delegates arriving later.

(Continued on page 41)

EDITORIAL COMMENT

READ THE REPORTS

IN this issue of SANITARY ENGINEER will be found a complete and detailed report of the Dominion Convention at Montreal. In accordance with its policy of rendering to all those in the trade the best possible service SANITARY ENGINEER was represented at the big Montreal meeting by a member of its staff. He personally looked after the securing of all the various important reports presented from all parts of the country, prepared the summaries of the numerous discussions that took place and also secured a number of exclusive photographs. Those not familiar with the work of reporting an important convention have no idea of the amount of detail to be handled. There are hundreds of important matters in which the men in the trade in all parts of the Dominion are interested. In order that those living thousands of miles away may have as complete a report of the meeting as if they had attended it SANITARY ENGINEER has spared no expense or trouble to present to them what occurred. A close perusal of the report of the meeting is advised as most of the matters taken up, and the discussions on them, are of national interest, and will have an important bearing on the future developments of the plumbing business in Canada.

CO-OPERATION KEYNOTE OF CONVENTION

THOSE who are working with the great object in view of putting the sanitary and heating business all over Canada upon the plane to which it is entitled found a great deal to encourage them in the annual convention which was held at Montreal last week. Questions of co-operation, organization and education came up so frequently and were discussed so earnestly as to show unmistakably that the delegates from all parts of Canada are thoroughly awake to the importance of pulling together. This is as it should be. Individual effort as far as it goes is excellent, but no individual, no matter how hard he works, can begin to get the results that are possible through the co-operation of a large body of men all engaged in the same business and with a community of interests that are identical. Speaker after speaker at the convention told enthusiastically of the results that are being attained, here there and all over the Dominion by local organizations who have come to see the importance of working together. The same results on a larger scale are possible when every man in the trade in each Province works together. They are possible on the maximum scale when every man from coast to coast realizes that his interests are in common with those of every other man and all join in one big organization. There is practically no limit to the results that an organization of this kind can accomplish and more and more those who are working for the good of the whole trade are getting the vision of what can be done. Co-operation and organization will work wonders and when to these are added education, a combination is formed that is irresistible. These three things are vital needs in the trade to-day. With their coming will vanish such evils as price cutting, which is perhaps one of the worst things that has to be contended with. With education will come an end to working hard and long only to find that jobs have been handled at no profit. Other trades are solving all these problems and the sanitary and heating engineers have made the start that promises to solve them. But it means work. It means close co-operation and close co-operation means that every man must do his share. There is every indication that the men in the trade are realizing this and are awakening to their responsibilities.

WILL BE APPRECIATED

THE action of the members of the Toronto Society of Domestic Sanitary and Heating Engineers in voluntarily increasing the wages of all journeymen by ten cents an hour is one that shows a commendable spirit on the part of the employers. There was no demand for wage increases from the men who were working under an agreement that will not terminate until July 1, 1920. Naturally they were agreeably surprised when they learned of the action of the bosses and appreciated what had been done more than ever when they learned of the motives which actuated the increase. The master plumbers took action after securing a very careful and complete report regarding the cost of living. This matter was gone into thoroughly and it was decided that the men were entitled to an increase. There is a lesson in the action of the master plumbers for many other employers of labor. The spirit they have shown is one which if carried out all over the Dominion would do more to prevent labor troubles and strikes than anything else can. The journeymen plumbers of Toronto realize that they are not working for men who have no other thought than for their own selfish interests. The granting of the increase in wages and the way in which it was done will not be forgotten by the journeymen and will go a long way towards making for the best of relations.

Modern Vacuum, Gravity and Home Steam Heating

Lecture Delivered at Twenty-Third Annual Convention of the Canadian Society of Domestic, Sanitary and Heating Engineers, Held at Montreal on June 3, 4 and 5, 1919, by A. J. Dickey, Manager, C. A. Dunham Co., Limited, Toronto

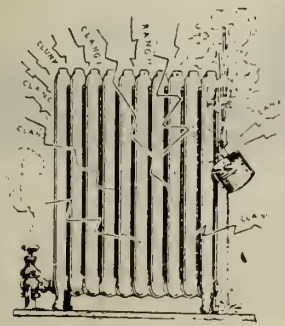
A. J. DICKEY

GENTLEMEN:—I appreciate this opportunity of addressing the members of this convention. There are many forces at work in the world to-day to bring about better conditions socially and economically. It took a force of enormous magnitude to bring the world to the realization that the old order of things must pass, and that we must bring about new conditions better suited to the age in which we live, as an enlightened and civilized people.

This being a land of free speech and thought, our problems will be solved largely through the development of public opinion, and it is necessary for leaders in each line of industry or branch of science possessed with upright ideals, to use his influence in directing this public opinion along the lines that will result in the greatest benefits to humanity as a whole.

Public opinion as applied to that branch of industry served by sanitary engineers, is an all-compelling force. Many practices in our plumbing and heating codes are in their present unsatisfactory condition because of absence of public opinion and through unscrupulous practices of men to underbid on competitive work, through use of inferior materials and stinting of the work.

Such practices can only be resorted to by men or firms that are in business to-day and are gone to-morrow. This very condition of things has brought the plumbing and heating business into some disfavor with public opinion.



A one-pipe steam radiator pictured true to life.

If the public is seized with a full understanding of the value of proper plumbing and heating requirements, then public opinion would force the development of rules and regulations that will thoroughly safeguard the public and the industry.

Education, particularly technical education, is a problem that will require the earnest support of the trade to prepare your workmen to think, reason, analyze and act correctly in the execution of his work as an artisan.

If all these qualities are possessed by your workers, they will be an enormous asset to your business.

I am very enthusiastic over technical education, and its effect on this industry for the future, if all members get behind the movement to encourage their men to take advantage of these wonderful benefits.

This reminds me of an incident that was recited to me by a contractor who was an ardent advocate of technical education.

This contractor's nephew was taking a college course, but worked at the heating trade during his vacations. His vision and understanding of nature's laws, through his college studies, filled him with enthusiasm for his task in vacation time. He was sent out as a helper on a job of heating in a residence. The steamfitter in charge of the job was sick one day and failed to show up. This lad went ahead with the work, and during the day the owner came around to inspect the work, and he was astounded with this man's technical explanation of the details of his own heating plant.

Several days later the owner called at the shop to settle his contract, and says he—"Is it necessary for your workmen to have a college education?" And the contractor replied: "Every one of my workmen is encouraged to pursue a course of study along his own particular line of work, and to keep posted on new developments in their line, as do I, by reading the trade journals."

The contractor remarked to me, when relating this incident, that this man had sent many new customers to him and he attributed it to the confidence inspired through the incident with his nephew.

A discussion of modern vacuum, gravity return and home steam heating, could be very broad in its scope, but in this lecture I wish to point out some of the salient features which are particularly outstanding in the modern type of steam heating system.

I will ask you to pardon my frequent reference to Dunham products in this lecture, but they are so closely bound up in present-day efficient steam heating that it is essential to refer to them with some explanation of the principles embodied in them.

One Pipe System

Until the last few years, heating systems, in some cases, were a rather haphazard arrangement of pipes, fittings, and boilers, and were sadly lacking in the refined specialties that provide smooth, satisfactory and economical operation.

To-day, public opinion compels improvement in heating that will produce greater economy and more real comfort. Public opinion, likewise, rebels against the use of noisy radiators or those that are likely to damage buildings and furnishings through leakage from air valves. It has likewise rebelled against the system of heating that does not permit of gradual control of steam at the radiators so that "as much" or "as little" heat can be admitted positively to the radiator as is required.

The noisy, jumping, electric arc lamp gave way to the quiet, efficient, tungsten and nitrogen lamp. Electric lighting has largely replaced gas lighting because of its quick control Just so, is the one pipe and two pipe steam systems giving way to more modern steam heating.

As you all well know, air valves on radiators are a source of a very great depreciation in building. The one pipe radiator is oftentimes very noisy owing to the pounding of the water, and especially is this true when the valve is only partially open.

If the air valve is not adjusted to a nicety, then the radiator is liable to become air bound and only a portion of it do useful work in giving off heat. I am sure that such instances are common in your varied experiences.

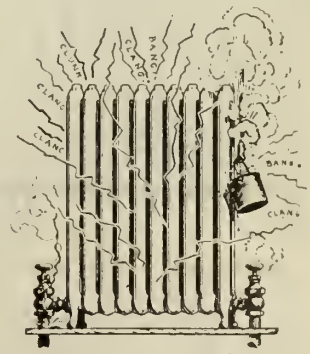
Two Pipe Radiator

In the two pipe connection to radiators, it is intended that the inlet valve will control the proper admission of steam; that the air valve will take care of all air to be vented from the radiator, and that the return pipe from the radiator will permit of the passing of water of condensation.

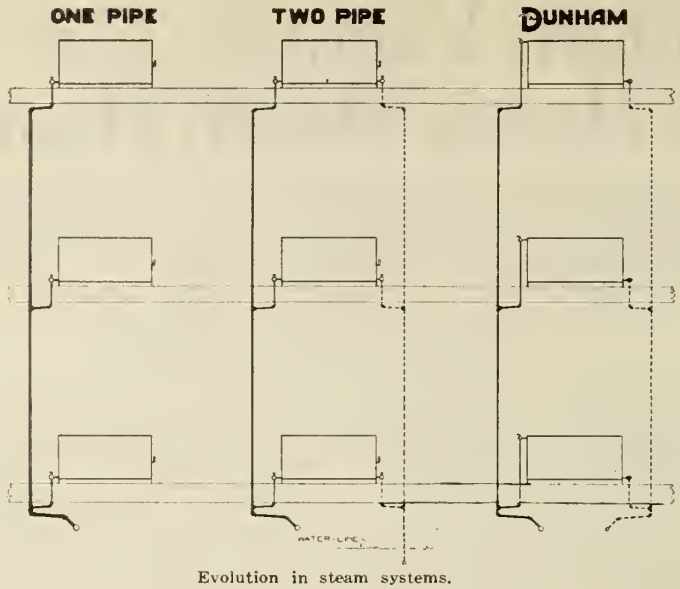
But we all know that in actual operation, when the valves are controlled by laymen, it is impossible to handle either the inlet or the return valves to accomplish their desired effect.

One Pipe, Two Pipe, Dunham

In the up-to-date steam heating system the change from the old two-pipe gravity system comes about mainly through the



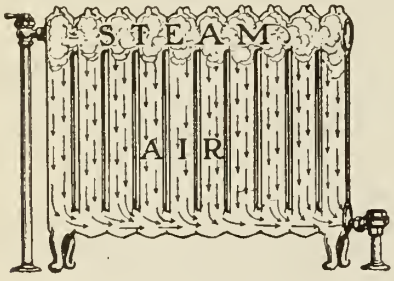
Radiator on Two Pipe System
D 5-1½



Evolution in steam systems.

application of the Dunham Radiator Trap to take the place of the hand-controlled valve at the return end of the radiator.

This trap passes air and water from the radiator, and closes when each individual radiator is filled with steam. It eliminates



Steam first entering radiator

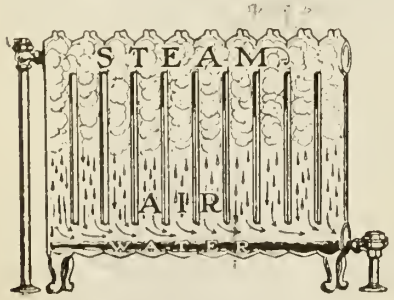
noise, air-binding, and any leakage of steam from air valves, and it provides a positive control of the heat, through the operation of the one valve—the inlet valve.

Radiator—Steam Entering

Air is heavier than steam, so that when steam is admitted at the top of the radiator, the air gradually settles to the bottom of the radiator and passes out through the trap. Circulation takes place in a natural way, and with a very small amount of pressure at the valve.

Radiator—Half Full of Steam

The amount of steam to be admitted to the radiator can be nicely and positively controlled, and as the steam condenses, the water descends and passes out through the



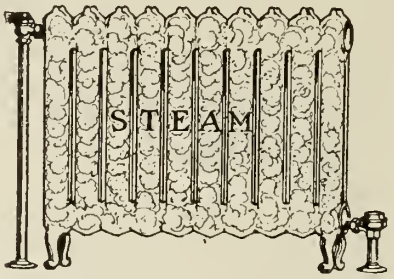
Radiator half full of steam.

return of the radiator, the same as does the air. If there is not enough steam admitted to entirely fill the radiator, then the trap remains open for the passage of air and water.

Radiator Filled With Steam

The radiator valve and the pipe supplying steam to it must be large enough to supply steam for the radiator when operating under its maximum condensing condition, and when the radiator is entirely filled with steam, the trap closes so that all steam is held within the radiator until it gives up its heat and is condensed to water.

The control of the radiator under the conditions described and which are secured in up-to-date steam heating plants, is analogous to the control of an automobile, where you can give it as much or as little gas as you want to regulate your speed. While the pipe radiator would not be unlike an automobile that must be either standing or taking a full speed supply of gas, such as



All air and water expelled. Radiator full of steam

when the radiator is shut off entirely or turned full on.

Surely, we have reached the stage in the application of steam heating where we must make use of this gradual yet smooth control of the steam supply to radiator.

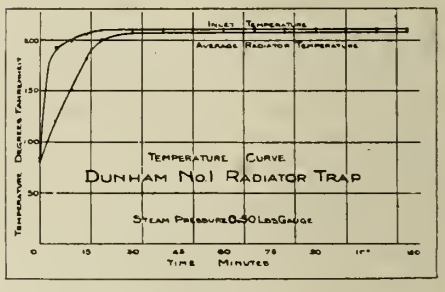
Dunham Radiator Trap

I feel that at this point I must say a few words about the Dunham radiator trap to clear up any points that may not have been made plain as to the functioning of the Dunham radiator trap as I have referred to it.

The major functions of the trap are to pass air and water and to close against steam, within the normal limits of pressure met in actual operation. Experience over the past fifteen years has proven conclusively that there is only one positive force which can be utilized successfully in a perfect radiator trap, and that is, temperature of the steam within the radiator.

The thermostatic disc in the Dunham trap contains a combination of volatile fluid, and the disc automaticallly expands under the temperature of the steam at varying pressures and temperatures, until the flat valve shuts off the discharge opening. The operation of this thermostatic disc is automatic under various pressures from 15 inches of vacuum up to 10-pound steam pressure, such as are usually met with on commercial service.

As water and air have a lower tempera-



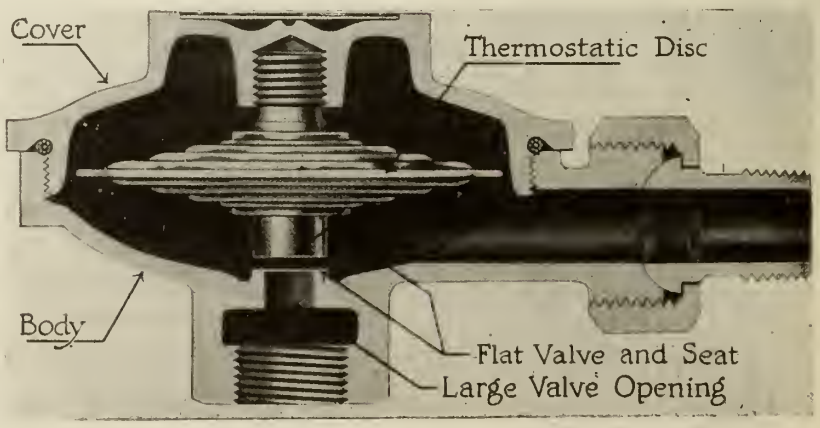
Efficiency Curve

ture than steam, they cause the gas on the interior of the disc to condense to a fluid, releasing the pressure on the interior and the valve is raised from its seat, permitting the air and water to pass out.

The Dunham trap was the first commercial thermostatic trap to be placed upon the market. It revolutionized vacuum steam heating and it overcame the wastefulness and loss of steam which was common to traps in use before the Dunham.

Efficiency Curve

This curve is interesting in that it shows on a Dunham system how nearly the temperature of the radiator approximates the temperature of the entering steam. The average temperature of the radiator is secured by thermometer readings in oil wells located over the test radiator, and if

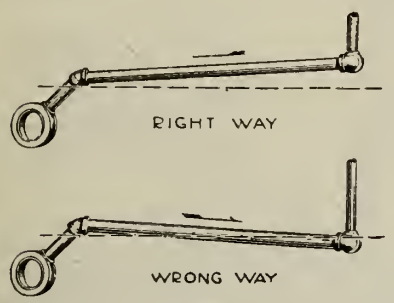


Sectional view of No. 2 trap, showing simplicity of construction.

there were any air pockets in the radiators the temperature reading would be so much lower that there would be a large difference between the average temperature reading and the temperature of the steam inlet. It shows conclusively that the trap has perfect efficiency in ridding the radiator of its air and making it do its full work in giving heat.

Spring Pipe Connections.

There are certain things that have a direct bearing upon the results secured



Common cause of trouble with steam-heating systems.

at the radiator, some of which the contractor and his workmen have a very great responsibility.

The artist in painting a picture makes it a masterpiece, because of the minutest details which are so carefully worked onto the canvas. Just so, in selling and installing a heating system, the details must be carefully considered.

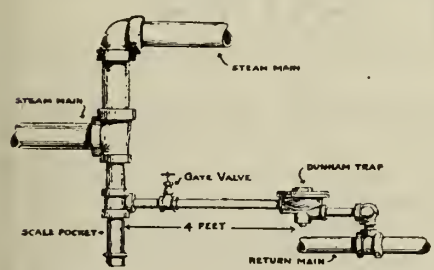
The natural tendency is for steam to raise (we see this on every hand when steam is escaping from exhaust heads in industrial plants), just so is it in the heating system.

If the spring pieces to the risers and to the radiators are not graded so as to avoid any water seals, then steam will not circulate properly to that radiator or riser.

The good workman will carefully avoid these water seals. The careless workman pays dearly for his carelessness, through tearing down the reputation of his firm.

Dripping Rise in Steam Mains

It is often necessary to raise steam mains to pass some obstruction, and wherever this is done or wherever water of condensation is likely to accumulate, suitable drip connection should be taken off through liberal drip pocket, so that the water cannot possibly interfere with the circulation of the steam.



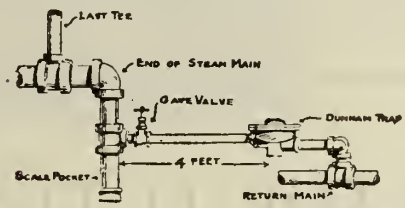
Method of Dripping Rise in Steam Main.

Drip of End of Steam Main

At the ends of steam mains the water of condensation must be taken off in much the same manner, through a liberal pocket so that the water has a chance to drop down out of the road and not interfere with the steam circulation to the last riser or radiator connection.

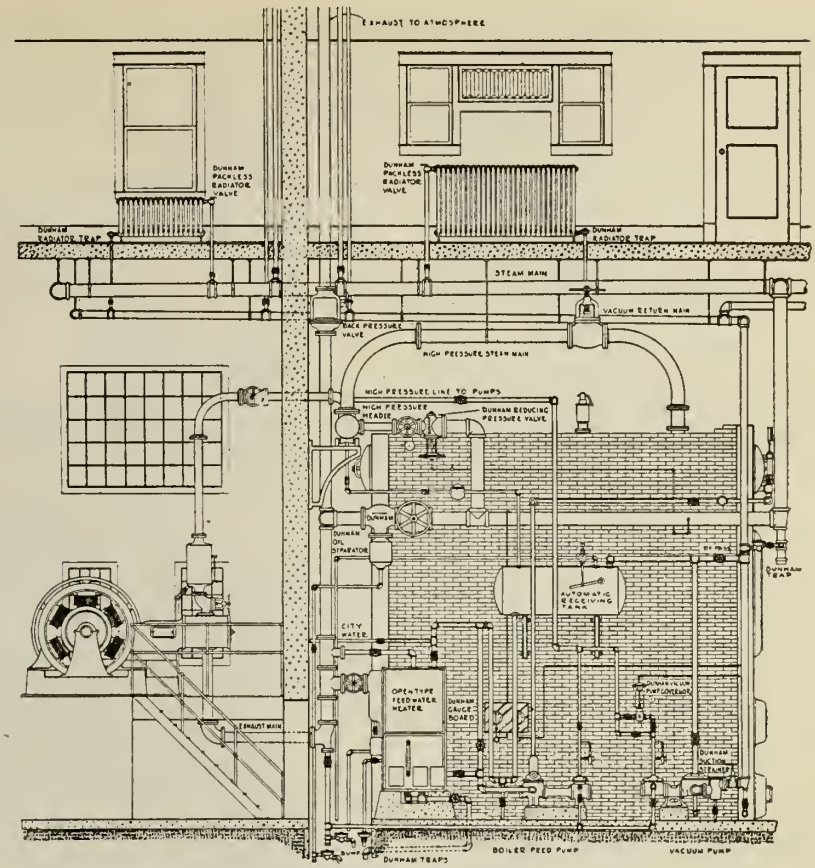
If return mains or return spring pieces are graded in the wrong direction, they will interfere with the circulation of steam just the same as though the water seal was occurring in the steam main itself or in riser.

I have known of numerous cases where poor circulation has been complained of and the trouble was due entirely to causes which I have just pointed out.



Practical and modern method of dripping ends of a steam main. Note scale pocket and trap, latter prevents steam entering return main.

Whenever a water seal occurs in any pipe, it requires that additional steam pressure must be carried on the entire system before circulation in that radiator or riser which is being obstructed by the water seal can be effected.



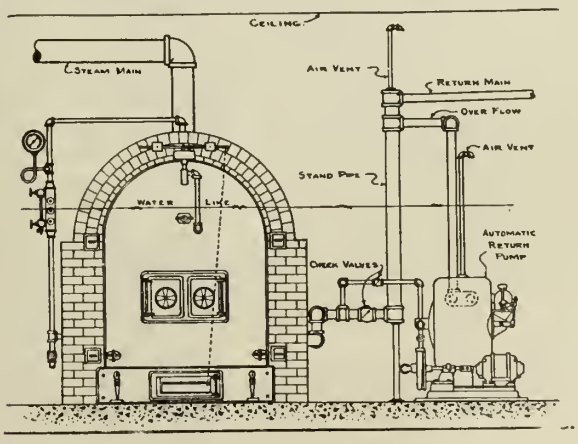
Typical Vacuum System.

Typical Vacuum System.

Vacuum heating is not new. It gets its name from the fact that some mechanical means is used for drawing a vacuum on the return piping from the heating system, which means, that the steam flows into the radiator because of the region of low pressure in the radiator due to the vacuum pump.

This type of system is particularly adapted to industrial plants where exhaust steam is available, or to any other type of building where there is exhaust steam available, or to large buildings spread over considerable area. In this type of system, the traps at the return of each heating fixture close off when the fixture is filled with steam, and the work of the vacuum pump is exerted into the farthermost radiator in the heating system, pulling the steam into the remote radiators so that the heating is positive in each unit.

Steam is circulated at very low pressure,



A Dunham return pump installation.

usually a pound or less; the control of the heat at each radiator is subject to the wishes of the tenant, and there is very great economy in this type of heating, especially where exhaust steam is used as there is 80 to 85 per cent. of the heat units remaining in the exhaust steam after it has done its useful work in the engines, pumps, generators, etc.

The positive control of the heat to the radiator on this type of system has naturally led to the development of a steam system applicable to the smaller types of buildings, yet free from so much mechanical equipment.

Dunham Return System

The Dunham return system is a two-pipe system making use of exactly the same radiator control and with free venting of the air in the boiler room through a return trap. The secret of free circulation of steam is the absence of pressure in the return piping system, with only a slight pressure in the steam piping.

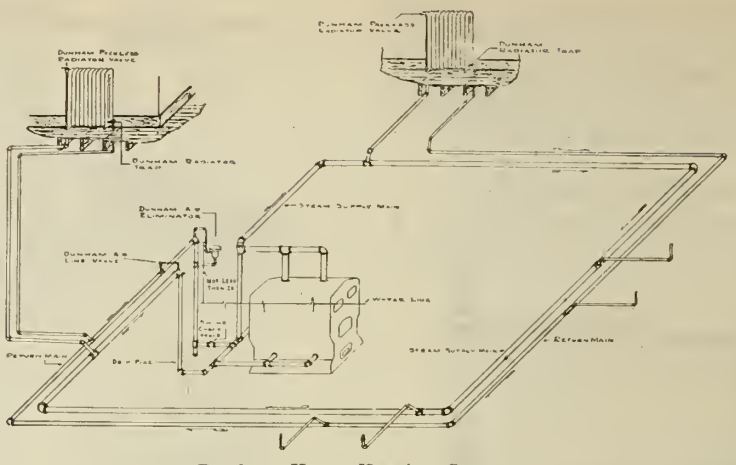
The Dunham return trap returns the water of condensation to the boiler, by equalizing the steam pressure on top of the trap with that in the boiler when the water has reached a maximum level in the trap.

With such a system as pictured on the screen, the returns from the heating system must come back to the boiler well above the boiler waterline.

In some installations, such as: schools, hospitals, clubs, etc., where ventilation is made use of, there are some returns which come back below the boiler waterline, and in such a case, an automatic electric pump would need to be used to return the water to the boiler.

The circulation of the steam through the radiator, with a small amount of pressure, accomplishes improved economy, together with more satisfactory heating, and this is what we must accomplish with our heating system to-day.

There are thousands of steam heating installations over this country that are very extravagant in their consumption of fuel, and very unsatisfactory in the effects produced at the radiator. Some of these systems are one-pipe steam systems, and others are two-pipe of the old gravity type. It is quite a simple matter to convert these old systems to more efficient and satisfactory systems, as pictured on the screen. It means the running of a return piping system, the installation of a return trap, as well as the individual traps at the radiators.



Dunham Home Heating System.

Steam heating is being applied more every day to residences and homes. It is safe, it is positive in circulation, noiseless, responds quickly, uses steam at most economical pressure, and keeps each radiator uniformly hot, permitting "as much" or "as little" supply of steam to the radiator as desired.

Dunham Home Heating.

This represents typical piping plan, and it is suggested that the steam and return main piping be run so that the radiator that gets steam quickest from the boiler would have to deliver its air the longest distance to escape from this system. This scheme balances the circuit.

The end of the steam main should be freed of its air, and all air from the system is vented through the air eliminator.

A sensitive damper control, maintaining only a few ounces of pressure, is all that is required.

I have intentionally omitted boilers, as I believe that the time has come when more attention should be given to the character of the installation between the boiler and the radiator than has been given in the past. Many boilers have been severely condemned from time to time for extravagant consumption of fuel, while the real trouble, in many cases, has been in the piping system and the methods of controlling the steam at the radiator.

I believe that the time has arrived when new methods in salesmanship will need to be used by the contractors in selling their services. They must link it up with up-to-date practices that have proven efficient and that have proven their points of merit over the old forms of heating.

Sell your clients on the basis of quality in materials and quality service. Encourage and educate your men to do their work up to the same standard. I believe that it is only by these methods can we collectively place the sanitary plumbing and heating business on the high plane to which it belongs.

FEATURES FOR FUTURE ISSUES

DID you ever follow a load of gravel for a half mile or so to the scene of building or repairing operations and parley with a farmer to such good intent that you sold him a hot water heating system and a soft and hard water system? That is what one Brandon, Man., engineer did, and the tale of his activities in securing business forms the basis of one of the most interesting stories that has ever appeared in SANITARY ENGINEER. *"Go out after the business and get it before it reaches the competitive stage"—there is the motto of this progressive dealer. Read how he studies the farmer's proposition from all angles—let this man tell you something interesting about his display rooms—it's a good story; it will appear in the July 1 issue.*

The next issue will contain also another new series issued by the United States Fuel Administration. The first will be on "Boiler Water Treatment." These should prove decidedly interesting to many manufacturers and others who are desirous of effecting economy in the use of coal. There will be others dealing with the smaller systems employed in the home.

In an early issue it is planned to run a story of an Ontario business which has one of the handsomest and most up-to-date display arrangements in Canada. Not only from a plumbing standpoint but from the electrical end does this shop show up well, and the business they do has been built up to its present enormous proportions on a foundation of service. First quality goods, guaranteed installation and a price commensurate with the work undertaken —this is a feature story which will appear in the July 15 issue of SANITARY ENGINEER.

LEAVING THE RESCUE SHIP

Great interest attached to the flight across the Atlantic attempted by Hawker and Grieve. Their disappearance and subsequent rescue created consternation, followed by world-wide joy. This photo shows Hawker and Grieve (in white sweater) leaving the Danish steamer Mary in a boat from the Destroyer Woolston.

Predicts Farm Work Will Maintain Small Town Plumber ; Electrical Development Noted

THERE is a remarkable development taking place in connection with the plumbing business in Western towns. Prominent on the business cards of H. S. Stead, a Neepawa man, member of the craft, are the words, "Water pressure systems for farms a specialty."

Here is a man who has developed from the ordinary business of plumbing and heating into that of an electrical worker as well for the reason that electric water pressure systems are in demand in his district. He is doing such an extensive business among farmers that he no longer maintains an office in town but covers his territory within a radius of 80 miles by using a small touring car.

Mr. Stead predicts that within a year or two the country plumbing business will be largely maintained by work on the farms. He has personally installed seven electric lighting systems in farm houses at a cost ranging from $700 to $1,000, and at the present time has orders for four more. In connection with four of the systems already installed he has put in three electric pumps this year, and one high-pressure pneumatic pump operated by electricity. He now has the contract for an air pressure water system which is destined to feed a barn 150 feet distant from the well, and a house 350 feet distant. The drinking troughs in the barn will be automatically fed under this system.

In the case of one farmer in the Kelwood district his bill for plumbing, lighting and pressure systems will run well over $2,000. He is having installed three lavatory basins, sink and drain board, toilet and 5-foot bath, an electric lighting system, and two electric pumps, one of them for hard and one for soft water. His hot water supply will be fed from his range boiler, from his hot-air furnace and from an independent jacket heater. The plumbing system is coupled to a sewer.

This farm home will be lighted with electric lights, the farmer's wife will use an electric washer and churn, also an electric toaster and iron. The farmer will use the same power for shearing animals, for operating a sawing machine, fanning mill and other machinery.

Mr. Stead was formerly for two and a half years with the Canadian Bank of Commerce as plumbing and heating expert. He was sent to Neepawa in connection with some plumbing changes in the branch bank there, and discovered the possibilities of making money in a small town. He finds that the installation of modern power and pumping plants in one farm house ultimately leads to other orders and he has all he can do at the present time to keep up with the business offered. In the Neepawa district the farmers are rolling in wealth after a succession of bumper crops at prevailing high prices

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

TRADE NOTES

Plumbing Inspector James Cluney, of Galt, Ont., has been granted six months' leave to take a course in plumbing at Toronto.

After being out on strike for twenty-five days the journeymen plumbers of Sydney, N.S., returned to work at the end of May at 65 cents an hour for an eight-hour day. The men struck for 75 cents an hour and an eight-hour day. The old rate was 52 cents an hour and a nine-hour day.

Efforts are being made by Toronto residents to get a public convenience placed in the Earlscourt district in Toronto, Ontario. The corner of Dufferin Street and St. Clair Ave. is spoken of as a suitable location.

James Brandon, of Saskatoon, is specializing in furnace installation.

Toronto's Board of Education is still considering the sanitary conditions at Kitchener, Pine, Coleman and Humewood schools. So far, however, nothing is being done. Inside conveniences at Pine school would cost $500.00, but the estimated cost is higher in the case of the others.

Wilson Bros., of Nanaimo, B.C., have a very timely ad. running in their local papers. The water situation at Nanaimo has been very bad and a house to house inspection, in an effort to remedy it, has been ordered. Wilson Brothers ask their clients that just as soon as the plumbing inspector points out the defects in their system to phone them at once.

PERSONAL

Garrett F. Frankland, secretary of the Toronto Society of Domestic Sanitary and Heating Engineers, is in Atlantic City attending the annual meeting of the National Society of Master Plumbers as representative of the Dominion Society of Domestic Sanitary and Heating Engineers.

Thomas J. Minnes, of Brantford, Ont., president of the Ontario Society of Domestic Sanitary and Heating Engineers, is spending a couple of weeks' holidays in the Adirondacks, having gone there directly after the Dominion convention in Montreal.

E. H. Russell, of London, Ont., while on his way to the Dominion convention in Montreal, was in the railway accident at Cardinal. He was riding in one of the four coaches which overturned, and while badly shaken up and bruised about the neck and arm, was able to take part in all the doings at the big meeting.

George W. Pipe, of New York, representing the Plumbers' Trade Journal, spent a couple of days in Toronto this week, after attending the Dominion convention in Montreal. He left on Saturday for Detroit.

OPENS CHICAGO OFFICE

Wm. B. Scaife & Sons, Company, of Pittsburgh, Pa., announces the opening on July 1 of a Chicago sales and engineering office at 38 South Dearborn Street, with Charles F. O'Hagan, formerly chief engineer of the company at Pittsburgh, as resident engineer and manager.

TENDERS

Tenders are now open for all work in connection with a new $250,000 medical school for the Western University at London, Ont.

Elliot Law, Preston, Ont., plans erection of a business block to cost $10,000.

The Hillcrest Housing Co., London, Ont., has commenced the erection of several dwellings, and plans to build at least fifty.

McEachren & Sons, Royal Bank Building, Toronto, are making arrangements to erect ten dwelling houses at Leamington, Ont.

Beatty Bros., Fergus, Ont., are planning to erect ten dwellings for their workmen.

Oscar Richard, Point St. Maurice, Cap de la Madeleine, Quebec, is erecting a $5,000 dwelling. Plumbing work to be let.

Thomas Carignan, Cap de la Madeleine, Quebec, is erecting a tenement to cost $8.000, and is interested in prices on plumbing goods.

Thomas Hall, 14 Jurors St., Montreal, is erecting two residences to cost $15.000, and wants prices on plumbing goods.

J. E. Peterkin, 161 Inglewood Drive, Toronto, is erecting three residences to cost $18,000, and will sublet plumbing contracts.

O. Lafortune, 181 Decarie Boulevard, Notre Dame de Grace, Montreal, is erecting two residences to cost $10,000, and will purchase plumbing supplies.

C. R. Davis, 189 Havelock St., Toronto, is erecting a $4,500 residence. Plumbing to be let.

L. H. Walton, 41 Westlake Ave., Toronto, is building a $6,000 residence. Plumbing to be let.

Adam Switzer, 216 Withrow Ave., Toronto, is erecting three residences to cost $10,500. Plumbing to be let.

W. Coulter, 505 Broadview Ave., Toronto, is building two bungalows to cost $7,000. Plumbing to be let.

F. R. Fry, 72 Windermere Ave., Toronto, is erecting a $5,000 residence. Plumbing to be let.

A. D. Grant, 5 Grenadier Road, Toronto, plans to erect duplex house to cost $11,000. Prices wanted on plumbing goods.

J. A. Shier, 1302 Lansdowne Ave., Toronto, is erecting four dwellings to cost $14,000. Plumbing to be let.

McEachren & Sons, Royal Bank Building, Toronto, have contracts for 37 dwellings for the Walkerville Land and Building Co., Walkerville, Ont., to cost $75,000. Erection of at least thirty more is contemplated.

The Ames-Holden Tire Co., Kitchener, Ont., is preparing plans for a large new factory. Prices will be required on plumbing goods.

The Royal Broom Co., Ingersoll, Ont., is preparing plans for addition to factory to cost $25,000. Prices will be wanted on plumbing work.

BIG PICNIC

Thursday, July 17, will see the resumption of the annual picnic of the Toronto Society of Domestic Sanitary and Heating Engineers. This will be the first outing that has been held by the organization for two years, as owing to the pressing needs of the war it was decided last summer not to hold a picnic. This year's outing, which will be held at Island Park, promises to be a record-breaker and every effort will be made to have at least 1,000 members of the society, with their wives and families and friends in attendance. Harry Farthing, who is chairman of the committee which is in charge of all the arrangements, reports that everything is going along splendidly and that the program will be one of the best ever put on by the society. There will be lots of sports and lots of variety.

"There will be something for everybody," said Mr. Farthing to SANITARY ENGINEER. "The program will be a winner and there will not be a dull moment. We want everybody to come out; the bigger the crowd the greater the fun. There will be events that will interest old and young, little and big, and we are looking forward to a most successful outing. The committee has worked together splendidly, and this year's picnic will be one of the best on record."

VOLUNTARY INCREASE

More than six hundred journeymen plumbers in Toronto will benefit by the action of the members of the Toronto Society of Domestic Sanitary and Heating Engineers in voluntarily granting their employees an increase in wages of ten cents an hour. The new rate, which became effective on June 9, figures out to seventy-five cents an hour.

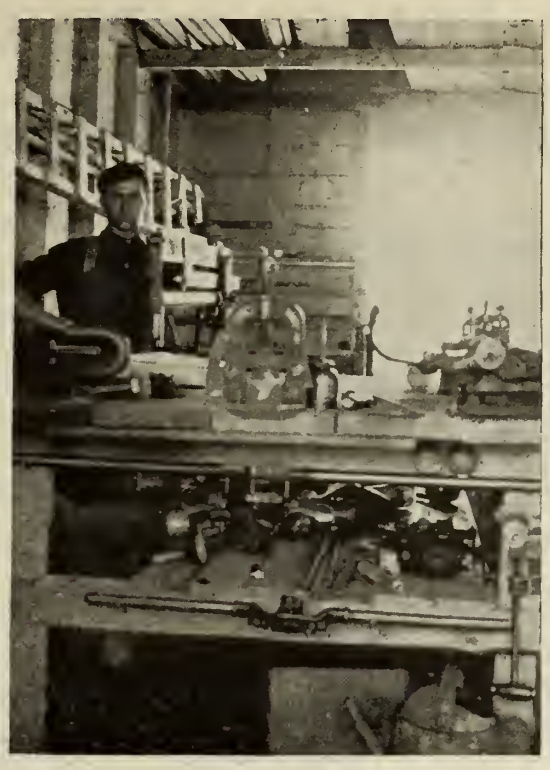
As previously stated, the increase was entirely voluntary on the part of the employers, and their action was taken after very carefully considering the increased cost of living. The journeymen have been working under a two-year agreement which will not terminate until July 1, 1920. The employers felt, however, after making their investigation into the cost of food prices, house rents, and living in general, that the journeymen were entitled to more money, and accordingly raised their wages by ten cents an hour. The investigation into the costs of living were conducted by the Agreements Committee of which Mr. Harry Waterman is chairman, and the committee's recommendation was carried without question.

SOME REAL BALL GAMES OVER ON THE DON FLATS

Some real big league stuff is being pulled off every Wednesday afternoon on the Don Flats, when the members of the various "Ender" Clubs of Toronto get out for a series of friendly games of baseball. There are real ball players, chaps who used to be ball players, but are sadly out of practice, but who will come back strong after a little practice; heavy swatters who are out to cop the batting championship from Ty. Cobb, and ambitious pitchers who unwind as many curves as a corkscrew. When everybody gets going there is a lot of real fun, and between one team and the other there should be plenty of material to make up a real team to accept those challenges that Brantford and Hamilton have been intimating are coming.

SELLING ELECTRIC PLANTS BY DEMONSTRATION

W. D. Dunlop & Co., plumbers and implement agents of Yorkton, Sask., intend taking an electric plant on the road this summer for demonstrating purposes. It is the intention to carry a full-sized 16-cell plant on a small car in order to prove personally to farmers what they are missing in the way of electric lights, a power to run small machinery, and in the installation of a water pressure system. In the last year and a half this firm has installed 20 of these plants in farm homes.



NOW GOING IT ON HIS OWN

All tinsmiths and plumbers will be interested in this picture which was taken on the day that E. Hill, of Gilbert Plains, Man., effected his emancipation from the daily grind of working for others and opened this little shop on his own account. He built the shop and equipped it and he has been busy from the start. He makes a specialty of installing tanks and furnaces as well as putting in pressure systems and doing general work in the tinsmithing line.

Catalogues and Booklets

THOMAS ROBERTSON & COMPANY, LIMITED

Thomas Robertson & Company, Ltd., of Montreal, are now sending out to the steamfitting trade a new catalogue of Sirdar boilers and radiators. These goods are manufactured for them by the American Radiator Co., of Canada, Ltd., in their Canadian factory at Brantford, Ont.

The catalogue has been printed in both the English and French language. The latter will be no doubt particularly appreciated by the steamfitting trade in the Province of Quebec, and any other parts of the country where the French language is used. Thomas Robertson & Co., Ltd., would be pleased to mail a copy to any steamfitter interested, on receipt of request for same.

CANADIAN FAIRBANKS-MORSE CO., LTD.

The Canadian Fairbanks-Morse Co., Ltd., Montreal and branches, has issued a catalogue illustrating and describing "Steam Plant Material Specifications." The catalogue is well illustrated and color work employed which adds materially to the appearance of the pages. Special headings are employed to direct attention to steam lines. boiler feed lines, boiler blow-down lines, exhaust lines and water pipe lines. A copy of this catalogue can be secured by members of the trade interested by writing nearest branch of the company.

OBJECTS TO COMFORT STATION

Parks Commissioner Chambers, of Toronto, is very strongly against the recommendation of his colleague, Property Commissioner Chisholm, that a public comfort station be erected in the vicinity of Broadview and Danforth Avenues in the Eastern section of the city. Mr. Chambers thinks that lavatories should be built when and where they are absolutely needed and he does not approve of one at that corner. When they are built, he believes they should be put underground below the street reservation.

"DUNHAM" TRADE MARK

The C. A. Dunham Company, Limited, have given notice in the Canada "Gazette" that they will make application to use the word "Dunham" as their trade mark in connection with their heating apparatus and appliances.

Burning Midnight Oil in Dauphin

E. J. Mitchell, tinsmith of Dauphin, Man., is working till midnight daily in an effort to keep pace with the orders he is receiving for furnaces and tanks. An extensive building movement has hit the farming community around Dauphin this spring, and as the various buildings go up it is necessary to "rough in" the hot water or hot air piping to the various rooms. All the business of this dealer this spring is with farmers. Since the close of winter he has already turned out 20 or 30 barrel tanks.

W. W. Hunt, tinsmith, of the same town, stated that he was unable to cope with the volume of business handed to him. He has out-of-town contracts that take him as far as Preeceville, 100 miles north. He is exceptionally busy on furnace work for new houses.

How to Figure a Seven-Piece Job

Practical Discussion Before the Ender Clubs of Toronto, by Harry Weinraub, Showing the Right Way and Wrong Way of Arriving at the Selling Price

Written by C. E. PARSONS, of SANITARY ENGINEER.

THE right way and the wrong way of estimating on a seven-piece job was the subject of an interesting and practical discussion before the "Ender" clubs of Toronto at their regular meetings this week by Harry Weinraub, chairman of the East-enders.

Mr. Weinraub emphasized the importance of checking up with great care all the material to be used. He stated that unless this is done systematically there will be many little things used of which no account will be taken, and while they cost the operator money, will be given to the man for whom the work is being done. In his own work Mr. Weinraub stated he has a special card similar to that shown in the accompanying table. On this card is listed everything that should be checked, and on each job he goes very carefully over the list and ticks off each item.

MATERIAL LIST

Soil Pipe
Soil Fittings
Vent Pipe
Vent Fittings
Galv. Vent Pipe
Galv. Vent Fittings
Local Vent Pipe
Local Vent Fittings
Thimbles
Thimbles, Hubs
Lead Waste
Lead Vent
4" Lead Bend
Sheet Lead
Caulking Lead
Oakum
Gasoline
Solder, Wiping
Galv. Water Pipe
Galv. Fittings
Lead Water Pipe
Gas Pipe Fittings
Refrigerator
Water Closet
Bath
Bath Trimmings
Basin Trimmings
Sink
Sink Trimmings
Drain Board
Plumbers' Time
Helpers' Time
Drain
Private Drain
Private Water Service
Cartage
Car Fare
Laundry Tubs
Laundry Trimming
Boiler and Stand
Stop Cock and Couplings.

Roughing Material

Taking as his basis for estimating the cost of the roughing material that the following items would enter into the figures, Mr. Weinraub arrived at a cost of $136.91.

COST OF ROUGHING MATERIALS.

	Net price.
36' of 4" soil pipe	$18.36
35' of 2" pipe	8.60
3—4¼" bends at $1.15	3.45
1—4 x 4 T Y	3.10
1—4 x 2 Y	3.10
1—4 x 2 B A fitting	2.25
1—4 x 1½ tapped tee	2.60
1—4 x 1¼ tapped tee	2.60
1—2 x ¼ bend	.55
2—2 x 2 T Y at $1.70	3.40
1—2 x 1½ tapped tee	1.60
Hanger screws	14.72
75' of 1¼" galv. pipe	15.00
2—1½ x 1¼ x 1¼ galv. tees	.80
8—1¼ galv. elbows	3.20
40' local 'v' pipe	4.00
2—3" local elbows	.75
1—2" thimble hub	.80
1—4" thimble	.50
5—1¼" thimbles	2.25
3—2" thimbles	1.35
64 lbs. lead waste	8.00
1—4 x 8 x 12 bend	3.33
1—1½ x 10 "P" trap	1.13
2—Pr. of 20 x 20 "S" lead at 32c	3.60
6 lbs. of oakum	.60
5 gals. of gasoline	1.80
20 lbs. of solder wiping	6.60
70 lbs. of calking lead	5.60
20' ½" lead waterpipe	4.60
200' ½" galv. pipe	15.00
½" galv. fittings	6.20
1—½" soldering nipple	.12
1—½" stop and waste	1.40
50' ½" black pipe	3 99
6—½" fittings	.60
Cartage	3.00
Car fare	1.00
Roughing material	$136.91

Finishing Materials

In computing the cost of the finishing materials the following items were included:

COST OF FINISHING MATERIALS

1—L.O. W.C. Outfit		$25.50
1—4' 6" enamel bath	$32.10	
1—Pr. compression cocks	3.60	
1—1½ waste and overflow	3.25	
1—Pr. ⅜ N.P. Suppl.	2.75	
		$41 70
1—17 x 119 basin apron	10.00	
1—Pr. basin cocks	2 42	
1—N.P. Supplies	2 70	
1—1¼ P. Trap	2.70	
		17.82
1—18 x 20 R.R. sink	15.05	
1—18 x 18 drain board	6.50	
1—Pr. comp. bibbs	2.75	
1—1½ 24 lead strap	2 25	
		26.55
1—16 x 24 R.R. sink	10.50	
1—16 x 16 drain board	5.50	
1—Pr. of comp. bibbs	2 75	
1—1½ x 24 lead strap	2 25	
		21.00
1—2 division cement tub	11.00	
1—1½ lead strap	1.25	
4—½ plain bibbs	3.29	
		15.54
1—30-gallon boiler	12.25	
1—Boiler stand	.50	
1—½ stop cock	.83	
1—Pr. boiler couplings	.54	
		14.12
		$162.23

Labor and Material

He obtained the cost of labor and material as follows:

Finishing material	$162.23
Roughing-in material	136.91
	$299.14
Seven fixtures at 16½ hrs. per fixture equals 115½ hrs. at 65c per hour	75.00
Labor and material cost	$374.14

The Incorrect Way

Mr. Weinraub then explained that by the old and incorrect way of figuring on the job he arrived at a selling price of $473.28 as follows:

Overhead, 10%	$37.41
Profit, 15%	61.73
Labor and material	374.14
Total	$473.28

The Correct Way

The correct way to arrive at the sale price he showed was by the divisional method as explained in the last issue of SANITARY ENGINEER, which is as follows:

Labor and materials ... $374.14.

Overhead, 15%; profit, 10%, equals 25%. 100, as basis for selling price, less 25, representing overhead and profit, gives 75 as the divisor. Dividing $374.14 (cost of material and labor) by 75, gives the selling price of $498.85.

Under the old system of figuring he showed that he would have done the work for $25.57 less than he should have charged, the difference between $498.85 and $473.28.

This selling price of $498.85 is arrived at by taking 15 per cent. as the basis for overhead. This is regarded by many of the men in the trade as too low when it is considered that in Detroit and many other American cities, not less than 30 per cent. is figured for overhead.

A hearty vote of thanks to Mr. Weinraub for his paper was passed at all the meetings of the "Ender" clubs. In replying, Mr. Weinraub stated that he was only too pleased to help the men in the trade in any way he could. He had commenced his study of doing business according to business methods as a result of an article that had appeared in SANITARY ENGINEER. It showed him that he was not making the money he should make because he was not doing business in the right way. Since that time he had been endeavoring to get on the right track, and the figures shown in the above contract, which was an actual job on which he figured, showed where some of his missing profits had been going.

RECEPTION AND ENTERTAINMENT COMMITTEE

Those upon whom the responsibilities rested for the reception and entertainment of the delegates to the Canadian Society of Domestic, Sanitary and Heating Engineers at the convention in Montreal are shown below. That they performed their duties agreeably and well was the consensus of opinion. The Reception and Entertainment Committee consisted of the following: Chairman and treasurer, R. J. Lockhart; secretary, B. J. Morris; J. Griffin, W. Ryan, F. Lepine, A. Noel, G. Delaney.

Heating and Ventilating

DETAILS

Sixth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the sixth of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on the "Details" a most interesting and illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the designs for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The seventh article of the series will appear in the next issue.

IN the teaching of almost any branch of engineering it is the practice to first make the details easy by giving the student a broad knowledge of the first principles of the science he is studying. While his mind is being prepared to solve the most complex questions his hands are being trained by the drawing of details. If he is studying, say, the construction of a locomotive, his teacher, while drilling the student's mind to a conception of the whole machine, sets as the first task in drafting, not a complete drawing of the locomotive, but rather some simple detail, such as the firebox or one of the driving wheels. Then, when the student has completed a drawing of every detail, he makes a drawing of these details assembled in such a way as not only to illustrate the complete apparatus, but also the function of every part of it.

So, when the student of the science of heating and ventilating, attempts to put on paper a drawing showing a complete heating and ventilating plant he must be first able to draw all of the details of the equipment shown. Of course, he might, in the absence of such ability, make a general layout, showing approximately the location of certain parts of the plant, but he could not hope to make a drawing that might be followed by others in completing the installation. It is for this reason that we are now taking up the subject of some of the simpler details used in the field of gravity circulation systems for steam and hot water heating.

In the descriptions of material much may be found that to the experienced fitter is elementary knowledge, but as we believe these articles will also be read by the younger men just entering this field, we feel that the presentation of such information will be essential.

One of the principles that we have already called the reader's attention to is that where balance or equalization is the main factor. When following this principle in running mains to radiators situated in cold parts of the building and at some distance from the boiler, we make due allowance for this in laying out the pipe sizes for that part of the radiation closer to the boiler, and perhaps in a much warmer part of the building. In doing this our aim is to provide for the free flow of the heating medium, be it water or steam, and as the greatest obstruction to this flow is that offered by the frictional resistance, due to the fittings and pipes, it is easily understood why a knowledge of such details is of the utmost value to one when installing such work. Air gathering at any part of the system prevents circulation, and in the absence of provision being made for the free venting of these locations the air accumulating will not only prevent circulation through that particular part of the apparatus but will also throw the rest of the plant out of balance.

We will take up the subject of piping first, and in doing so would call the reader's attention to the fact that while wrought iron pipe is, as a rule, specified for heating mains, a great deal of steel piping is used. If the fitter's threading dies are in good shape and he finds that he is having difficulty in making clean and even threads because of the tendency of the pipe to chip, he can be assured that it is steel pipe he is working with instead of the wrought iron specified.

All pipe from ⅛ in. to 1¼ in. is butt-welded. All pipe above this is lap-welded. All pipes (except 2½ in.) up to 7 in. nominal inside diameter are slightly larger than the size specified Wrought iron pipe is also made in heavier grades than standard. The external diameter in the heavier pipe is the same as the standard pipe and the difference in the thickness of the walls is made up by the reduction of the bore.

Before pipes are put in place they should be set on end and pounded so as to release all loose material such as scale, etc., and the fitter should look through every pipe to see that it is clear. All pipes must be straight.

Elbows are used to change the direction of pipe line. Unless otherwise ordered, they are supplied with right hand threads, but they can be had with left hand threads, and also with right and left threads. Elbows, like all other cast iron fittings are provided with reinforcements. Reducing elbows are made only with right hand threads.

An elbow used at times by fitters is that known as the street elbow. These elbows are male at one outlet and female at the other.

A tee is just what the name indicates, a fitting shaped like the letter "T." In ordering a tee, state the size of the run first and then the stem. The run is that part of the tee corresponding to the top of the letter "T"—the stem is the branch. If all of the outlets are the same size, say 2 inch, all that you need do is just specify the tee as being a 2 in. tee. When ordering reducing tees, always be sure and give the size of the stem or branch last. A bull-head tee is one

(Continued on page 41)

Ventilating the Modern School

Fifth Article of Series Written Especially For "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

THE fourth article of this series described the method of approach in designing gravity ventilating systems, and when writing that article we endeavored to draw the reader's attention to the fact that every consideration of the natural laws regarding air currents had to be taken. Gravity ventilating systems of any kind are more or less at the mercy of the elements and the careless handling of indifferent or ignorant attendants. Gravity systems have often been condemned because their designers have not always kept one eye on the weather. But as well as keeping an eye to the weather the designer should also remember that some school janitors have a confirmed dislike of extra work, such as adjusting dampers, etc., and in designing the ventilating plant, the engineer should endeavor to make it so simple that either an impatient or lazy man cannot fail in an understanding of its functions.

Now gravity systems of ventilation require the use of a certain amount of "grey matter" on the part of the janitor, and they also require careful work in their installation, so much so, that if there is the slightest doubt in the mind of the designer that either of the two elements noted might be lacking he should lay out the system for mechanical ventilation.

With the mechanical ventilating system much smaller air ducts are required than those used in the gravity systems. The smaller flues required for the mechanical system will about offset the additional expense of the fan and motor necessary.

About the only two reasons for installing a gravity in preference to a mechanical ventilating system are those found in the difficulty of always securing power to drive the fans and in the fact that there is always a temptation to keep down expense by allowing the fan to remain idle for the greater part of the time when its use is absolutely necessary.

Mechanical ventilating systems can be so designed that air can be delivered to the class rooms in exact quantities under the most untoward circumstances, and where it is necessary to condition the air by passing it through a washer, dehumidifier or a cooling apparatus, a fan is one of the essential features of the installation, indeed, indispensable.

The principles of fan engineering may be readily grasped, and while it is not our purpose to supply all the data that it is necessary to have when designing a plant of this description, we will feel that much of our work has gone for nothing if we do not at least point out the way that leads the reader to a knowledge of the basic laws governing such a system.

Our studies already have covered in a general way the standard requirements for school room ventilation. It will be remembered that 30 cubic feet of fresh air per class room occupant was the standard set for adequate ventilation. If we are in possession of data regarding the number of people that it is necessary to supply pure air for we can readiy estimate that the size of fan required will be one that will deliver the amount of air found by multiplying the number of people by 30. This requirement was taken up in the third article of this series and if the reader will refer to the data given therein it will make repetition here unnecessary.

A few years back the fans most used in the ventilating of schools were those known as the paddle wheel type. This type of fan generally had eight blades, the blades being one fourth of the diameter of the wheel with their tips inclined backward or forward and sometimes straight. They were usually inclined backwards to reduce the eddying of air in the fan.

The fans generally favored to-day are those of the multivane type. This type of fan has a great number of much smaller blades than those found in the paddle wheel type, and the tips of the blades are, as a rule, turned in the direction of the revolution, so as to increase the velocity pressure without using a large fan or running it at an excessive speed. The fan casings are so designed that the excess velocity pressure is reduced and a certain proportion of the velocity pressure converted into static pressure. This is a very superior type of fan, and requires much less room than a paddle wheel fan of a like capacity.

In selecting fans it is well to compare the catalog ratings of fans of like type with regard to the diameter of the fan wheel. As a rule the fans listed in the modern catalogue will do all of the work that they are rated for, so all that it is necessary for the engineer to do in selecting a fan is to refer to any of these catalogues for the description of a fan best meeting the conditions surrounding the installation he has in hand. Fans are made for up-discharge of air, top-horizontal discharge, bottom-horizontal discharge, angular discharge, either up or down, double width, full-housed casings, and for almost any condition that is likely to govern their setting. So in selecting a fan for the eight-roomed school under discussion, with the above data in hand, there should be little difficulty in specifying the fan most suited for the particular problem in front of us. Fans are generally driven by electric motors, and as motors are a detail of electrical engineering, it would be well for the ventilating engineer, unless he has considerable knowledge of the subject, in making his specifications, to cover only the work to be done by the fan and in specifying the motor, specify the current whether direct or alternating, and, if alternating, the frequency of the current. This will enable the fan manufacturer to supply the most suitable motor with the fan.

The following specification is given as a suggestion in the method of presenting the requirements for a simple mechanical ventilating system without such refinements as air washers, dehumidifiers, etc.

System

The heating plant shall be constructed as a one pipe, low pressure system. The heating of the class rooms, corridors, etc., is to be effected by direct radiation, disposed as per the accompanying plans. The ventilation is to be secured by means of the fan and vent coils as shown on the basement plan. Fresh air will be admitted into the fresh air rooms from the outside through suitable screened openings, provided with close-fitting valves for the control of the admission of air. This air will be heated to the desired temperature at the coils and from thence will pass by way of the galvanized iron ducts to the brick fresh air stacks shown at each class room. The tempered air will be admitted into the class room at about 8 feet from the floor line. The foul air will enter the vent stacks at the floor line. The vent stacks are to be equipped with easy acting dampers, so as to permit the closing of these ducts individually.

Gauges

The ducts of galvanized iron are to be of the following gauges:

For pipes 8 in. in diameter or equivalent, to be No. 28.

For pipes 9 in. to 12 in., or equivalent, to be No. 26.

For pipes 13 to 18 in., or equivalent, to be No. 24.

For pipes 19 to 24 in., or equivalent, to be No. 23.

For pipes 25 to 30 in., or equivalent, to be No. 22.

For pipes 31 to 40 in., or equivalent, to be No. 20.

For pipes 41 to 50 in., or equivalent, to be No. 18.

For pipes 51 to 60 in., or equivalent, to be No. 16.

Construction

All large ducts to have standing seams or to be otherwise reinforced.

Supports

Support pipes from floor joists and beams by means of metal hangers.

Bends

The drawings indicate the general direction in which the air ducts are to be run, but the contractor is to make provision for all offsets by means of long radius elbows.

Trunks

Provide and connect all trunks and branches of galvanized iron connections as may be required.

Joints

All joints in metal must be lapped in the direction of the flow of air.

Dampers

Provide volume dampers for all pipes; these dampers are to be fixed to regulate the supply of air at the time the first tests are made.

Faces

Provide galvanized iron diffusing faces set in suitable wall frames about eight feet from the floor line of class rooms indicated on the plan. Size of openings, 24x27.

Vents

There are to be no faces placed for vents. These openings are to be finished by other contractors.

Fan

Provide and set on concrete base one (1) No. — standard or equivalent fan complete, with electric motor and suitable starting device. Between fan and concrete base place cork insulation for the prevention of vibrations.

Indirect Coils

Provide and set vento radiators 4x15 x40 at 5c. 645 sq. ft,

HEATING AND VENTILATING DETAILS

Continued from page 39

where the stem is larger than the run. There are also side outlet tees, angle tees, and division tees. A type of division tee is also known as an O.S. fitting. This fitting is used quite extensively in some parts of the country. It is generally used where a better flow is required to a radiator on a branch than to a radiator above situated on the same riser.

Long turn fittings and branches are much the same as the standard fittings, differing only in having a longer sweep.

Crosses are fittings shaped like a cross, and while they are used a great deal, many experienced fitters will not use them in their practice.

Nipples are short pieces of pipe threaded on both ends and are used for short connections. They are the "close," the "short," the "shoulder," and the "long." Close nipples are threaded to allow the fittings to come almost together. A shoulder nipple is a short nipple having a piece of unthreaded pipe left at the centre. Long nipples are simply short pieces of pipe. Nipples can be had threaded right and left, as well as all left or right. Nipples can also be had with hexagon centres to take a narrow wrench, and when connecting up materials that cannot be turned they are usually made right and left.

Couplings are used for connecting up pipe. Each length of standard pipe is furnished with a coupling on one end. The standard coupling is tapped right hand at both ends. Couplings are also made, as a reducing fitting, and where pipes are reduced in size and it is required to keep one side of the run in true alignment eccentric couplings are used. Reducing couplings are made of cast iron and are only threaded right hand.

A flange is made of two flat plates bolted together, and in the larger sizes ribbed for strength. These plates have threaded openings for the connections of pipe, the two plates are bolted together and they can be bought also without bolt holes. The faces of the flanges have a gasket placed between them. These gaskets are made of various materials. A form of gasket made of heavy brown paper soaked in white lead and boiled linseed oil is sometimes used on low pressure work where the flange faces are absolutely true. Few good engineers care to use this type of gasket and prefer for the purpose a gasket made of a composition of asbestos or vulcanized rubber, sometimes reinforced with a wire framework. Corrugated copper gaskets are also used.

Bushings are used to reduce an outlet in a fitting. Caps to close the end of pipes. Plugs to close the openings of fittings. For plugs and bushings right hand threads are standard, but left hand can be obtained.

There are many other fittings used in addition to those mentioned, but the above list covers the material with which the student must first become familiar.

There are so many types of hangers on the market that we are not mentioning them in detail. The requirements for a good hanger are that it can be easily adjusted after the pipes are set in place, that it is strong and sightly, and that it allows for the contraction and expansion of the pipes which it supports. Where pipes are supported from concrete slabs above it will be necessary to have "inserts" installed when the concrete is being poured. The inserts are made to take a standard bolt to which the hangers are attached. At the same time as the inserts are being set the metal sleeves for pipes passing through the concrete should also be set in place and these sleeves should be filled with sand until such a time as they are required for the piping.

DOMINION CONVENTION GREAT SUCCESS

Continued from page 29

Proxy Vice-Presidents

V.P. for New Brunswick—James Griffin, Montreal; Nova Scotia, Walter Ryan, Montreal; P.E.I., A. Noel, Montreal; Manitoba, Geo. Delaney, Montreal; Saskatchewan, James Saunderson, Montreal; Alberta, T. R. S. Lepine, Montreal; British Columbia, C. Daoust, Montreal.

Chairman Sanitary Committee — J. Clifford Huot, Quebec.

Chairman Essay Committee—A. Landreville, Joliette, P.Q.

Credential Committee—J. Watson, J. A. Gordon, T. Latourelle.

Mfrs. Representatives and Supply Men Introduced

It was moved by Mr. H. Mahoney, Guelph, Ont., and seconded by Mr. T. H. Ferguson, of Toronto, that the order of business be suspended and that the representatives of the manufacturers and supply men be received at once and the vice-president, Mr. C. R. Myers, of Brantford, then introduced the following gentlemen to the convention:

Frank T. Rawley, Dominion Radiator, Montreal; B. J. Morris, Taylor Forbes Co., Montreal; J. L. Caron, Thomas Robertson Co., Montreal; W. J. Darling, Empire Manufacturing Co., London; J. Dalcourt, James Robertson Co., Montreal; R. Bonham, James Robertson Co., Montreal; G. Hadley, Steel & Radiation, Ltd., Montreal; W. R. Stavert, Jenkins Bros. Manufacturing Co., Montreal; J. M. Robertson, Thomas Robertson Co., Montreal; S. A. Brewer, Thomas Robertson Co., Montreal; E. Needham, Canadian Wolverine, Sarnia; R. J. Lockhart, Gurney Massey Co.; J. P. Kennedy, Dominion Radiator Co., Montreal; Joseph Devereux, Standard Sanitary, Pittsburgh; H. Lamontagne, Thomas Robertson Co., Montreal; J. R. Baxter, James Robertson Co., Montreal; T. Helliwell, Gurney Massey Co., Montreal; George McKnight, Golden Gate Manufacturing Co., Montreal; J. A. Rheaume, Dominion Radiator Co., Montreal; T. L. Robertson, Thos. Robertson Co., Montreal; A. W. Gardner, Steel and Radiation, Montreal; F. Shakell, Canadian Fairbanks Morse, Montreal; R. A. Tuggey, Canadian Fairbanks Morse, Montreal; C. F. Smallpiece, Taylor Forbes Co., Montreal; P. Largie, Warden King, Ltd.; N. Bouthilleir, Warden King, Ltd.; F. J. Wall, Mott Co., Ltd.

The trade journals were represented by the following gentlemen:

Edwin Newsome, Sanitary & Heating Journal; Hartwell Illsey, Sanitary Engineer, Plumber & Steamfitter of Canada; Cecil D. Dunn, Sanitary Engineer; A. D. Campbell, Plumbers' Trade Journal, New York; G. W. Pyke, Plumbers' Trade Journal, New York.

The question of supplying goods in connection with the housing scheme and selling to individuals outside the plumbing trade was discussed and several pertinent questions asked. Among those taking part in the debate were Mr. Helliwell of Gurney Massey Co., Mr. J. M. Robertson of Thomas Robertson Co., Mr. Needham of the Canadian Wolverine, Mr. Shackell of Canadian Fairbanks-Morse Co., W. H. Darling of the Empire Manufacturing Co., S. Brewer of Thomas Robertson Co., B. J. Morris of Taylor Forbes Co. The Master Plumbers were represented by Messrs. F. Maxwell, Toronto; T. J. Minnes, Brantford; C. R. Myers, Stratford; J. T. Blyth, Ottawa; E. H. Russell, London; George Delaney, Montreal; J. H. Doughty, Mimico; Ben Noble, London; G. F. Frankland, Toronto; H. Mahoney, Guelph; J. Thibeault, Montreal.

It was then moved by Mr. J. E. Walsh, Montreal, that a hearty vote of thanks be tendered to the supply men for coming to this convention this afternoon. The motion was seconded by Mr. G. F. Frankland and carried unanimously.

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

FOLLOWING on the heels of the decline in range boilers made in the United States, a similar move has been recorded here and prices during the past few days have undergone a substantial reduction.

Solder has declined 2c per pound since last issue following an easing away in the tin market. Manufactured lead products have held quite steadily and with a firmer undertone following the stiffening market on the metal.

Ingot metals show some slight changes. Tin is down about 2c per pound, copper has firmed up, lead and antimony are both firm. Little interest is shown as yet in aluminum and spelter is quiet from a buying standpoint.

Enamelware is holding firm and unchanged with a somewhat improved demand apparent. Brass goods are steady and no change is noticeable in soil pipe and fittings. The labor situation is looked upon as a factor which may tend to advance prices on this latter commodity.

TORONTO, June 12.—Lower prices have been reached on the smaller sizes of range boilers, the new quotations showing a decline of about 10 per cent. Solder is down 2c per pound and ingot metals show considerable fluctuation. Lower prices on cotton waste are looked for and a better outlook prevails in scrap metals. Business is very fair and seems to be improving.

Range Boiler Prices Have Been Reduced

RANGE BOILERS.—As a result of prices having been reduced by American manufacturers, new and lower quotations are now in effect in range boilers. While business has been to some extent affected by unsettled conditions and labor troubles it has, on the whole, been very good. Quotations are as follows:—

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	12 50	14 50
40-gallon	13 50	15 50
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Firm Prices In All Lines of Enamelware

ENAMELWARE. — With production costs remaining high and only a limited amount of business offering, manufacturers state that there is little prospect of any reduction being made in prices of enamelware. While there is a lot of good business in prospect, it is developing slowly, owing to general unsettled conditions. Prices on a few of the well-known lines are as follows:—

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 14 x 15 in.	6 45
Do., corner, 15 in.	7 15
Sinks, roll rim, 18 x 30 in.	15 05
Sinks, flat rim, 20 x 30	6 47 6 35
Do., 18 x 30	5 62 5 50
Do., 18 x 24	5 12 5 00
Do., 16 x 24	4 92 4 80
Do., 14 x 20	4 25 ....
Closets, oak tank and seat	25 50
Do., enamel iron or white vitro tank	27 50

Soil Pipe Prices Expected to Advance

SOIL PIPE, FITTINGS.—While there is apparently no immediate prospect of settlement with the metal workers who are on strike, it is generally expected that when an agreement is arrived at it will include shorter hours and higher wages. This will mean an advance in prices, manufacturers say. In the meantime, stocks in many lines are rapidly being depleted by the business that continues to offer. Quotations are as follows:—

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	20%
Medium and extra heavy soil pipe, 4 in.	25%
Medium and extra heavy soil pipe, 2 in. to 6 in.	35%
8 in. extra heavy pipe and fittings	15%

PIPE FITTINGS

Cast iron fittings	20%
Plugs	35%
Bushings	35%
Unions, ¼" to 2½"	50%
Do., ⅛", 3" and larger	45%
Dart unions, ¼-inch to 2-inch	25%
Do., 2½-inch and larger	15%
Nipples, up to 4-inch	60%
Do., 4½-inch and larger	50%
Do., running thread 4-in. and under	30%
Couplings, 4-in. and under	40%
Do., 4½-in. and larger	20%

MALLEABLE FITTINGS

	Black	Galv'd
Malleable Fittings, Class A, lb.	$0 50	$0 60
Do., Class B, lb. net	0 22	0 30
Do., Class C, lb. net	0 14	0 21

No Price Changes In Brass Steam Goods

VALVES.—Although many of the brass specialties that have to be imported from the United States have been steadily rising in price, no change has been made in the lines manufactured in Canada. Business has not been brisk and is showing the effects of the strikes in various parts of the country. Marine orders continue to come in in fairly good volume. Prices are as follows:—

Compression work, standard	50
High grade	49
Fuller work, standard	45
High grade	38
Basin cocks, No. 0 standard	40
Nos. 1 and 2	40
Bath cocks, compression	50
Bath cocks, Fuller	45
Flatway stop and waste cocks, standard.	50
High grade	47
Roundway stop and waste cocks, standard	50
High grade	47
Brass steam cocks, standard	Net List
Globe, angle and check valves, standard.	23%
Do., removable disc	22%
Radiator valves, standard	31%
Do., removable disc	Net List
Basin Cocks—	
No. 0 and 1, Fuller pattern	45
Compression	40
Quick opening	50
Globe angle and check valves, standard, medium pressure	23%
Radiator valves ,standard med. pressure	31%
Radiator valves, removable seat, medium pressure	25

Wrought Pipe Prices May Advance Shortly

WROUGHT PIPE.—Higher production costs may before long result in advances being made in wrought pipe, it is stated. In the meantime quotations are unchanged, and a nice volume of business is being handled. Quotations are as follows:—

WROUGHT PIPE

Price List No. 39, April 3, 1919

Standard Buttweld

	Steel Blk.	Steel Gal.	Gen. Wrot. Iron Blk.	Gen. Wrot. Iron Gal.

MUELLER

Water, Gas and Brass Plumbing Goods

CANADA'S BEST

We wish to direct your attention to the fact that there is nothing in water, plumbing or gas brass goods practice that we do not manufacture. The test of over 60 years of producing nothing but the very best in these lines conclusively proves that we are the masters of such manufacture.

We are illustrating a few of our various lines and wish to direct your attention to the fact that—

Our 1919 Catalog A is ready for distribution.

WE MAKE:

1—Tapping Machines
2—Corporation Cocks
3—Goose Neck Connections
4—Ground Key Curb Cocks
5—Rapidac Bath Cocks
6—Rapidac Basin Cocks
7—Globe Valves
8—Drilling Machines
9—Regulating Valves
10—Meter Testers
11—Bath Supplies
12—Service Boxes
13—Basin Combinations and many other articles of highest quality.

Boiler Tubes Show Little Change

BOILER TUBES.—There is very little doing in boiler tubes as yet, and the outlook seems to be that this condition will prevail for another month or so. By that time it is hoped that more activity will be manifest and jobbers indicate that they should be in a position to take care of all business from the standpoint of supplies. There is no difficulty now being shown in getting through shipments promptly. The range of prices follows:—

BOILER TUBES—	Seamless	Lapweld
1¼ inch	$27 00	$.....
1½ inch	28 00	.....
1¾ inch	30 00	26 00
2 inch	30 00	26 00
2¼ inch	33 00	28 00
2½ inch	40 00	32 00
3 inch	46 00	38 00
3¼ inch	.....	45 00
3½ inch	56 00	42 00
4 inch	70 00	54 00

Waste to Decline? Oakum Unchanged

WASTE, OAKUM.—There is a somewhat better demand for cotton waste, but this is not represented in any enormous volume as yet. The strike in Winnipeg for the past three or four weeks has certainly curtailed movement of goods to that section of the country, and consequently has cut down the volume of sales to a great extent. Prices have held without change though there is some indication of lower prices coming.

There is nothing new in the situation in oakum. There is a fair movement and quotations are well maintained at the figures shown herewith.

	Per 100 lbs.	
Best American	$21 00	$22 00
Clipper, spun	.....	21 00
Do., unspun	.....	10 50
Plumbers' spun	.....	9 50

Sheets, Plates Maintain Firm Level

SHEETS, PLATES.—Indications are that there will be no change in the market situation on sheets, as a result of the proposed tariff changes. There has been no change during the week in quotations, the figures below being well maintained. The demands of labor submitted to the employers of the steel mills in the U.S. may not be met, and that means a possibility that July 1 may see a general tie-up of the various plants. Some interests state that they cannot possibly meet the demands, so unless the two elements get together, the situation may develop rather unsatisfactorily. Stocks in the hands of jobbers are very good, and they state they would experience no hardship for a month at any rate.

Sheet copper has advanced, being quoted at 26¼c per pound, mill shipment, and 29c per pound, shipment from stock.

Solder Declines 2c; Lead Products Hold

LEAD AND ZINC PRODUCTS.—A revision downward on solder has been made this week in some quarters, the decline amounting to 2c per pound. Guaranteed is being quoted at from 33c to 37c per pound; strictly at 31c to 35c; commercial at 28c to 31c; wiping at 27½c to 30c; wire at 34c to 40c.

No change in manufactured lead products has been made, the following figures being those ruling to-day:—

Scrap Metal Shows Slow Improvement

OLD MATERIALS.—The scrap market is not improving rapidly, although there is a fair volume of business being done. The United States market is perhaps taking a little more material now than for some time past, but even yet the great bulk of this is in the form of shipments on contracts that run into thousands of tons. The scrap metal business is pretty well divided, and lines are quite clear. There is the small pedlar, with his wagon, who scours the country. He in turn sells to the man who handles about five or ten ton lots, and the next dealer is the one who takes in car lots. The clearing house is the large dealer who will undertake a contract up around 50,000 tons, deliveries to be made on a definite schedule. It is not until this last named class gets busy that the whole procession can be said to be fully engaged.

Tin Down, Copper, Lead Hold Firm

INGOT METALS.—The market continues to show a good deal of variation, but the undertone as it applies to copper, lead and antimony seems to be in a fair amount of strength. The position of tin is rather quiet. Spelter is not providing much interest. Business is fairly good and there is no difficulty in getting supplies.

COPPER.— The buying movement which has been apparent in the United States, which has tended to keep the price fairly firm, is reflected in the situation locally. The price of 18½c per lb. is a ½-cent advance and stocks are at a sufficiently high level to take care of the business which is offering.

TIN.—There seems to be only a casual interest in this metal. Supplies have been coming through quite readily, and buyers do not seem inclined to go into the market for any more than their immediate need. The price shows a decline of 2c from the figure which was quoted last issue, and now rules at 58c per lb.

SPELTER.—Production seems to be falling off, and there is little in the situation which would indicate any bullish tendencies. As a matter of fact there is really very little movement either way. The price remains at the unchanged figure of 8c per lb., which is a slight decline.

LEAD.—Greater buying activity is apparent in this metal. There is little indication that low prices, or very low prices anyway, are going to be reached. Markets in the United States are held at a pretty firm level, and the demand is really very satisfactory. There has been a considerable movement locally from all accounts, and the outlook here is pretty satisfactory. Price ranges around 6½ to 7c per lb.

ANTIMONY.—There is no indication of any easing away in the market of this metal. The price of 9c per lb. shows an advance, and there is a fair amount of activity apparent. Stocks are not heavy or ample to meet the requirements of the trade.

ALUMINUM.—There seems to be some business coming to hand on this metal, but it is still along rather restricted lines. Supplies seem to be improving somewhat, and a much better trade is looked for in the coming week. Quotations range from 40c to 42c per lb.

H. C. Crow, sales manager of the Canada Metal Co., Toronto, has left for England, where he plans to spend about six weeks.

A. E. Dyment has been elected vice-president and chairman of the Board of Directors of the Canadian General Electric Co., Limited, to fill the vacancy created by the death of W. D. Matthews.

J. R. MEADOWCROFT PASSES ON

A WELL-KNOWN and respected heating and plumbing man in the person of John R. Meadowcroft, died in Montreal on Friday, June 6, at his home, 32 Lorne Avenue.

The late Mr. Meadowcroft was a native of Montreal, having been born there 64 years ago. For upwards of 48 years he had been connected with the Garth Company, of which firm he was managing director at the time of his death. Entering the shop of Mr. Charles Garth as a boy ,Mr. Meadowcroft continued to master various details of the business and as this expanded he was given greater responsibilities. He had taken a great interest, and particularly of late years in various fire-fighting apparatus. Some of his inventions have been approved throughout America, being recognized and used in some of the larger centres.

Among other things which enjoyed his support, Mr. Meadowcroft was a member of the Montreal Board of Trade. Membership was held by him in the St. George's, Engineers' and Montreal Reform Clubs. The funeral on Monday was largely attended, attesting the esteem in which the deceased was held and the wide extent of his acquaintance.

WE manufacture a full line of Steam, Vacuum and Combination Gauges, Locomotive and Duplex Gauges.

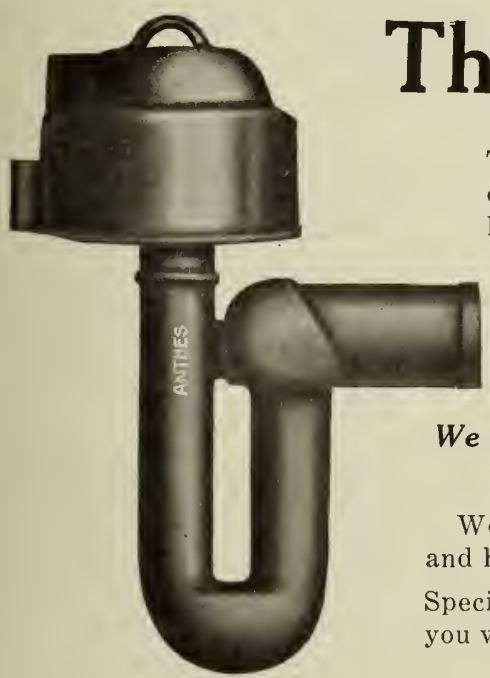
MORRISON'S Standard Test Gauges, Hydraulic, Altitude and Sprinkler Alarm Gauges, Combination Water Works Gauges.

PYROMETER Gauges, Engineers' Clocks and Revolution Counters, Pressure Gauge Testers, Pyrometers for Bakers' Ovens.

RECORDING Pressure and Temperature Gauges, Blast Pressure Gauges. Dealers in Thermometers for Heating Installations, Feed Water, Flue Gas, etc.

THE JAMES MORRISON BRASS MFG. CO., LIMITED

93-97 Adelaide Street West, TORONTO, ONTARIO



The ANTHES Syphon

The Anthes Syphon is of a type endorsed by sanitary engineers the world over, because it operates by natural laws. It is cast entirely in one piece, which means there are no joints to open, and they have no moving parts to get out of order.

Supply Anthes to your customers, because they are the BEST. Anthes Syphons last a lifetime.

We will supply you with Sewage Disposal System Blue Prints upon request

We carry a full line of soil pipe and fittings, light, medium and heavy, in all sizes.

Specify Anthes Soil Pipe Fittings and Syphons every time and you will procure both quality and service.

EVERY ORDER SHIPPED THE DAY IT IS RECEIVED

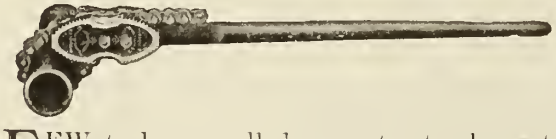
Williams' Improved "Vulcan" Drop-Forged Chain Pipe Wrench



FEW tools are called upon to stand greater strain and harder wear than the pipe wrench. Because Williams' "Vulcan" Chain Pipe Wrenches have withstood every test during years of hard, continuous service under all conditions, they have earned a well-deserved reputation for dependability, and are favorably known the world over. They embody every good feature for which Williams' *Superior* quality stands.

Made in 8 sizes for ⅛ to 18 inch pipe. All Flat Link Chains are "proof-tested" on a standard tension machine and "certified." Every wrench is unconditionally guaranteed.

There's Something about an Original that Can Never be Imitated!

IF you've ever heard Harry Lauder sing his Scotch songs you could tell an imitation with your eyes shut.

You've seen Charlie Chaplin do his stunts—do you think an imitator could fool the people?

Whether it's real diamonds or paste—whether it's pure gold or brass—an imitation is simply an imitation—**and nothing else.**

That's why the thoughtful steamfitter isn't going to fall for anybody's talk about something "just as good" as "X" Boiler Liquid. He knows that for positive results it is safer to stick to the original. An imitation of the genuine "X" may look like it—but that's all. Patents are allowed on the "X" Liquid process. Its quality **can't** be imitated. Imitations of the genuine "X" Liquid cause foaming. **"X" will prevent foaming.**

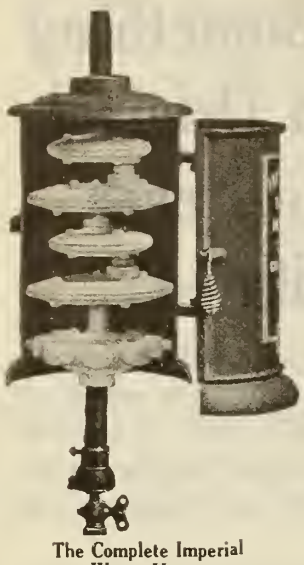
No fitter can afford to experiment with his profits. When you get a leaky or cracked boiler job you want to know that you can send any man to that job—have him finish it quickly—otherwise there's the kicking, the arguing and the time-wasting that is utterly useless from a money-making standpoint.

Over 25,000 steamfitters now know that "X" Liquid is the **only** scientific process for repairing leaky and cracked boilers—and for making them LEAKPROOF—RUST-PROOF — AND SCALEPROOF. They know that with "X" they make three times the profit that they could by dismantling and welding.

And they wouldn't risk their reputations experimenting with an imitation.

"X" LABORATORIES

636 Washington St. Boston, Mass., U.S.A.



The Complete Imperial Water Heater

BY installing "IMPERIAL" heaters, you serve your customers' interests, as well as your own.

Why Jenkins Bros'. Valves Are Superior

Fig. 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

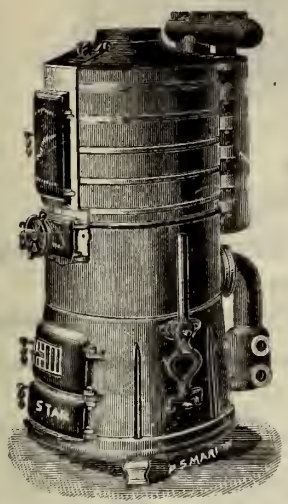
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.

The principal feature of the Star Boiler is that no other round hot water boiler has any coal-saving improvement not embodied in the "Star."

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Have You Taken Down Your Sign?

A prominent merchant who has made a great success of all branches of his business has said that withdrawing advertising from a good trade paper is like taking down your sign. Advertising to the trade you serve is business insurance, but premiums must be kept up or the policy will lapse.

There never was a time when the trade was keener for business information. That is why the advertising pages of the SANITARY ENGINEER are being followed so closely at the present time.

WORTH WHILE PUBLICITY

The general tendency in Canada is towards selling high-grade goods. There never was a time, in the history of the country, when all branches of the Canadian trade were more interested in securing all possible information regarding products they can recommend and guarantee to their customers. Advertisers in SANITARY ENGINEER reach the cream of the trade in all parts of the Dominion.

"Canadian" Plumbers' Rubber Goods

Plumbers and Sanitary Engineers, who know the market, find that the Dominion Rubber System Supplies give absolute satisfaction. That means satisfied customers. That is why "CANADIAN" Flush Balls are so much in demand. They can made right and fit tight.

"CANADIAN" Furnace Bulbs are always dependable and much cheaper than pumps—no valves or springs to get out of order.

Ask your jobber for the "CANADIAN" brand—supplied through Dominion Rubber System branches

EVERY FITTING TESTED

Think of it!

Twelve Years without a leak

EVERY TANK GUARANTEED

MADE-IN-CANADA

VitrO Tanks that were installed ten years ago are still going strong without sign of the first leak.

Surely this fact is sufficient evidence that tank troubles have been successfully overcome.

In the construction of the VitrO all chance of trouble is avoided by eliminating those features which in other tanks cause trouble. The VitrO is all in one piece with no joints to open up and no linings to leak.

Installing VitrO No-trouble Tanks is a mighty profitable way of building a permanent, satisfactory business. It gains for you a reputation for reliable, honest work that is well worth while.

OUR GUARANTEE

A new Tank will be given to replace one that at any time proves defective from either material or defective workmanship.

Write us for a **VitrO** Catalogue.

Join us in our success by specifying VitrO No-Trouble Tanks when placing your next order of goods.

GALT :-: CANADA

Sanitary Engineer

Plumber and Steamfitter of Canada

VOL. XIII. PUBLICATION OFFICE, TORONTO, JULY 2, 1919 No. 13.

Judge a Building By Its Plumbing

THIS advice offered prospective tenants and house-buyers is sound advice.

If every prospective tenant or purchaser of a house made a thorough inspection of the sanitary arrangements in the house, instead of paying so much attention to the outside appearance, and usually so little attention to its appointments, sanitary engineers would be overwhelmed with work.

But they don't—

Therefore, it behooves the sanitary engineer to advise.

If the sanitary arrangements in his client's property are several years old—they are out-of-date. They need replacing—or, to say the least, they greatly need repair and replacement of parts.

There is going to be a lot of work of this nature done this year—and the sanitary engineer should be equipped for sudden calls. He should be fully supplied with information regarding the most up-to-date appliances. He should have us at his elbow. We can be of great service to him.

Our engineers are ready to advise him. Write us and let us place our facilities, our equipment, and complete stock of everything in sanitary supplies at your disposal. It will help you greatly.

"Dual" Mixer

A valve that really mixes Hot and Cold Water, and maintains a uniform mixture.

For ease of operation, simple construction and easy installation, it has set a new standard of efficiency.

Cold Water must be turned on first, no possibility of scalding.

Made in several forms for showesr, Sprays, Operating Rooms, etc.

At the well-known works of Messrs. Brunner, Mond & Co. these valves provide baths for 2,500 employees.

Inside Facts About Heating the "Dunham Way"

The DUNHAM HEATING SERVICE

The Dunham Radiator Trap is distinctive in the simplicity of its construction.

It is this fact that makes a Dunham Heating System so simple, yet so efficient.

The Dunham Radiator Trap is the heart of Dunham Heating. It gets rid of all air and water from the radiator, but holds the steam in until every last bit of heat is given off. It does this automatically—no noise—no air valves on the radiators.

Dunham Heating is standard where efficient and economical operation is desired.

Dunham Heating Service, in advising on heating problems, is given without obligation.

Complete details on request.

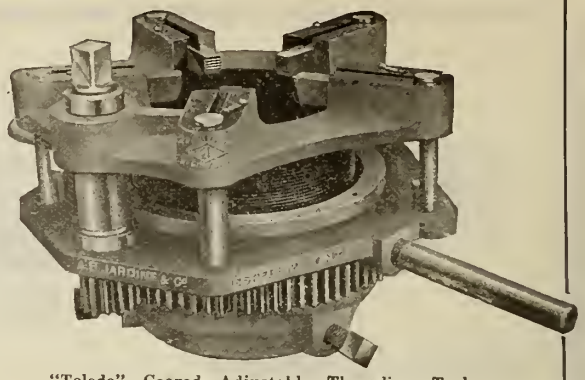
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity 2½ to 6 in. inclusive. Weight, 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

Have The Maritimes Had Fair Play?

THE Maritime Provinces did not enter Confederation very willingly and it may surprise people in other parts of the Dominion to learn that at the present time the people of New Brunswick and Nova Scotia are not altogether pleased with the results of the bargain. There is a distinct feeling among them that the advantages of Confederation have gone to the other Provinces. In the course of an article in the July issue of MACLEAN'S MAGAZINE, Thomas M. Fraser explains why this feeling has grown and the basis for it.

This article was written for the purpose of letting the other provinces know that the feeling exists but it will be of intense interest to people in the Maritimes. Be sure to read it—"The Spirit of the Maritimes."

"The Land of National Leaders"

An article on the political aspect of the Eastern Provinces and the achievements of their leading statesmen.

"Guarding Our Coast Line"

An extremely interesting description of the measures that were taken to patrol and guard the Atlantic seaboard during the war.

Bonar Law, the man from the Maritimes, who has been the able lieutenant of Lloyd George at all crises in Great Britain, appears on the cover in a handsome three-color reproduction.

Other Big Features of the Number

"With the Snowball Brigade"

By Captain Louis Keene

Just back from Siberia—Captain Keene tells some sensational and intensely gripping things about conditions in that country which the Canadian forces are helping to stabilize. It is a record of international complications, strange atrocities and almost unbelievable living conditions.

"The Three Tommies"

By Robert W. Service

A war poem of unusual strength.

"Solving the Problem of the Arctic"

By Vilhjalmur Stefansson

The fourth instalment of his remarkable story of the five years he spent in the north for the Canadian Government, appearing exclusively in MACLEAN'S.

Three Magnificent Stories

The best fiction obtainable is found in this issue: "Owners Up," a race horse story by W. A. Fraser; "His Majesty's Well Beloved," by Baroness Orczy; "Bunkered," by Allen C. Shore.

Success and Satisfaction with "Sovereign" Radiators

They are made in every useful variety of shapes, sizes and designs—to fit into handy places about a house—to meet the demands of the area to be heated—and to correspond, in pattern and finish, with the decorative scheme adopted for each particular room or hallway.

SCREWED NIPPLES

The sections of "Sovereign" Radiators are joined together by screwed nipples. These make an absolutely tight and unleakable joint. Every radiator is tested under hydraulic pressure before leaving the factory.

LARGE CONNECTIONS.

Large, smooth connections between the parts of a radiator ensure an easy flow and regular distribution of water or steam. The "Sovereign" has a particular merit in the ample proportions of its connecting parts.

LARGE HEATING SURFACE

The larger the inner surface the heating element comes in contact with the larger will be the exterior heat radiating surface of the radiator. The "Sovereign" realizes the fullest heat distributing capacity.

Burnham Boilers

Takes the cuss out of grate cussings

There was a time when we, too, made a profanity-provoking grate; to replace one of the bars of which, it was necessary almost to tear down the boiler

But now all grates can be changed without having to remove a pin or bolt.

Only a hammer is required, and one man can do the work alone.

Every Burnham grate bar is made with two flat and two curved faces to its axle. The flat faces are at an angle from the rocking arm, so that it can't jump out (see cut) of the socket lug, unless purposely tipped to its extreme limit. Then it can be easily lifted out to replace. Or as easily put in.

Don't Wait for Competitive Trade

J. E. Yates Co., Brandon, Man., "Goes Out After Business" Before it Gets to Competitive Stage—What Keen Observation Will Do For Sanitary Engineers—Unique Store Display—Selling Electric Lighting Systems

"GO out after the business," is the slogan adopted some years ago and followed successfully by the James E. Yates Co., sanitary engineers, of Brandon, Man.

Mr. Yates does not believe in doing business on even a strictly competitive basis. While competition is looked upon to-day as the acme of business success, Mr. Yates goes it one better by not waiting for prospects to get to the place where competition for their business commences. He has his ear to the ground at all times and has also worked up a local following who note any signs of prospective building or alteration work, and immediately he is tipped off and plans are made to be first on the job when work is ready to be commenced.

Follows Load of Gravel

Mr. Yates illustrates this plan as follows: One day he was returning from an outlying town and noted a load of gravel being hauled along the road a short way ahead. A load of gravel does not convey much to the ordinary individual but Mr. Yates has developed a keen observation, and being of the opinion that the gravel was to be used for building purposes he slowed down his car and followed the wagon. When it turned into a roadway leading to the farmhouse of a man with whom Mr. Yates was acquainted he followed it in, and was surprised to note something which could not be seen from the road; the farmer's house was jacked up and apparently some considerable work was being contemplated.

Aftr parleying with the farmer for some time, and being told that he was not going to further expense to put in any plumbing or heating facilities, Mr. Yates succeeded in formulating such an attractive proposition that before leaving he had secured instructions to instal hot water heating and a soft and hard water system. This was the result of following a load of gravel.

Studies Farm Trade

Another farmer in the vicinity of Brandon had a large barn of valuable

One of the display sections used by James E. Yates Co., Brandon, Man., to bring to the attention of their customers and prospects the various styles of goods which they have to offer. The arrangement is very neat and in its spick-and-span appearance at all times creates a good impression on all who enter the display rooms of this aggressive Western firm. View of another section is shown on the following page of this issue.

This is the first display which greets the visitor to the James E. Yates Co., Brandon, Man., display rooms. It is immediately to the left of the entrance and really serves a double purpose in being an interior display and also a window display. It illustrates a complete three piece bath-room and in addition there is a showing of mirrors, either separate or in the medicine chest, as well as some of the most commonly called for bath-room fittings. To those whose space is limited, there is perhaps a message in this "double exposure."

stock. He had undergone severe financial trials in recent years, and was looking to the sale of the stock on hand to set him up in a few months time. While Mr. Yates knew this farmer could not afford to purchase an electric light plant, he recognized that the farmer was risking his only opportunity of financial rejuvenation by using lanterns for lighting purposes in the barns. Mr. Yates, knowing that this prospect would be good for an extension of credit, outlined the risk the farmer was taking and put forth a proposition which was immediately accepted. An electric lighting system was forthwith installed on this farm and payment was made in due course when the stock was sold.

Gets Tips From Friends

"We have a great many friends who put us in touch with any building activity," says Mr. Yates, "and as soon as work is commenced on an excavation we are immediately made aware of any building which may be contemplated."

The Yates Company has found it good business to watch the society columns of the newspapers for news of marriages, etc. There are many old houses in the vicinity of Brandon which are not equipped with up-to-date facilities, and, when a newly-married couple settles in a house of this kind they immediately become a prospect of the Yates Company for business. Mr. Yates had just secured an order from such a prospect as this to instal a heating and water system at a cost ranging from $800 to $1,000. The newspapers are a valuable source of information regarding the social activities and the building plans of various people both in the city and throughout the surrounding country. Mr. Yates has found it well worth while to watch the papers.

The Yates Company has two men constantly on the road in automobiles, and these men are constantly bringing in business picked up in just such a way as that outlined herewith. Mr. Yates believes in training the observation of his staff as well as his own. These men are on the country roads around Brandon each day and are always on the watch for signs of possible business.

Electric Light Plants

This is an active department of the James Yates Co. business. Mr. Yates finds the new generation of farmers around Brandon are much more disposed towards investing money in modern facilities than were the older generation.

For the purpose of display, a complete system is installed in one of the windows of the Yates store, and a great many electric bulbs are arranged around the window frame. The display illustrates the advantage of the system, the steady and sufficient power which can be supplied, and the elimination of the fire danger where such a plant is substituted for the lantern and lamp.

When asked as to the best way to sell an electric light system Mr. Yates replied that once a system is installed on a farm it acts as the best advertisement of the advantages to be gained. Farmers from the surrounding district will gather to see how the system works, and then when they are free to discuss the matter without being urged on by a salesman they come quicker to a realization of the distinct value of such a plant.

A great many farm homes and buildings are wiped out by fire, and a good sized conflagration may reduce a farmer to low financial standing. A large number of such fires are caused by lanterns and lamps. It is apparent that the elimination of the fire danger is one of the biggest points of value in such a plant.

Unique Display Features

It is not only in the outdoor department of the Yates business that this company excels in unique features, for the arrangement and display of the various lines in the store shows that much forethought and consideration have been given to the matter.

There are six sections for the display of the various lines individually, on a floor which is raised a few inches from the aisle down the middle of the store. Partitions about four feet in height have been erected around the sections, and the whole interior of the store is finished in white enamel, kept absolutely clean. The result of this arrangement is that wall fixtures may be shown to better advantage as each is backed against a portion of the partition or wall, and the division into sections gives better facilities for display.

The Reason For The Raised Floor

Mr. Yates points with pride to the ef-

fective way in which the various sinks, pumps, closets, etc., are displayed in their individual sections. There is an interesting feature to note in connection with the raised floor. The floor of the display sections was raised a few inches above the main aisle for the purpose of keeping unlikely prospects from marring the splendor of the various articles on display. There is a peculiar psychology in human beings which will not urge them to undue exertion unless the interest warrants such. Mr. Yates was quick to observe this tendency in his visitors, and hence the raising of the display floor. After watching the effect for some time Mr. Yates has confirmed his opinion on the subject, namely that those who are really interested and are good prospects will step up the few inches to examine the articles closely, and those who are not really interested and are "just looking" will look from the aisle as they will unconsciously feel that the raised portion of the floor is not to be walked on. In this way no offense is shown and the job of keeping the various articles resplendent in their polished brilliancy is rendered less difficult.

The display shown in the J. E. Yates Company store is truly an example of what sanitary engineers can achieve in the way of display, and the idea that this class of trade has not much to gain from attractive store displays is one which is fast going into the discard. Mr. Yates has found this out, and close attention to the appearance of his store is paying him back in dollars and cents.

TO SAVE ELECTRIC BULBS

Experiments in which the Government is taking part are now in progress at Madison, Wisconsin, to try and eliminate the enormous loss due to the breakage of electric light bulbs in shipping. At the present time no less than 150,000,000 bulbs are being produced each year. These figures indicated what an item it is to the big manufacturers if they can save breakage in their wholesale shipments, and this explains why at the forest products laboratory, in Madison, the manufacturers have thought little of smashing $4,000 worth of bulbs in an intensive study of the problem of how not to have bulbs break in shipment.

Three of the nation's biggest producers have sent experts to Madison to conduct a series of tests with a new style of packing. If the new material saves enough bulbs from breakage, an entire change in the manner of making shipments may be adopted. The experiments have so far proved nothing, but the engineers in charge who are working at the Government plant, on experiments of their own, are confident that the annual breakage will be materially reduced.

If one-tenth of 1 per cent. of the nation's shipments are now broken in shipment and this breakage, by a different packing, can be cut in half, the companies will save a total of some 75,000 lamps a year.

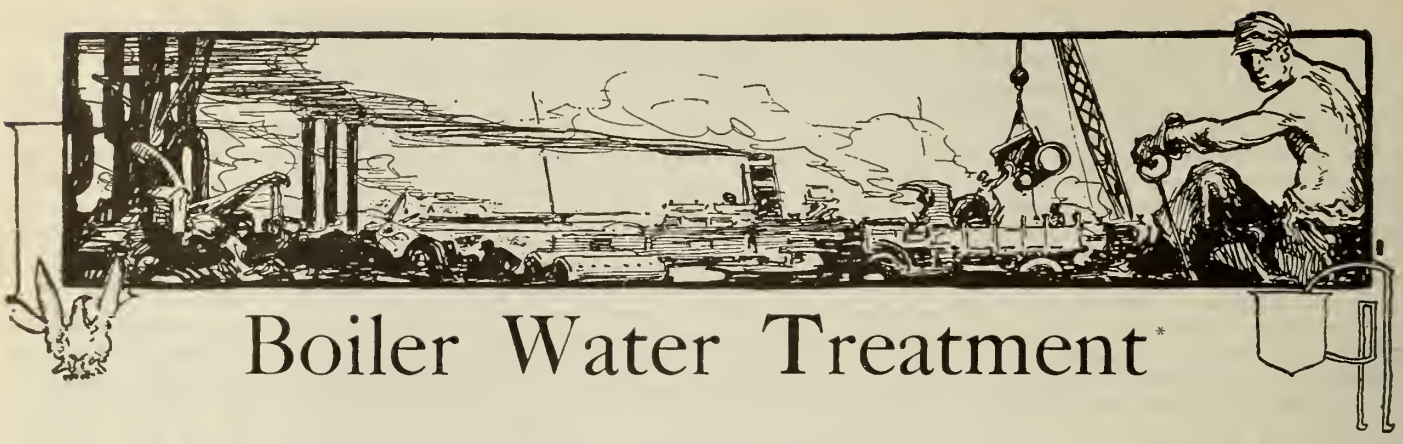
SHOULD KEEP BOOKS

The importance of doing business in a proper way was emphasized by the investigators at the school probe now going on in Toronto. After referring to the hopeless task of getting at accurate details by questioning, Mr. Shirley Davidson said in part: "There can be no more sinister reference against the honesty of a trustee than that he keeps no books. Even the criminal code provides that if the court finds that a suspect has kept no books he may be sent to jail. That just illustrates the idea of the law as to keeping books. A man should keep books if he wishes to keep honest." In commenting further on the case he stated that no books had been kept for twenty-seven years and that this was no oversight, but deliberate defiance, despite a report made by Judge Winchester some time ago.

CRAFT APPRECIATED PROMPT REPORT

From all parts of the Dominion congratulations have come to SANITARY ENGINEER for the very complete and detailed report which appeared in the issue of June 15 of the Twenty-third Annual Convention of the Canadian Society of Domestic Sanitary and Heating Engineers at Montreal.

SANITARY ENGINEER was the first publication of any kind to carry this report in full. Realizing just how important to the men in the trade it was to present in detail the discussions on the various topics, SANITARY ENGINEER was represented at every session. As was expected, a great many matters of real interest to the trade from one end of the Dominion to the other were taken up. The views of men who are leaders in their profession are always not only of interest, but of value to others. Many hundreds of plumbers, scattered all over Canada from coast to coast, who were unable to attend the big meeting at Montreal and take part in discussions of national importance, were enabled through the detailed reports in SANITARY ENGINEER to follow what occurred almost as closely as though they had been there. Service of this kind means a lot of work and no small expense in getting a lengthy report of this kind to a large number of readers quickly. SANITARY ENGINEER succeeded in doing this and the letters of appreciation that have been received and the messages of congratulation that have come in are their own reward and recognition of the service this publication aims to give its readers.



Boiler Water Treatment*

A source of unnecessary waste of fuel originates in the use in boilers of so-called "hard" water. This leads to the deposition upon the boiler metal of insulating material contained in the water which retards the flow of heat from the furnace to the water to such an extent that the amount of heat escaping through the stack is materially increased.

How a notable reduction in factory heat losses may be effected through the substitution of "softened" for "hard" boiler water is clearly shown in this bulletin.

This is one of a series of Engineering Bulletins issued by the United States Fuel Administration in collaboration with Bureau of Mines, Department of the Interior, under their slogan of Maximum Production, Minimum Waste. It is the intention of SANITARY ENGINEER *to reprint, through their courtesy, additional bulletins as available. There is much of interest to the owner of an industrial plant or those engaged therein in this article. The next bulletin which will be dealt with is, "Saving Coal in Steam Power Plants," which will appear in the next issue.* —EDITOR'S NOTE.

IF you cover a steam pipe with asbestos, magnesia, or other heat-insulating material, you keep the heat in the steam; if you line or coat a boiler tube with scale or other heat-insulating material, you keep the heat out of the boiler water, and send it to the stack. By lagging your pipes you save fuel easily. By lining your tubes with scale you waste it continuously and needlessly.

The Nature and Origin of Scale Formers in Boiler Water

All natural waters contain more or less of this heat-insulating material, partly as suspended matter (such as clay, fine sand, insoluble forms of iron, aluminum, etc.), partly as dissolved matter, such as compounds of calcium, sodium, potassium, and other minerals salts.

Much of the suspended matter, as well as most of the dissolved matter, may form scale, but the suspended matter may generally be removed by filtration, which will be discussed later.

Dissolved Matter Which Forms Scale

Of the material commonly in solution in boiler waters, the bicarbonates and sulphates of calcium and magnesium are the most important scale formers. Natural waters containing in solution bicarbonate of calcium or magnesium, or both, exhibit what is called "temporary" or "carbonate" hardness; those containing dissolved calcium or magnesium sulphate, or both, possess "permanent" or "sulphate" hardness. In the case of the sulphate scale the temperature required to separate it is too high to make its removal by heating alone a practical means of treatment. In the case of water exhibiting carbonate or temporary hardness great improvement in its properties may be effected by the use of open heaters of the exhaust steam type. As a rule sulphate scale is denser in structure with a higher heat-insulating value than carbonate scale, but the conditions of formation affect this considerably. Where a porous structure permits water to penetrate the scale its heat-insulating effect is greatly reduced.

The Effect of Scale

In many respects the effect of an increasing deposit of scale on the passage of heat through the walls of a boiler tube is very similar to the effect on the passage of water through a tube of continually decreasing bore. In the case of the water tube, the only way to get a uniform volume of water through it in a given time, in spite of its diminishing bore, is continually to increase the pressure in water; so in the case of boiler a tube covered with a dense scale the only way to maintain a constant flow of heat from the furnace to the boiler water is to increase the "heat pressure," so to speak; that is, to burn more fuel.

Heat loss.—The most important effect of scale is due to the fact that in certain forms it is a wonderful heat insulator. Its chemical composition seems to have little to do with its heat-insulating power, the big question being the density or mechanical structure of the scale. A series of experiments by Prof. Schmidt, of the University of Illinois, gave the following results, showing decrease in heat-transfer efficiency of tubes coated with scale of different thickness and composition:—

Character of scale.	Thickness Inch	Composition.	Loss of efficiency
Hard	1/50	Mostly carbonate	9
Soft	1/32	" "	7
Hard	1/32	" "	8

This expressed in dollars and cents means that with a deposit of 1-9 inch of scale, 16 cents of every dollar paid for coal is lost.

The data just given must not be regarded, however, as indicating that the decrease in the heat-carrying capacity of scale covered tubes can always be calculated with the accuracy that these figures would indicate. The important facts are, though, that the loss is easily prevented and that the advantages of soft water abundantly justify all expenditure necessary to secure it.

Just what the loss is in any particular case could best

*For a very elaborate discussion of this subject see Bulletin No. 1752, University of Texas, by W. T. Read and E. P. Shoch. The table showing the calculated reduction of heat-transfer efficiency was taken from this source, and the discussion of the zeolite process is based on data furnished by that bulletin.

be determined by comparing the fuel consumption with clean and then with scale-covered tubes, other operating conditions being kept uniform.

Means of Removing "Scale Formers" From Water

The methods employed in softening water may be divided into two main classes, (a) those in which the scale-forming property is removed before the water enters the boiler, (b) those in which the softening is effected within the boiler itself by means of so-called "boiler compounds."

As to which one of the two classes of methods should be employed in any particular case would depend on the size of the plant, and on the character of the water to be softened. In the case of waters of abnormal composition, it would frequently be impossible to produce a satisfactory water by either method and a new water supply would be necessary.

It can not be too strongly emphasized that this question of water treatment is one in which the employment of competent chemical and engineering knowledge is both absolutely necessary and highly profitable, and it would be far wiser to omit all forms of water treatment (involving the use of chemicals) rather than to undertake such without knowing accurately the composition of the water and of the material used to soften it. It is most important to remember that the quality of the water, even when secured from the same source, varies widely from time to time. These variations are not only seasonal and monthly, but daily and even hourly. A condition of excessive concentration of the water after a protracted drought may be changed within an hour to a correspondingly excessive dilution by a summer storm. The result would be to decrease enormously the percentage of dissolved matter and to increase, probably to a much greater degree, the amount of suspended matter.

As a consequence, a prescribed treatment of the water based on its analysis at any particular time might not lead to satisfactory results if applied at some other period.

As an instance of the serious danger of an unintelligent "dosing" of boiler waters may be cited the results of a long series of investigations which have, apparently, shown that carbonate of soda in solution produces brittleness in boiler steel. Carbonate of soda (soda ash) is used in most water-treating processes and its unintelligent use may readily lead to a very dangerous condition in a boiler.

When Boiler Compounds May Be Used

Boiler compounds afford a very useful means of boiler-water treatment in plants whose size or value of output would not justify the use of a more expensive method. This would be true of a large percentage of the plants of the country.

In spite of a great variety of trade names a very large percentage of all boiler compounds consist most largely of carbonate of soda, to which caustic soda is sometimes added, and occasionally phosphate of soda. Starchy materials, and those containing tannin, are frequent ingredients. The supposed effect of these last two materials is to coat the particles of precipitated incrusting material and prevent its cohesion into compact scale.

Objections to the Use of Boiler Compounds

The chief disadvantage (assuming that they are used intelligently) is the necessity of frequently blowing down the boiler to prevent the accumulation of "sludge" and of alkaline (sodium) salts in the water, both of which cause foaming. Furthermore, this blowing down must be supplemented by washing out, and occasionally closing down the boiler to complete the removal of the sludge and of the boiler compound itself.

Whenever competent supervision of boiler-water treatment is available within the plant organization, it is preferable to soften the water before it enters the boiler, and this must be done when the percentage of scale-forming ingredients is high.

Water Softening by Other Chemical Means

By treating the water before it enters the boiler.—The removal of scale-forming components from water by chemical means, whether before or after entering the boiler, is accomplished by converting the calcium and magnesium compounds into practically insoluble forms, causing them to separate from the water and allowing the material to be removed by blowing down, filtering, or sometimes by settling. Lime and soda ash are generally used for this purpose when the softening occurs before the water enters the boiler. The lime combines with the carbon dioxide, which held the calcium and magnesium carbonates in solution; these are no longer soluble in the water after removing the carbon dioxide, and therefore separate from it. In a similar way the sulphate scale is removed by its conversion to insoluble carbonate by the soda ash.

The lime-soda process.—There are in current use in power plants practically only one lime-soda process, of which there are two varieties differing chiefly in the temperature of the water when treated. In all essential respects the two varieties are similar. The treatment consists of adding to the "raw" water softening agents in carefully controlled amount (which must agree with the composition of the water), mixing these thoroughly within the water, and permitting sufficient time to elapse for the separation of the "sludge" before the water is fed to the boiler.

In the case of the "hot-continuous" process this separation is effected more rapidly, which permits of less storage capacity than in the case of in the cold-continuous. In all cases, though, it is of the utmost importance to provide sufficient storage space to allow the sludge to be completely deposited before the water is fed to the boiler; otherwise the partially completed softening process will be completed within the heater, and the purpose of the treatment will be largely defeated. Another advantage of the hot process is that it expels the air from the water and so reduces the corrosion.

The zeolite process.—This is entirely unlike the processes described above and (unlike them) gives a water of zero hardness. The softening agent is an artifical material composed largely of sodium compounds, which are exchanged for the incrusting (scale forming) material of the water; that is, the water dissolves sodium compounds from the softener and replaces it by the calcium and magnesium which had caused the hardness of the water. The hard water simply flows over the permutit packed in a cylinder, or is forced up through it and flows from it with all scale-forming material removed. After a time the softener must be regenerated by allowing a solution of salt to flow over it, restoring its original composition and activity. The "permutit" process is a well-known efficient variety of the zeolite treatment.

Advantages and Disadvantages of Zeolite Process

The construction and operation of this softening equipment is extremely simple, and, as already stated, water of zero hardness is furnished. On the other hand, in the case of water of a high degree of temporary or carbonate hardness there is a correspondingly large amount of sodium salts introduced into the water so that foaming is liable to occur (as is liable to occur when softening water of a similar composition by means of boiler compounds). In such cases the following modified form of the zeolite process is used.

The Lime Zeolite Process

In this an intermittent or continuous tank equipment, as described already under the lime-soda process, is connected through a filter to a zeolite softener. Only lime is used in the tank, the soda compound being secured from the zeolite. The filter is placed between the tank and the zeolite softener to avoid any sludge coating the permutit particles and so impairing its efficiency.

Filters.—No process of water softening is satisfactory unless the amount of suspended matter is reduced to a

minimum. In the case of very finely divided matter this may be done by adding so called coagulants—alum, for example—but these should be used with extreme caution and always under expert direction. Ordinarily, though, such suspended matter is removed by filters, of which the sand filter with a down flow of the water is the most satisfactory type. They are not expensive either in original or maintenance costs.

Removing Scale Already Formed

The purpose of the methods described above is to prevent the formation of scale. There is another class of water-treating material used largely to remove scale already formed and to some extent prevent the formation of new scale. Graphite and kerosene are most often used for these purposes. Their action seems entirely mechanical.

Opinions as to the desirability of their use vary from enthusiastic commendation to absolute condemnation, though their use seems generally approved by practical men. Neither should be used, however, in boilers in which there is already a heavy deposit of scale, as the loosening of this and its accumulation in the bottom of the boiler is apt to lead to blistered and bagged boiler metal. Both graphite and kerosene should be used very cautiously. Kerosene, if used in excessive quantity, is apt to distil over and attack gaskets.

Some Examples of Economies Effected by Softening Water

There is a very direct relation between softening water and saving fuel; the following are a few cases reported of such economies:

1. A marble company reports a saving of 21 per cent. of fuel by softening its boiler water.

2. A crucible steel company, by substituting soft for hard water, effected a saving of 3,600 tons of coal per annum, which based on current prices would be valued at about $22,000.

3. The Chicago & Northwestern Railroad Co., comparing its operating expenses in 1902-3 before and after softening its water supply, reported a saving of $75,000 per annum. This saving was effected at a period when coal cost probably less than one-half the prices charged to-day (1918).

4. In addition to these, other cases have been reported in which the profits resulting directly from the substitution of soft for hard water have been reported as varying from 32 per cent. on an investment of $7,200 to 71 per cent. on an investment of $7,000. These profits resulted largely from the elimination or reduction of operating costs, such as cleaning heaters, piping and economizers, cost of cleaning instruments, interests, and depreciation on spare or idle boiler, etc.

5. Furthermore, it has been estimated that the use of hard water in a great number of the locomotive boilers of the country involves the consumption of 15,000,000 tons of coal more than would be needed were soft water only used.

6. A steel company, whose annual output is 50,000 tons reports a saving of 200 pounds of coal per ton of steel resulting from the softening of its boiler water.

The above are convincing evidences of the opportunity presented to power-plant operators for saving, by means of water softening, a very considerable proportion of the coal which will be mined during the current year.

The United States Fuel Administration feels that it can count very confidently on the adoption by all power-plant operators of this simple and effective means of fuel economy, which is of such especially vital concern at present

---

IT COSTS more now to get your picture painted than formerly. Still that is one form of dissipation that we can side-step and still have a fairly good time.

* * *

OCCASIONALLY one sees a stork in the Zoo, but there must be a stack of these things some place in the woods, for there were 1,352,792 births in United States last year.

* * *

A CALIFORNIA man left $19,000 to his son. The only string is that the son has to earn $30,000 clear before he can get the $19,000. Chances are that by the time he piles up that sum he'll have cut enough wisdom teeth to know how to handle the smaller amount. It looks as though that fond parent knew a thing or two that the average chap never thinks about.

* * *

TORONTO has had a street car strike for over a week. Of course, there have been some cases of inconvenience. The remarkable thing is how well people have got along without the cars. The automobile age has provided a tremendous amount of transportation. Each year now will make it increasingly hard for a street car strike in any large city to inflict the inconvenience of ten years ago on the general public.

Some Good News for Our Readers

OPINIONS vary as to the value of the window or interior display from the sanitary and heating engineer's point of view. However, there is no getting away from the fact that the story we have secured from a Brantford, Ont., firm, which will illustrate the many displays this firm uses, is a dandy and even the skeptics cannot help but be impressed by the showing this firm makes. This will be a feature story for the July 15 issue of SANITARY ENGINEER.

There will be another lecture by the noted merchandising expert, Frank Stockdale, on the subjects "Salespeople of To-day and To-morrow." Mr. Stockdale, in this lecture, makes an interesting distinction between "pulling" and merely "waiting on" a customer. This is a decidedly live topic to the sanitary and heating trades to-day and much interest will be found in its careful reading. The questions of service, of viewing the sale from the other side of the counter, handling the difficult customers, are among the interesting questions that are dealt with in this lecture.

The next issue will also contain the second in the series on fuel conservation issued by the United States Fuel Administration in collaboration with Bureau of Mines, Department of the Interior, on "Saving Coal in Steam Power Plants." This will be of decided interest to many readers and will be well illustrated.

Electrical Business Developing Fast

Insistent Demand From All Over the Country for Electrical Labor-Saving Devices in the Home—Revival of Building Offers Splendid Opportunity for Sale of Electrical Fixtures

THAT there is big business ahead in electrical utilities and electrical fixtures is the opinion of those in close touch with the electrical development that is going on all over Canada. An absolutely legitimate field, in which many sanitary engineers are already making good profits, is wide open to the trade, with a volume of business which is bound to increase every year. There is not only a lot of good business to be had now, but with the steady extension of electric lines into the rural districts, the purchase by farmers in outlying sections of their own power plants, and the general and insistent call for more and more labor saving appliances in the homes, the business has a future that is rosy indeed. Many American firms are predicting that the business in appliances and fixtures is going to rival that in motors and supplies, which runs into many millions annually. If this is true in the States it will be equally true in Canada, and is already apparent in the demands that are being made upon the electric power companies for more and still more power to take care of the increasing loads.

Demand for Fixtures

For the past four years, owing to conditions and restrictions, electrical development has been held back. It is still held back, but not because of restrictions. hTe situation at present revolves around the inability to get sufficient supplies of materials with which to fill orders for equipment. In Ontario there are a number of requests in for new power lines and extensions to power lines. Some of these will not be proceeded with for two reasons. One is the difficulty of obtaining equipment required to construct the lines. Some of the lines will go ahead this year. Others will be held back pending lower costs. But they will be built sooner or later and in the meantime new projects are constantly being developed. Those who are in touch with the situation in those districts where it will be impracticable to build power lines declare that there is a noticeable increase in the sales of home power plants. People want electricity and they are going to have it, even if they have to put in their own plant. Every plant of this kind that is put in, and there are many of them being sold all the time, means just that many more prospects for the sanitary engineer to increase his business.

The farmers, all over the Dominion, are getting to be big buyers of electrical devices. Many of them now light

Continued on page 27

An electrical display such as is shown above contains any number of suggestions that are of real interest and value to buyers. Every article makes an attractive showing and collectively they make a feature that would enhance any store and create in those coming in the desire to buy. At night when the lights are all turned on the general effect is even more attractive. Many plumbers are finding that electrical goods are splendid sellers and a big help in bringing additional business to their shops.

Protecting the Home Town Front

The Part That "Mud" Plays in the Success of a Town—The Four Important Factors in a Town's Growth—Measuring Miles by Minutes—Getting the Right Sort of People to the Town—The 100 Per Cent. Citizen

THERE is a message here for every sanitary and heating engineer who derives a living in the smaller towns and it is to give the ideas of one of the most noted Merchandising experts in America that this talk is reproduced. Frank Stockdale is becoming better known in Canada every year. He has delivered lectures in a vast number of communities in Canada during the past year, and a multitude of merchants are looking to him to throw some light on many vexed problems of merchandising. Among the places he lectured at recently was Regina, where he delivered a course of lectures in connection with the convention of the Retail Merchants' Association, Saskatchewan branch. A special representative of SANITARY ENGINEER attended the convention to take a report of these addresses and this one containing a distinct message for the sanitary engineer in his relation to his community is the first to be reproduced.

The next lecture deals with the subject, "Salespeople of To-day and To-morrow." Mr. Stockdale in this lecture makes an interesting distinction between "selling" and merely "waiting on" a customer. The question of service, of viewing the sale from the other side of the counter, handling the difficult customer, are among the interesting questions that are dealt with in this lecture.

"IN my opinion the day has arrived in most places, and will arrive in all places, when the competition to which you must give your attention as a part of your business will take you outside of your own stores and hook you up in the ranks of the protectors of the home town front. Competition is no longer between individuals exclusively. in many places the main competition is not between individuals but between towns. The town problem is one you will be interested in when you know what it means.

"In the State of North Dakota is being carried on a campaign, and the object of that campaign is to promote the interests and the welfare of the communities of that state as a whole. In the United States there are at least 10,000 declining towns. In Illinois between 1900 and 1910 there were 357 incorporated cities and towns that actually went backward in that period. These centres had fewer people in 1910 than in 1900. That is an indication of an almost universal condition.

"The whole of Canada is going forward in population, but we have this problem on our hands. I like to compare the community of to-day with the family of yesterday. The family of yesterday had the spinning wheel in the home. Now we have in the community a man responsible for bringing clothing to the homes. Yesterday people raised and ground their own cereals, whereas to-day the retail grocer is responsible for supplying foodstuffs. Yesterday the man cut his wood or dug the mine, whereas to-day the coal man provides these fuels. Things that used to be done in the home are being done in the community by other people. The communities are the big families to which we belong, and the trouble is we do not recognize our relationship to that family. We look upon ourselves as individuals, but we have an inter-dependence with provincial and national life. A house divided against itself cannot stand. That is historical. A community divided against itself cannot prosper.

Fewer and Bigger Towns

"There are tendencies going on towards the centralization of population. In my opinion we are going to have fewer towns and bigger towns. Community building is a real problem.

"The greatest ally of the mail order house is spelled with three letters, 'MUD.' In your town two things are necessary to make good towns. Good roads and good stores. Good roads make a poor town, unless it has good stores in it. Good stores don't make a good town, unless there are good roads in an agricultural community. The town with the best roads and stores will be the best town.

Things That Make a Good Town Internally

"A town must be a good place to live in and a good place to make a living in. One of the problems of the Canadian Northwest is to make your towns a good place in which to live. The natural advantages of that country are unsurpassed."

The following four points were emphasized by Mr. Stockdale as being the essentials of a good town:

Production or manufacture.
Transportation.
Trade.
Civic Welfare.

"People are congregated in a town for trade," continued Mr. Stockdale. "If the prosperity growing out of that trade is not directed along the lines of civic welfare, the town is not much good. Water supply, sanitation, streets, sidewalks, schools, entertainment features are the essentials of civic welfare. In all new countries the problem is to make them good places to live in. People make values and the country wants people.

Town as Big as the Territory Served

"The single taxers say 60% of our values are social values or community values brought about by the coming together of people. There is a lot of truth in this. The average man does not realize what it means to bring people to his town, or what it means for people to go out of his town. The farmer opposes the interests of the farm, because of the imaginary Chinese wall built around the town. How big is your town? You will say 200, 300, or 1,000. Your town is as big as the trade territory that you supply. If you reach out fifty miles, that is the size of your town. You want to protect that town front. The fronts will overlap a great deal.

"One farmer thinks the town people are a nuisance and sends away for everything he wants. This farmer's land is worth $100 an acre, compared with $20 for better land in another section not so close to town facilities. He gave for his reason for not moving to the better and cheaper land the fact that he had had enough pioneering. This farmer's land was worth five times the price of better land, because it was near a town.

"You cannot pioneer in a crowd. The farmer's wife has social connections in town, the children attend the town schools, the son works in a store in town. These things enhance the value of the land located near the town, and the farmer owes the town something for increasing the value of his property.

"The bigger the town is, the farther

the influence on farm property extends. Some people vote down school improvements, but this is a serious matter. The town with good schools and churches draws people. This is the basis of community development.

Attracting the Right People

"How can you induce the greatest number of people to live in your community? There are two kinds of people that are attracted to communities; one is the old man who has made his money. The other is the young man who wants to make his money. One has fortune and the other has energy. These are the shifters. Communities of the East are losing to the communities of the West the men of this class. Old men go to California, because it is a better place to live in. The man who makes money in this country gets out of this country unless he gets good roads. There are 75,000 people from the State of Iowa in the Iowa Society of California. There are 125,000 Iowans in California. They are not there for the climate, as most people think. California has had its climate for a long time, but it is only recently that the people have got the habit of going out there in such numbers. One official of the railways, who investigated the matter, said people were going to California for good roads. One farmer in California stated that he spent most of his time motoring while in California, and that he spent $6,200 in five years on car expenses.

"The climate makers of California are the drawing card. The spirit of the people of California makes it what it is. They are real boosters in Los Angeles —the city advertising built. They back their boosting with their money too. The booster who does not back it with his money is a four-flusher.

"Good roads are needed to hold the people, and good roads are a factor that is developing and causing this evolution in our communities.

Measuring Miles by Minutes

"The way to measure distance is not by miles, but by minutes, between towns. Thirty-five miles may be forty-five minutes, or four hours. Good roads will develop the community, and these good roads are going to eliminate a lot of the small towns. There are just two things a small town can do—either grow into a big town, or get off the map. Small-town people get busy.

"If a town has good transportation it is a good retail town. The support of the town comes from the dollars that go over the retail counter. Thirty cents of every dollar goes to pay telephone, out of every dollar and goes into circulation.

"Retailers are the backbone of the community from an economic standpoint. It is not what a man earns—that is an individual asset, but what he spends—that is a community asset."

A 100 Per Cent. Citizen

At this point Mr. Stockdale outlined the following as a 100 per cent. citizen:

Man who works in community, 10 per cent.

Man who lives in community, 40 per cent.

Man who spends for all he needs in community, 50 per cent.

"Money must go over the retail counter before you can have civic welfare," said Mr. Stockdale, continuing. "The trouble with the average community is 'smugosity' (a word coined by Mr. Stockdale to express the self-centred composure of some communities). Smug meaning self-satisfied,and ossified meaning bone.

"Ignorance is shown in modern community building. We adhere too much to individuals. The price of co-operation is sacrifice. You have to sacrifice some of the things you would have as an individual to have the things you would have by co-operation.

"What is the great improvement in city government, which we have had in the last few years? The commission form of government. You cannot wipe out a town instantaneously, but it is the slow fire of competition which does the damage. The war shows the value of unity of command, purpose and action. That is the secret of community building.

"Some towns furnish everything to make a real organization, but nobody is willing to furnish the time and energy. We have to get all the interests of the community together. If you are going to have a good community you must get individual responsibility. This co-operative work is a part of your business, not as a community duty. You help to gain by helping the other fellow to gain.

"If you want to live in the kind of a town
Like the kind of a town you like,
You needn't slip your clothes in a grip
And start on a long, long hike.
You'll only find what you left behind,
For there's nothing that's really new.
It's a knock at yourself when you knock your town.
It isn't your town—it's you.

"Real towns are not made by men afraid
Lest somebody else gets ahead.
When everybody works and nobody shirks,
You can raise a town from the dead.
And if, when you make your personal stake
Your neighbor can make one, too,
Your town will be what you want to see,
It isn't your town—it's YOU."

REQUIRE LICENSES

The Safety and Health Committee of the council at Edmonton, Alta., has recommended the passing of a by-law compelling all persons who do electric work to take out a license. The matter was taken up with the committee by a delegation of electrical contractors. Some objection is being taken to the by-law on the ground that it is too arbitrary.

QUESTIONS AND ANSWERS

Continued from page 28

CAN'T RAISE STEAM PRESSURE

Question:—Last fall we installed a ——boiler in a store at ——. We have never been able to raise one pound of steam on it. We had never put that type of boiler in any of our buildings before, but we know that other people have been able to raise steam on the same size of boiler carrying a larger load of radiation. The people that sold it to us have promised to send a man down to see what is the matter, but we have not seen him yet, and while waiting for him we thought we would write to you and see if you could suggest what might be the trouble. We have washed the boiler out several times with soda, so the water should be clean. Another thing, there seems to be a rumbling in the boiler whenever we have a good fire burning.

Answer: — The noise in the boiler would lead us to believe that there was still some oil in the boiler in spite of the frequent washings that it has received. We would suggest that you turn off all the radiators and run the water off the boiler through the safety valve opening, while maintaining a hot fire on the grates. The flushing out of the boiler should be maintained steadily for three hours at least with steam pressure indicating on the gauge up to 10 lbs. See that the boiler is setting level on the floor. See that there are no air leaks into the boiler caused either by missing cleanout stoppers or otherwise; that the check draft is not open; that draft chains are properly adjusted; that weights on automatic damper levers are in their proper positions; that the damper is set the right way; that the heating surfaces are clean and that there is no core sand in the grate teeth. Examine the flue and see that there are none of the following conditions: Cleanout door allowing air to leak into the flue. Flues cross connecting. Air leaks of any kind in flue, including pipe of any other appliances. Smoke pipe reduced. Smoke pipe in flue too far in. Reduced size of flue. Flue not high enough. Boiler too far from flue. Obstruction in flue. No air entering boiler room. Other buildings or trees affecting draft.

BALDWINS, LTD., TO HAVE TIN PLATE MILL AT TORONTO

Baldwins, Ltd., of Swansea, Wales, is negotiating with the Imperial Munitions Board and the Harbor Commissioners of Toronto to purchase the plant of the British Forgings Co., at Toronto, Baldwins, Ltd., plans to establish a large tin plate mill and would use the electric furnace of the forgings plant in making steel ingots. The plant has a capacity of about 450 tons of steel per day. It would be adaptable to the manufacture of tin plate with few changes so far as the electric plant is concerned, but considerable additions would be required for the rolling and dipping of the plate.

American Plumbers Co-operating

Secretary Frankland Tells of Good Results Reported by Delegates to the Big Convention at Atlantic City—Trade Extension Idea Is to Make Every Plumber a Business Man and a Salesman

"THE members of the craft in the United States have realized the value of co-operation and they are working together splendidly and getting real results," said Garrett F. Frankland, of Toronto, secretary of the Canadian Society of Domestic, Sanitary and Heating Engineers to SANITARY ENGINEER on his return from Atlantic City, where, as official delegate from the Canadian organization, he attended the thirty-seventh annual meeting of the National Association of Master Plumbers of the United States. There was a large attendance from all parts of the country at the gathering, which was held on June 17th, 18th, 19th, and Mr. Frankland states that a great deal of time was spent in the discussion of what has been done through co-operaone can see is the trade extension plan This work is carried on by the Trade Extension Bureau. One of the ideas of the Bureau is to impress upon every plumber the vital importance of his being a businessman and a salesman. A paragraph issued to the trade in a recent bulletin of the Extension Bureau sums up the whole idea as follows: "When every contracting plumber and fitter has become a businessman and a salesman and when every old building has been renovated of its antiquated plumbing and heating, then our work will be done."

Adopting the Plan

"The plumbers on the other side of the line have realized that if they were to get anywhere they had to learn the business side of their trade. No matter how good a workman a man was if he did not know how to figure correctly, and that means taking account of overhead and everything else, he was going to come out short. This situation was just as bad in the United States as it is in Canada and for exactly the same reasons, the plumber was a plumber and knew nothing about business. Through the work of the various associations and of the Trade Extension Bureau, though, the number of plumbers who are becoming real businessmen and real salesmen has been tremendously increased. The movement is gaining ground all the time, because the plumbers who are still working along the old lines are finding out that they are not able to remain in the race with men who are doing business in the right way. They are falling in line, not by ones or twos, but in scores.

Lesson for Canadians

"There is a big lesson for the plumbers of Canada in what their comrades across the line are doing. They can see the results of working along the right lines, eliminating price cutting, charging fair prices that allow of fair profits, and of going after business in an aggressive manner. Every man in the trade should be a businessman, and everyone should also be a salesman. We are working through our associations along these lines in Canada, and every plumber in the country should give the work his most hearty support."

Mr. Frankland states that at the convention there was a good deal of discussion regarding reconstruction problems, especially in connection with the building trades. The opinion was general that a great deal of work will be carried on and the trade appeared most optimistic regarding the outlook.

Co-operation Counts

The Trade Extension Bureau will do its share in helping the plumbers to go after new business, especially in developing small business. A campaign is planned in which the manufacturers will take a very active part and in which advertising will be a feature. The master plumbers are also co-operating actively in all that is being done. Mr. Frankland states that the Trade Extension Bureau is an exceptionally strong organization, which includes the National Association of Master Plumbers, National Association of Heating and Piping Contractors, the Range Boiler Manufacturers, Sanitary Potters' Association, Soil Pipe Manufacturers' Association, National Association of Brass Manufacturers, Enamelled Sanitary Ware Manufacturers', Association, the National Boiler and Radiator Manufacturers' Association, the Trade Press and other bodies. It is aimed to deal with all trade problems in a practical way and in the manner best suited to work out in the best interests of all. It has been working for nearly two years and has made great progress, and this is being fully maintained.

Had a Booth

In order to extend its work among those who attended the big convention in Atlantic City the Bureau had a special booth, where all the visitors were welcomed and the objects of the work explained. Mr. Frankland states that many of the manufacturers and jobbers also had exhibits in which the delegates were keenly interested.

In connection with the work of the Ontario Association, of which he is also secretary, Mr. Frankland is planning shortly to visit the Niagara Falls district and discuss trade matters, especially organization work, with the members of the craft. Other work of a similar nature will be undertaken in various parts of the province, and the members of the Executive plan to hold monthly meetings at points from which they receive requests for help in connection with the work. In the evenings, after the regular executive meetings, they plan to visit the local associations and discuss with them matters of importance to the trade.

A RISKY OCCUPATION

The Toronto "Globe" man has been figuring out the capacity of electric furnaces. Simple thing, too—just as simple as measuring snow with a stic' or stepping off a frontage with your feet.

The "Globe" goes on to say that Toronto has "the largest single electric steel plant in the world as far as known." So far so good. Then the "Globe" goes on to tell its readers just how great this great furnace is:—

"The ten six-ton Heroult furnaces at the British Forgings plant are capable of turning out sixty tons of high-grade steel per day."

Quite so, but why stop at sixty? The "Globe's" man has proceeded on the good old plan that two and two make four. Therefore, ten six-ton furnaces equal ten times six, which makes sixty! Splendid!

But the "Globe" might be surprised to know that this plant has turned out as high as 350 tons per 24 hours, even with its "sixty tons per day" capacity. As a matter of fact, these furnaces can take a heat every five hours, and if worked at anything near real capacity, can make five heats per day. Taking only sixty tons per day from such an outfit as the British Forgings have would be about the same as having a plant and staff equal to that of the "Globe" for the production of a weekly paper.

The "Globe" is quite right in stating that ten times six makes sixty, but it should also recognize that computing the capacity of electric furnaces is slightly different from painting the political situation at Ottawa.

CAUSED BY LIGHTNING

Lightning started a fire which caused a loss of $1,800 at the Anthes Foundry in Toronto. John Bibby, the manager, had his arms somewhat severely burned while trying to rescue his auto.

What Others in the Trade Are Doing

How Plumbers All Over the Dominion Are Keeping Their Names Before the Public —There May be Many Hints in Some of These Advertisements Which You Can Use With Good Results When You Are Arranging Your Own Copy

Andrew Sheret, Victoria, B.C., devotes one-half of his double column advertisement, two and a half inches deep, to an illustration of a handsomely tiled bathroom in which HEALTH, represented by a woman, is a central figure. The rest of the ad. is occupied by the following announcement: "Plumbing and Heating, (in display), bath tubs of high-grade quality now selling at the reduced price of standard grade. We also stock the extra heavy Kitchen Range Boilers which will last the life of two of the ordinary."

* * *

Kellow & Robinson, Leamington, Ont., make the following announcement: "All Settled (in display type). We are now running smooth in our new place of business, and in better position to handle all work promptly and efficiently. Get our estimates on new or repair work for plumbing, heating, tinsmithing and electric wiring."

* * *

Greenaway & Elliott, Bowmanville, Ont., in a two column advertisement, four and a half inches deep, show an illustration of themselves just coming out of the doorway of their garage in their auto already to start on a job. Below is the following: "Besides being first-class plumbers and tinsmiths we are agents for —— sheet metal building goods. Phone 18, Day or Night."

* * *

Thomas Hoare, Pincher Creek, Alberta, in a display ad. two columns wide and five inches deep, surrounded by a border, announces: "Another new venture (in large display type). Plumbing, heating, tinsmithing (in smaller display). Having opened up a work shop in town I wish to announce that in addition to plumbing and heating I am prepared to do other work such as eavestroughing, water tanks and watering troughs, of any size made to order. All kinds of tinware repairs. Deep and shallow well pumps. Installation and repair work. Auto radiator repairs, phonograph repairs, lawn mower grinding. In fact anything you may want fixed and that you don't know just where to get it done, bring it here. Shop right at the bridge, but any work left at Jackson Bros. will be attended to. I will quote prices on any job (in display)."

* * *

E. S. Coppins, Woodstock, Ont., is going out after business in adjoining territory. In the Oxford "Tribune" published at Ingersoll, Ont., he has a single column space, three inches deep, in which he announces in display type: "E. S. Coppins, 371 Dundas St., Woodstock, Ont., Plumbing and Electric Fixtures of All Kinds. Get our Prices."

* * *

Noble & Rich, London, are also after business in Ingersoll, which is located 18 miles east of London. In a double column advertisement, five inches deep, they show an illustration of a handsome bath tub with shower. Under the caption "A Nice Bathroom" in heavy display type they say: "A nice bathroom and equipment is a good feature to any house. It enhances the value and makes life a pleasure for its occupants." The cut shows you a shower bath suspended over the tubs. "This shower is a beautiful piece of plumbing. To take a shower when you rise in the morning will send you down stairs three steps at a time, ready for the chores, breakfast and work. Write us to-day for particulars. We are always pleased to let you have prices and information."

* * *

Peter & Sylvester, Stratford, Ont., devote their entire space to the following announcement in display: "Cook by Electricity. See Our Ranges."

* * *

D. N. Flander, Ingersoll, heads his advertisement "Do you need a new stove or plumbing?" and the reading matter goes on to extend an invitation to all to come and look over the stock. The advertisement closes with: "We will accept bonds in payment of purchases at this store."

* * *

Edward Mackness, Sarnia, Ont., features "Perfect Plumbing" in the heading of his announcement to the public and then continues: "If you knew the perfect nature of the plumbing work we have done for others in this community, we feel quite certain that you would have employed us long ere this. But you need not put it off longer. Send for us and get acquainted with the perfect plumbing we do. Plumbing, heating and tinsmithing estimates, cheerfully given."

* * *

J. C. Stewart, Weyburn, Sask., uses a double column space to an illustration of a deep sea diver repairing a an attractive illustration showing a three-piece bathroom set and a satisfied owner looking things over. The advertisement is headed: "Have a Beautiful Bathroom," and in display type the announcement continues: "Farm and City Home, Every Job Guaranteed, See J. C. Stewart."

* * *

The Hunt Plumbing Co., London, Ont., devotes one-half of its space to an illustration of a deep sea diver repairing a pipe a long way under water while a fish watches the work. The advertisement goes on to say: "That no matter how difficult the job is, the Hunt Plumbing Co. will tackle it and the customer is assured of the best possible service."

* * *

Marsh & Scott, Medicine Hat, Alta., in a double column advertisement, two inches deep, make the following announcement: "Marsh & Scott, plumbing, heating, sheet metal work, tinsmith and repairing, Sixth Avenue, Phone 3655."

* * *

R. A. Bond & Co., Medicine Hat, Alta., in a single column advertisement, two inches deep, say: "R. A. Bond & Co., First St., Plumbing, heating, sheet metal work. Repair work is our specialty."

* * *

Gordon Mann, St. Thomas, Ont., in a liner advertisement says: "Gordon Mann, Spohn Block, corner of West End Market, Phone 1434, Best Materials, Competent Workmen, Reasonable Prices."

* * *

Howard Statham, Strathroy, Ont., who as stated in a recent issue of SANITARY ENGINEER, handles bicycles as a sideline in connection with his plumbing shop, devotes his entire advertisement, three columns wide and two and a half inches deep, to boosting the machine he handles. He says in part: "The best Made in Canada and fully guaranteed bicycle. Supreme in material, appearance and lasting quality. The service we give after the wheel is yours is a big consideration. Come in and see our stock of bicycles, sundries and tires."

EDITORIAL COMMENT

THE SIGNING OF PEACE

NOT since the armistice has anything occurred which has so affected the markets of the world as unconditional acceptance by Germany of the terms of peace laid down by the Allies. The effects though are vastly different. The signing of the armistice brought to a sudden stop months of ceaseless activity and many looked out on the reconstruction period with no little misgiving. So far Canada has come through the after-the-war period splendidly. All over the country plumbing men report that business has been excellent and that it gives every promise of remaining so. In spite of strikes and labor troubles business in general has been good. Behind everything though there was always the doubt as to what Germany was going to do in regard to the armistice. This was reflected perhaps more in British and American circles than in Canadian business, and caused a great many projects to be held up until it was certain that there was to be no resumption of hostilities. Possibly one of the great factors in deciding the Germans was the firm stand taken by the Allies. The Hun knew that if he attempted any of his old tricks and did not sign at the time specified several powerful Allied armies in command of Marshal Foch would at once occupy German territory. The final surrender is as complete as that indicated by the armistice. The results will be immediate and far-reaching in business. The commercial world will feel free to go ahead unhampered by any more shadows of war. No country on the globe has a brighter future than Canada and big men all over the country are looking for a period of steady development that will last for many years.

KEEP WELL POSTED

NO man can know too much about the business in which he is engaged. The greatest prizes in the commercial world to-day are going to the men who know. These men, because they have the energy necessary to become posted on all sorts of details which the average man passes up as unimportant, get a wider vision which gives them a tremendous advantage. They study most carefully the needs of the buying public which they serve and not only supply them but by judicious management create new needs. They are posted thoroughly on time-saving and labor-saving methods because these things under present day conditions mean either a big saving or a big loss. By using the general knowledge which they are constantly seeking they develop the faculty of being able to think and what is equally important to act quickly. This naturally develops in the man aggressiveness in business that can be obtained in no other way. It makes them keen merchants and keen does not in any way mean that they are ready to stoop to methods of unfair dealing, but that they are quick to see the chances for trade and quick to take advantage of them. Most persons who have come in contact with the outstanding figures in the retail trade to-day are astonished at the wide knowledge they have. These men would be expected to know all about their own stores, but they frequently surprise people by the grasp they have of numerous details, most of which when analyzed will be found to have a bearing of some kind on the business in which they are engaged. There is nothing superficial about this knowledge. It is based on actual facts, because accuracy is a vital element in successful business building. Small mistakes will often wreck a business quicker than anything else and no one knows this better than the keen retailer.

SHORTER WORKING HOURS

IN view of the continued and successful demands on the part of employees for shorter working hours the experiences of some of the large British firms is somewhat interesting. These firms feared that shortening the hours of labor would greatly affect production and also decrease the efficiency of the capital required to carry on the business. In one case, two twelve-hour shifts were changed to three eight-hour shifts and it was found that the output increased. Then Lord Leverhulme, the British soapmaker, tried out the plan of having four six-hour shifts at some of his numerous factories. It is stated, that the management is confident that the men work harder per hour than under the old system and that in this way the output is increased and the working efficiency of the capital made greater. The latest British advocate of the shorter working week is Lord Northcliffe, who, it is stated, may try out a plan for a five-day week for all brain workers in his employ. Retailers all over the world are particularly interested in the move for shorter hours, as thousands of their employees are watching what is happening and are making their demands from time to time.

NEEDED LARGER VISION

THE question is often asked why Government operated enterprises cannot be operated as efficiently as privately owned businesses. Some clue to the answer may be shown in the figures which follow. The United States Railroad Administration, which controls properties valued at more than twenty billion dollars, recently decided to expend $1,000,000 in advertising for passenger travel. At the same time came an announcement that the tea associations were going to spend at least $2,000,000 to stimulate tea drinking and that one sugar company was preparing to spend $2,500,000 in advertising. Neither the tea firms nor the sugar firm are in a class with the railway organization when it comes to capitalization. The handling of the railways, moreover, bears closely on the prosperity of the entire country, and yet those directing affairs probably thought they were doing something really big when they decided to spend a million for advertising. One reason apparently why Government enterprises usually are not a success is because the men at the head of affairs are not big enough men or men with a broad enough vision to see the needs of what they are directing or its possibilities of development. Those in charge of the railways realized that they ought to advertise. They will get results from their advertising too, but they will not get the full results because they have not realized the importance of what they are trying to do. If the men who planned the sugar firm's advertising or that of the tea companies, had the work of laying out a campaign for a $20,000,000,000 corporation they would limit the expenditure to a million. It is just because big men undertake big things that they get big results. The same thing applies in proportion to every retailer. The man who expects to build a big business by using a one-inch space once a week, giving his firm name only and not telling the people anything about what goods he has to offer, may get some business as a result of his advertisement. But, imagine how much business the mail order firms would get if they depended on that sort of advertising, or what the turnover of some of the big retail stores would be if they limited their advertising appropriation to a dollar a week.

HIGH WAGES AND BUYING

ONE of the greatest changes that merchants and manufacturers, looking out into the new world that has followed nearly five years of war, find is the radical advance in wages. These have been so general as to affect the whole commercial fabric. One result of the high wages in Canada during the war period has been to make business in general, and the plumbing business in particular, especially good. The plumbing trade was perhaps never in its history on so sound a basis as at present. So far business during the reconstruction period, while perhaps quiet in a great many respects has been in a thoroughly healthy condition. There is every indication that it will remain so and that strikes and other disturbances are not going to have any really serious effects. As a result of the high wages that have prevailed the buying power of the general public was tremendously increased. The average man has been making good money and he has been spending more than ever in making his home a better and more comfortable place, or in buying things that will enable him to do his work quicker and more efficiently. Now that he has learned what he can do, it is safe to say that his tastes from a buying standpoint have been raised and that he will continue to be a better buyer than he was before. One of the very largest buyers in the Dominion to-day is the farmer and he is likely to remain one of the premier purchasers. Taking a general survey of the outlook indicates that the plumbing men are likely to be large gainers as a result of the higher wages. Will wages decrease? There is no chance of this apparently if organized labor can prevent it. Little by little conditions are becoming stabilized and things are getting back to a normal basis as far as volume of business is concerned.

MEANS LARGER BUYING

THE last issue of the *Labor Gazette* gives some interesting figures showing how wages have advanced in the past year. The statistics also indicate that there is little lack of employment this season, as compared with the same period a year ago when things were very busy and help scarce. In Montreal in April of 1918, 4,916 temporary workers in the first fortnight received in wages $90,352.12. In the same city during April, 1919, 4,417 temporary workers received in a fortnight $129,603.88. This indicates the much higher schedules in effect and the figures in other places show that the increase is general. In Victoria, for instance, in April, 1918, 200 workers received in wages $7,369.63, while in April, 1919, 198 workers received $9,019.80. At St. John, N.B., 247 workers received $8,161, as against only $7,627.27 received in the same period a year ago by 267 workers. All this has an important bearing upon retail trade in all its branches. People are making more and are spending more making full allowance for the fact that commodities have advanced. The average man is living better to-day than he ever did. The section of the buying public hit hardest by the increased cost of merchandise are the fairly well-to-do people working on a fixed salary, or those people who have money invested and receive from it an income that does not vary appreciably. These people have had to curtail their buying, while on the other hand, the average worker has been buying as he never bought before.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

LOSS IS $50,000

Fire, which started in a storehouse of the R. McDougall Co. at Galt, Ont., spread to the pattern shop, destroying both buildings and causing a loss of $50,000. The firm manufactures pumps and tools.

LAVATORIES FOR BEACHES

Residents of the Beaches district, Toronto, are bringing the lack of public conveniences in that section of the city, which may almost be called a summer resort from the number of its summer residents, before the city council.

PUBLIC CONVENIENCE FOR GUELPH

Guelph, Ont., is seriously considering the installation of public conveniences in the basement of the City Hall. These would have outside entrances, illuminated at night.

MONTREAL BUILDING BY-LAW

Montreal's building by-law, which has been under consideration for the past eight years, is nearly ready for adoption. The draft of the by-law is at present being submitted to the Engineers' Institute, Architects Association, as well as the Plumbers' and Builders' Associations and the Fire Underwriters.

Details are not yet available, but it is known that the by-law will be published in both English and French.

TENDERS

Sarnia, Ont., ratepayers will vote on a by-law on July 14 to provide $350,000 for a new combination technical school and collegiate institute.

The Greenfield Land and Construction Co., 225 St. James St., Montreal, plans the erection of four $4,000 residences.

Tenders will be called shortly for the erection at St. Thomas, Ont., of two new six-roomed public schools.

The McEachern Construction Co., of Toronto, has commenced the erection of twenty-five new dwellings at Leamington, Ont.

W. J. McFadden, Durham, Ont., has commenced work on two new dwellings. Plumbing to be let.

George W. Beatty has commenced work on a business block at Forest, Ont., to cost $10,000. Plumbing to be let.

The Hospital Board at Galt, Ont., is calling for tenders for a new home for nurses to cost $30,000.

The Republic Motor Truck Co., of Alma, Michigan, is preparing plans for a Canadian branch factory at London, Ont., to cost $150,000.

Wilbur R. Webb, 537 Greenwood Ave., Toronto, is receiving tenders for the erection of four bungalows to cost $16,000.

John McCormack, 364 University Ave., Montreal, will let plumbing and heating contracts for new twelve-flat residences, costing $20,000, for the Lakeview Land Co.

DEATH OF L. T. HUNT

The death occurred at Rochester, Minnesota, following an operation, of L. T. Hunt, hardware and plumbing, Thorold, Ont. Mr. Hunt was for some years in business at Alvinston, Ont., but about ten years ago went to Thorold and took over the business of the late C. N. Stevenson. His son, W. H. Hunt, was engaged in the business with him. Mr. Hunt had been ill for more than two years.

HISTORY OF WAR PRICES

A history of prices during the war, covering the whole field of prices from the beginning of 1913 to the end of 1918, is announced for publication in the form of a series of bulletins by the Price Section of the United States War Trade Board.

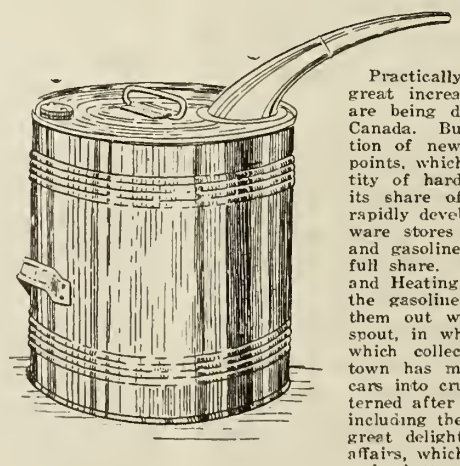
The bulletins now in press were designed especially to the needs of business men by their division into 50 important industrial classes. There is, for example, a complete price inquiry of interest strictly to cotton men, and one for each important class coming under the general head of food, clothing, rubber, paper and fibres, metals, fuel, building materials and chemicals. The history of prices during the war, which, when finally printed, will include 57 bulletins, will be issued piecemeal.

LEADING FIGURES

David K. Trotter, secretary of Local Union No. 144, Montreal, sent the following letter to the Montreal "Gazette":

"To the Editor of the "Gazette:

"Sir,—At a meeting of the Master Plumbers' Association of Montreal and vicinity held here to-day, exception was taken to statements in an item published in yours of yesterday under the caption, "The Plumbers' Union." There it is stated that 'the scale of wages (for plumbers and steamfitters) is from 30 to 35 cents an hour,' and further, that 'no increase in wages has taken place during the last four years commensurate with the higher cost of living.'



Selling Lots of Gasoline Cans

Practically all trades are benefiting from the great increase in the number of automobiles that are being distributed among farmers in Northwest Canada. Building material is required for the erection of new garages that are being erected at all points, which entails the need of a considerable quantity of hardware. The blacksmith trade is getting its share of repairs, and, indeed, blacksmiths are rapidly developing into expert repair men. All hardware stores are going in for auto accessories, oils and gasolines, while the tinsmiths are reaping their full share. The proprietor of the Yorkton Plumbing and Heating Company stated that he was selling all the gasoline cans he can manufacture. He turns them out with an exceptionally long funnel-shaped spout, in which is placed a fine meshed wire screen which collects all dirt. Another tinsmith in this town has made quite a success of converting Ford cars into crude racing models with a new body patterned after that used on the speedways to the south, including the wasp tail. The younger farmers take a great delight in running into town in these rakish affairs, which not only have a sporty appearance, but make better speed over country roads with the load placed closer to the ground.

"The officials of Local No. 144 who released this particular information must have been asleep on their jobs during the past four years; or, if new ones, they have not been thoroughly coached in conditions presently prevailing.

"These are the facts: First-class plumbing and steamfitting firms in Montreal (and they are many) were paying competent mechanics in these trades in

	Per hour
1915	37½ cents
1916	40 cents
1917	42½ cents
1918	45 to 50 cents

while a month ago this association recommended its members in view of the increased cost of living and the rise in wages that was taking place in other branches of the building trades to pay first-class plumbers and steamfitters up to 60 cents per hour.

"In justice to the master plumbers of the city, I trust you will give the same publicity to this statement as was given to the one complained of.

DAVID K. TROTTER,
Secretary.

ELECTRICAL BUSINESS DEVELOPING FAST

Continued from page 19

their homes and their stables by electricity, and in, addition have provided for their wives' taking advantage of the power by getting electric washers, electric cleaners and many other electrical appliances. The number of farmers enjoying these comforts is growing far faster than those not in touch with the sales have any idea. And those in the trade state that they will continue to grow because electricity has demonstrated beyond any question of doubt that it is a real servant, and does its work quickly and economically.

Tell One Another

Electrical devices very often sell themselves. They are obviously so efficient and so simple that anyone can see their value. And people have not been slow to appreciate the value of a helper of this kind, especially those who have been having trouble in getting hired help. No woman who has ever used an electric iron, or an electric washer or an electric vacuum cleaner ever wants to go back to the old methods. She is not only satisfied with her electric helpers but she is a tireless booster for them among her friends. This is perhaps one of the main reasons why electric goods are selling so fast. It is also one reason why so many dealers have been quick to see the opportunity and take advantage of it. The sanitary engineer comes into close personal touch with the homes in his community, and when they find a demand for goods that will render real service in the homes they are right there to look after all the business that is offering. Electricity has, perhaps, done more in the past ten years to make the homes of Canada better and more comfortable places than any other agency. It is also doing more to take the drudgery out of housework than any other agent. Not only this but it has shown people miles out in the country and away from power lines that they can have at small cost all the electrical conveniences that are to be found in the most expensive city homes. Is it any wonder then that the demand for electrical goods of all kinds is growing by leaps and bounds?

Because building has been held back for nearly five years the sanitary engineers have not been able to do anything like a normal trade in fixtures. Now, however, with the building all over Canada showing a steady increase there are going to be some splendid chances for business. Every home that is built, almost, offers more or less prospects for fixtures. Certainly every home that has electricity in it offers prospects for more business. The mail order firms have been making a big drive in the electrical business of all kinds, both fixtures and utilities, and they have got results. The local dealers, however, have been handling a big share of the trade, selling more in the aggregate, it is stated, than either the straight electrical dealers or the mail order firms. The sanitary engineers now are one of the big factors in the distribution of electrical goods and they are steadily increasing their sales.

"There is a big and steadily growing demand in all parts of the Dominion for electrical fixtures," stated one large distributor to SANITARY ENGINEER. "Owing to conditions during the past four years there has been nothing like the opportunity for selling electrical fixtures that there will be from now on With the revival of the building business there will be splendid chances for the sanitary engineer to sell fixtures. They handle general supplies, sockets and so on, and handling electrical fixtures is a logical development. People all over the country who are building houses will require a lot of electrical fixtures and equipment, and there is a splendid opportunity to get this business. It is a perfectly legitimate class of business for the sanitary engineer to go after. The mail order firms sell thousands of dollars' worth of fixtures every year to people all over the country, who buy from the mail order houses and then get a local electrician to put them up or put them up themselves. If the local dealers will go after this business it is theirs and they should go after it because it carries a good profit, it is a nice trade to handle and the fixtures make an attractive showing in the store."

Another source of business is that offered by the farmer according to this distributor who dealt with this phase of the question as follows:

"There is a big demand from the farmers for electrical labor saving equipment of all kinds, and it is going to be a lot bigger. In Ontario the electrical lines are being extended to all parts of the province. In the Northwest, where there is no such power available, we find a large increase in the sales of home power plants. This business is growing fast and it brings with it the sale of utilities as we supply connections and equipment by which the farmers who have their own power plants can connect up with the washing machine or other devices.

"Never in the history of the business," this factor pointed out, "has there been such an advertising campaign as is now being put on by makers of the various appliances. In the big American magazines they are using pages of space each enormous interest on the part of the buying public and this is being reflected in Canada. We can notice more results now than were apparent a year ago."

Electrical fixtures and supplies lend themselves to attractive arrangement and by following up the displays with aggressive sales work of the right kind, the dealer will find this a department which responds quickly to a little energetic development.

CANADIAN GAS CONVENTION

The annual convention of the Canadian Gas Association will be held at the Clifton House, Niagara Falls, on August 21st and 22nd. An excellent program of papers is being arranged. The officers of the association are C. C. Folger, Kingston, Ont. president; V. S. McIntyre, Kitchener, Ont., vice; C. S. Bagg, Montreal, 2nd vice; George W. Allen, secretary, Toronto; and executive committee, J. P. King, Stratford, Ont.; Arthur Hewitt, Toronto; J. S. Norris, Montreal; A. A. Dion, Ottawa; E. H. Caughell, St. Thomas, Ont.; J. M. H. Young, London, Ont.

—Briggs in Chicago "Tribune."

LOCATION OF RADIATORS

Question:—I have a client who wishes to have the radiators in his new house placed against the inside walls. He says that a fitter told him that the belief that radiators were better against an outside wall was only superstition, and that he could show him lots of places where he had put the radiators on the inside walls, with excellent results. What is your opinion?

Answer:—Our opinion is that a radiator should be placed in the coldest part of the room. The coldest part of the room is ordinarily close to a window or an outside door. The faster the air circulates around a radiator and the greater the difference between the temperature of the heating surface and the air, the more efficient is the radiator. Another thing, if the radiator is against the warm inside wall the warm air above the radiator will ascend to the ceiling and down the outside wall, where it becomes cooled. Then this cold air passes over from the outside walls across the floor to the radiator where it is again warmed. The result is that it is always quite cold at the floor line and too warm at the head. Everyone knows that such a condition of temperature is anything but conducive to physical well-being. When radiators are placed against inside walls, and no complaints have been registered by the occupants of the rooms it is a pretty good guess that the rads are in rooms not much used as sitting rooms or offices. The only argument in favor of putting radiators against the inside walls is one of economy in the cost of installation.

UNBALANCED CIRCULATION COIL DOES NOT HEAT

Dear Sirs:—

Kindly give me some advice on this job that I am sending you a rough sketch of, as we find that the coil does not heat properly but the range boiler heats fine.—Yours truly, Nova Scotia subscriber.

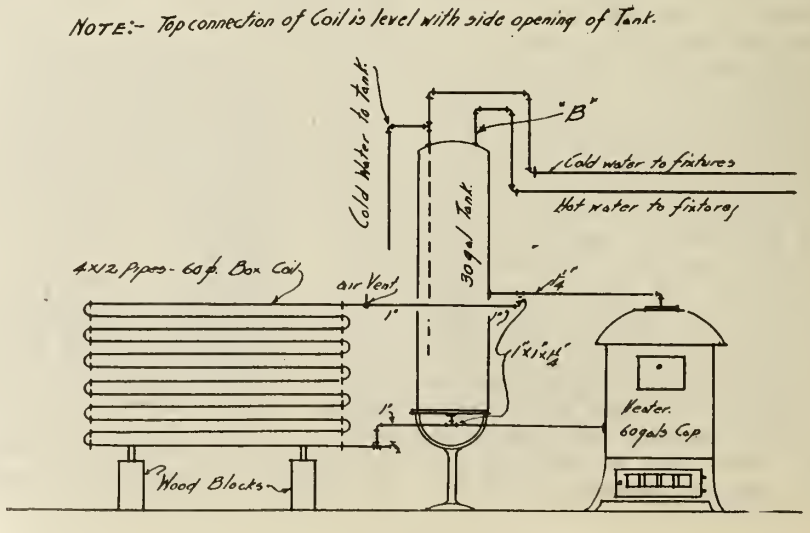
Answer.—Unless the draw from the tank is less than the average, or that the coil is larger than might be actually required in a 60 gallon tank heater is not large enough to be properly connected to the load represented by a 30-gallon domestic tank and a box coil of 60 square feet of radiation. Under ordinary circumstances all that a heater of that size could be used for in addition to the 30-gallon tank would be a surface equivalent to 45 square feet of direct cast iron radiation. However, it is evident that the principal difficulty experienced in the operation of this system is the faulty circulation due to an unbalanced arrangement of piping.

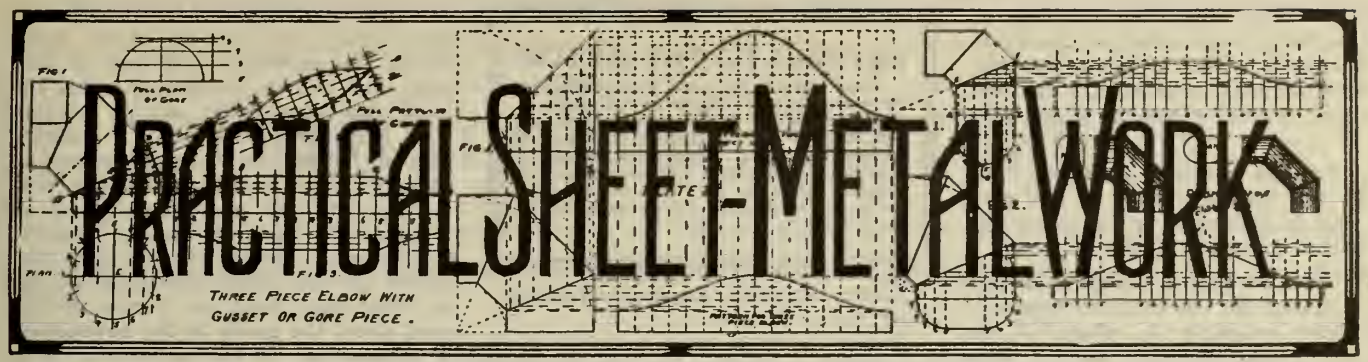
We would recommend that the side opening in the tank be plugged, and that the hot water feed from the heater to the tank, fixtures and coil be connected by way of a tee in the pipe marked "B." When connecting the feed to the coil keep it a little lower than the highest part of the branch leading to the fixtures and then it will not be necessary to provide air vents.

It would be well to lower the horizontal pipe running below the tank so that the return from the tank would be a little lower than the return from the coil. In fact it would be better to drop that return line down close to the floor so that there would be a decided riser where the return connects with the heater. In the work of connecting radiators to a domestic water supply a rare degree of care and skill is required; much more so than in ordinary steam fitting practice. Watchfulness must be exercised at every turn to guard against too easy a flow through any part of the system at the expense of some other.

The way the installation is made as indicated on the accompanying sketch, the pipe coil is just setting to one side of the circulation, and as the flow through the tank is so much favored by the present system of piping the water in the coil may be considered as being in the same condition as the water in the back eddy of a running stream. Even the best balanced heating system of this kind is bound to be subject to certain fluctuations in the degree of service every time hot water is drawn from a fixture. When a hot water tap is opened the cold water runs into the bottom of the tank and sets up a disturbance in the circulation that often arrests for a time the return of water from the radiators.

Continued on page 21





ONE of the most useful pipe fittings in furnace construction is that of an offset boot. It takes the place of a round to rectangular piece as well as an elbow in many cases.

For instance, if a straight round to rectangle piece is used, and the warm air pipe has then to be turned to the horizontal, this horizontal pipe will be much lower down than would be the case if an offset boot be used.

Then an angle elbow can be used, too, under certain conditions, which would reduce friction in the warm air pipe line.

This pattern is developed by the triangulation method, though the plan is not used in this case. No matter what size or proportions of a filling is required, the method here described can be adopted.

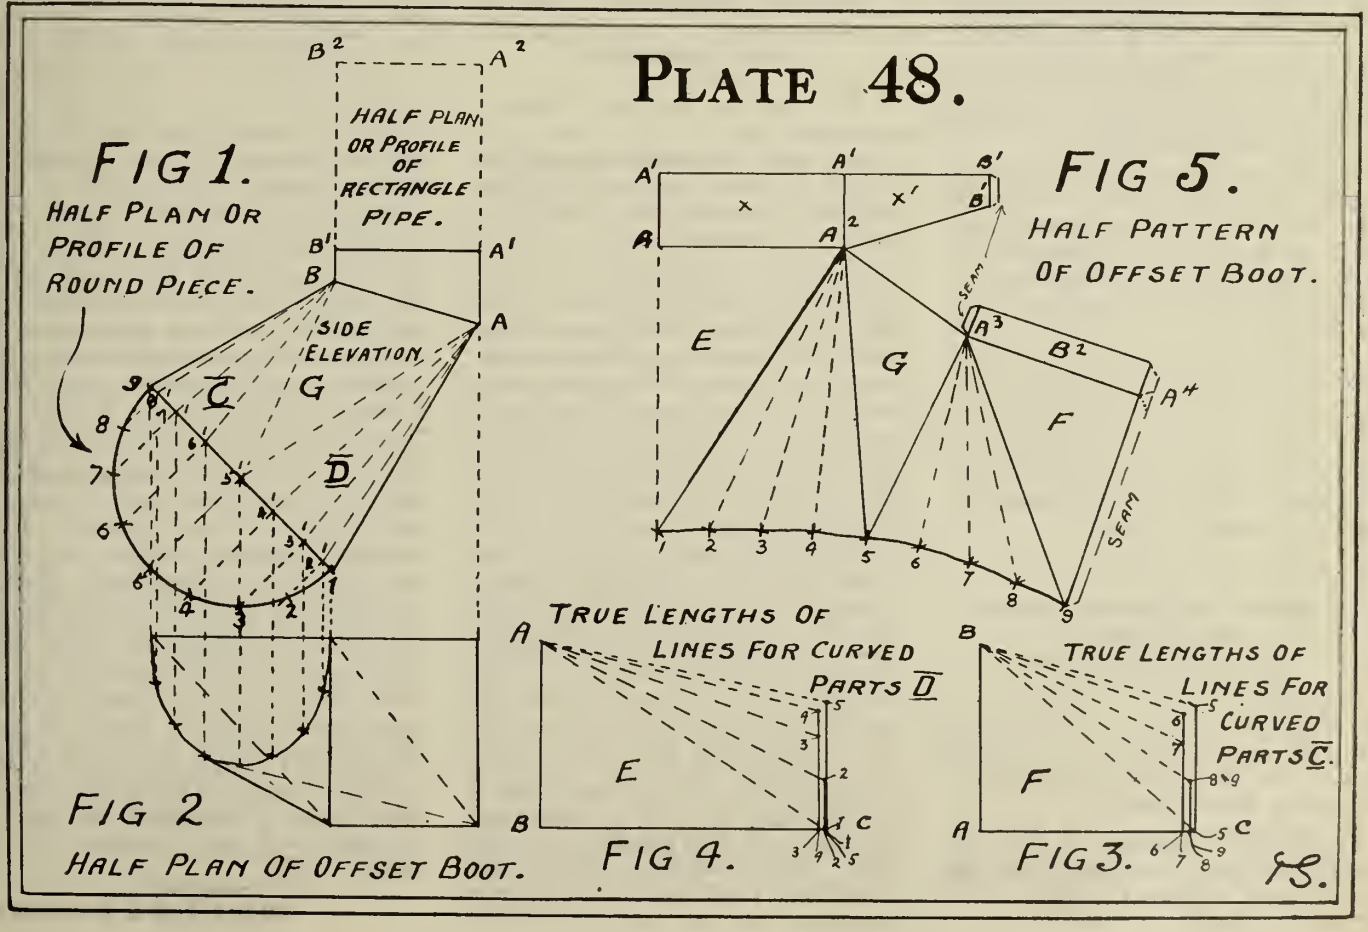
First draw the side elevation shown in Fig. 1—B^1, A^1, B, A, 9, 1. and determine centre of line 1 as at 5. With 5 as centre, draw the half circle, which is really a one-half profile of the round piece and takes the place in practice of the half plan of round part of the fitting. From B^1 and A^1, draw the half plan of rectangular piece, as shown, at B^2, A^2, which may be any desired length. Fig 2 shows how a half plan of the boot may be developed, though it is not required in this case, but is shown merely for practice in striking off a plan from the elevation of an irregular shaped article.

Next divide the half profile of the round piece into eight equal parts, 1, 2, 3, 4, to 9, and draw dotted lines from these points at right angle with line 1. 9, which now becomes the base line of piece to be developed, intersecting same as shown by 8^1, 7^1, 6^1, 5^1, 4^1, 3^1, and 2^1.

Next draw dotted lines from B to 3^1 to 5^1, and from A to 5^1 to 1, the portion marked G between points A, B and 5, will be flat, while the rest will be formed with a circle.

Now turn to Fig. 4. This diagram shows the true length of the portion that is curved with the half elevation for the lower part of the boot.

First draw a vertical line, A, B, the height equal to half the length of the rectangle piece, and from B draw a horizontal line at right angle to A B, the same length as the line A 1 in Fig. 1. thus establishing three points A, B, C. Now draw a dotted line connecting A with C; this is the first true triangular line developed. Now place the compass point at 2^1 on base line in Fig. 1, and open to point 2 on the circle, transferring this measurement to C in Fig. 4. Next open compass and transfer measurement between point A 2^1, Fig. 1 to B C on Fig. 4, thus securing point B 2 on horizontal line. From 2 draw a vertical line equal in length to the distance between 2^1 and 2 in Fig. 1; repeat these operations until all the distances have been transferred. Then draw a number of dotted lines from point A to the top



of short vertical lines shown in Fig. 4. These dotted lines are the true length of the triangular lines to determine the length of material required for the one lower side, or rather quarter of the pattern.

Fig. 3 shows the true length of lines for the top quarter section of the pattern, and is developed by following out the method described in Fig. 4.

Now turn to Fig. 5, which is a full half pattern, for the fitting required. First draw rectangle X, which is the half plan of the rectangle piece. Next draw X^1, which is the side elevation shown at B^1, B, A^1, A, in Fig. 1. The two, X and X^1 are the half pattern of the back and sides of the rectangle piece, while B^2 is the half pattern of the front of rectangle piece.

The next step to take is to transfer the true lengths described in Fig. 4 to their place on A and A^2. Place compass point at A in Fig. 4 and open up to C, this measurement to be transferred to A^2, 1, repeating this operation until all the dotted lines have been transferred from Fig. 4 to Fig. 5, A^2, 1, 2, 3, 4, and 5. The distances between the last named figures are determined by cutting each small arc, 1, 2, 3, etc., with the measurements procured on the half circle in Fig. 1.

Section G is now to be developed. Place the compass at A^2 and draw an arc at A^3, cutting same by placing the compass point at 5, using a measurement equal to length of dotted line shown in Fig. 3, B, 5^1.

Now follow out the same operations in transferring all the dotted lines from Fig. 3 to A^3, 5, 6, 7, 8, 9, in Fig. 5.

By connecting each of the points procured, 1, 2, 3, 4, to 9, with a solid line, the curved stretchout portion for round part of pattern is complete.

Now to develop part F. Place the compass point at B in Fig. 3, and open to A. Then draw arc A^4 by placing compass point at A^3, Fig 5. Next cut this arc by transferring the measurement A, C, from Fig. 3. By joining points 9, A^4 and A^3, the complete half pattern for boot is developed.

By turning over the pattern at 1, A, A^1, a full pattern is procured in one piece, which would be seamed at line 9, A^4. If, however, it is necessary to make the fitting in two pieces, an extra allowance of metal will be required at portion of pattern A' and 1.

MARKET CONDITIONS AND TENDENCIES

Continued from page 36

ANTIMONY.—Another advance of 1 cent has been recorded in the prices of antimony, and quotations are now being made at ten cents, with a good volume of business being handled.

ALUMINUM.—Business in this commodity has been somewhat quiet and prices remain stationary at from 40c to 42c per lb. Stocks are plentiful.

LETTERS TO THE EDITOR

These columns are open to contributions upon any topic of interest to the trade, it being understood that the views expressed are those of the contributors, and do not necessarily imply editorial indorsement. Names of contributors will be withheld, if desired, but name of writer must accompany correspondence as an evidence of good faith.

Editor, Sanitary Engineer, Toronto:
Dear Sir:—

Having heard so much recently about reconstruction during the war I naturally look for something doing in the trade along that line. Now the trade does and should take the stand that it should not work for nothing, but, say boys, how about telling the general public what they are paying for? The medical profession tell the world what they have done to make Jerusalem and Bagdad fit to live in, how they made it possible to put through the Panama canal. The biggest thing done by them was to turn a flock of plumbers loose who did all the work, and the M.O.'s took the credit for same.

Now, how about educating the trade up to a level where they have data for the difference in health after sanitation has been installed in said places? Also in schools where modern plumbing has rplaced old systems. In work shops where new installations have been made, and generally to claim half the credit which the medical profession claims for itself, then work will come and prices will be a secondary consideration. How about making the public know that our trade is as, or more, important than the medical profession?

More Again "Ratsy."

Editor, Sanitary Engineer, Toronto:
Dear Sir:—

I read with considerable interest the article in the June 1 issue of SANITARY ENGINEER entitled, "Says small town plumbers are passing up fine opportunity for a lot of good business." There is undoubtedly a good deal of force in what the manufacturer says about there being opportunities for selling more goods in the farm homes. When he compares the methods of the piano salesman or of the sewing machine agent to the methods of the plumber, though, I differ with him. He apparently does not take into account the fact that both pianos and sewing machines carry a margin of profit that is very high. I am told that four hundred per cent. is not an extreme profit on many of the pianos. Selling with a high profit like this enables the piano salesman or the sewing machine man to take a few dollars down and then so much a month. A great many people will buy goods on this plan who would not buy if they had to pay all cash. The plumber is not in a position on a margin of profit that runs from ten to fifteen per cent., very often a good deal less, to go to a farmer and say, "Here, you need a bathroom in your house. Give me $25 down and so much a month and I will put it in." In most cases there are too many people after the work, and there is a lot of price cutting. Price cutting is one of the worst things the plumbing trade has to contend with, and in the smaller towns the local man very often has to compete with firms from the cities. Another point in connection with the matter is that the piano salesman and the sewing machine man have behind them an organization that believes in extensive advertising. Many of the prospects they follow are the direct results of inquiries that come from the parties having read about the goods in the newspapers or magazines. If the manufacturers of the various household necessities in plumbing goods were to advertise as extensively as the piano firms or the phonograph makers or the sewing machine companies, and then co-operate as closely with the plumbers as these other firms do with their agents I think sales could be very largely increased. In the meantime more co-operation between the men in the trade and the manufacturers would help. Many of the manufacturers do not protect the plumbers at all. I know of instances where farmers and others in my district have gone down to the Toronto Fair after being told by the local man all about what would be the best goods to instal, and then the manufacturers' representatives at the fair sold direct to the party. The plumber, after one or two experiences of this kind, is not very enthusiastic about putting business in the way of a manufacturer who never even says "Thank you." The great trouble with the plumbers to-day is that they are not business men. The great majority of them have gone into the business without any knowledge whatever of business. They are good, efficient workmen, but all they know is plumbing. There are scores and scores of good men who have put in all their time and experience for years, only to find at the end of that time that they have been working for nothing, not even making a decent living. There have been other cases where the men not only put in their time and experience but any little money they may have had as well, and come out with nothing to show for their work. Not only are these conditions far more general than those who are not in touch with the trade would believe, but plumbers generally have not been sufficiently self-respecting. They have been distrustful and suspicious of one another, and in many cases have said extremely hard things about one another. Because we have called ourselves names other people have called us names. If a man called a plumber a thief and a robber, in most cases the plumber smiled and walked away instead of resenting it and making the party take it back. There has been too much altogether of this sort of thing, and until the plumbers put a proper estimate upon themselves they cannot expect others to do so. It is a funny thing, but none the less true, that plumbing and heating, two of the most important matters as far as life in populous centres is concerned, are two of the most poorly paid businesses in the country to-day.

Yours truly,
SMALL-TOWN PLUMBER

Heating and Ventilating

CHARTS

Seventh Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the seventh of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on the "Details" a most interesting and illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the designs for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The eighth article of the series will appear in the next issue.

THE working drawings and specifications prepared by an engineer are by no means the only diagrams made by him in doing his work. Working drawings illustrate only the result and thought in the mind of their author, and do not indicate in any way the problem that he had to solve; nor do they trace the paths taken by his thoughts in coming to certain conclusions. The reader must understand that a man in the habit of conveying his thoughts to others by means of the pencil, becomes so used to the feel of the pencil in his hand, that it is second nature for such a man to mark down every step taken by him in his task, and in the course of time he depends less and less on the written or spoken word, and by means of a system of signs and charts finds that he keeps his mind concentrated on any particular phase of his subject, or that with ease he can run back over the ground he has already covered and pick up the neglected points with a great deal more facility than if he had to find his way through a maze of words or figures.

The careful student keeps a pencil in his hand to continually mark the point that he wishes to remember, and finds that the use of the pencil keeps the mind on the work. This experience is enough to show how valuable his eyes are, and when he remembers that the written word is only a substitute for the language of the ear, and not for the eye, he must surely come to the conclusion that a pictured representation of the subject is of much more value than the most lucid description of the same thing.

When structural engineers are designing roof trusses, it is usually their practice to draw what is known as a "stress diagram." They mark down, by means of a scale, a line representing a certain force, the length of the line being proportioned to the value of that force, and the direction of the line indicating the direction of the force. Then they set against it a line or lines representing certain contributory or counterbalancing forces, also drawing these lines by scale measurement. When the lines are arranged so as to "close the diagram" the scaled measurement of every line, as controlled by the circumstance of the design, indicate the proportionate value of each force. Mathematical calculations could be made so as to give the same results as those of the stress diagram, but such a method would necessitate the use of figures and formula that could hardly be remembered by the ordinary mind. The use of stress diagrams is mentioned here to illustrate how a fairly complex mechanical problem can be solved by the simple means of graphic analysis.

Business executives have taken a leaf out of the book of the engineer's practice of making charts, and some of these executives appear to carry the system of charting to points beyond reason. But even the abuse of such a good thing as the graphic system only proves how valuable thing it is when properly used.

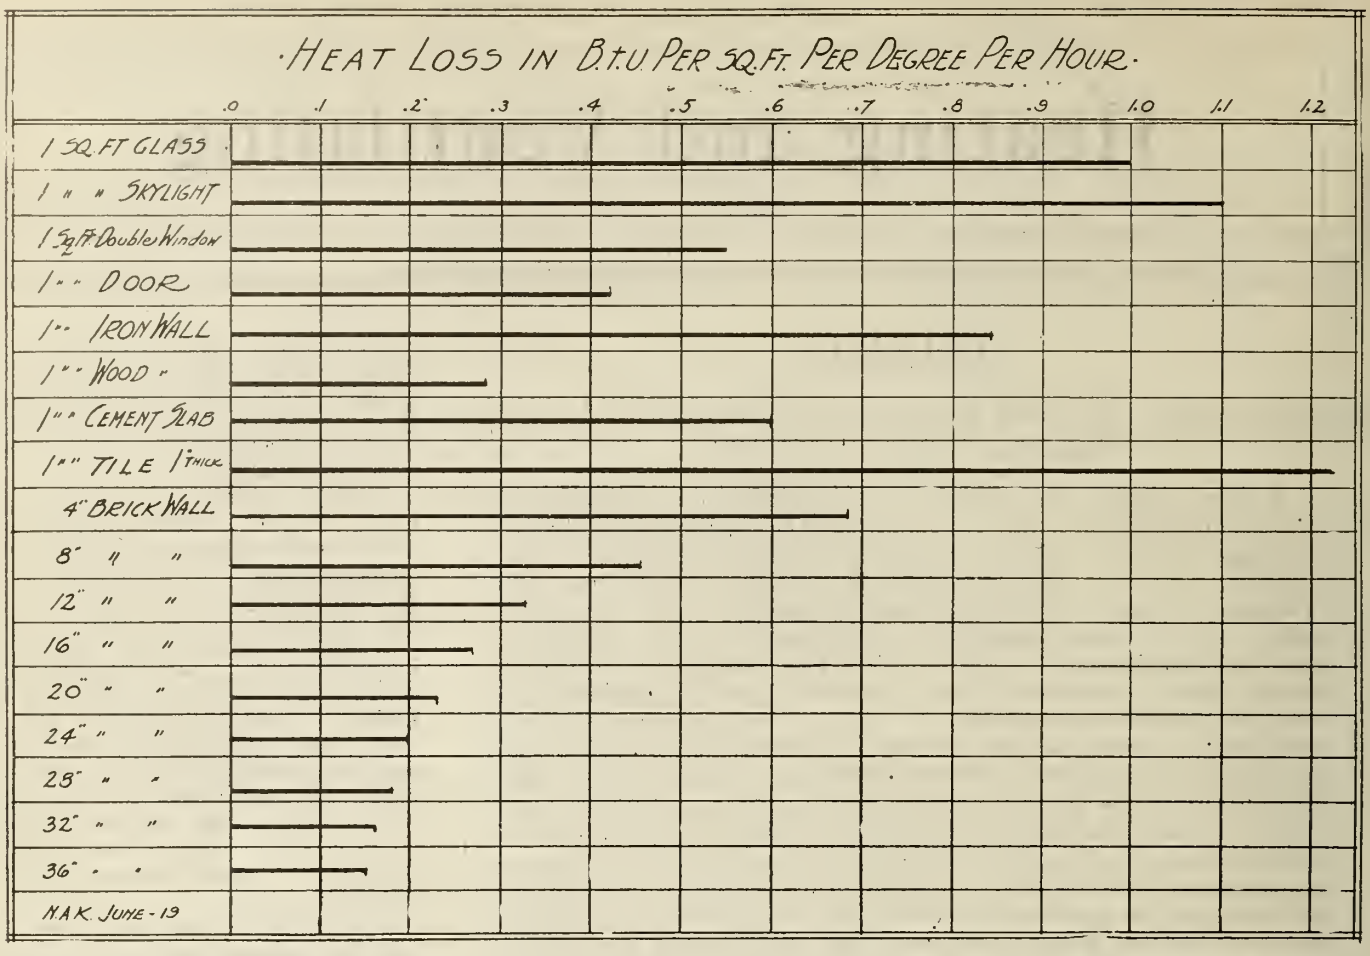
When the student has had some experience in making charts he will discover many fields where they can be used to advantage, and it is just here where the danger lies. The temptation to use charts to the exclusion of everything else may result in the making of the chart the object, instead of the instrument.

A chart has nothing to do with the working drawing except in so far as it is an aid to clear and definite thinking. It may take many forms, and in some of the well-known systems can be read by anyone that understands the use of such, but most designers have their individual systems and their charts can only be understood by their originators. If charts are made for the purpose of keeping records or for the purpose of conveying information they must be made in accordance with some uniform standard of practice.

In endeavoring to live up to our promise to steer clear of formulas we may find it necessary to give graphic charts from time to time, so as to avoid the use of more extended calculations, so we believe it is advisable at this stage of the series to show how a chart may be made and how some of the others will appear.

The reader will remember that in the April 15th number of the SANITARY ENGINEER a graphic indication of the proportionate value of the B.T.U. compared with one pound of water with one square foot of glass, etc., was followed by an article on the value of comparative standards, and the chart herein shown illustrates again in a graphic way the heat losses through various materials in B.T.U. per square foot per hour, and sets comparative standards for the materials mentioned.

In the chart each division marked by a vertical line represents one-tenth of a B.T.U., and when using the chart to figure radiation the area of the mater-



ials in square feet should be multiplied by the figure given at the top of the corresponding column, and the result should be multiplied by the temperature range to find the total heat loss, and to this total heat loss there should be added factors as follows:

10 per cent. for northern or windy exposures.

10 per cent. if heated in daytime only and if the building is not exposed.

20 per cent. if the building is heated in daytime only and is exposed.

30 per cent. if building is heated only at intervals.

When the reader refers to the chart he will note that there is one line much longer than any of the others, and in running his eye back over the line he finds that one square foot of tile 1 in. thick is a very poor heat insulating material. If we had said that one square foot of tile transmits .13 B.T.U. more per hour than the same area of window glass it is unlikely that the difference would be remembered, but when the same difference is shown graphically the proportion is presented with force sufficient to make the point worth remembering. It will also be noted that adding extra thickness to a 16 in. brick wall has very little effect from the standpoint of heat conservation.

This chart gives only constants for a few materials and the reader should make a chart along the lines of this and keep adding proportionate scales of value to it when he has the opportunity, as with the increased cost of building the use of new forms of material in construction is to be expected, and the heating engineer should be in a position to show his client why he should, or should not, use certain materials in his walls or in his roofs, and if the engineer has a chart of the heat transmitting value of the material specified, he can use that chart in showing the reason for the amount of radiating surface necessary, and presenting his argument in a graphic form he will have no difficulty in pointing out to his client the relative value of materials. It is quite within the province of the heating engineer to take up such a matter with his client, and if he does not he may find that he has lost the commission of installing a heating plant proportioned to the construction; and that he has lost it to some party that has not allowed for conditions that might have been brought to his attention had he made use of a chart such as that given.

Charts are made often for business purposes, showing from day to day how a certain margin of profit must be made to keep above the line known as the "danger mark," and if for some reason or other the profits fall near the "danger mark," the management are aware that some energy must be exercised to lift the line of profit to a point high enough to make up for the depression or otherwise they must drift into bankruptcy.

WATER SHORTAGE AT NANAIMO, B.C.

According to reports appearing in the local press, the water situation at Nanaimo, B.C., is a very serious condition. The city council has appointed a water committee to deal with the matter and they are facing the situation in an energetic way. During the month of May an inspection of the entire system has been carried out. This inspection included every house in the city, and it is hoped that with all leakages repaired and every effort being made to stop wasting water that 25 per cent. will be added to the city's supply. This will not mean an adequate water supply or proper fire protection but will avert a water famine.

The cause of the trouble appears to be that the present pipe line from South Forks to the city is inadequate and that an additional pipe line must be laid. This must be done at once, it is urged, and every effort made to finish this year. So far one of the great deterring elements to the extra line has been the cost.

Ventilating the Modern School

Sixth Article of Series Written Especially For "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

REFERENCE has been made in this series of articles to the necessity of conditioning the air. The reader may question the necessity of installing anything more than that part of the apparatus that is to be used for anything more than that of the purpose of heating the air to the required temperature and to the conveying of it to the different parts of the building. His argument might be that fresh outside air requires no other treatment than that of the changing of its temperature during the cold weather.

Now, while it is true that most school buildings are situated in districts so free from dust that the installation of air washers might seem unnecessary, it is, nevertheless, a fact that where these are installed they have more than paid for themselves in the higher standard of air conditions found throughout the building. It is not only for the purpose of removing organic matter that their installation may be recommended, but also because they serve as humidifiers, and, under some circumstances, as cooling apparatus.

In taking up the subject of "Relative Humidity," it might be well to call attention to the fact that many heating engineers and physiologists lay greater stress on this than they do on almost any of the other phases of their science. There is no room for dispute when stating the fact that a person is quite comfortable in a room when the relative humidity is maintained in proper proportion to the temperature, even though the room in which he may be confined is heavily charged with carbon dioxide. And, on the other hand, even though the air in the room may be relatively pure a great deal of discomfort is experienced when the relative humidity is either too high or too low.

It is generally considered that the correct humidity to maintain in a school building is from 35 to 50 per cent. A good average is 40 per cent., with a room temperature of 68 degrees F. The new point of this is 42 degrees.

The method of humidifying the air to the proper proportion can be understood by a study of the arrangement of the air washer in relation to the heating and cooling surfaces used.

The first thing to decide upon after fixing our relative humidity standard is to find the corresponding dew point. The dew point is that when the air becomes saturated with moisture. For air at 70 degrees and a relative humidity of 35 degrees the dew point is about 37 degrees F.

per cent. the dew point is about 37 dethrough the washer the air will become saturated to the dew point, thus when the air is heated to 70 degrees F. at the secondary heating coils it will still contain approximately the same weight of water it picked up in the washer but its volume has become so much greater with its higher temperature that the air will seem to be no longer moist.

The best air washers are of the spray type and may be used as humidifiers. Paradoxical as it may seem, a form of spray type washer may be used for removing excess moisture from the air when using the apparatus as a cooling device. This special type of air washer is known as a dehumidifier. It is operated on two sets of sprays, the first using cold well water and the second refrigerated water.

Some cooling systems are installed on the principle of the mechanical refrigerator where a small brine pump is used in conjunction with a series of the regulation coils. Attempts have been made to cool air by placing blocks of ice in the fan room, but this has never been a success.

While it is not likely that our readers will be called upon to instal anything very elaborate in the way of an air cooling apparatus for a school building, it is well that they have a reasonable understanding of the function of such a plant, so that in the event of the matter being discussed by the board they will be in a position to supply some of the necessary information

Just as with heating systems, so with humidifying systems sensitive automatic control may be provided by means of "thermostats." In one type of installation two separate thermostats are used, one of these being placed in front of the air washer so as to control the temperature of the dew point and the other situated in the room where the temperature of the class room air is to be controlled.

There are also two other methods used in controlling humidity; one by the use of differential thermostat and the other by the use of the differential hygrostat. It is unnecessary to take up these two latter methods, as the first method mentioned is the simpler and the one most used in this country for school houses.

Many manufacturers of heating apparatus will endeavor to reduce the cost of installation of the other parts of the heating and ventilating system in the hope that thereby they may effect the sale of the specialty in which they are interested. Their favorite object of attack is the air washer. Their cry is "Cut it out, it is a useless expense." The truth is that if these same men were acting as independent engineers, with the interest of their client at heart, they would insist on the installation of the washer, if for nothing else than for its humidifying value.

Humidity in its relation to heating is worthy of the greatest amount of study. It is a self-evident truth that dry air, even when heated above the normal, will still be chilly. In breathing dry air the mucous membranes of the eyes and nose are affected so much that colds are easily contracted. The body becomes sensitive to drafts and the whole physical economy is thrown out of gear. The sallow faces of Canadians when compared with those of dwellers in countries where moist air is daily breathed should be proof enough that in our blind desire for higher temperate we have lost our sense of the health value of a lower temperature with higher humidities.

After the ventilating system is installed it is advisable for the engineer to call at the building when occasion affords, so that he can be assured that the plant he designed or installed is being properly operated. The writer, in his search for knowledge, has made it a practice to visit schools in any town where he has had an opportunity of spending a few extra hours, and has found, time and again, expensive ventilating systems unused, either because of the ignorance or laziness of the man placed in charge. I have seen the air washers covered with cobwebs, the ventilating fans standing idle, the wires disconnected from the motors, and to cap all, the boilers so full of soot that it was difficult to understand what the janitor was being paid for. It has been my pleasure at other times to find men in charge of these plants gifted with energy and intelligence in such degree that their services were of the very highest order. Men of this type are not hard to find and when a school board is prepared to pay for such service the lot of the ventilating engineer is happy indeed.

HAMILTON PICNIC

The members of the Hamilton Society of Domestic, Sanitary and Heating Engineers have completed arrangements for their annual picnic, which will be held at Wabasso Park on July 5. The Hamilton members have sent to the craft in Toronto a hearty invitation to attend in large numbers and have assured them that they will do their best to see that all are well taken care of and have a good time. Also they have issued to the Toronto men an official challenge to a game of baseball, and this, it is expected, will be accepted by the enthusiastic fans who have been making their way to the Don Flats each Wednesday afternoon. It promises to be a great game, but this is only one of the features of the big day the Hamiltonians are putting on, as there will be a big program of sports. The Toronto society will hold its picnic at Island Park on July 17, and it is likely that an effort will be made to have the Hamilton ball players play a return game in Toronto.

The Canadian Oil Co., Ltd., Toronto, is preparing plans for a $50,000 branch warehouse to be erected at London, Ont.

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

WHILE the markets have been practically stationary in all lines of plumbing goods, there are many indications that this condition is only temporary and it is expected that higher quotations will become effective shortly on soil pipe and fittings, wrought pipe and some lines of brass and copper goods. As a result of labor troubles production has been considerably diminished and with a fairly active demand stocks of some goods are very low. It is practically impossible to obtain some lines of soil pipe.

The market for ingot metals is very firm and advances are noted in lead of ten cents per hundred and of half a cent a pound in spelter. Sheet copper has advanced one cent a pound. Prices of tin show no change and as supplies are coming in that are ample to meet demands, no immediate changes are expected. The market for aluminum has been somewhat quiet. Antimony has advanced a cent a pound.

From all parts of the country reports indicate a steady development in building and this will undoubtedly be greatly stimulated by the signing of peace. A great many large projects which have been held up because the owners did not consider it wise to proceed until it was certain that conditions were likely to be settled, will, it is stated, be gone ahead with. In Toronto alone it is stated that there was no less than $15,000,000 worth of building held up until it was known what the outcome of the peace proposals was to be. The settlement of the Winnipeg strike is welcome news in trade circles and a resumption of activities in the West is expected very shortly.

TORONTO, June 28.—Shortages of stock are becoming acute in some lines of soil pipe, brass goods and fittings, and the situation, owing to increasing demands due to building activity, is growing steadily worse. While prices so far have shown no change, there is little doubt that higher production costs will shortly result in pipe and fittings moving to higher levels. Ingot metals show a tendency to advance with the exception of tin, and spelter is up half a cent a pound, and lead shows an increase of ten cents per hundred. Sheet copper is a cent a pound higher. Prices of enamelware remain unchanged. A good, steady volume of business is reported.

Enamelware Prices Show Firm Tendency

Toronto.

ENAMELWARE.—Lines of enamelware are showing a tendency to develop very firmly as a result of steady improvement in demands and continued high costs of production. "Certainly there will be no reduction in prices," said one large manufacturer. "While stocks just now are ample to take care of demands, there has been a noticeable increase in the volume of business. I am not anticipating any increase in prices just now, but the market will be very firm, and if manufacturing costs continue to advance as they have been doing, higher prices are not at all unlikely." The signing of peace terms is expected in many quarters to have a noticeable effect in further stimulating building, and this will naturally increase the demands for these lines. Quotations on a few of the well known lines are as follows:

Bath-tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$32 10
Bath-tubs, 5½ ft.	35 70
Basins, flat back, 14 x 15 in.	6 45
Do., corner, 15 in.	7 15
Sinks, roll rim, 18 x 30 in.	15 05
Sinks, flat rim, 20 x 30	6 47 6 35
Do., 18 x 30	5 62 5 50
Do., 18 x 24	5 12 5 00
Do., 16 x 24	4 92 4 80
Do., 14 x 20	4 25 ....
Closets, oak tank and seat	25 50
Do., enamel iron or white vitro tank	27 50

No Changes Show in Price of Range Boilers

Toronto.

RANGE BOILERS.—The lower quotations which went into effect as a result of reductions made by United States firms remain unchanged. Business has shown some improvement although labor troubles in various parts of the country are showing their effects. A steady increase in the building activity is noted, however, and prospects are that range boilers will be in demand. Quotations are as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	12 50	14 50
40-gallon	13 50	15 50
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Higher Prices Likely For Soil Pipe, Fittings

Toronto.

SOIL PIPE, FITTINGS. — Stocks of these goods have become so depleted owing to the continuation of strikes that many firms are finding difficulties in filling orders. It will only be a matter of a very short time before they are completely out of several lines. There is every hope now that a settlement will be reached with the men who are out and that work will be resumed. There is little doubt, manufacturers say, that production costs will be greatly increased, and this means an advance in prics. In some quarters the opinion is expressed that this will be at least ten per cent. At the present time orders are coming in faster than most firms can get the goods, and there is every indication that a nice season's business will be handled. Quotations are as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	20%
Medium and extra heavy soil pipe, 4 in.	25%
Medium and extra heavy soil pipe, 2 in. to 6 in.	35%
8 in. extra heavy pipe and fittings	15%

PIPE FITTINGS

Cast iron fittings	20%
Plugs	35%
Bushings	35%
Unions, ¼" to 2½"	50%
Do., ⅛", 3" and larger	45%
Dart unions, ¼-inch to 2-inch	25%
Do., 2½-inch and larger	15%
Nipples, up to 4-inch	60%
Do., 4½-inch and larger	50%
Do., running thread 4-in. and under	30%
Couplings, 4-in. and under	40%
Do., 4½-in. and larger	20%

MALLEABLE FITTINGS

	Black	Galv'd

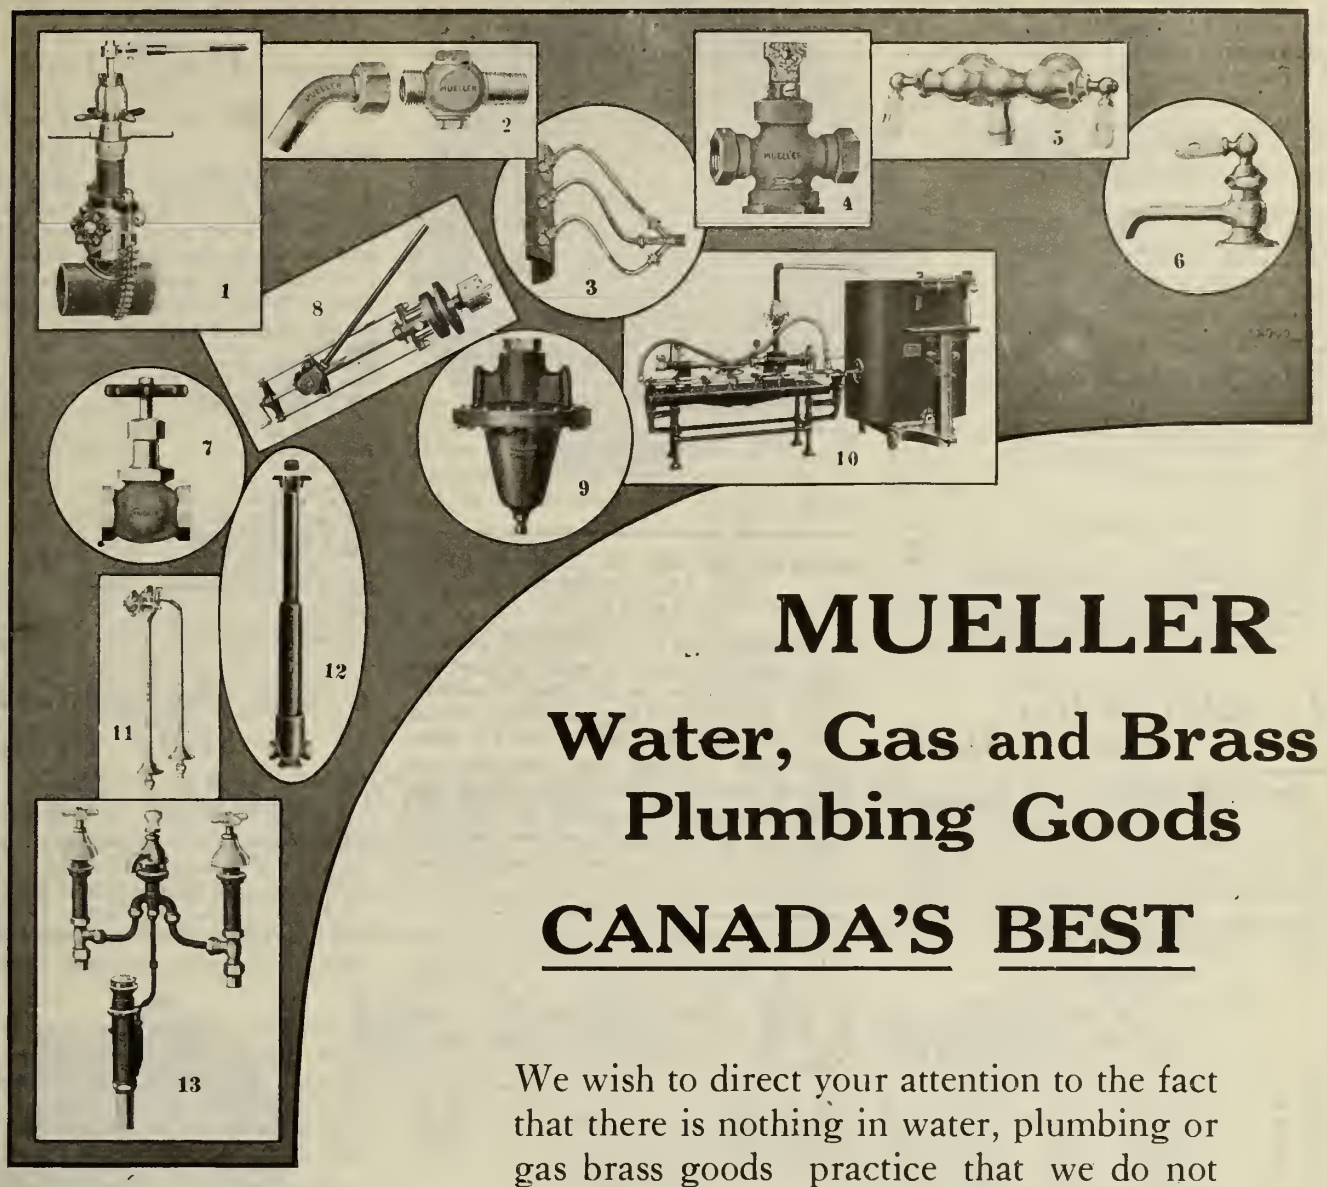
Brass Steam Goods Remain Unchanged

Toronto.

VALVES.—Prices of all brass goods have remained stationary although the market is a firm one owing to increased



MUELLER

Water, Gas and Brass Plumbing Goods

CANADA'S BEST

We wish to direct your attention to the fact that there is nothing in water, plumbing or gas brass goods practice that we do not manufacture. The test of over 60 years of producing nothing but the very best in these lines conclusively proves that we are the masters of such manufacture.

We are illustrating a few of our various lines and wish to direct your attention to the fact that—

Our 1919 Catalog A is ready for distribution.

WE MAKE:

1—Tapping Machines
2—Corporation Cocks
3—Goose Neck Connections
4—Ground Key Curb Cocks
5—Rapidac Bath Cocks
6—Rapidac Basin Cocks
7—Globe Valves
8—Drilling Machines
9—Regulating Valves
10—Meter Testers
11—Bath Supplies
12—Service Boxes
13—Basin Combinations and many other articles of highest quality.

H. Mueller Mfg, Co., Limited

SARNIA, ONT. CANADA

demands and lowered production caused by labor troubles. Marine orders have been coming in steadily and there is an improvement noted in business in general. Firmer prices for copper and ingot metals have not yet affected brass goods but it is not unlikely that slight advances may be made in some lines before long. Quotations are:

Compression work, standard	50
High grade	49
Fuller work, standard	45
High grade	38
Basin cocks, No. 0 standard	40
Nos. 1 and 2	40
Bath cocks, compression	50

Globe, angle and check valves, standard, medium pressure	23%
Radiator valves ,standard med. pressure	31%
Radiator valves, removable seat, medium pressure	25

Wrought Pipe May Move Up Shortly

Toronto.

WROUGHT PIPE.—There is every indication that increased costs for manufacture will result shortly in wrought pipe moving to higher levels. Business shows some improvement, and this, it is expected, will be maintained. Quotations are as follows:

WROUGHT PIPE

Price List No. 39, April 3, 1919

Boiler Tube Prices Are Holding Steady

Toronto.

BOILER TUBES.—Business in tubes is inclined to be quiet and prices are showing no change. Labor troubles in various parts of the country are showing their effects on trade, and no very marked improvement in business is expected until conditions generally become more settled. Quotations are as follows:

BOILER TUBES—	Seamless	Lapweld
1¼ inch	$27 00	$.....
1½ inch	28 00	.....
1¾ inch	30 00	26 00
2 inch	30 00	26 00
2¼ inch	33 00	28 00
2½ inch	40 00	32 00
3 inch	46 00	38 00
3¼ inch	.....	45 00
3½ inch	56 00	42 00
4 inch	70 00	54 00

No Changes Shown in Waste or Oakum Prices

Toronto.

WASTE, OAKUM.—Only a fair volume of business in these lines is being handled at the present time as a result of labor troubles and so many factories being closed. The settlement of the troubles in Winnipeg is expected to result in increased business in that district, but trade in general is not likely to show any decided gains until conditions are more stabilized. Prices are as follows:

	Per 100 lbs.	
Best American	$21 00	$22 00
Clipper, spun	.....	21 00
Do., unspun	.....	10 50
Plumbers' spun	.....	9 50

HIGHER PRICES GO INTO EFFECT ON ALL LINES OF ENAMELWARE

As SANITARY ENGINEER goes to press, announcement is made of new and higher quotations on all lines of enamelware. Baths have been advanced 10 per cent. and the new prices on all other lines show a 5 per cent. increase over former figures. The new prices are made necessary, it is stated, by continued high cost of production, wages and general manufacturing costs having climbed steadily.

Sheets and Plates Are Holding Firmly

Toronto.

SHEETS, PLATES. — The markets have been stationary in sheets and plates and with only a fair volume of business offering. Some improvement is expected shortly, but there is nothing to indicate that there will be any revision of prices. Stocks that are ample to meet all demands are on hand and shipments are being made promptly.

Sheet copper has advanced a cent a pound, the prices being 26¼c for mill shipment and 29c per lb. for shipment from stock.

Firm Markets For All Lead Products

Toronto.

LEAD AND ZINC PRODUCTS.—Firm prices are ruling for all lead and zinc products, with a tendency toward slightly higher prices in many lines. No changes are shown yet in manufactured lead products or in solder, the quotations on the latter being as follows: guaranteed, 33c to 37c per lb.; strictly, 31c to 35c; commercial, 28c to 31c; wiping solder, 27½c to 30c; wire, 34c to 40c.

Firmer Markets For Scrap Copper, Lead

Toronto.

OLD MATERIALS.—A distinct improvement in business is noticeable in the markets for yellow metals and lead, and advances are expected at any time. The market for scrap rubber is decidedly weak. Prices at present are as follows:

Dealers' Buying Prices—		
Tea lead	....	0 03
Heavy lead pipe	....	0 04
Pipe scrap	....	8 00
Stove plate, per ton	....	10 00
No. 2 busheling	....	8 00
Yellow brass	....	0 07
Red brass	....	0 10
Light brass	....	0 05½
Scrap zinc	....	0 04½
Heavy copper	....	0 15
Wrought iron, No. 1, per gr. ton	....	15 00
No. 1 machinery cast	....	14 00
Heavy melting steel	....	9 00
Old rubbers, boots and shoes	0 06	0 06¼
Overshoes, lumbermen's rubbers boots	....	0 04½
Bicycle tires	....	0 04½
Automobile tires	0 03½	0 04

Copper, Antimony and Spelter Are Higher

Toronto.

INGOT METALS.—A firm market for all ingot metals is ruling with a splendid volume of business offering. Spelter has advanced half a cent, antimony a cent, and copper 2½ cents. Lead prices are also up ten cents per hundred. Prospects, it is stated, are for a strong market.

COPPER.—There has been a fairly brisk demand for copper and at higher prices, the quotations at present being in the vicinity of 21 cents. A strong buying movement continues in the American markets.

TIN.—Business in tin has been somewhat quiet, with stocks more than ample to take care of all the trade that is offering. Prices, however, have shown no change, and quotations are being made on the basis of 58 cents per lb.

SPELTER.—There has been considerable activity in spelter and a very firm market has developed with prices half a cent higher, the quotations being now 8c per lb.

LEAD.—An advance of 10c per hundred has been made in lead with a lot of business offering and prospects for a continued firm market. Quotations range from 6½c to 7½c.

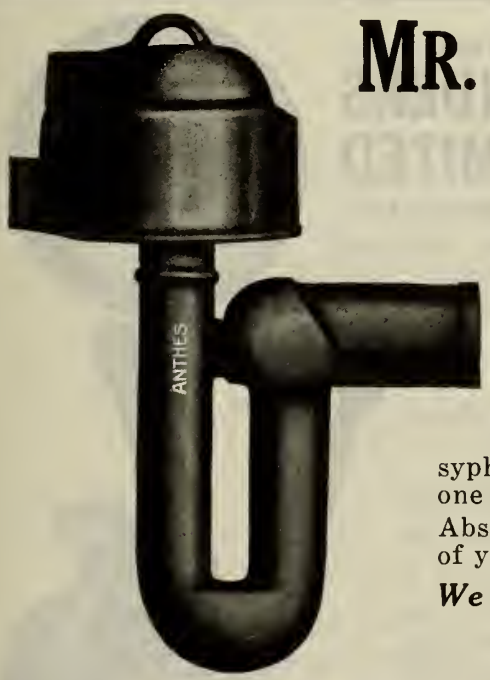
THE JAMES MORRISON BRASS MFG. CO., LIMITED

93-97 ADELAIDE STREET WEST, TORONTO, ONTARIO



MR. RURAL PLUMBER—

The farmer of to-day has capital and he means to have comfort. Thousands of farmers in all sections of the country are installing Sewage Disposal Systems and the demand at the present time is very keen.

You have only to let the farmer know that you are in a position to handle this work to secure many jobs.

In all this work it will pay you to use ANTHES syphons, soil pipe and fittings because of their durability. The ANTHES syphon is the only syphon which works on natural laws. It is cast entirely in one piece, having no moving parts to get out of order.

Absolute satisfaction and more business from the friends of your satisfied customers is the result.

We will furnish you with Sewage Disposal Blue Prints upon request

WE SHIP PROMPTLY ON RECEIPT OF ORDER.

Anthes Foundry Co., Limited

Men Worth Reaching

THE SANITARY ENGINEER, Plumber and Steamfitter of Canada, was established in 1907. The subscribers represent the most progressive members of the sanitary plumbing and heating trade in Canada. The paper is issued twice monthly, on the first and fifteenth of the month. Circulates in all provinces of Canada and also in Newfoundland. There is no waste circulation on SANITARY ENGINEER, because subscribers buy the paper for business. The advertising pages are read closely by the largest buyers of sanitary and heating goods in Canada. These men buy for business as well as for private consumption and therefore represent the best class of readers. When you advertise in the SANITARY ENGINEER you are assured of an attentive audience, who are looking for information about your goods and your method of doing business. Cost of advertising is very moderate indeed. We will gladly supply detailed information regarding rates, circulation, etc.

Occasionally advertisements are inserted in the paper after this page has gone to press. The insertion of the Advertiser's name on this page is not part of the advertising order, but is inserted solely for the convenience of the reader of the paper

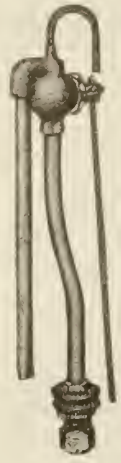
Quaturn Ball Cocks



Did you ever sell a **whistling, noisy Ball Cock?** It didn't advertise you very well, did it? And very likely your customer was not much pleased either.

Next time use Quaturn.

Because, under moderate pressure they operate quickly, positively and noiselessly.

Because the working parts may be renewed when worn, without taking off the body, and they are interchangeable with all other Quaturn fixtures.

Because they close with the pressure and therefore tend always to close tighter, eliminating leaks.

Because a satisfied customer means more business for you.

No Waste Circulation

THE SANITARY ENGINEER, PLUMBER AND STEAMFITTER OF CANADA was established in 1907. The subscribers represent the most progressive members of the sanitary plumbing and heating trade in Canada. The paper is issued twice monthly, on the first and fifteenth of the month. Circulates in all Provinces of Canada as well as Newfoundland. There is no waste circulation on SANITARY ENGINEER, because subscribers buy the paper for business. The advertising pages are read closely by the largest buyers of sanitary and heating goods in Canada. These men buy for business as well as for private consumption and, therefore, represent the best class of readers. When you advertise in the SANITARY ENGINEER you are assured of an attentive audience, who are looking for information about your goods and your methods of doing business. Cost of advertising is very moderate, indeed, and we will gladly supply detailed information regarding rates and circulation.

GALT - ONT.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. **We can advise you** and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Why Jenkins Bros'. Valves Are Superior

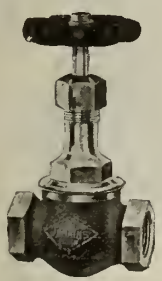

Fig. 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

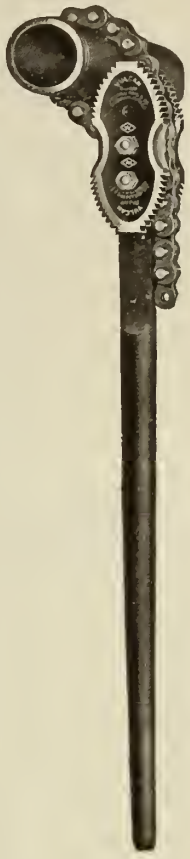
Mark of Proof Is Proof of Quality



There's proved and certified strength in every

WILLIAMS' IMPROVED "VULCAN" CHAIN PIPE WRENCH

Each and every Flat Link chain is "proof-tested" to two-thirds of its listed catalog strength in a standard tension machine. To each chain so tested is attached the Gray Leaden Seal, illustrated above, and every Flat Link Chain leaving our works *must* bear this seal—the Proof of Quality—as evidence that it has passed our standardized "proof-tests."

Look for this Mark of Proof for it is Proof of Quality—it guarantees uninterrupted, severe service as well as safety to the operator. Williams' "Vulcan" Chain Pipe Wrenches are the *only* wrenches which offer this certified assurance.

Introducing The "ALLPRISER"

Know Your Costs

EVERY common-sense business man must realize the absolute necessity of having easily understandable, up-to-the-minute cost figures to successfully operate a business. The higher the market price of commodities becomes, the more essential it is that he must *Know, Not Guess,* at costs. But the average business man in our line has heretofore felt unable to afford such apparent luxuries and has continued the old expensive practice of *guessing at costs* every time he sells, with the result that losses have been a part of his daily life.

Eliminate Loss

Do away with this guess work, and instead take on "ALLPRISER" Cost Service. Do not sell a fitting for 10c when it costs 12c; it may take 15c worth of time to actually figure up its value. Sail four square with the wind, lay your cards on the table, and see that you get all, but no more, than your just recompense—and you will get it, never fear.

Reduce Overhead

If you really desire to reduce your overhead expenses, a simple set of bookkeeping books properly kept, plus an absolutely essential cost system will just do that little thing for you and permit you to establish a legitimate profit, and at the same time help to keep down the cost of living. I do not believe any one in our craft wants to be anything but honest, and it is just plain "ignorance" that creates the appearance of some apparent wrongdoing.

A Direct Appeal

Need I appeal any further than to say that I will render this service at $25.00 a year? In so basing this ridiculously low charge I am banking on the hearty response of each and every member engaged in our worthy and most necessary calling to create a volume sufficient to justify "only $25.00."

The issue in loose leaf form will be off the presses July 1st (or very close to it).

I have started something for More Efficiency. Don't show you have fallen down, but instead write *Right Now* for subscription blank. References:—*The Trade.*

What Is "Allpriser?"

It is a flexible leather-bound book 7 x 9 containing 150 pages (loose leaf). It is a Trade Cost book specially gotten up for plumbing and heating.

It includes a list with net prices of all staple every day articles at a glance. "ALLPRISER" includes a regular service of price sheets compiled and revised every time a change takes place.

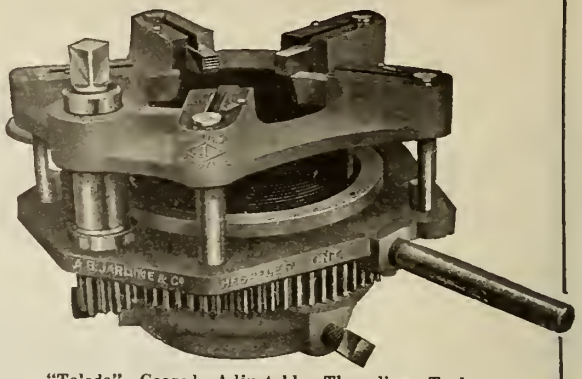
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity 2½ to 6 in. inclusive. Weight, 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

The Financial Post

This is a business man's paper. It is of interest to every man who has money invested either in his own business or in bonds and securities of various kinds. It is published weekly, and the news is given in very readable form.

Wholesale and retail merchants find it valuable because they are interested in market tendencies and market factors, not only as applied to their business, but also as applying to business in general. They need to know conditions local and remote. They need information to enable them to buy right and sell safely.

And the knowledge they need they can have for the insignificant sum of $3 annually.

THE FINANCIAL POST OF CANADA,
143-153 University Ave., Toronto.

Please enter me as a regular subscriber, commencing at once. If I am satisfied with the paper, I will remit $3 to pay for my subscription on receipt of bill.

OFFICIAL BULLETIN

OF

The Canadian Society of Domestic Sanitary and Heating Engineers

To the Sanitary and Heating Craft throughout the Dominion of Canada, Greetings—

As President-elect of the above Society, I extend to all those engaged in our calling, a hearty invitation to join us in our effort to organize those in our business throughout Canada.

Our Society stands for a fair deal to everyone and only by everyone doing their utmost to further the organization of our craft, will we attain those conditions which are the desire of all.

You will be doing your bit if you have, first of all, read the report of our recent Convention, as published in June 15th issue of the SANITARY ENGINEER, if you have not read same, do so at once. Secondly, notify our secretary that you desire to help and give particulars of our trade conditions in your city or town, stating if you belong to a local or provincial association, or if there is one in your locality.

Watch this page in each issue, and remember our motto—

ALL FOR ONE
AND
ONE FOR ALL

Yours for co-operation,

FRANK R. MAXWELL, President.

Address all Communications to

Garrett F. Frankland,
Secretary.

Quaturn Ball Cock

Did you ever sell a **whistling, noisy Ball Cock?** It didn't advertise you very well, did it? And very likely your customer was not much pleased either.

Next time use Quaturn.

Because, under moderate pressure they operate quickly, positively and noiselessly.

Because the working parts may be renewed when worn, without taking off the body, and they are interchangeable with all other Quaturn fixtures.

Because they close with the pressure and therefore tend always to close tighter, eliminating leaks.

Because a satisfied customer means more business for you.

The Value of the Business Press to Business Men

"Business men do not realize the value which trade journals and technical magazines may have for them in increasing the efficiency of their factories and in giving them a broad and comprehensive view of their business.

"Our foreign competitors read almost every article published upon their business with great care and thoroughness. Many of them have duplicate copies of their favorite trade paper sent to their homes so that they may read them away from the business without being disturbed. Many foreign manufacturers contribute articles to these journals on phases of the business with which they are most familiar. Such articles are bound to be helpful and have a constructive effect.

"Our trade journals and technical papers are the best in the world, and they should be supported and encouraged by our business men.

"Copies should be placed where employees can see them and they should be urged to read and study them.

"These papers are preaching the gospel of sound business on practical lines and are helpful not only to business but to the country as a whole.

"If the suggestions made by them in the past had been followed by our business men it would not be necessary at this time to point out some of the fundamental weaknesses in American business."

—Edward N. Hurley, formerly Chairman of the Federal Trade Commission, in "The Awakening of Business."

Burnham Boilers

Reduces Profanity

WITHOUT any claims for eligibility to the Bible Class, we are doing our part to reduce profanity in relation to boilers.

For example, the exclamation points caused by the scoop hitting on the fire door frame, because the door opening is so small you almost have to use a shoe horn to get the scoop in.

Like the Burnham fire travel, Burnham boiler fire box doors are generous in size.

One reduces coal bills.

The other reduces profanity.

Both induce friendship for Burnhams.

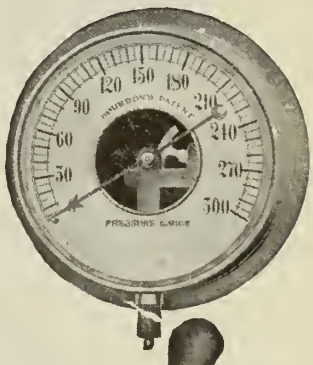
FIVE WORKS---OVER 3,000 EMPLOYEES

UNITED BRASSFOUNDERS AND ENGINEERS, LIMITED

EMPRESS FOUNDRY, CORNBROOK, MANCHESTER, ENG.



DURING THE WAR our plants were exclusively engaged on work of supreme national importance.

At the commencement of the new era we are pleased to announce that we intend to again direct our energies to the intensive production of:—

GUNMETAL and BRASS VALVES and COCKS.
STEAM, WATER and COMPRESSED AIR FITTINGS GENERALLY.
CAST IRON STOP and SLUICE VALVES.
SEMI-ROTARY PUMPS.
EXTRUDED BRASS and BRONZE BARS.
BRASS BOLTS and NUTS, STUDS and GENERAL TURNED WORK FROM THE BAR.
CAST AND MALLEABLE IRON COCKS and PIPE FITTINGS.
PRESSURE and VACUUM GAUGES.
INJECTORS and GENERAL JET APPLIANCES.
ENGINE GOVERNORS (Pickering, Proell, and Other Types).
SPRAYING MACHINES, for Insecticides and Lime-washing.
COPPERSMITHS' WORK.
"STELLA" BRAND ALLOYS: MANGANESE COPPER, SILICON COPPER, FERRO ZINC, PHOSPHOR COPPER and TIN, etc.

"UBEL" POST-WAR SERVICE

If you are interested in any or all of the lines mentioned, and are in a position to take a hand in the energetic distribution of the same, please communicate with us NOW to our Head Office, at above address.

AN ECHO OF THE CONVENTION

Talking about the recent Convention of Master Plumbers held in Montreal, the conversation naturally drifted to Associations and their work, and in commenting on their work my companion said: "There is one thing that every writer on Plumbers and Plumbing seems to have missed, and that is the advantage of personality in the Plumbing business."

The speaker was a successful Master Plumber and a man of long and varied experience, and as his opinion was worth having it is passed on for your consideration.

In part he said: "When I started out for myself I made up my mind that I was going to get business, that I was not going to sit down and wait for someone to give me a job, but I was going out to get it, and the results were really surprising.

It was wonderful the number of people who were interested in good Plumbing and Modern Sanitary Fixtures, and I was there to tell them all about it. I gradually got the confidence of my customers and plenty of work, and my activities were not confined to small work alone, but my business gradually expanded and eventually I was called in, at my customers' request, to confer with Architects and Engineers about the Plumbing and Heating which they intended to specify and instal in their new homes and industrial buildings.

It was all personality. I took an interest in my customers and in their work, and it is only fair to say what is contrary to all that I ever heard, that I found them quite willing to pay me a fair price for my services."

"Of course," he continued, "I am no longer very active in the business, having passed it over to younger hands, but the policy which made the business successful is still maintained, with the result that the connection is ever widening and I really feel that the business has a valuable asset in the good-will of its customers."

The conversation is repeated as the experience is out of the ordinary and contains suggestions which should be very valuable.

When talking to your customer, recommend PORT HOPE Enamelware. You can talk well of it because it's good and carries an unconditional guarantee. Your customers will like it for its rich appearance, good color, and the ease with which it is cleaned.

"Carry the Stock, Let People See It"

Cowans, of Brantford, Have Two Model Bathrooms — A Special Room Where Only Electric Lamps Are Shown and Store and Window Displays—Steadily Expanding Business Has Been the Result of Enterprise

Based on an interview by C. E. PARSONS, of Sanitary Engineer, with C. D. Henderson of Cowans, Brantford, Ont.

ONE of the handsomest and most up-to-date stores in the whole province," is what anyone in the trade will tell you, if Cowans, of Brantford, Ont., is mentioned. Travellers will tell you that Cowans' is a "real" shop, with much emphasis on the real. Plumbers from other towns and cities who have gone over the shop will tell you that they only wish they had one like it. The best of all these encomiums is that they are all true. Cowans' is a real shop. The city of Hamilton, twenty-five miles away, is more than four times as big as Brantford, but there is not in Hamilton a retail plumbing and electrical shop that can even compare with Cowans'. In fact you may go all over Ontario and you will find very, very few plumbing and electrical shops that can be classed with it. Cowans' simply goes to show that it is the man behind a business and not the location of the business or size of a town that makes for success. If Cowans' were located in a town only half as big as Brantford the store would still be a model because of the methods that are followed and the principles along which the firm works.

Service the Foundation

When you come down to a final analysis of the steady growth and success of this firm you find that everything revolves around the word "Service." Service means a whole lot. It includes getting a stock of goods of unquestioned quality, fitting up an attractive place where buyers will want to come to see them, getting the buyers to come to that store, and then, after they come, demonstrating to them beyond question that you have the goods without which their homes are not complete. Getting a stock of really quality goods that are suitable to the needs of the community in which they are to be sold is not always as easy as it sounds. Making one's store the recognized centre for high-grade goods requires faith, courage and enterprise. Keeping the goods moving and sales steadily expanding requires salesmanship, not only personal but those results which come from a well-displayed stock, an attractive store and good advertising. Almost any one of these essentials to merchandising success may be found in the average store. It is the combination that puts Cowans' in a class that is a great deal above the average.

Quality an Essential

Quality is one of the essentials the firm insists on. It makes no difference whether you want to buy a glass globe for an electric light or to have an expensive heating system installed. The principle on which Cowans work is that the best goods must be furnished and the customer absolutely satisfied.

Not only is particular attention paid to the arrangement of the display rooms in Cowans' of Brantford, Ont., but full advantage is taken of the display windows as well. This is an attractive arrangement of electrical goods which this firm put in some time ago and which brought good results.

"Satisfied customers are perhaps one of our very best advertisements," said C. D. Henderson, the business manager, to SANITARY ENGINEER. "They tell one another and they send their friends. We have got a lot of good business from this source. As far as our other methods are concerned we believe in keeping our store absolutely as attractive as possible. There is no better way of stimulating sales than to get people into your store and then keep them so interested in goods which are of real value in the home that the desire to purchase is aroused. Many plumbing shops are anything but attractive. There is little or no effort made to induce people to "sell themselves" on things they see. Many plumbers are content to go along and make an installation or do a repair job without reaching out after the splendid business that is to be had for the going after."

Elaborate Displays

"Display" is one of the features that stands out at every turn in the Cowans' store. Before the prospective buyer comes in there is a most attractive window display that invites attention. Every article in it bears a price card. Every article is looking its best. and the window itself is shining. There is absolutely nothing dead about the window display. It suggests a live store where you will get good goods and good service. There is an appeal about a window display of this kind that involuntarily wins the average shopper, especially those who are seeking the better things.

"We try to get lots of action in our window displays," said Mr. Henderson. "I don't mean that we have a lot of me-

chanical contrivances in motion but we make the displays interesting. The things we show and the use we make of the advertising helps suggest to those who see the display what they will do. Everyone gets a mental picture of the things in action. People like to look at displays that suggest action and we have had the most satisfactory results from our windows. We keep it changed regularly and always try to have the seasonable lines before the public."

The Store Arrangement

The store arrangement throughout is most attractive, and Mr. Henderson says that this is another big factor in producing sales results.

"You cannot keep your store too attractive," said Mr. Henderson. "People like to buy in a place where everything is well displayed and clean and neatly arranged. It pays to carry a stock that will meet every requirement of the district.

"People like to compare one line of goods with another and make their own selection. They like to deal in a store where they can get lots of information about the goods. We always make a point of getting all the information we can about the goods we handle, what they will do and all the good talking points that help make sales. This is invaluable in keeping stock turning over. The salesman who knows all about his goods and has the right kind of stock has no trouble in selling it.

Aim to Sell the Best

"We are constantly aiming to sell higher quality goods. We try to educate our customers along this line and find them generally willing to listen provided we can convince them, and we usually can, that a dollar is neither here nor there in comparison with the service that is obtainable from a first class article. We always keep away from the question of price until we have explained all the good points of an article, and by that time the prospective buyer is usually in such a frame of mind that he sees that price is really not the important matter that he might have thought it was. If a customer comes in and says, 'How much is that vacuum cleaner?' we do not reply but ask him to let us show him how it works. We give a complete demonstration of what it will do and use all the talking points that are available in driving home the service he will get and the value that he will obtain by purchasing the machine, and so on. By the time we have finished we have aroused between our sales talk and the demonstration the desire in the man's mind to buy. We have convinced him that unless he has a cleaner in his home he is really missing something that will help make the home better. It is then usually a question of our machine or some other make, and we can refer anyone to a long list of satisfied customers who have bought our goods and know just what they can do. The prospective buyer knows most of these people personally, and if he gets in touch with them they will boost for our goods. The same thing applies to electric washers, a heating or plumbing installation, or any other thing. Satisfied customers are one of the best ads. any firm can have."

The illustration gives a general view of the interior of Cowans' store, showing how the stock of fittings, etc., is neatly kept in drawers. On the front of each drawer is a picture of the part cut from a catalogue.

The illustration shows the two model bathrooms in Cowans' store. These are fitted up complete, the equipment in one being more expensive than that in the other. These rooms have helped Cowans' turn over a lot of equipment of this kind and are besides a most attractive feature of the store.

Helps the Sales

In addition to their elaborate store display, Cowans' have three special demonstration rooms. One of these is a model bath room. It is handsomely furnished and equipped with the very latest fixtures and equipment. It is aimed to show people who want the very best just what a model bathroom should look like and also just exactly what they can have in their own home. A large show card in the centre of the model bathroom says:

"Up-to-Date"

"This bathroom is an example of the latest goods being installed in all the larger cities."

Another card says:

"Your home is judged by your bathroom; make it clean, neat and well-appearing with these small fixtures."

Handsome fixtures, all nickel-plated, lamp shades and lighting fixtures are shown, and the whole effect of the room is to make the prospective buyer think of the best goods and want them because it is obvious that they are not only ser-

Note the wall display of bathroom fixtures in conjunction with the bathroom equipment and electrical fixtures. An arrangement of this kind shows prospective buyers exactly how the goods will appear in their own home, a valuable selling point.

viceable, but beautiful, and an addition to the home.

In case, however, the prospect does not wish to spend quite so much money, the firm has another model bathroom immediately adjoining. This is equipped in a most attractive but not so elaborate a style as the first and contains complete equipment just as it will appear when installed in any home.

Produces Results

"These model bathrooms certainly produce results," said Mr. Henderson. "When people, who are going to build a new house or who are remodelling their old house come down here and see these rooms, they can see quickly just exactly what they can have, and we can give them the exact cost in a few seconds. They appreciate this sort of service. Besides this our goods speak for themselves. We are careful to handle only quality lines and goods that we can stand behind. Prospective buyers are quick to understand this when they see our stock and our store arrangement. It speaks for itself better than anything we can say, and automatically helps in backing up our general sales talk. They get the impression which we want them to get that we know our business thoroughly and that anything they get from us they can depend on. Our model bathrooms usually suggest ideas to people who are building or remodelling. There are any number of little points they see that they had not thought of. We find that they ask us about this or that and that they usually take our advice when it comes to deciding upon a purchase because they are satisfied that we will tell them what is best. We try to live up to this in every way."

Special Lamp Room

Immediately behind the model bathrooms is a special showroom for electric lamps. No other goods are shown in this room but electric lamps. There is as complete a stock there as one could wish to look over, big lamps, little lamps, plain lamps and fancy lamps, in fact all sorts of lamps, and at all prices. When a prospective customer has selected a lamp he thinks he would like, it is placed on a special display pedestal right in the centre of the room and connected, so that he can see just what it will look like. The pedestal is of wood and handsomely finished, and serves to enhance the beauty of the lamp.

"Our lamp sales have been most satisfactory," said Mr. Henderson. "We find them steadily increasing. In the last year we have sold more than two hundred, and the sales are getting heavier each season. They are big sellers at Christmas time for presents but we handle them steadily all through the year."

Sell Many Washers

Electric washers are another good seller, Mr. Henderson says. The firm holds demonstrations on these machines, and a feature of the demonstration is a window display. In this, machines are put in actual operation in the window with an experienced lady demonstrator in charge. Of course this brings in a lot of prospects and many sales are usually made. A list of prospects is also obtained, and these are closely followed up.

Cowans' electric iron sales average two hundred each year, and Mr. Henderson says this will be increased. Irons are displayed at various points in the store on display tables, on ironing boards and at other points. Throughout the store are placed show cards with such inscriptions as "True economy lies in buying good things."

Believe in Advertising

"Our newspaper advertising and our window displays are the two best mediums we have of bringing people to our store," said Mr. Henderson. "We advertise regularly, using usually from half page space to whole pages, depending upon seasons and specials we may be offering. We have tried movie slide ads., but I would not say that they are good. We always get direct and very satisfactory results from our newspaper efforts. We try to keep our offerings interesting, attractive and seasonable, and we know from the questions that are asked by people who come into the store that the ads. are read, and read carefully."

Merchandising Pays

As will be seen from the accompanying photos, electrical fixtures are a big line with Cowans'. They have carried

This photo shows the attractive arrangement of stock in the front of Cowans' store at Brantford, Ont. Note the effective arrangement of fixtures and bathroom equipment. At night when all the lights are turned on the effect is even more striking.

them ever since electricity displaced gas a few years ago, and before that the firm carried a full line of gas fixtures.

"We go right after the merchandising side of the business," said Mr. Henderson. "It not only pays, but pays well. So many plumbers centre their efforts on plumbing and plumbing only. We have found that it is most profitable to handle electric fixtures, electrical utilities, and other lines. It means all year round business. There are no dull seasons. If the plumbing business is quiet we are still turning over our stock, and as all the lines carry a good profit we are making money all the time. Aside from that the handling of fixtures and other lines brings other trade. Hundreds of people know about our stock and our store that probably never would have heard of us if we only did plumbing."

Eliminating Repairs

Cowans' are in line with the policy that many of the most progressive plumbing firms are adopting, that of making every one of their employees a salesman. For instance, if a man goes out to a house where he has been called to make repairs, in the great majority of cases he does not make the repair at all. He sizes the job up carefully and usually advises the party to put in a new part. Very often not only a new part, but modern plumbing or complete rearrangement is suggested, and in every case the arguments for this are backed up by convincing reasons. It has been found that by following out this policy in general that much good business is obtained and that the property owners get much more satisfactory results. Most people are very reasonable about suggestions of this kind, Mr. Henderson says, and would far rather pay a little more and get a new part and a satisfactory job than to pay a fairly heavy price for repairs and then have to do the thing all over again in a short time.

System in Shop

It should not be gathered from what has been said that Cowans' are actively interested only in the retail selling end of the business. The practical end, that is, plumbing and heating and repairs, is looked after just as thoroughly.

A stock is carried that is considered ample to meet every requirement. For instance, there is a pipe rack that will hold a whole car load of pipe. There are 1,000 bins of fittings of various sizes, and complete equipment for doing work expeditiously. A power pipe cutter reduces shop costs on this work to a minimum. This machine, an emery wheel, a drill, and other accessory tools are all electrically driven. The firm believes in having the tools to do whatever work is required, and it also believes in looking after them. The workshop is kept neat and clean. The tools are kept in good working order and clean. There is a special room with a special man in charge for the small tools. Every workman who gets a tool out to do a job gets a bill, which is checked up with the time it is taken out and returned. In this way tools are not only kept track of and are not lost or mislaid, but if workmen are careless and break tools repeatedly the firm soon knows about it.

Supplies in Bins

There are neat and well-arranged bins for supplies. Instead of fastening one of the pieces to the front to show what the bin contains, a picture taken from a catalogue is pasted on the front of each bin. This saves stock and answers the purpose just as effectively.

"A whole lot of money can be made or lost by running a shop properly or by letting things slide," said Mr. Henderson. "We find that by working along the lines we do and by having the proper tools to do work quickly, we can figure much more closely on work and make more money."

So far, Mr. Henderosn has not been greatly impressed with the possibilities of the Ontario Housing scheme.

"It does not look to me as if it would work out," he stated. "It is hard to overcome a natural condition with an artificial remedy."

Great Activity in Building May Result in Delay in Securing Plumbing Equipment

Impossible to Get Unskilled Help, Declare Manufacturers—Much Difficulty is Also Being Experienced in Getting Molders—In the Meantime Orders Continue to Pour In

"THE situation has completely changed. Four months ago we were wondering if we would be able to keep going all year. Now, orders have been coming in so briskly that we have enough to keep us working to capacity for six months, and more business is coming in all the time."

This is a paragraph from a letter written by a manufacturer of plumbing goods to a firm in Toronto. It pretty well sums up the situation.

Help is Scarce

"One of our big troubles just now is to get help," said the head of a large firm making enamelware. "It it practically impossible to get molders. With the harvest coming on it will be more difficult than ever to get unskilled help. Business has opened up splendidly and we have lots of work ahead. We are not going to be able to keep up with our orders because we cannot get men. The men that we have are working shorter hours than ever before and drawing higher wages. In the past four or five years there have been few apprentices, and there is no one to take the places of the men who have left. To add to our troubles we are finding difficulty in securing materials in quantity because so many stocks are low and there are such big calls from all over the country."

Lots of Building

The splendid manner in which building has gotten under way has been a big factor in creating the demand for plumbing goods that is now making many of the manufacturers wonder how they will get the goods. In all parts of the country new residences are being erected and the majority of them are of the type that require plumbing goods. Many thousands of these homes are already started and many more will be built. With the signing of peace a great deal of building in connection with the larger projects was released. Many of those who were planning big jobs would not proceed until they had definite assurance that conditions were likely to be such that they could proceed without any such interruptions as have been frequent during the past five years.

Architects Busy

All over the country architects are very busy. Many of them have more work in hand than they have handled during the past five years, and more projects are being developed all the time. Just how long this condition of affairs will continue cannot be judged now. Whether it is just a spurt caused by the holding up of so much work during the war, or whether it is merely the start of a construction programme that will continue to develop, remains to be seen. There are those who hold diametrically opposite views. Some take the stand that in a year or so all demands for housing will have been met at the present rate of building. Others are looking for an unprecedented period of prosperity that will last for many years. One thing is certain, there never has been so much ready money in circulation in the country in general. In a great many places there is no question at all that the building which is under way and planned for this season will not be ample to take care of the requirements. Even with what is being done by private parties and housing commissions there will still be a great demand for reasonably priced dwellings.

The Coal Situation

Some manufacturers are beginning to get anxious over the outlook for coal. Reports from the mining centres are not reassuring in regard to supplies. No less than 40,000 miners, it is stated, have left for Europe in the last four months. It has been impossible to replace these men, and as a result the normal production of coal has been greatly lessened. Some of the manufacturers who have been trying to arrange to get in supplies of coal that will see them through the winter have not met with much success, and they are wondering just where they are going to get off at.

Canada's New Bankruptcy Act

First Uniform Legislation for Dominion in Forty Years—Will Lessen Expense, Make Proceedings More Speedy, Abolish Unfair Preferential Treatment, Provide Honorable Discharge—Retailers' Wishes Recognized.

Hon. Hugh Guthrie, Solicitor-General, before Montreal Merchants' Association

THE new Dominion Bankruptcy Act is due to the fact that for the past forty years there has been no proper Bankruptcy Act covering the whole Dominion. Russia and China, along with Canada, have no general Bankruptcy Act, but all other civilized countries have. There has been no Dominion law since 1878, and in the interval the various provinces have passed insolvency laws, but the trouble was that these were not uniform. Men who did a national business experienced difficulty through the variety of insolvency laws, while exporters in Great Britain said they could not secure uniformity in their claims with the preferences and priorities that were allowed in the various provinces. The demand for a Dominion Act came from the Boards of Trade, the wholesale and retail houses, the Bankers' Association, and many other bodies all over the country. Under the old Dominion Act, which lasted only for five years, the machinery for winding up an insolvent estate was very cumbersome and slow, the expense was too great, and the difficulty was that the assignees were not a class of men that would make good trustees, and very often no dividend was declared on the estate. The matter of expense as well as lack of uniformity was one of the difficulties with the Provincial Act, and one instance was given of a case in British Columbia where an estate of $730,000 brought only $3,000 for distribution to the creditors.

Voluntary and Involuntary

The Act as it is being passed by the Commons and Senate provides for two kinds of bankruptcy:

1. A voluntary one, for any man may make an assignment to a trustee under the Act.

2. An involuntary one, where the man is placed in bankruptcy against his own will. This applies to all except wage earners with less than $1,500 a year, and to farmers, who cannot be put in bankruptcy against their will.

There was an effort made to limit the application to traders, such as is the case in France, and was the case under the old Canadian Act, but experience has shown that this should be broadened and the Act in Great Britain applies even to farmers. The retail merchants declared that such a limitation to traders would be unfair to them, and that there should be a very general application. They told us that doctors and lawyers, professional men generally, preachers and university men were the biggest debtors so far as far as they were concerned. Thus the Act was broadened. So far as the farmer was concerned it was argued that he might be the victim of hard luck one year; he might be hailed out, and if he were compelled to give up his farm and stock he would have no chance to right himself, so he was exempted.

Where Debt Exceeds $500

The bill, as it went through the Commons, applied where indebtedness was $200 or over, but the Senate increased this to $500, and the Commons is agreeing to this; that is where a man owes $500 or over and refuses to pay.

Jurisdiction is vested in the Superior Courts of each province, and a few cases of appeal are allowed.

Choosing Trustees

Trustee—Anyone may apply to the Secretary of State for Canada, and the appointments are made by the Governor-General-in-council. Many chartered accountants have made application, and these will be assigned to districts, but all property, no matter where it is located, will be vested in the trustee. Each one must give a permanent security for $10,000. In the case of an individual estate the creditors may compel him to give an added security for the value of the estate.

The Act provides whereby an honest debtor may receive a discharge where he has not been guilty of impropriety, where he has kept a proper set of books, where he has given up all his assets and in fact has acted honestly, he is entitled to a discharge by a court which would be good against the world.

The procedure—The petition is presented to a court, which will have it served on the debtor, and in eight days the judge appoints a trustee who takes charge, under the supervision of the creditors and inspectors. The trustee must report to the court, and his security is not given up until the whole case is discharged.

Fees are Limited

Payment to trustee—The trustee may be given the creditor's vote or he may be limited to an amount under the Act which will not exceed five per cent. of the estate that is in his hands.

Lawyer's fees are likewise limited by the bill so that the estate will not be "gobbled up." The inspectors are allowed only their disbursements. In the case of lawyers where an estate is over $5,000 they are allowed 5 per cent., where it is under $5,000 not more than 10 per cent., and only the 10 per cent. if the inspectors agree.

Stringent provisions are made against preferential settlements or cases where fraud exists. The clauses are based largely on the English Act, and vary greatly compared with Ontario and Quebec Acts. Speaking generally, all cases of fraud or attempts to delay or any preference that is given one creditor over another are set aside, and if the money has been paid it may be reclaimed. Everything has been done in order to assure that the full benefit of the assets may be divided share and share alike, without preference or priority.

In regard to joint stock companies, the banks, railways, trust companies, and insurance companies, for which there is special legislation, are excepted. One of the difficulties under the present Act dealing with joint stock companies, is that it is difficult to settle the list of contributories. The new Act provides a very simple means; the trustee takes the books and settles the list of contributories himself. In the case, for instance, of John Brown, who has paid $60 each on his shares, he is called on to pay the remaining $40, and if he does not he can be sued in court within 30 days, and no new defence is allowed that was not in the original plea. This method is much more expeditious and less ex-

ITS MERITS

The analysis of the new Canadian Bankruptcy Act by Hon. Hugh Guthrie was given at a meeting of the Merchants' Association of Canada, held in Montreal, at which a staff member of SANITARY ENGINEER *was present. Mr. Guthrie declared that the new act would grant uniformity, secure speedy, cheap and reliable proceedings; abolish preferential or priority creditor abuses; grant an honorable discharge to a deserving debtor, and work out beneficially to the commercial and financial interests of Canada.*

From the point of view of merchants it is gratifying to note that they won out in their protests against the limitation of the act to "traders"; now it includes the "professional" classes as well, many of whom they described as their "worst debtors."

Current Events in Photograph

First Dirigible to Cross Atlantic

The photo gives a good idea of the great size of the R34. It was taken shortly after the explosion which tore the dirigible from her moorings. The explosion was caused by the gas in one of the front sections becoming heated by the sun. It tore a section of the outer skin thirty feet long from the forward lower surface of the gas bag. This accident has delayed the return trip of the huge aircraft. But it is now on its way, having left Wednesday at midnight.

pensive than under the present procedure.

The priorities allowed are as follows:

1. Expenses of trustees as a first charge.

2. Costs in obtaining judgment are allowed to the first man who has secured execution against the company.

3. Three months' preference only to wage earners.

4. Taxes due to provincial or Dominion Governments which are declared a lien on the property and must be paid.

Landlords Three Months Only

In regard to landlords—A change has been made in the law as it is in the Province of Quebec regarding landlords. As a result a criticism has been brought up that we are too hard on the landlords, while on the other hand the claim is made that they should rank as ordinary creditors. We have decided to allow the landlords three months' preference only on their claims. Again the criticism is raised that as soon as the law takes effect you will see all rents payable in advance. But that is not a hardship and as a matter of fact, in New York this is the custom in force. If more than three months rent are due him he will be treated as an ordinary creditor and obtain his dividend with the rest.

The main objects that will be obtained by this Act are thus:

1. It will grant uniformity in bankruptcy acts for all the provinces.

2. The proceedings will be as speedy, as cheap and as reliable as possible. wholesaler, got a square deal.

3. It will abolish preferential or priority creditor abuses.

4. It will provide for the honorable discharge of an honest bankrupt.

5. The whole Act will work out to the financial and commercial interests of Canada.

It may be six months or more before the Act is put into actual operation. The consensus of opinion is that a reasonable time should be allowed to pass before it comes into effect. Practice forms must be drawn up, rules of practice approved of, trustees chosen, etc., but in six or eight months the bill will be proclaimed as law and come into force.

Inland Trade Commission Favored

R.M.A. Secretary Advocates It Before Cost of Living Enquiry

Ottawa, July 12. (Special.) — Among those who gave evidence before the Cost of Living Committee at Ottawa the past week were E. M. Trowern, secretary of the Dominion Retail Merchants' Association. He said that he had been in this position for 25 years, consulting with 55 different sections of the retail trade. He said the trade had been badly handicapped because the retailer is not familiar with the wholesale and manufacturing end, and finds it hard to get the facts. This often causes dissatisfaction. He said the retailers had been asking the Government for the past ten years to create some sort of an Inland Trade Commission, modelled after the Federal Trades Commission of the United States, but, taking into consideration the difference in our laws. Mr. Trowern read to the Commission a paper on this subject. He thought the policy of the Government should be to see that everyone, from the consumer to the wholesaler got a square deal.

He would advocate giving such a commission as he proposed all the power now given under the criminal code, which cannot now be operated. The man who wanted to fix prices should come before the board and make his case. Suppose the retailer has the suspicion that he has been paying too much for some article, he can get no explanation, but suspects the manufacturer is taking advantage of the market. That would be a matter for the Inland Trade Commission to take up. The retailers would lay the evidence before them and they would call the party concerned before them and find out if advantage were being taken of the market. Then an order could be passed saying that profits were excessive, and a price could be fixed fair to all. If it is found out that the profits are not excessive, the public mind is relieved. The whole question of the tariff and everything else relating to the question might come under the proposed commission.—T.M.F.

Omissions in Architect's Plans Result in Varied Quotations

Not Always Price-Cutting, But a Different Interpretation of Work Wanted That Results in Low Figures, Says Windsor Man—Plumbers Should Have Appreciation of What Their Position in Community Is

MUCH has been written of the discrepancy in quotations which different sanitary and heating engineers will submit for the same work. Some have said it is plainly and simply a case of price-cutting, that a full appreciation of the work to be done and its value was not apparent. That the lumber or heating engineer wanted to beat the other fellow to it and was willing to sacrifice his profit or do cheap work to accomplish his end.

Plans Incomplete

But are all these "bouquets" being handed to the trade justified? Is the sanitary or heating engineer being judged fairly? Isn't there a chance that there may be another reason for the great variation in prices asked? In the opinion of M. A. Brian, Windsor, Ont., there are architects who fail in supplying proper plans and specifications, with the result that the interpretation of same may easily vary and quotations submitted as a result of the incomplete information on plans thus show wide variance.

What One Plan Showed

A representative of SANITARY ENGINEER recently called on Mr. Brian and this matter was one that he believed should come in for correction. "Just look here," stated Mr. Brian, "and I will show you just what I mean. Here is a set of plans which I call good. You will see in looking these over that first of all the position of the house on the lot is given. In that way it is easy to determine the pipe needed to connect up with the water mains and the sewer pipe required, also the amount of excavation work this will entail.

"Here again are separate layouts for the basement, first floor, second floor and attic. Every fixture wanted is shown, the position of every fixture is marked—such specifications enable me or any other plumber or heating engineer to figure correctly. I do not know, but I venture to say that the prices sent in on this job will show very little difference.

These Were Different

"Compare those plans then with these I have here," continued Mr. Brian, drawing forth another set which he had for a plumbing installation on a small factory. "In these plans of the factory there is absolutely nothing to indicate the equipment wanted, nor the position of the various fixtures. I figure this work may run up close to $1,000; I figure also that there may be a quotation as low as $800. Not because another plumber is trying to cut my feet out from under me but because they have not dug into the matter as closely as I have. The result will be that they are given the work, and when they get at it they have all this equipment they never figured on to install, and are out as a consequence a whole lot of money."

Eliminate Guess-Work

There in a nutshell is one of the main causes of the present diversity of quotations according to Mr. Brian, and it is easily understood how this lack of information on the plans submitted may have just this result. Mr. Brian appreciates the fact that there is some price-cutting going on, but thinks this will be overcome when the trade are given plans which leave no room for guesswork or an opportunity to turn in different interpretations.

The Windsor craft are organized now and good results are expected from these get-together meetings. One good result expected is that the trade will find out that the other man is human, too, that he is facing problems and that they have many interests in common which can be discussed.

Plumbers' Position

"When the trade realize the importance of the position they occupy in the life of a well-organized community, we will all be better off," stated Mr. Brian to SANITARY ENGINEER. "The plumber has been called a robber and thief and all kinds of other uncomplimentary names, and he has calmly accepted it. Let me tell you no man can apply those names to me and get away with it. I am in business to make a success; my prices are fair in line with the work I do, and no man can trample on me and my calling without running right into trouble. The sooner we all stand up on our feet and choke off any person who seeks to malign us, the better for the trade as a whole. The plumber is a mighty important man in the community, or at least should be. In fairness to himself and his fellow members he should lose no opportunity to do a little advertising on just what a strong link in his local industrial chain he is."

May Make British Goods in Canada

British Manufacturer Looks Toward Canada With New Vision — Changes Will Assist in Greater Production — War Creates Broader Views, Say Steel Company Officers

MR. BEVERLEY ROBINSON, president, and Mr. Hugh Kearns, managing director, of B. & S. H. Thompson & Co., Ltd., Montreal, have just returned from a four months' business trip in Europe. They visited the British Isles, France, Italy, Sicily, Switzerland, etc.

During an interview with SANITARY ENGINEER, Mr. Kearns stated that the attitude of the British manufacturers has undergone a very great change with regard to Canadian business. They realize now that they must be prepared to meet the conditions of the trade in this country, the unwillingness to do so in the past having diverted a very great proportion of the Canadian trade to Germany.

Labor—New Equipment

British manufacturers freely admit that labor in the past did not get the share of profits which they should have, but this condition is largely accounted for by the competition which grew up among themselves. It is recognized that cheap labor in the past will not be available now, and to offset this many of the progressive manufacturers are installing new and up-to-date equipment in plants which had become obsolete.

The labor troubles have been serious, but Mr. Robinson and Mr. Kearns were told by a gentleman who had been on one of the Government committees which negotiated with organized labor during the war, that the labor leaders in England, contrary to the general idea, are extremely reasonable and patriotic men. Difficulty is experienced by these labor leaders in controlling their people at all times, but with this class of men directing labor, and the common sense of the British people, the labor situation would undoubtedly be straightened out.

May Build in Canada

A number of British manufacturers intimated their intention to manufacture in Canada in order to secure their share of our trade, and a great many people in the various walks of life, whom Mr. Robinson and Mr. Kearns met, intimated their intention of migrating to this country.

Great Britain is recovering much more quickly than the other countries which Mr. Robinson and Mr. Kearns visited. On the continent there is an extreme shortage of coal which is greatly hampering the return of commercial activity, and, of course, conditions there have been much more upset by the war than in Great Britain, because of their closer proximity to it.

Now that peace is definitely settled, an era of prosperity should be confidently looked for, our having become better known in Europe through Canada's wonderful record during the war will contribute to this.

EDITORIAL COMMENT

THE CRAZE FOR FACTORIES

THERE are municipalities in Canada that are willing to give the shirt off their back in order to secure industries.

This is not a new disease, but it seems to be like the measles in that there is no telling when it is going to break out in a fresh place.

For a number of years the cry of the municipalities has been, "We must have industries." They have in many cases lost sight entirely of the fact that industries go where conditions are favorable for their development. They fail to recognize the history that has been written all over this country of the fool industry seeker.

There are taxpayers in scores of Canadian villages, towns and cities who are even yet putting up their good money for some idiotic scheme that was foisted on the place years ago, and the only memory they have now is the taxes they pay for their foolishness. It is not correct in many cases to say that these concerns were "foisted" on the municipality. Too often the municipality was out looking for the proposition. It was a happy time for the promoter who had a real lemon in his pocket. It was not hard for him to find places that would listen to him. He would give employment to one hundred people, he would do this, that and the other thing. Well, if he failed? Municipality had the building or the plant, if there happened to be a plant. They might have an asset and they might not. They certainly had a liability in the money or loan they had made.

But this thing still lives. Only a few days ago a Canadian city had a letter from an American concern. This firm happens to be all right. It has been planning to come to Canada for a branch business to handle export trade. It is coming no matter if the municipalities make concessions or not. If they have to pay their own way they will do it. That firm right now has four wonderfully favorable propositions before it. They are being offered for nothing what they were prepared to pay for.

Here is another and perhaps a more concrete case, because we are able to publish some of the correspondence. In this instance a Canadian city, quite an industrial place, wrote to an American plant, intimating that they had heard they were going to open a business in Canada, and on the strength of that taking the opportunity of pointing out the advantages of this particular Canadian centre.

It was only a few days after that the city received the following letter from the U.S. firm:—

"Replying to your letter of the 14th ult., will say, that we now have before us a Canadian proposition, in which this particular city has offered us ten acres of land on a railroad siding and have agreed to build on this land a one-story fireproof factory to contain 30,000 square feet, and turn same over to us, free of charge, and give us water and taxes free for ten years. The Hydraulic Power Co. have agreed to give us electric power at ½c per K.W. hour. In return we are to start operations with at least 100 men and to agree, in case we discontinue during the first ten years, to return the property to the city.

"If you have any better proposition to offer, we would be pleased to receive it, and give it due consideration."

Now there may be some few details that were lacking in the offer that was made to the company. They might have been offered free hay and oats for the first six months, free street car rides for the employees and a twenty per cent. discount on their grocery bill at the corner store.

But after looking over what that Ontario town is prepared to do, one might well be prepared to lean back and say, "If you know of a better 'ole, go to it."

BUSINESS COMES LAST

THE calm admission by Hon. Hugh Guthrie, K.C., before the Merchants' Association of Montreal, that for forty years there had been no proper Bankruptcy Act covering the whole Dominion shows how little attention Governments pay to business interests. Russia, China and Canada, said Mr. Guthrie, were the only countries without legislation of this kind. All other civilized countries had it, he declared. The trouble with too many of the men who go to Ottawa seems to be that they are too busy pulling strings to have any time at all for helping business. In fairness to some of the elected representatives, it might be stated, that they have not the slightest appreciation apparently of the problems that retailers and other business men are facing continually. The new Bankruptcy Act will facilitate matters in some lines greatly. It is being passed largely as a result of the combined efforts of the wholesale and retail firms of the Dominion, the Bankers' Association, and other organizations. Had these men not got busy the Government would probably have slumbered on for another

forty years, or perhaps for 140 years before it did anything on its own initiative to help business men. One thing busy merchants and others interested in commercial pursuits have to learn is that if they want to get anything done at Ottawa, they have to initiate it and practically put it through themselves. Even then, very often the progress is impeded owing to official red tape, indifference and just plain ignorance.

STRIKES ARE EXPENSIVE

WHILE it is too early yet to make any accurate estimates of what strikes have cost Canada this year, it is certain that the loss will run into several millions. Business men are always directly affected when any large number of men go on strike and big plants are tied up. In the case of Winnipeg it will be many months yet before business recovers from the effects of the walk out there. In the street car strike in Toronto, although it lasted not quite two weeks, down-town merchants lost heavily. No stores, it is stated, were hit harder than the big department stores. Business men who have discussed the situation with SANITARY ENGINEER urge the necessity of evolving some plan by which differences can be arranged without the men ceasing work and plants tied up. Many of them declare that so far as practical results are concerned the present plan is not a great success. In spite of the machinery that is supposed to exist at Ottawa for arranging disputes thousands of men have quit work and scores of plants and millions of dollars' worth of machinery have been idle. This is where the greatest loss occurs. Another big loss aside from the production standpoint is to the workers themselves. It will take many of them months at full time to make up for the time they have lost. In England the Whitley plan of settling labor troubles has been adopted and from reports is working satisfactorily. It is likely that an effort will be made to investigate this plan and have it tried out in Canada. In the meantime, it is encouraging to know that good progress is being made in settling numerous strikes all over the country.

THE SPEED AGE

MANY people who in watching the developments of the past ten years in bicycles, motor cycles, automobiles and aeroplanes expressed the view that the world was moving too fast, are waking up to the fact that the real speed is yet to come. When aeroplanes during the war frequently exceeded 120 miles an hour, easily outdistancing the fastest express trains, many people thought the limit had been reached. Some of the huge new planes that are planned for commercial purposes will make those 120-mile-an-hour planes look like lumbering old stage coaches. As a result of the developments in air service the world is contracting rapidly. Just what the next ten years has in store it would be most interesting to know. Certainly there is every indication that under the impetus given aeroplanes through the war they are to play a big part in the commerce of the future. Not only aeroplanes but dirigibles. The successful trip across the Atlantic in 108 hours of the big British dirigible R 34 opens up some tremendous possibilities, especially when it is remembered that this is much faster time than the speediest of the Atlantic liners can make the trip in. And the cost of operation is not to be considered. All air routes which will clip days and in some cases weeks off the present schedules of trains and ships, and which will put the most distant points within easy reach, are now being planned and materialized so rapidly that it will only be a short time before the trips are actually being made regularly. Just what this means to business men in time saving and in the delivery of mail, to say nothing of merchandise, cannot be estimated. It is especially gratifying to know that the leader in this great new development is Britain and that improvement after improvement is being made which brings air travel ever nearer to the point where it will come into general use and be devoted to the service of hundreds of millions of people.

WHY NOT STOP THIS?

FROM time to time SANITARY ENGINEER has mentioned the serious fire losses in Canada, most of which are directly traceable to carelessness. At the present time reports from Northern Ontario indicate that enormous losses are occurring there through forest fires. Fortunately, so far there have been none of the harrowing tales of scores being burned to death that have so often come out of the north country. This fire loss, which has been occurring annually, and runs into millions very often, could in the opinion of many of those who have looked into conditions be practically eliminated if the Ontario Government took the necessary steps. Why such a terrific loss should be allowed to occur each season and demoralize business conditions in many northern towns, to say nothing of adding to insurance rates, if an efficient system of forest protection can be established, it is difficult to say. It would appear that it would be more than worth while for the Government to remove this menace if there is any way of doing it. Each year is seeing a substantial growth in Northern Ontario. In mining alone the past twelve months has seen a tremendous development to say nothing of agricultural and lumbering interests. The north country is rich, but one of its terrors has been the forest fires. This has impeded development unquestionably. The losses from the fires have gone a long way towards making Ontario's fire loss one of the largest in the world per capita. It is time, it would appear, that somebody got busy and studied this problem.

Saving Coal in Steam Power Plant

Economy in any power-plant proposition absolutely demands definite knowledge (1) as to whether coal would be saved by purchasing power on the one hand or generating the power in a privately owned plant on the other hand, and (2) if the decision is in favor of the latter alternative how to save coal and obtain maximum production with minimum waste.

The object of this bulletin is to set forth the underlying principles, the determining factors, and the method of applying them to the problems in hand in such manner as to be of greatest service to the owner, manager, and engineer.

Isolated Plant Versus Central Station Power

If the available power purchased or privately generated is obtained purely from a hydro-electric service its use will, of course, save fuel over any steam-power proposition. If, however, in a steam plant all the exhaust steam were sufficiently utilized the boilers would still have to be operated at about 90 per cent.[1] of their former output to supply the heating steam (even if at low pressure) if the engines were shut down, and the saving in coal would be only 10 per cent. instead of 100 per cent.

B. If the purchased power is produced in a central steam plant capable of delivering a kilowatt hour for, say, 2½ pounds of coal, then its use will waste or save in comparison with a private steam plant, as follows:

B-1. If all the exhaust steam from any design of private plant is absorbed by heating and process work, no central power station[2] of condensing operation can ever be designed to compete with it in the matter of coal consumption.

If the engines in this private plant were all removed it would still require 90 per cent. as much coal as formerly to make low-pressure steam for heating, and outside current at 2½ pounds per kilowatt hour would still have to be purchased.

If the private plant had been using 8 pounds of coal per kilowatt hour it would save eight-tenths of a pound of coal, to replace which it would buy current costing 2½ pounds. Thus, for each pound saved in the private plant 3⅛ pounds are burned in the central station. This example represents the extreme case in favor of the private plant.

B-2. If the same private plant operating noncondensing wastes all of its exhaust steam, coal will be wasted in the ratio of 8 to 2½ per kilowatt used. Coal will be saved by substituting purchased power. This example represents the extreme case in favor of the central station current, and the ratio is 8 to 2½ or 3.2 to 1.

To sum up cases B-1 and B-2, the use of exhaust steam is the determining factor. Where it is all used the small private plant generates its energy as a by-product of its heating. The engine or turbine acts as a pressure reducing valve between the boiler and the heating system, and abstracts a small percentage (3 to 12 per cent.) of heat from the steam. Therefore shutting down the engine will save only this small fraction of the total coal. For most cases of this kind it is safe to say the engine absorbs less than 10 per cent. of the heat or fuel. As a matter of fact, many cases could be quoted where no saving of coal occurs when the engines are shut down[3].

[1]Exhaust steam contains, within a few per cent., as much heat as direct steam. Thus an engine or turbine with steam consumption of 20 pounds and 60 pounds per indicated horsepower hour will discharge in their exhaust about 88 to 96 per cent. of the heat of the steam admitted at their throttles respectively. In the examples given 90 per cent. is assumed.

[2]Operating condensing in accordance with standard practice. If a central plant were designed to furnish exhaust steam to its customers it could then compete on a coal basis with the private plant. This is the sound theory of the "city block" or "district" system of power and heating.

[3]There are sound technical explanations for these cases, but it is aside from present purposes to enter into a detailed discussion.

[4]The proportion of exhaust required for heating represents almost the same proportion of coal which will have to be burned for direct steam heating if the engine is replaced by purchased power.

[5]Equal coal consumption obtains when the proportion of total coal required for heating alone equals one minus the fraction obtained by the ratio of the kilowatt hour coal consumptions of the isolated plant to the central plant figured from the purchaser's switchboard. Example: With purchased current at 4 pounds of coal and private power at 7 pounds, an equal coal consumption with either system will obtain when the proportion of coal required for heating is 1 minus 4/7 = 3/7 of the total coal.

Hence for purposes of approximate calculation the power is a pure by-product of the heating. But assuming 10 per cent. of the heat of the steam to be taken by the engine, then only 10 per cent. of the coal consumption will be saved if the heating is done by direct steam. Eight pounds of coal per kilowatt hour, the figure assumed, is based upon an extravagantly wasteful boiler plant, but even under these conditions the small private plant using all its exhaust would save coal over central station current for power ratio of 3⅛ to 1.

If on the other hand no exhaust steam is used in the same private plant, the saving in favor of the central station power is in the ratio of the coal used per kilowatt hour for the two cases, or with the figures assumed, 8 to 2½, that is 3.2 to 1.

It is evident that in a noncondensing private plant, as the use for exhaust steam decreases a certain point will be reached where the same coal consumption would obtain by the generation of power by either type of plant. A still further reduction in the utilization of exhaust would then throw the balance in favor of central station power.

This critical point of equal total coal consumption depends upon the coal consumed per kilowatt hour in the private plant and the central plant, respectively. Thus if the central station has a coal rate of 3 pounds per kilowatt hour and the private plant 6 pounds, the critical point is reached when 1 minus 3/6=1/2 of the exhaust or coal is needed for[4] heating, and the same total coal will be consumed whether the power is purchased of the engine operated. If less than one-half of the exhaust is used, the purchased current will effect a saving; if more than one-half of the exhaust is used, running the engine in the private plant will save coal.

Take another case and assume that current can be supplied at the purchaser's switchboard for 2 pounds of coal, and that the small plant produces it for 5 pounds. Then, if 1 minus 2-5 = 3-5 of the coal or exhaust is needed for heating no change in total coal consumption will occur if current is purchased, the engines shut down and boilers operated for heating only[5].

If the coal per kilowatt hour for outside current is less than the same figure for the private plant, the most coal will be conserved by carrying just enough load to furnish exhaust for the heating and buying the surplus power. Thus the small plant obtains a part of its power as a by-product of its heating and buys the balance for the least total coal consumption. This method saves more coal than shutting down the small plant entirely, even when a saving would be thus effected. There are many cases where at night or during non-heating months where an important coal saving can be made by buying the power which is in excess of that required to furnish exhaust for heating.

Still another situation is met when the private plant is of modern design and operates solely for generation of power. Such cases would be determined purely on a comparison of the coal consumed per kilowatt hour. Central station power is produced at consumers' switchboard from a minimum of about 1¾ pounds of coal in the largest and most modern plants up to 3 pounds, 4 pounds, 5 pounds, and upward in less efficient stations.

In moderately large private plants of good design a kilowatt hour is produced for a little over 2 pounds, while less efficient and smaller plants consume up to 10 pounds and over. In this whole problem it is necessary to regard coal as the basis of economy and not money as heretofore. Central station interests and private consumers should patriotically endeavor to meet each other half way in sacrificing by reduced rates or increased expense when important economies in coal are at stake.

PART II

After due consideration has been given to the question brought out in the previous discussion and if it has been determined that the plant is justified in continuing to operate, attention must be given to those points having a bearing on economical operation. No transformation of energy can take place without appreciable loss, and every effort should be made to keep the various losses down to a minimum. Diagram A shows a typical distribution of heat in a medium-sized hand-fired plant.

Stopping Fuel Waste

Beginning at the grates upon which the fuel bed rests, see that the air spaces are properly proportioned to avoid loss of combustible material into the ash pit. This will depend on the kind of coal used. Study the fuel with this point in mind. Five per cent. is not an unusual loss from this cause.

The amount of grate surface is important, as it determines the rate of consumption. Ratios of grate area to boiler heating surface will vary from 1:35 to 1:60, depending on the characteristics of the coal and whether hand fired or stoker fired. For power purposes in hand-fired plants do not permit the rate of combustion to fall below 15 pounds of coal per square foot of grate surface per hour, or go above 28 pounds with bituminous coal. With stokers the rate may be as high as the design of plant and the draft will permit. With the fine-steam sizes of anthracite the rate of comparison should not be less than 10 pounds.

With settings tight to prevent infiltration of air, heating surface clean, radiation losses reduced by proper covering, piping and steam mains lagged, engine valves tight and properly set, all condensation returned to the feedwater heater a good start will have been made in fuel conservation.

Human Element Important

However, merely placing the plant in good physical condition will not suffice. Conditions change from day to day, from hour to hour, even from moment to moment. These changes must be interpreted, and the degree of intelligence with which they are interpreted marks the degree of success which will be realized in fuel saving.

A good plant poorly operated will show low efficiency, while a poor plant skillfully operated will sometimes show a relatively high efficiency. Therefore,

Ultimate efficiency=E×H

Where E=Equipment

and H=Human element.

Check Operation Closely

Find out what the boilers are doing. Provide facilities for weighing the coal; for measuring the feed water; for checking up on combustion; for determining draft; for taking temperature readings at important points. To appreciate the significance of the above items it is desirable to become familiar with the literature of power-plant operation. Read Bulletin No. 1 of the United States Fuel Administration on Boiler and Furnace Testing, Technical

Paper No. 80, and various other publications of the Bureau of Mines. In small and moderate sized plants, hand fired, a boiler efficiency of 60 and 70 can be expected, while in medium-sized stoker-fired plants 70 to 75 per cent. should be realized. In any given plant determine what efficiency should be expected, considering load and equipment, and keep the plant up to mark set.

Principal Losses

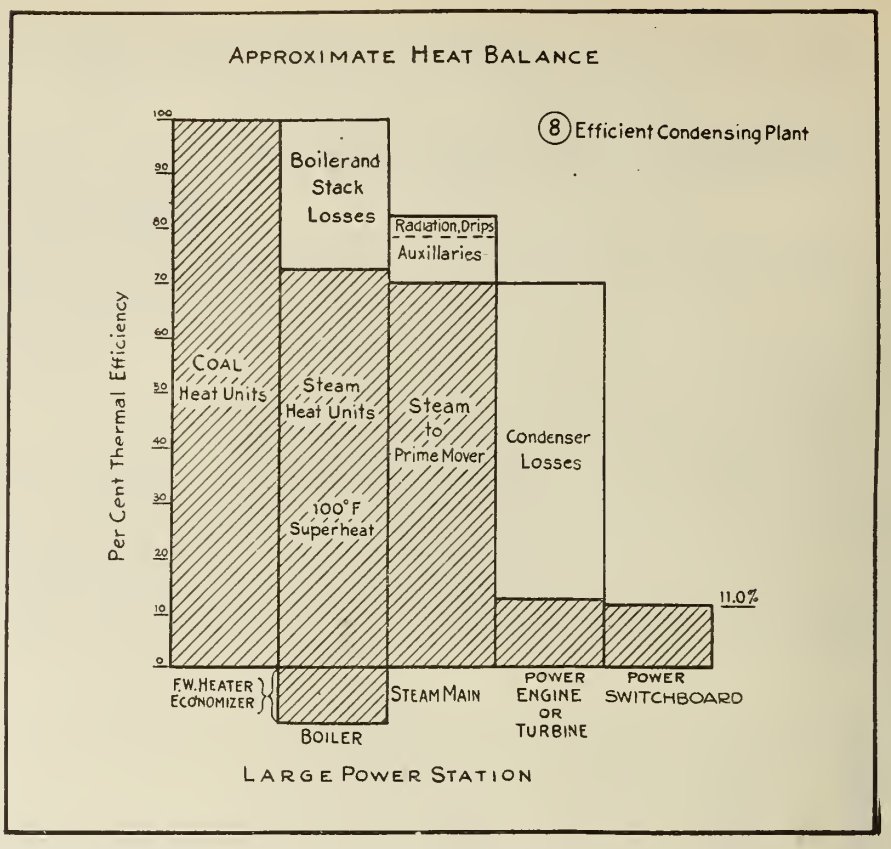
The chief losses in boiler-plant operation are:

1. Cause, dirty boiler, loss up to 25 per cent., remedy, clean boiler. 2. Leaky setting, loss up to 15 per cent., remedy, tight setting. 3. Poor firing, loss up to 40 per cent., remedy, good firing.

1. A boiler may be dirty on the inside or outside or both. Dirt on the inside is due to scale formation and can becorrected by cleaning the boiler and then giving consideration to the character of the feed water and its proper treatment. See Engineering Bulletin No. 3 of United States Fuel Administration.

Outside cleaning must receive careful attention. A slight accumulation of soot deposited in a few hours' run will result in a great loss of efficiency. Someone must be delegated to follow up this matter of soot and see that the cleaning is done thoroughly, frequently and regularly.

DIAGRAM B (c)



2. Air leaks reduce efficiency. The ordinary brickwork setting develops cracks and crevices which allow a considerable amount of air to enter the setting, lowering the temperature of the gases of combustion. The porous character of the brick itself is such that an appreciable leakage takes place through the walls.

The remedy is to point up the brickwork with plastic fireproof mixture and paint or cover the setting with a coat of air-tight material.

3. Bad firing includes allowing holes to develop in fuel bed; carrying an uneven fire; carrying too thin a fire; carrying too thick a fire; stirring fire, thus forming clinkers; and improper manipulation of dampers. It is here that the human equation becomes of most importance. Attention concentrated on what takes place from day to day in front of the boilers will pay greater returns for the time spent than in any other part of the plant.

Power Plant Records

The importance of keeping a systematic record of operations can not be overestimated. In this way affairs in the power plant are lifted from the realm of guesswork to certainty. While the system adopted for the ordinary plant may be very simple, the records should be arranged for convenient reference so that comparisons of results with past performance may be made. Thus it is possible to note the effect of changes in equipment or methods and improvements in economy or the reverse may be at once detected.

Engine Room

After the steam has been delivered to the engine, care should be taken to see that it is utilized to best advantage. Where all the steam is needed, the economy or rate of the engine itself is not of particular consequence; that is, a simple slide-valve engine using steam at the rate of 40 or 50 pounds per horsepower may be the most desirable type to use. This all depends on circumstances. As the demand for exhaust steam decreases, the importance of economy in the engine increases. Should there be periods during which all of the exhaust is not used, the maximum economy of the engine during these periods is of utmost importance. At such times the most economical generating unit should be selected and one of a size that will be economically loaded with the amount of power developed.

Use of Exhaust Principal Factor

A portion of the exhaust should be used for heating the feed water to the highest temperature practicable; not less than 200° in any event.

Exhaust mains should be pitched in the direction of flow, drained and trapped, and the condensation returned to the heater. Use no live steam where the work can be done with exhaust. To get the most efficient transfer of heat the radiating surface of coils and other heating elements should be properly disposed to promote circulation of the heat-absorbing medium, whether air, water, or other liquids. Large increase in efficiency or capacity can sometimes be made in old systems by a little attention to this feature.

In the case of stills, evaporators, or triple effects in which deposits of suspended or residue matter is liable to form, periodical cleaning of the coils is essential.

Venting radiators and steam lines of air should receive careful attention. See Engineering Bulletin, No. 6, on Saving Fuel in Heating Systems. For large systems vacuum returns are recommended. Direct radiation should be checked up with special respect to location in order that heat loss through exposed walls and windows shall be taken care of efficiently.

A study of the accompanying heat balance diagram will serve to indicate the small portion of the heat developed by the fuel which is used in generating power.

Do not, therefore, assume that the steam after passing through the engine is a waste product. It will represent a large percentage of the heat delivered by the boiler. Save it wherever possible. It is the principal product of the plant. The power is the by-product.

A DETROIT man has quit the pulpit because the world does not want the gospel as he wants to preach it. The world has been preached at until it's black in the face, and what it wants is some church members who will measure up to the preaching that is done to them.

A SUGAR refinery in Montreal hastens to deny that it has any labor trouble. Conditions are as sweet as the product of the factory.

Much Needed Plumbing May Be Installed Under Local Improvement Plan

Guelph City Council Holds Conference With Plumbers to Discuss Ways and Means—Further Information is Being Secured

AN important conference was held at Gueiph, Ont., between the city officials and the local plumbers to try and work out details of a plan by which a large amount of much-needed plumbing work may be done on the local improvement plan. Mayor Carter, who is behind the move, has been investigating conditions and is anxious that every home in the city which can be connected with the sewers should be. Many homes where sanitary accommodations are badly needed are without them in Guelph, owing, it is stated, to the cost of installation. With a view of solving this problem and making for a general betterment of civic health, Mayor Carter called the conference.

The matter was gone into fully, and there is every hope that a plan will be formulated by which the work that is required can be proceeded with and arrangements for payment spread over a term of years. Just what can be done in arranging this financial matter could not be discussed at the meeting as no one was prepared to give definite figures. Because of this it was decided to postpone the meeting until this and other data can be secured.

The city officials at Guelph realize the importance from a health standpoint of providing every home with proper sanitary equipment. Guelph so far has been free from serious outbreaks of disease, and one way of keeping it so, the officials believe, is to provide modern plumbing as far as possible in every home.

The move made in Guelph is being watched with considerable interest, it is stated, by some other communities, and if arrangements can be made for doing the work under the local improvement plan it is likely that this method may be adopted by other places.

Proper Sanitation First Aid to Housing in Town Planning

Superintendent of Hospitals in Montreal Discusses Importance to Health of Proper Housing Conditions—Infant Mortality Largely Due to Insanitary Homes

MR. J. E. LABERGE, Superintendent of Hospitals in Montreal, in a paper read before the Canadian Medical Assoc., at its annual meeting in Quebec, made a number of suggestions of keen interest to sanitary and heating engineers. In discussing the importance of proper town planning he emphasized the need of proper living conditions, especially in every home. Dr. Laberge declared that sanitary records should be kept showing the state of every house generally, and that this would go a long way in helping the authorities in their fight to stamp out disease. A thorough inspection of houses by the civic authorities, he said, would be a splendid plan for reducing the tremendous infant mortality. It was a well-known fact that where the death rate among infants was high, unsanitary conditions were usually to be found. Public instruction on the importance of living cleanly was urged by him.

Make Cities Healthy

It was pointed out by Dr. Laberge that the main object of town planning was to make cities more beautiful, healthy, and suitable to live in. There was no more important problem connected with town planning than the housing question. No town could possibly boast of model hygienic conditions if slums were permitted to exist.

Apart from the question of slums, there was in all great cities large numbers of dwellings which were not healthy; the cause was due, not so much to their construction as to the ignorance of tenants in matters pertaining to hygiene. Public education was badly needed here.

Need for Reform

"The question of housing," declared Dr. Laberge, "should be embraced in all social reform works; that is to say, each and every one should co-operate to assure healthy habitations. Persons espousing this laudable cause will not be sufficiently prepared for the struggle, if governments, whether federal, provincial or municipal, do not lend their assistance. It is not simply a legislative intervention that is necessary, financial aid is of prime importance.

"Education is also an important factor, because, in order to permanently change the condition of dwellings, the habits and morals of the people must be changed; they must be inculcated with the desire for cleanliness, and finally, they must be made to appreciate the benefits of sunlight and pure air to preserve human health."

Should Keep Records

After contending that all town planning ought to embrace measures pertaining to plenty of open spaces, parks, etc., Dr. Laberge declared that sanitary records should be kept showing the state of houses generally. This would result in the health authorities having wonderful control. Legislation ought to be enacted, making it more easy for municipalities to purchase grounds, etc., on which model houses could be erected. "In addition to this there should be by-laws making it incumbent on proprietors to keep their houses in up-to-date sanitary state. In the end this would be found more profitable than permitting them to decay for lack of proper care. But the most important phase of the question would be the marked improvement in human health."

Need Strict Laws

There should be strict laws compelling tenants to keep their premises in good order. A man did not make a good citizen because he merely paid his rent. He owed it to the public at large to see that both his house, yard, lane, etc., complied with the health laws. When these principles of health were outraged both the tenant and the landlord ought to be held responsible. One of the most important moves, to do away with slums, would be the passing of inexorable by-laws and legislative laws making it a serious offence when landlords rented houses that were unsanitary.

PRACTICAL METAL WORK

(Continued from page 34)

Next draw three more dotted lines from 5,5 6,6 and 7,7 Fig. 2, to the intersections on joint line M N. The points where these horizontal lines cross the vertical lines 1, 2, 3, 4, etc., Fig. 2, as shown by the shaded portion, is the pattern of the hole required for the branch.

Now draw lines upwards from 1, 2, 3, in line with the stretchout shown in Fig. 3 from the various intersections on joint L M N in the elevation Fig. 1, until all the stretchout lines have been crossed in Fig. 3.

Now draw the curved lines from N to M, M to F, F to M and M to N, crossing each point already crossed as shown at 1,2,3,4 5,6,7, etc. The outline MFM. N N O O is the pattern for the branch piece required.

An allowance must be made for seams and joints, these to be determined by the person making the pipe. If a riveted joint, only one width of caps would be necessary, but if a locked seam is required it would be necessary to allow three times the width of the lock.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

The plumbing contract for the Molsons Bank at Iroquois, Ont., has been secured by Hickey and Aubut, Montreal.

George W. Reed and Co., Montreal, have secured a roofing contract for a $35,000 building for J. McGill, Dorval, Quebec.

Felix Gareau, plumber, Montreal is dead. Mr. Gareau was but 34 years of age. His remains were conveyed to Cote des Neiges cemetery for interment.

W. J. McGuire and Co., Limited, Montreal, has secured the plumbing and heating contract in the new Bell Telephone Building on Ontario street. The cost is said to be $80,000.

John Watson, Montreal, is taking a short vacation. Mr. Watson told SANITARY ENGINEER (confidentially) that he knows a good fishing ground, and that it just requires "angler's patience" to get them. As practical proof he produced a snap-shot showing 50 beauties on a string which he and his partner got the last time. Here's luck again.

Telles Latourelle, president Montreal Master Plumbers' Association, spent a short vacation and went to Niagara Falls by boat, accompanied by Mrs. Latourelle and family. Mr. Latourelle reported his pleasure at again being home, the heat being very great while holidaying. Montreal and its environs looks good to its citizens every time they return.

BUSINESS CHANGES

P. Lamay & Co., plumbers, of Montreal, have dissolved, and Jos. Lepage is continuing under the same style.

CONVENTION IN CLEVELAND

The convention of the American Society of Sanitary Engineering will be held this year at Hotel Winton, Cleveland, Ohio, on September 15, 16 and 17.

TENDERS CALLED FOR SCHOOLS

L. C. Charlesworth, Deputy Minister of Public Works, is calling for tenders up to noon July 24 for general contracting, electric wiring and plumbing, heating and ventilation, for the erection of farm buildings and workshops at the Agricultural schools Reymond, Youngstown and Gleichen.

OBITUARIES

Harry J. O'Neil, manager of the St. John, N.B., branch of the James Robertson Co., Ltd., met a tragic death in Boston harbor last week. While on a trip to New York he had stopped at Boston and was on a passenger steamer in the harbor when the arrival of a transport in port sent all the passengers rushing to one side of the vessel to witness the return of the troops. He was crowded overboard and was drowned before help could reach him. He had occupied the post of manager only a year, succeeding the late Jone Keefe after twenty-one years' service with the company. E. J. Terry, who has been a member of the St. John staff for several years, has been appointed manager in place of Mr. O'Neil.

MAY APPOINT INSPECTOR

The Board of Health at London, Ont., has recommended James C. Young for the position of city plumbing inspector, and the matter is now being considered by the council. It is expected that the appointment will be made, although there may be some opposition. In the past the appointment of a plumbing inspector has been opposed by some of the property owners, who declared it was an unnecessary expense, and failed to take into consideration the importance of the work from a civic health standpoint.

HAMILTON OUTING AT WABASSO PARK

The annual outing of the Master Plumbers of Hamilton, held at Wabasso Park, proved a most enjoyable affair in spite of the efforts of the weather man to cut the fun short. In addition to the party of Hamiltonians, with their wives and families, fifty-five of those in the trade motored over from Toronto and took part in the doings. Gordon Stewart of Hamilton was master of ceremonies, and both he and W. J. Walker were kept busy welcoming everybody and seeing that everybody got acquainted. A feature of the programme was a baseball game between Toronto and Hamilton. This battle has been in prospect for a long time, and both nines have been getting ready for it. It turned out to be a real game at that, and a glance at the score will indicate that it was some swatfest. Both teams relied upon heat hitting to win, and they clouted the ball all over the lot. It was a close game all the way through, and the score was 15 to 14 in favor of Toronto. A. Rogers, who officiated as umpire, gave every satisfaction. The Hamilton nine are looking for a return game, when they hope to even matters up. Before the programme could be completed a heavy shower of rain came on and lasted so long that the outing had to be cut short. In spite of this, however, everyone had an excellent time.

DON'T FORGET THE BIG PICNIC ON JULY 17

The annual picnic of the Toronto Society of Domestic Sanitary and Heating Engineers will be held at Island Park on Thursday next and there is every indication that it will be of the real old-time, get-together, everybody-have-a-good-time variety. Harry Farthing, who is chairman of the committee which has arranged the program, promises that it will be a real day and one that no one should miss. "The more the merrier," says Mr. Farthing. "We should have at least 1,000 of the boys with their wives and friends out, and we will see to it that they all have a good time."

CANADIAN GENERAL ELECTRIC CO., LTD.

"Fixtures, glassware and appliances for farm lighting plants," is the title of an attractively printed catalogue issued by the Canadian General Electric Co., Ltd., of Toronto. The pages are eight by ten and a half inches, and there are numerous illustrations showing the application of various electric devices to farm work. Among other lines listed besides the fixtures and glassware are portable electric sewing machines, heating and cooking appliances, motors for household work, vacuum cleaners, electric washers, wiring devices and supplies. Copies of the catalogue will be sent to readers of SANITARY ENGINEER upon request.

TIN PLATE PURCHASES INCREASING

Canada is now one of the largest buyers of tin plate, terne plate and taggers tin that the United States has. Figures available for the latest monthly period show that in that time Canada purchased

H. A. MAGUIRE

For the past six months connected with the Toronto office of the MacLean Publishing Company, has been transferred to the Chicago office of the company and will have charge of work on two of the MacLean papers, Hardware and Metal and Sanitary Engineer, in the Chicago territory. Before joining the MacLean Publishing Company staff, Mr. Maguire spent 11 years in the hardware business. For several years he was on the traveling staff of D. H. Howden & Co., wholesale hardware, London, Ont.

9,496,288 pounds, valued at $709,301. The United States' next largest customer for tin was the Argentine, which took tin valued at $425,419.

BRITISH GAS STOVE MAKERS COMBINE

With the idea of strengthening their position in holding home markets and in going after export trade, British gas stove makers have combined under the name of Radiation, Limited. The new company has a capital of $13,750,000, and includes the businesses of John Wright & Eagle Range Co., Ltd. of Birmingham; Richmond Gas Stove and Meter Co., Ltd. of Warrington, and the Davis Gas Stove Co. of Luton. The head office will be at Birmingham.

TRADE WITH DANISH INTERESTS POSSIBLE

Information has been received from the Foreign Office by the Board of Trade that the Danish Government have now given a general guarantee, which has been accepted by the associated Governments, that goods imported into that country will not be re-exported to enemy countries. They announce, therefore, that except for goods on lists A or B, all restrictions on export to Denmark, whether by freight or by parcel post have been removed.

Exporters should, however, satisfy themselves that the goods are not subject to any Danish import prohibition.

Applications for licenses to export goods on lists A or B should continue to be made to the Export License Department (4, Central Buildings, Westminster, S.W.1.), but no certificates from the Danish associations need be produced.

RAISING BLOCKADE ON GERMANY

By unanimous resolution of the Allied Council in Paris it has been agreed that the new peace treaty shall not be effective until the deposit of ratifications by the signatory powers. At the same time it is announced that trade with Germany will be permitted to begin as soon as Germany herself has ratified. The announcement given out is as follows:

"The Council of the principal Allied and Associated Powers has adopted the following resolutions in regard to the raising of the blockade on Germany. The Superior Blockade Council is instructed to base its arrangements for rescinding restrictions upon trade with Germany on the assumption that the Allied and Associated Powers will not wait to raise the blockade until the completion of the ratification as provided for at the end of the treaty of peace with Germany, but that it is to be raised immediately on the receipt of information that the treaty of peace has been ratified by Germany."

WIRE COMPANY ELECTS OFFICERS

At the organization meeting of the Clinton-Wright Wire Company, the merger of three Massachusetts manufacturers of wire products and specialties, George M. Wright was elected chairman of the board, Evan F. Jones treasurer, John A. Denholm and George F. Wright vice-presidents. The board of directors is composed of the officers mentioned and Harry Bronner, president of the Missouri Pacific Railroad; Frank A. Drury, president of the Merchants National Bank of Worcester; Paul B. Morgan, president of the Morgan Construction Company; Charles F. Fairbanks, formerly president of the Clinton Wire Cloth Company; Richard B. Young, E. H. Rollins & Sons, and George F. Naphen, of Liggett & Drexel.

BRITISH ALUMINUM CO.

"The Casting of Aluminum" is the title of an interesting booklet published by the British Aluminum Co., Ltd., of London, Eng., Canadian branch, 265 Adelaide Street W., Toronto. It deals at length with the subject of aluminum alloys, their development and uses. There are sections which deal with "Mixing Alloys," "Moulding," and "Melting," in which a great deal of valuable information is given. Copies of the booklet may be obtained upon request by readers of SANITARY ENGINEER who are interested.

Western Canada Industrial Congress

Industrial Matters and Questions Pertaining to Development of the Western Markets Will be Discussed

WESTERN Canada is to have an industrial congress from August 11 to 16, to which manufacturers and industrial leaders of the continent, as well as those of the United Kingdom, are being invited. The purpose is educational to a large extent along industrial lines, though one of the intentions is to promote and increase the friendly relationships between the United States and Canada and to create a greater unity as between Eastern and Western Canada.

Discuss Markets

Subjects up for discussion are Western markets, Western industry, Pacific trade and transportation routes, Oriental commerce, the future alignment as between East and West in so far as manufacturing is concerned, and the great question of building up the Pacific regions and the adjacent inland territory.

The congress is assuming international importance, and thousands of American manufacturers as well as those of the eastern part of Canada as well as England will be on hand. The discussions are to be made by men foremost in industry and science as applied to industry on this continent.

The Speakers

Among those who will speak are Sir Robert Borden, Prime Minister of Canada; Henry Ford; Harold McCormick, head of the International Harvester Co.; E. W. Beatty, president of the Canadian Pacific Railway; Robert Dollar, head of the Dollar Steamship Lines, and many others.

All interested in industrial development in the West or in Western markets are invited to attend. The movement is accompanied by a propaganda to the effect that Eastern factories which sell to Western markets in bulk should build branches in the West.

The Itinerary

The congress dates are August 13 and 14 at Calgary, Alta., though a trip through the territory and including other Western cities will commence at Medicine Hat, Alta., August 11, and conclude at Edmonton, the capital city, where the Premier and Government members will entertain the guests. A side trip will be made to Canadian Rocky Mountain resorts.

Congress headquarters are open at the Palliser Hotel, Calgary.

Heating and Ventilating

RADIATORS

Eighth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the eighth of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on the "Radiators" a most interesting and illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the designs for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The ninth article of the series will appear in the next issue.

TEMPERATURE is transferred from radiating surfaces to the surroundings by radiation, by convection and by conduction.

Radiation occurs when the heat is transmitted from the radiator by the direct action of the heat rays. An example of this is surfaces of an article of furniture exposed to the radiator surface becoming intensely hot, even when the air between the radiator and the furniture may be quite cold.

There is really very little radiant heat used in warming rooms, and while we term the heaters "radiators," the name is not really expressive of the function of the fixture. A better term might be one expressive of the purpose of the so-called radiator as an apparatus for delivering heat by means of convection.

Convection is a term that is not as readily understood as the term circulation, and while convection might be considered as a sort of circulation, it must not be taken as meaning exactly the same thing. When air moves in a room the movement is called circulation. For an instance we will consider that the movement of the air is due to a difference of temperature condition and that there is a hot radiator set so that it is continually adding heat to the air. The heat is added to the air by direct contact of some of the air particles with the heated surface of the radiator. If some means could be devised to keep the air currents stationary little heat would escape from the radiators.

As the most of the heat transference is due to convection, and as convection is greatly accelerated by a brisk movement of the air currents, provision for a free air movement over the surface is desirable.

When radiating surfaces are much less than required to heat the room, an increased measure of heating efficiency of such may be had by the use of a small electric fan used in a manner that will keep the air circulating around the radiator. As a radiator becomes warm an accumulation of air clings to the metal and this accumulation grows thicker and thicker as the surroundings become warmer, or as the temperature of the radiator itself rises.

If a radiator is constructed so that there is a great deal of surface exposed to a uniform body of air the heat transference is much more rapid than when a like amount of surface is arranged in such a manner that some of the air passing over part of the surface has already been heated by other portions of the radiator. It is for this reason that a low radiator of a narrow type with ample air passages is much more efficient than a higher radiator with smaller air passages.

Very often the estimate for heating a building is based on the high efficiency of low radiators of the hospital type, and when the installation is made failure is experienced because of the use of a type of radiator different to that on which the estimate was made.

Radiators should not be crowded close to the walls and they should always be set so that there will be a free circulation of air around them. Do not put radiators under window seats and expect that you are going to get the best service from them. If you have to place radiators under window seats, try and arrange the details so that the radiators will have ample space for air passage, and then arrange for a positive supply of air returning from the room to the bottom surfaces of the radiator, and a free escape of air from the top.

Air will not take up heat from a radiator in anything like the same volume as the heat is brought to the radiator by the heating medium of steam or of water. Now, iron or steel is a good conductor of heat or cold, so some engineers have made attempts to increase the efficiency of radiating surfaces by adding surfaces to the radiator by the use of extended metal desks or rods. These extended surfaces become warmed through the conduction of heat from the primary surfaces of the radiator to which they are connected, and where such surfaces are arranged, so as not to interfere with a free flow of air, they are of the greatest value. This type of radiator is used to a greater extent in Europe than in America.

Reference has been made to the fact that radiators give up some heat to their surroundings by conduction. The amount of heat transmitted in this way is so very little in the ordinary practice of heating that we can practically ignore it in making our calculations or in laying out the design.

The great principle to work to in choosing our heating surfaces, and in in-

stalling them is an easy air circulation.

The efficiency of radiators in B.T.U. is figured for steam by the condensing power of their surfaces. Thus: One pound of water condensed from steam at 212 degrees gives up 966 B.T.U. If a radiator, say, of 24 sq. ft. is set in still air at a temperature of 70 degrees Fahr. and condenses 6 lbs. of water from steam, as above, in one hour's time, we can base the estimate of the radiator efficiency thus: 6 ibs. of water is equivalent in B.T.U.'s to 6 x 966 B.T.U.'s = 5,796 B.T.U., and 5,796 B.T.U. divided by the 24 sq. ft. of the radiating surfaces gives us 241 B.T.U. per sq. ft. per hr.

Under different conditions more or less water might be condensed in the radiator within the same length of time. If the room had been colder than 70 degrees the condensation would have been more rapid, and on the other hand had the room been warmer we would have had a corresponding low rate of condensation. If there was a brisk air movement over the heating surfaces the condensation would have increased. For example. if the air was traveling over the radiator at a temperature of zero and a velocity of 1,000 feet a minute, the condensation would have been 2.7 lbs. per sq. ft. of water with a corresponding heat emission of 2,488 B.T.U.

If the air is dry the condensation will be a great deal less than if the air is moist. Then the material of which the radiator is made will also have a bearing on its efficiency, wrought iron being 70 per cent. less value than cast iron.

The form of the radiator has a much greater bearing on its heat transmitting value than has its material, and wherever possible the engineer should use the lowest radiators possible with the greatest free airway

For quite a long while engineers here in Canada have been using an average efficiency of 255 B.T.U. per hour for cast iron radiation and have found that with very few exceptions that this was a safe constant to use. The American Society of Mechanical Engineers recommends a constant of 244 B.T.U. If the reader prefers to use the A.S.M.E. figures he should be careful to figure on a boiler based on the same estimate. This warning is given, as lacking a caution of this kind one might allow too great a margin in estimating the boiler capacity, and as a result instal a boiler much too large. The radiators most in general favored on this continent are those made of cast iron, in various styles and patterns. Although there have been special occasions where the owners of very valuable residences have had the radiators cast in patterns harmonizing with the decorations of the rooms in which they are situated, it is, as a rule, desirable to use radiators of a plain inconspicuous type.

In some of the older houses in New York State there may be found radiators made up of steel or wrought iron plates. These radiators are usually set in the walls and grained to imitate wood panels. When one realized that it is not a very large room that 48 square feet of hot water heating surface will heat, and that a radiator of that size requires space equivalent to a 6 ft. x 8 ft. panel it becomes easy to understand why there are not a great many installations of that kind found throughout the country.

There are a few of the older buildings in Toronto heated by radiators running around the rooms in the form of pipe coils set in recesses at the base board levels. One thing that impresses the visitor to Ottawa is the amount of 3 in. single pipe radiators used there. Of course, they are principally found in the older buildings, but one cannot help but be struck with the appearance of the same when comparing them with the pipe and box coil installations made elsewhere in Canada at about the same date.

When called in to make a survey of an existing heating plant, the reader, no doubt, has often noticed a form of radiator made up of tubes screwed into a base. The radiator is, as a rule, made up of 1 in. tubes 3 feet long, so that in estimating the areas of such we can usually consider that each tube is equivalent to 1 square foot of heating surface.

There are several types of pressed metal radiators on the market. The claim is made for them, by their advocates, that they, being lighter than cast iron, can be set in positions impossible for the setting of the heavy cast iron type. That the thin walls of the radiator permit a great free airway between the sections and that they are easy to instal.

Cast iron radiators are so well-known to the trade that rarely has an experienced journeyman occasion to refer to a catalogue for the equivalent area of any type or height, and, as a rule, these men are so familiar with cast iron radiators that they frequently can "rough in" from the figures they carry in their heads.

To the man that has difficulty in remembering the areas of certain types of radiators, we are giving an example as a suggestive tip, and he will find that when he can carry in memory the area of a certain style of radiator he will find it very easy to use that style as a standard to figure the capacity of other radiators by. We will, as an example, refer to the ordinary two column cast iron radiator. We do not suppose that there is one reader of this article who does not know that a radiator 38 in. high of this type has an area of 4 sq. ft. per section, but we would ask the reader if he ever has noticed that the 38 in. could be very easily read as 3.8 sq. ft., which is nearer the actual area of that radiator. And if the reader says he has, no doubt he has also noticed that a 32 in. radiator contains 3.2 square feet; a 30 inch radiator 3.0 square feet; a 26 inch radiator 2.6 square feet; a 23 inch radiator 2.3 sq. ft., and a 20 in. radiator just 2 sq. ft. Four loop radiators have an area just twice that of those of two loops. These figures are close enough for the reader to set a basis for radiators of other types.

Cast iron radiator sections are connected together by means of either screw or push nipples. Push nipples are made with a slight taper so as to fit into the machined tapered openings of each section. Screw nipples are used in radiators when the openings are tapped for this purpose, and they are built by screwing up one section at a time.

Hot water radiators are nipple-connected top and bottom. This type of radiator is also often used for vapor-vacuum and vacuum steam systems of heating.

Ordinary steam radiators are only fitted with nipples at the bottom of the sections. Radiators can be assembled so that a small chamber with doors may be set between some of the sections for the purpose of providing a plate-warming closet in dining-room radiators.

Radiators can be built to fit almost any circumstance. They can be set to follow the lines of a bay or bowed window; they can be run along a stairway, following the lines of the treads and risers, or they can be set in a corner or in a circle as circumstances may demand.

A type of radiator much in favor where floor area is at a premium, or where the unbroken wall surface is long enough to permit the installation of such is the radiator made up of "wall sections." These radiators are a little more than 3 in. thick at the hub and are made in 5, 7, 6, 7, 9 square foot sections.

Direct, indirect or semi-direct radiators are made up the same as the direct pattern, differing only in that they are equipped with special bases with damper controlled openings, permitting air from outdoors to pass over the heating surfaces for the purpose of ventilation.

Indirect radiators are radiators that are not set up in the rooms to be heated. These radiators are set up in a chamber at some suitable location, and there they warm the air that is used in heating or ventilating the room which they serve. Indirect radiators are usually of the extended surface type.

Pipe coils are frequently used as radiators in factories, etc., and when figuring on such surfaces a greater heat transmitting value per sq. ft. may be allowed than when figuring for cast iron radiation. The proportion is about as follows: cast iron rads., 250 B.T.U.; pipe coils, 300 B.T.U.

Ventilating the Modern School

Seventh Article of Series Written Especially For "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

THE ventilating system of a school, however well designed or installed, cannot be considered as perfect if some regard has not been paid to the thorough ventilating of that portion of the building generally termed the basement.

At one time it was considered quite the thing to leave the sanitary and heating arrangements of a school as the last thing for the designer's attention, and as a result the plans were pretty well advanced before some hole was found under the building where the heating apparatus could be placed and a few modern sanitary appliances fixed.

You will remember the building with its nice new maple floors and its nice clean sanitary trim at about the time you first saw it. Well, suppose you also remember the basement and how dark it was in certain corners—the narrow winding stair and the malodorous "sanitaries" that were set back against the porous brick fresh air flues. It was a pretty good school building above the basement, and members of the school board and also their architect were mighty proud of what they had erected. Only a few months slipped by and then an epidemic of sickness swept through the school. The "old fogeys" shook their hoary heads and said, "See what these new-fangled things have brought us to, better by far had we heated the school with a stove and had the lavatories out in the backyard." For once the "old fogeys" were right. The building of the school with a dark, low basement was a mistake. So the next school that the board were called upon to build they built with a good high basement and with the windows well out of the ground. They took good care to have a dry basement and to get such a basement cost them a lot of money. They had the walls below the grade level thoroughly waterproofed, and by a system of field tiles kept the ground water from gathering around the walls. Finally they found that it was costing so much money to excavate for a basement that they built their new schools entirely out of the ground.

Some of their later schools might well have been built with a semi-basement as the sites were of a nature to warrant that system of construction, but no, they had decided on a policy of "no basements" and they were as stubborn in that policy as they were stupid when they blasted out ten feet or more of rock and hard pan in the days of the basement building.

We started out to write this article as one of the series regarding the ventilation of schools, but when we came to the part of the subject having to do with the lower regions of the school building we could not but drift into thoughts of that great question of sanitary equipment and a consideration of the amount of experiment and time that has been spent in making the modern school building what it is to-day—perhaps the greatest example of sanitary science in the world.

No ventilating engineer is worthy of the name if he does not see the importance of abolishing from the school building every contributory cause of ill-health. It is not simply the money or the prestige gained through vigorously fighting for the best, and only the best equipment that will bring him the greatest degree of satisfaction, it is the consciousness of knowing that he has stood for what is simply a question of right and not of expediency.

One of the things that sanitarians had first to fight for was the installation of the individual water-flushed closet to take the place of the malodorous range. Then, after the individual type was installed it was found that very frequently the children neglected to flush them, and it became necessary to provide some kind of an automatic flushing system. Automatic flushing at intervals was tried out and found not to be of much value unless it was practically continuous. Continuous flushing is very wasteful, and yet it is astonishing how many schools all over the country still use such a system. The writer has had occasion to visit certain public schools during every hour of the day and night, and it has often been his experience to hear the automatic flushing of these fixtures going on at short, regular intervals all night long. True, the janitor could have turned the water off, but it was a case of a little extra work, and so the water was allowed to run.

There are many seat action closets now being installed in public schools, and should the reader be called on to make any recommendations regarding such, our advice is not to advocate the cheapest.

See that the closets are made of non-absorbent materials with good heavy walls, and a water-way of at least 2½ in. clear diameter.

The bowl should have as little fouling surface as possible, having rather a large water surface. In schools the bowls should not be more than 14 inches high. Some time later it is our purpose to take up sanitary fixtures, one by one, and describe in detail the functions of each and every part of these fixtures so that our readers can be guided in drawing up specifications for this class of work.

Naturally the reader will be interested in how these toilets should be ventilated, and when we write of the ventilating of closet stalls or rooms, we do not wish the reader to confine this with the necessity of ventilating the W.C. bowl itself above the water line; that is a subject that will be taken up at a later date when such fixtures are described in detail. The system of ventilating that we are now touching on is the direct extraction of foul air from the room.

The ventilating system of the toilets must be kept distinct from that of the rest of the building. The foul air should be drawn from the W.C. stall through vent openings set a few inches above each bowl and carried to an exhaust flue, but there are also occasions when by the use of an exhaust fan the foul air may be drawn from the stalls by way of the vents in the closet bowls.

Closets should be set up in double rows, that is, with back to back, with a working space of passage between the rows. They should be set so that light will fall along the passage in front of them. The partitions between the stalls may be of marble, slate or some other non-absorbent and non-staining material. They should be built in such a way that they will be practically vibration proof. There is nothing more annoying than to have partitions erected that will not stay in place, so be sure when you instal partitions that they are heavy enough to stand a certain amount of racking, otherwise trouble will be experienced in making the doors always fit. Partitions should be kept 12 inches from the floor at their bottoms and 6 feet above floor at their tops.

For too great a length of time, urinals, as found in schools, have been simply marble or slate slabs with galvanized iron gutters and periodic automatic flushing device that had the same bad features as the periodic automatic flushing system of water closets. Seldom are these types of fixtures properly ventilated.

Urinals of solid glazed porcelain and also of Carra glass and fire-clay are the things to recommend. Fixtures of this kind are fitted with adequate openings and are no doubt the most sanitary that can be had. The flushing of the urinals should be effected by a spray flushing device or an integral flushing rim, distributing the water evenly over the surfaces.

There are a few other items in connection with the sanitary equipment of a school that might be written here. There is the matter of showers, of floor drains, of hot water service, etc., but as these things have not any direct bearing on the matter of the purity of air we can leave them for a later article dealing with plumbing fixtures alone.

The reader must not think that we have wandered far afield from the subject of ventilating when we stop to write of plumbing systems, for these things have a great bearing on the matter, and we feel that we can close this article by calling attention again to what we wrote at the beginning when we stated that no system of ventilating, however complete, could be considered as perfect if the basement was not also thoroughly ventilated.

Salespeople of To-day and To-morrow

Some Facts on Sales and Salespeople, and on What Salesmanship Means—The Vital Points in Handling Customers

Sanitary Engineer's special report of the third lecture by FRANK STOCKDALE

THIS is another of the addresses delivered by Frank Stockdale, the noted business expert, in connection with the Saskatchewan R.M.A. Convention, as reported by the special representative of SANITARY ENGINEER.

The concluding address on "Meeting To-Day's Competition," which will appear next issue, deals with some interesting points. The flypaper stage of business is passed, is Mr. Stockdale's contention in this lecture, customers no longer light and stick. He examines the nature of the competition and points out that it is not all from the Mail Order House. The need of studying conditions and evolving new methods. Limit the stock, but give the assortment. Our competitors are winning out because they are giving thought to the business, and the remedy is obvious.

"THIS is a very important subject because the sales people are the front line forces of the retail business. They occupy the front line trenches between the counter and the shelves, and if they have not got the morale they require they will not 'go over the top.' If your store disappoints the customer he or she will be disappointed with your whole institution to a greater or less degree. We must realize that one of the most important things is to look after the front line trenches. The war has proved that no discovery during war time took the place of infantrymen who went over the top. The need was for man-power. Your store cannot battle successfully to-day with the competition it has to face unless it is equipped with the right kind of man-power, and that is the power of the salespeople behind your counters."

"It takes a lot of preparation to fit the soldier for modern battle. Modern warfare is not so far ahead of modern business. Soldiers must be put through months of training, even then they are not equipped, for years of training are required. The evolution of business is such that if you are eventually going to compete you will have to have your salespeople trained. Salespeople of to-day and to-morrow will be trained salespeople. It is not a waste of money to train salespeople, and very few are born salesmen.

The Imperative Need of Training

"If soldiers were going into battle against soldiers who were not trained they would not need to be trained, but your salespeople are in direct competition with the best in the country. The customers who come into your store are coming direct from dealings with trained salespeople in other stores, and they compare your salesmen with the trained and the best ones who have waited on them. You are being compared with the best, that is the reason the customer is particular. Some say customers are getting very particular and harder to please. Some merchants say salespeople are not as good as they used to be. I believe salespeople are better than they were, but their job is a great deal bigger because their competition with trained people is so great. You perhaps lose more customers because of the service your salespeople render than from any other two causes.

"Salesmanship is a big job. If an electrician makes a mistake he blames it on anything which is not understood generally; if the doctor makes a mistake the customer dies, and the blame is laid at the door of some unknown disease, but if the salesman makes a mistake he is the big loser."

A definition of salesmanship, given at this point, was as follows: "Salesmanship consists in acquiring a psychological ascendency over the mind of your customer."

When a Sale Happens

Mr. Stockdale stated that one merchant had remarked that he would like to know "when a sale happens." The reply from another merchant was as follows: "A sale happens in my store when a customer leaves the store after having bought more goods or better goods than he or she intended to buy. Otherwise the customer has just been 'waited on.'"

"Negative salesmanship is where the salesman does not sell as much to a customer as he or she intended to buy when entering the store," continued Mr. Stockdale. "The people who work in retail stores are divided into two classes, store waiters and salespeople.

"Clerks, waiters and bar-tenders were listed together as non-essential occupations for the purposes of the draft system in raising the United States army. While this classification is in part insulting to the retailers, yet it is unfortunately only too true, in a great many cases."

Mr. Stockdale spoke of the type of merchant who thinks he is performing a great feat of salesmanship when, owing to his failure to stock a particular line of goods for which the customer asks, he is able to sell other goods to the customer in their place. Regarding this practice Mr. Stockdale pointed to the dangers of substitution.

"What is the thing you sell in your store?" asked Mr. Stockdale. The correct answer was "service." "The thing the customer wants to have is satisfaction. Service is necessary to satisfaction. You may render service but if it is not of the right kind there will not be satisfaction.

Viewing Transactions From Both Sides of the Counter

"Our mail order houses in the United States are big and powerful as yours are. The head of one of the large mail order firms was asked the reason for the success of that particular business. His business has exceeded the record of $1,000,000 of orders in one day. His answer was as follows: 'The success of this institution is built on the fact that we endeavor always to view the transaction from both sides of the counter.'

"Your customer lays down his money on your counter for satisfaction," added Mr. Stockdale. "The home plate of every sale is satisfactin, and if your service does not take you around to the home plate you will be left on the bases and will not score. Satisfaction consists in bringing the right goods and the right people together. You must know the goods and know the people. The first job of a salesman is to know the goods, but after that he must study the people."

At this point Mr. Stockdale referred to the point, "The customer is always right," and issued a warning that if the customers were not always right they soon became other merchants' customers. "We have to acknowledge that some of them tell the plainest lies. If you will look for honest people you will find however, that the proportion of dishonest people is very small and very few will come back time after time and try to get the better of you. Give this class of customer plenty of rope and he will be shamed.

The Folly of Argument

"Don't argue with your customers. You will never sell anything through argument. Real salesmanship avoids arguments. Do not try to convince the customer or a controversy is bound to ensue. The salesman who starts in to contradict the customer makes a big mistake. I have observed a lot of salesmen who get overconfident in sizing up a customer, and I find that many of this type are missing many sales. It is dif-

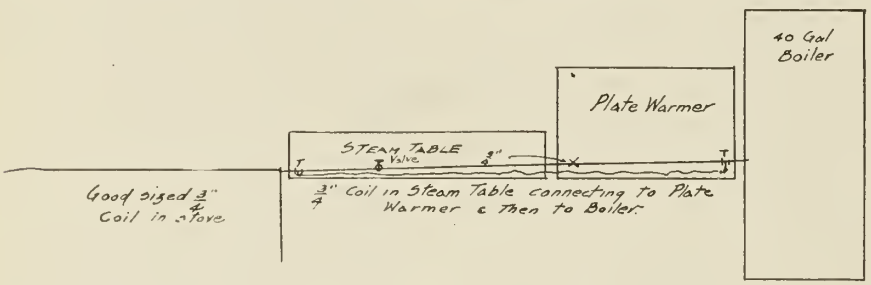
The Editor, Sanitary Engineer:

Dear Sir,—We have a problem which we would like to see solved, and any information you can give us will be greatly appreciated.

The trouble is in the connections of a range boiler, steam table, and plate warmer in a hotel here. I am enclosing a sketch to give you an idea of how we have it connected up. The trouble is that the pipes and fittings near the boiler are always giving out. They seem to be eaten up by some action of the water.



40 Gal Boiler
Plate Warmer
STEAM TABLE
Valve
3"
Good sized 3/4" Coil in stove
3/4" Coil in Steam Table connecting to Plate Warmer & then to Boiler

When the steam-table and plate-warmer are not in use, the valve on the return pipe to the boiler is opened, permitting the water to travel straight from the stove to the boiler, and when they want to use the steam-table and plate-warmer they just close the valve. This job works fine, it gives good service, and does not hammer, and we cannot see why these fittings and pipes will not stand up. The principal trouble is from the point marked X to the boiler. Would it make any difference if I connected the direct supply to the top of boiler and let the connection from the steam-table and plate-warmer go to the side? Our water pressure here is about 10 pounds.— H. B., B.C.

Electric Corrosion

Answer.—We take from your sketch that the wavy line is intended to indicate the direct connection at the top of heating coil in the stove and the side opening of the tank, and that the upper line, with valve shown on same, is a sort of by-pass line running through the steam-table and the plate-warmer, so that there is a positive flow of hot water travelling up from the coil to the tank, either by way of the direct connection or by way of the by-pass through the steam-table and plate-warmer. We assume that there is a cold water connection from the bottom of the tank to the bottom of the coil in the stove.

Now, if we are correct in our assumption, and if there are no traps in the plate-warmer piping the only thing that we can see that is causing the pipe in the plate-warmer to give out is electrolysis. This would be caused by having two different metals in the piping. Perhaps you have brass or a copper tubing in the plate-warmer and a wrought iron pipe connecting at the point X. If you are using well water, or in fact any kind with the exception of that of rain, you are bound to have an electric action in piping of different materials. There is nearly half a volt difference in the electric value of the materials of piping mentioned.

We would suggest that if there are different metals used in the make-up of the apparatus that you change over to all one metal, or if that is impossible substitute a lead-lined pipe where corrosion is taking place. When you substitute the lead-lined pipe, some corrosive action will take place on the lead, but this action of corrosion is such that it will change the nature of the lining of the pipe to a chemical body that will resist any further electrical action on the pipe itself. For instance, if the water is impregnated with chlorine the lead will be changed to chloride of lead, or if the water is charged with sulphur the reaction will be sulphide of lead.

We would like to have you send us about a pint of the water you are using in a container so that we could test it for electrical conductivity.

SANITARY ENGINEER:—

Dear Sirs:—In Question Box, June 1st issue, I note: Natural Vacuum System—I read with some interest the answer. Can you give me more information on this, and explain it, or can I get a book more fully explaining it, as I am working on an invention where natural vacuum would be of great help?

Another question: Is there such a thing as a thermostatic valve that will open with 200 degrees Fahrenheit, and close with 150 degrees, asd can stand or work on a 60 pound or 80 pound water pressure, or can such a thermostatic automatic valve be made, and if so, where can I get one, as an invention I am now working on depends upon that idea? I have one invention now that will heat three ordinary rooms with the heat now going to waste up the flue and is not utilized in the ordinary kitchen range or stove. I have connected up radiators, that is, pipe coil radiators, on a 60 pound pressure water, and heat three rooms, besides giving ample hot water for domestic purposes, but at times air pockets form and circulation seems to stop. Would a check valve hinder circulation on so great a pressure? The air pockets should be relieved at the high points, I know, but how to do this automatically is what I am working on now. Sometimes when range is used for baking the thermometer shows hot water from range entering coiler with tap com. at boiler. The thermometer registers 215° degrees Fahrenheit, which means, practically, that one pound of steam is there in some shape. I did not know that 1 pound of steam could be developed in a 30 gal. boiler full of water and 60 pounds water pressure feeding the tank.

Here is a query for you to answer:

At Bishop Du Vernet's house he wanted to draw a glass of cold water at his bathroom basin cold water tap. The pipes are buried fairly deep, none exposed. The longer he let the water run, the warmer it did get. Finally, it began to run hot, so he phoned the city, wanting to know when it had begun the free delivery of hot water. The city clerk told him that he must have a Harry Hanson coil in his neighborhood. The city clerk then 'phoned me that the Bishop had complained of not being able to get any cold water in his house and wanted to know if I had any of my coils installed in his neighborhood; I said there were three ¼ of a mile away, but there was one at about 1 block away, but I could not think that these should affect the city main pipe. Not long after the Bishop came in and wanted to know about my coil. I was scared and hardly knew what to say.

Now, I went out to investigate and found that by coincidence, or it just happened, that these four people were baking at the same time and that none of them could get any cold water for some time after. This scared me more, as I was installing coils about as fast as I could make and put them in, and it would mean loss of business in the coil business, and therefore hit upon the idea of heating the rooms with the extra heat through radiation. But what I want to know is, how could the main city pipe get the hot water in it? Several others have complained of this same trouble, too much hot water, and they don't want to install a radiation How can I overcome this? My idea of it is to put is a thermostatic valve, which will open when water gets 150 degrees hot, as that is hot enough. An ordinary 30 gal. boiler gets hot from top to bottom in 1 hour. Can you suggest something to remedy this, as the complaint is too much hot water?—H. H.

H. H., Prince Rupert, B.C. We will answer the queries contained in the above in the order that they are presented.

First: The principle of natural vacuum in heating systems is taken advantage of by many manufacturers of heating apparatus and we will refer your request for further information to some of these companies, so, no doubt, you will receive several books and letters describing their systems in detail.

Second: There are a number of thermostatic valves on the market operating on temperature ranges less than what you require, and we feel sure that where the thermostatic action is only to take place in such a range as mentioned that it would be a comparatively easy problem to devise something that would work even against the high pressure indicated. This question will also have to be handed to some of the manufacturers. However, we believe from your enquiry what you really wish is a thermostatic air vent to release the air from a hot water heating system. Frankly, we do not know of anything that would be practical working against such a pressure. The force of 80 lbs. is sufficient to lift a column of water about 185 feet in the air, so you can see from this what would happen if the air vent should open with that weight of water behind it.

Third: Regarding the formation of steam in the system. Water confined in a system at 60 lbs. pressure does not steam even at a temperature of 307 degrees Fahr. and the fact that the thermostat registers 215 degrees is not an indication, there being heat in the water to the extent of 1 lb. pressure—in fact at 60 lbs. pressure and the temperature at 307 degrees there is only a total heat of 1,175 B.T.U. when compared with the total of 1,146 B.T.U. of 212 degrees steam in an open vessel.

Fourth: If the hot water is backing from your coils into the city mains, the mains must be at a higher level than the coils. Perhaps the Bishop's house is set well above where your coils are located.

We do not think that the installation of a check valve would be advisable, as we consider that not having any relief for the system outside of the back pressure on the city mains that the damage from an explosion would be very great.

COMPARATIVE MERITS OF WATER SUPPLY SYSTEMS

Question.—Would a compressed air system operating a displacement pump in a well be as satisfactory generally for a private system of water supply as a pneumatic system using deep well pump to tank against air?

Answer.—The choice of systems in a case of this kind can be made only after closely studying the local conditions and deciding which will meet the most important essentials. Either system will satisfactorily meet ordinary requirements but such a consideration for instance as the location of the spring may be a deciding factor in the choice of system. If the spring or the well as the case may be is located some distance from the house a system with a pneumatic water storage tank in the basement of the building would probably be the most satisfactory all round. A fresh water system would be likely to give the best results if the spring or well is located close to the building.

It might be stated that both of the systems mentioned have their good points. By pumping against air pressure in a tank there is a lot of water stored in the tank. This may come in very handy in case anything should happen to the pump or the power source which drives the pump.

A feature that is provided by the other system is that fresh water may be pumped direct from the spring or well to the fixtures. This, of course, keeps the water from losing its fresh taste as it is liable to do if stirred for any length of time in a tank. Many people would prefer water of this kind and hence would favor the system which would provide it.

WOULD NOT BE ADVISABLE

Question.—A housing scheme is under consideration in our town and in order to help keep costs down some of those interested are urging that three inch soil pipe could be used for the four piece bathrooms that are planned, consisting of closet, bath, basin and sink. Would you advise the use of this size pipe and would there be after troubles from stoppage?

Answer.—We would not advise the use of three inch soil stack. It might in certain cases work out all right, and then again it might not. Throughout Canada, and, as a matter of fact, the United States as well, four inch soil pipe is accepted as the standard required in work such as is mentioned. This size has been decided upon, not as a result of chance, but as a result of years of experience. While a three inch pipe might reduce expenses very slightly, there is a chance that in the long run it would prove unsatisfactory and expensive, and might have to be replaced by the standard four inch pipe. The slight difference in cost in a case of this kind should not be allowed to weigh against the opinion of the best men in the trade, and they have adopted the 4-inch pipe.

HOUSING ENTERPRISE IN NOTTINGHAM

Among the first houses to be built under the British Government's housing scheme are those of a public utility society called the Swanpool Garden Suburb, Lincoln. They are intended mainly for the use of the employees of an engineering firm, which have taken a leading part in the promotion of the society. There is a management committee of 12, which includes a number of workpeople who will be tenants of the houses. There is also a woman's consultative committee to give advice as to housing from a woman's point of view.

The site obtained by the society comprises about 350 acres and it is proposed to build 3,000 houses. Provision has been made in the plans for the erection of public buildings, schools, institutes, laundries, swimming baths, etc., and a noteworthy feature of the scheme is the effort which has been made to preserve the existing natural beauties of the site.

The lighting and heating plans present novel features. It is proposed to employ waste heat and steam from the firm's works, and to have a combined system of central heating and hot-water supply to serve each house. In addition, electricity generated at a central station will be supplied to each house for lighting and cooking, and also to the village for different public purposes such as street lighting, laundry power, and sewage pumping. Construction work has already been begun in the case of twenty-six houses of the new village fronting an existing road.

PRACTICAL SHEET-METAL WORK

THREE PIECE ELBOW WITH GUSSET OR GORE PIECE.

By THOMAS STANFIELD

IN a letter from a reader, SANITARY ENGINEER is asked to describe how patterns for a branch pipe can be made, the branch to be at an angle of 45° from the main pipe.

As the size of pipe or branch required was not stated we are describing a method to adopt for both pipes of same diameter. But the same method can be followed even though the branch be a smaller diameter.

Fig. 1. Let E F G H L M N O P be the elevation, with A B C D the plan of main pipe and J K the plan of the branch piece.

First divide plan A B C D into equal parts 1, 2, 3, 4, 5, 6, 7 and repeat until the whole of the circumference is divided. Next draw dotted lines down until they intersect the joint at L M N.

Now divide plan of branch piece J K in the same manner as was adopted in plan A B C D.

Next draw dotted lines upwards from 1, 2, 3, 4, 5, 6, 7 plan J K until they meet the dotted lines drawn from plan A B C D. These lines should meet at the joint L M N.

The next step to take will be to draw stretchout lines, as shown in Fig. 2 and Fig. 3 respectively.

First draw the stretchout line Fig. 2 as shown at F E H G. These points give the total length of main pipe.

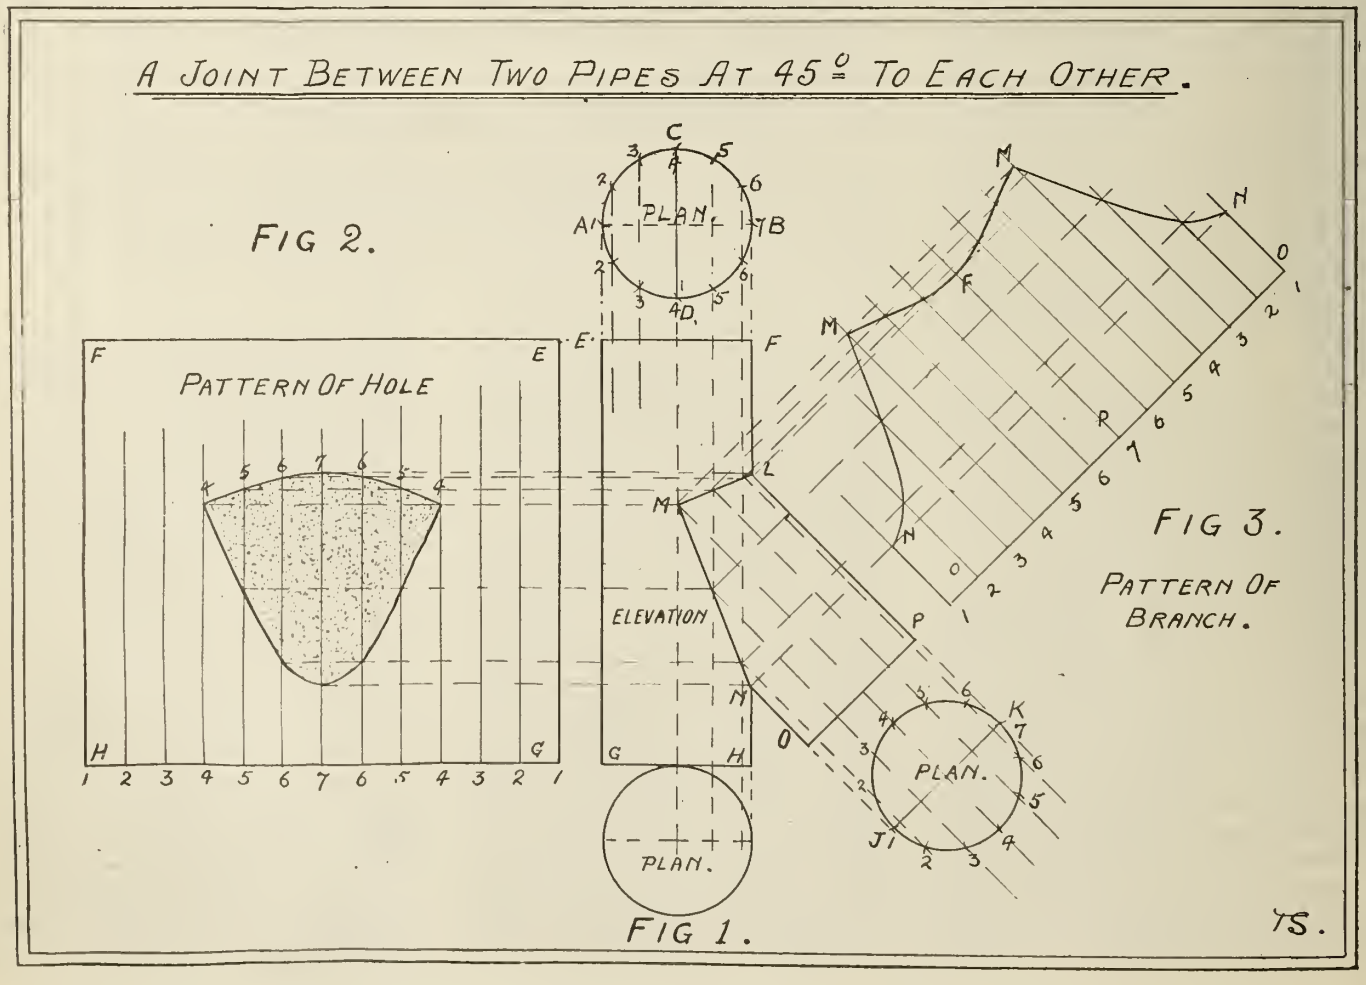
Now transfer the measurements on plan A B C D. 1, 2, 3, 4, 5, 6, 7 and repeat backwards, making 7 on line H G the centre.

Next draw the stretchout line for pattern of branch piece as shown by line O P O Fig. 3, and transfer the measurements from plan J K 1, 2, 3, 4, 5, 6, 7, repeating these backwards in same manner as was done in Fig. 2.

Now draw a number of dotted lines 4, 5, 6, etc., on both the stretchout lines in Figs. 2 and 3.

From line 7 Fig. 2 draw horizontal line until it meets point L on elevation, and repeat by drawing lines from 6,6 Fig. 2 to intersections on M L elevation until the four lines are drawn.

Continued on page 25



MARKET CONDITIONS AND TENDENCIES

(Continued from page 38)

of the dealers to let go of a considerable part of their holdings. They figure out that prices are not going to jump very much higher, especially in coppers. In fact it may be that they are now near the level that will make about as good selling as can be expected for some weeks.

Fairly large shipments of iron and steel are being made to the United States market. Canadian mills and foundries are not taking up very much material. Range of prices now in effect follows:

Dealers' Buying Prices—		
Tea lead	....	0 03½
Heavy lead pipe	....	0 05
Pipe scrap		8 00
Stove plate, per ton	....	12 00
No. 2 busheling	....	8 00
Yellow brass	....	0 08½
Red brass	....	0 13
Light brass	....	0 06
Scrap zinc	....	0 05
Heavy copper	....	0 16½
Wrought iron, No. 1, per gr. ton	....	15 00
No. 1 machinery cast	....	16 00
Heavy melting steel	....	12 00

Copper Gains Strength; Spelter, Antimony Up

INGOT METALS—Higher prices have been recorded in copper, spelter and antimony, and lead maintains a fairly strong position. A better feeling is shown in markets in the United States and same is geing reflected here. Tin is easier.

COPPER.—A sharp advance has been shown in copper since last issue, quotations moving up 4c per pound to 22½c. A much improved demand is in evidence with stocks reported ample.

TIN.—An easier tone is apparent in this metal, quotations being made at 55c to 56c per pound, a decline of from 2c to 3c per pound. The market in London, England, showed substantial advances during the week, but whether this will continue is still uncertain. The British situation, if continued on its present move, may affect the markets here and a reaction to higher levels set in.

SPELTER.—Quotations have stiffened, 8½c and 9c being asked for this. Business is showing some improvement.

LEAD. — The market maintains a fairly strong undertone and there is little new in the situation as it exists to-day. The price holds at 6½c to 6¾c per pound. Some efforts are apparent to create a bull market on this metal in the United States, but leading interests seem content to hold quotations steady.

ANTIMONY. — Continued strength marks the position of this metal and a further ½c advance has been made this week, bringing quotations up to 9½c per pound.

ALUMINUM.—A little more activity is apparent in this metal, with quotations now generally being named around 35c per pound.

SALESPEOPLE OF TO-DAY AND TO-MORROW

(Continued from page 31)

ficult to sell one article after having gone the limit in sales talk on another article ,and this is the danger if you make a mistake in sizing up what the customer wants before you know.

"When you try to sell a customer something they do not want they forget to come back to your store again. Be careful of over-insistence. Lead the customer instead of trying to drive. We are apt to siez the customer up according to our standards instead of according to their standards."

In referring to the customer who comes into the store and says that he or she is "just looking," Mr. Stockdale gave the following illustration:

"A Woodstock, Ont., merchant told of a lady who came into his store to look at certain goods which she was thinking of buying in the Fall—some few months later. The salesman explained that they would have some better lines in at that time, and suggested that she delay looking until the Fall, and then visit the store. The lady in question went to another store in town, and by the exertion of salesmanship was induced to buy goods on the spot."

Mr. Stockdale gave another illustration of how some merchants take much for granted and make a mistake in sizing up customers. He referred to the travelling salesman, who often makes purchases from merchants whom he usually visits in a business way. The point was emphasized that many merchants mistake good customers for salesmen, and do not give them even usual attention.

"The merchant who will not pay the greatest attention to the travelling salesman reaps his own reward," added Mr. Stockdale.

People Learning to Shop

"Merchants should also give customers the same attention when they do not buy as when they do make a purchase." The 5c, 10c and 15c store is teaching the people to shop. We are developing a nation of looker-shoppers. It is there they are getting their education.

"The customer who comes in to buy a 10c article should be given the same attention as the one who comes in to buy a $10 article. Take care of the people who come in to look. Don't let any lookers come in to your store, as far as your treatment is concerned.

"The attention you give to Mrs. Brown has a greater influence on your store than you imagine. Mrs. Brown takes a lot of your time and buys very little, and she is hard to wait on. When you take this attitude towards customers you are making the mistake of your merchandising life. You may call this customer what you please, but Mrs. Brown corresponds to the baseball fan. She is the store fan—what would baseball be without the fan? Mrs. Brown knows more about the merchandise than the clerk behind the counter. She asks questions which are hard to answer. Mrs. Brown belongs to all the clubs in the town and attends them regularly. Don't forget the stores are well discussed at these meetings. The reputation of your store is made or marred right there. Mrs. Brown is sending customers to your store or away from it. Get Mrs. Brown boosting for your store.

"A satisfied customer is the greatest advertisement. Mrs. Brown is satisfied or is a dissatisfied customer who gives much of her time giving word of mouth advertisng.

"Whenever you think of salesmanship you think of certain clerks who are born and not trained. If you have the right foundation, salesmen can be developed through experience, and if you do not have the right foundation you cannot develop a salesman. The study of the science of salesmanship is a good thing.

"The person who stands behind the counter to-day and succeeds is the person who really wants to serve the customer, the salesman who has the spirit of service. How many can say that their customers fell you like to serve them? If they feel that way they will come back to your store, but you must have the service spirit in your salesmanship.

"Don't forget the Biblical quotation: 'He who would be the greatest among you, let him be the most willing servant.'"

AMERICAN WIRE MILLS ARE RUNNING CLOSE TO CAPACITY

Reports from New York state that sales of wire products during June by the largest interests have run close to full capacity of the mills which means that approximately 200,000 tons have been disposed of to merchants and manufacturing interests in all sections for shipment over the next 60 to 90 days. Manufacturers' contracts generally run about three months, but in a few instances wnere needs have been pressing, contracting has extended over the fourth quarter of the year. Buying by distributors however has been confined to 60-day shipments.

It is notable that very heavy sales of fencing have been made for this time of the year for shipment into the agricultural districts. This is probably due to the relatively light buying earlier in the spring season when buyers were disposed to hold off in anticipation of lower prices. Another point of interest is that stocks in hands of consumers, jobbers and dealers as well as of manufacturers have been reduced to a very low point, and there is a disposition now to replenish stocks. In the case of the mills even stocks carried in warehouses have been about one-third of normal. The policy now is to replenish these stocks also, but mills are not operating up to the extent of specifications.

The mills of the American Steel & Wire company are operating about 80% of capacity, but the operating end is being urged to increase output to take care of the large increase in business that has been coming in in the last 60 days.

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

STEADY advances in the price of copper and ingot metals point to new and higher quotations on brass goods very shortly. Some manufacturers have already withdrawn quotations and new figures will, it is stated, be out shortly.

A new basis of quoting has been determined upon for lead and waste pipe with the object of minimizing frequent changes in list prices.

A reduction is now in effect in wrought iron nipples to bring the prices of these goods in line with revisions made in other lines.

With the exception of tin, which shows a decline of from two to three cents a pound, the market for ingot metals has been very strong. Lead is very firm, copper is up four cents, spelter prices have advanced and antimony shows an advance of half a cent.

Owing to labor troubles and lack of production it is difficult to obtain some lines of soil pipe at all. Stocks generally, it is stated, are very low.

As stated in the last issue of SANITARY ENGINEER, new quotations are now in effect on all lines of enamelware, baths showing an advance of ten per cent. and the other lines of five per cent. Manufacturers are having trouble in maintaining production, owing to the difficulty in obtaining molders and unskilled help.

Business in general is reported excellent. Great activity prevails in the building trade and indications are that it will be even greater. The class of buildings being erected calls for a large amount of plumbing goods and some manufacturers are now booked ahead with orders for some time.

TORONTO, July 15.—Brass goods are one of the centres of interest in the trade at present and owing to advances made in prices of copper and ingot metals some manufacturers have withdrawn all quotations on valves and other lines. New figures which will be higher are expected. Prices of cotton waste have been reduced, the new quotations being from ¼ to 1¼ cents a pound lower than former prices. A reduction is also in effect in wrought nipples. Higher prices for all lines of enamelware. A new basis of quotation for lead and waste pipe has been arranged. As a result of no settlement having been reached in connection with the strike stocks of soil pipe are getting very low and some lines are very difficult to obtain.

Higher Quotations On All Enamelware

ENAMELWARE.—As stated in the last issue of SANITARY ENGINEER an advance of ten per cent. on baths and five per cent. on other lines is now in effect. Manufacturing costs continue high and there is great difficulty being experienced in securing skilled help and also molders. As far as the business outlook is concerned, it is excellent and orders continue to come in from all parts of the country in numbers that are most satisfactory. Reports received from those in close touch with building activity indicate that a lot of new work is developing, which will result in a steady demand all season for all lines of plumbing goods. Many large projects are also getting under way. Quotations on a few of the well-known lines of enamelware are as follows:

Bath tubs, rill rim, 4, 4½, 5 feet, 24 to 30 in. wide		$35 30
Bath tubs, 5½ ft.		39 25
Basins, flat back, 14 x 15 in.		6 80
Do., corner, 15 in.		7 50
Sinks, roll rim, 18 x 30 in.		15 80
Sinks, flat rim, 20 x 30	$6 77	6.65
Do., 18 x 30	5 80	5 99
Do., 18 x 24	5 37	5 25
Do., 16 x 24	5 17	5 05
Do., 14 x 20	4 45	....
Closets, oak tank and seat	....	25 50
Do., enamel iron or white vitro tank	....	27 50

Range Boiler Prices Remain Unchanged

RANGE BOILERS.—A nice volume of business is being handled in these lines and it has been showing a steady improvement with prospects that it will remain good throughout the season. The demands for homes are very brisk and builders all over the country apparently are realizing that there is money to be made and are getting busy. Reports show that not for a long time have so many blocks of houses been under construction. More than 400 dwellings are already under way under the Housing Commission's plans, and many private individuals are erecting three, six and ten houses. Prices of range boilers show no change and the quotations are:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	12 50	14 50
40-gallon	13 50	15 50
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Soil Pipe is Firm; Decline in Nipples

SOIL PIPE, FITTINGS.—Not for a long time have stocks of some lines of soil pipe been as low as they are at the present time. This is due to the strike which has now been in effect for some time and is still unsettled. As far as business is concerned it has been excellent, but with stocks the way they are it is difficult to fill some of the orders. There is every indication that prices are going to advance.

Wrought nipples have registered a sharp decline. Wrought couplings and wrought pipe are not affected by this change.

The present scale of discounts which are applying on wrought nipples are for 4 in. and under 80 per cent., replacing a former discount of 60 per cent.; 4½ in. and larger are now quoted at 70 per cent., replacing a former discount of 50 per cent. and 4 in. and under running thread are now quoted at 50 per cent., replacing a former discount of 30 per cent.

Quotations are as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	20%
Medium and extra heavy soil pipe, 4 in.	25%
Medium and extra heavy soil pipe, 2 in. to 6 in.	35%
8 in. extra heavy pipe and fittings	15%

Dart unions, ¼-inch to 2-inch	25%
Do., 2½-inch and larger	15%
Nipples, up to 4-inch	80%
Do., 4½-inch and larger	70%

MUELLER

Water, Gas and Brass Plumbing Goods

CANADA'S BEST

We wish to direct your attention to the fact that there is nothing in water, plumbing or gas brass goods practice that we do not manufacture. The test of over 60 years of producing nothing but the very best in these lines conclusively proves that we are the masters of such manufacture.

We are illustrating a few of our various lines and wish to direct your attention to the fact that—

Our 1919 Catalog A is ready for distribution.

WE MAKE:

1—Tapping Machines
2—Corporation Cocks
3—Goose Neck Connections
4—Ground Key Curb Cocks
5—Rapidac Bath Cocks
6—Rapidac Basin Cocks
7—Globe Valves
8—Drilling Machines
9—Regulating Valves
10—Meter Testers
11—Bath Supplies
12—Service Boxes
13—Basin Combinations and many other articles of highest quality.

Advance is Looked For In Brass Steam Goods

VALVES.—Some manufacturers have withdrawn quotations on all lines, and this undoubtedly indicates that new figures are in preparation. That they will be higher is a foregone conclusion, owing to the advances that have taken place in copper and the high cost of production generally. Manufacturers report that business has been good with prospects that it will continue so. Marine orders continue to come in steadily. Quotations which are still in effect are as follows:

Compression work, standard	50
High grade	49
Fuller work, standard	45

Radiator valves, removable seat, medium pressure	25

Wrought Pipe Holds Unchanged

WROUGHT PIPE.—The market is steady on wrought pipe. No change is shown in the new list published under date of July 4, except in wrought nipples as mentioned above. Prices appear below. Manufacturers and jobbers report a distinct improvement in the volume of business they are doing.

Boiler Tubes Maintain Position

BOILER TUBES.—Boiler tubes are without any quotable change this week and jobbers report a fairly nice volume of business being handled. Quotations follow:

BOILER TUBES—	Seamless	Lapweld
1¼ inch	$27 00	$.....
1½ inch	28 00	.....
1¾ inch	30 00	26 00
2 inch	30 00	26 00
2¼ inch	33 00	28 00
2½ inch	40 00	32 00
3 inch	46 00	38 00
3¼ inch	.....	45 00
3½ inch	56 00	42 00
4 inch	70 00	54 00

Cotton Waste Prices Revised Downward

WASTE, OAKUM.—In line with information given out in these columns on June 15, prices on cotton waste have been revised downward and new quotations now available show a reduction of from ¼c to 1¼c per pound in some quarters. The figures now prevailing on lines of white cotton waste that have changed are as follows: XXX, 18c per pound; XX, 16¾c; X, 15¾c; XC, 13½c; Japanese, 13c; those ruling on colored waste are: No. 5, 13¾c per pound; No. 1, 12¾c; No. 7, 11¾c; No. 1A, 10¾c; No. 1B, 9¾c. An improvement in volume of business is reported.

No new developments are yet shown in respect to oakum, prices holding steadily and demand very fair. The prices follow:

	Per 100 lbs.	
Best American	$21 00	$22 00
Clipper, spun	.....	21 00
Do., unspun	.....	10 50
Plumbers' spun	.....	9 50

Sheets and Plates Continue Active

SHEETS, PLATES—The general view held in regard to business coming to hand at the present time on sheets and plates is that there is a very satisfactory volume of trade. Prices are very well maintained, although it is indicated some slightly lower figures are offered in some quarters on black sheets, though this is not expected to last. A report to-day from Buffalo shows where one big interest have stopped taking orders for wire products for the present, and that their tin plate mill is operating to 75 per cent. of capacity. All over reports indicate an increasing inquiry for all iron and steel products with sheets perhaps the slowest to respond. Prices are firm at following figures:

10 gauge	$4 75	$5 45
12 gauge	4 80	5 50
14 gauge	4 85	5 10
16 gauge	4 95	5 20
18-20 gauge	5 80	....
22-24 gauge	5 85	....
26 gauge	5 90	....
28 gauge	6 00	....
3-16 inch plate	4 90	6 25
¼-inch boiler plate	4 50	5 80

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS.

10¾ oz.	$7 80	$8 10
U.S. 28	7 40	7 70
U.S. 26	7 10	7 40
22 and 24	6 95	7 25
18 and 20	6 80	7 10
16	6 65	6 95
12 and 14	6 50	6 80

An extra is now charged on galvanized sheets. 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

New Basis On Lead and Waste Pipe

LEAD AND ZINC PRODUCTS. — A new basis of quoting has been determined upon in lead and waste pipe, which it is thought may result in minimizing frequent changes in the list prices. List prices have been advanced 1c per lb., making the list on lead pipe 12½c and lead waste pipe, 13½c, and to which a discount of 10 per cent. now applies; sizes over 8 in. take a list of 14½c.

There has been no change in prices shown below on solder. Business in these various lines is reported very satisfactory.

Lead pipe, list, per lb.....	....	$0 12½
Lead waste pipe, list, per lb.....	....	0 13½
Do., over 8 inches, list, per lb....	....	0 14½
Above subject to discount of 10%.		
Lead traps and bends	....	15%
Lead wool, lb.	0 11	0 12½
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 11	0 12½
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 33	$0 37
Solder, strictly, lb.	0 31	0 35
Solder, commercial, lb.	0 28	0 31
Solder, wiping, lb.	0 27½	0 30
Solder, wire, lb.	0 34	0 40
Zinc sheets, per lb.	....	0 17

Scrap Prices Show General Revision Up

OLD MATERIALS.—There has been a general revision upward in scrap prices this week and a much better feeling prevails throughout the trade. Even higher prices seem to be well within the realm of possibility now. It is said there is a movement on the part of some

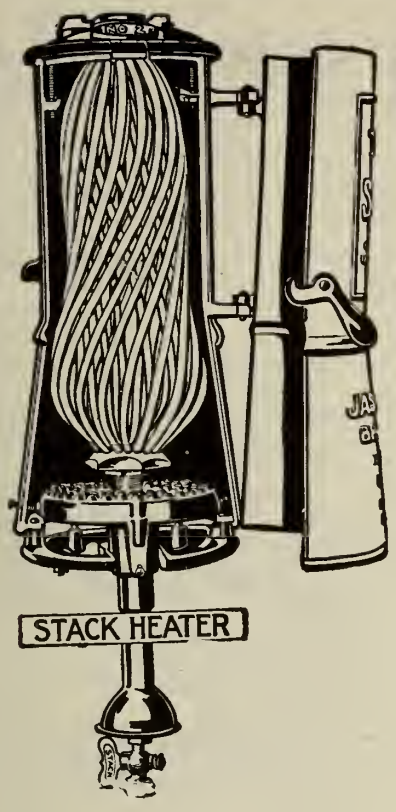
BUSINESS FOR SALE

LIVE PLUMBING, TINNING AND ELECTRIC wiring business for sale. Good town, with good connections. Much work in prospect. Will require about $10,000 to finance. Good opening for energetic firm. Enquiries from those meaning business only are solicited. For further information write the Standard Sanitary Mfg. Co., Box 292, Hamilton, Ontario.

WANTED

WANTED—I AM OPEN TO CONTRACT FOR well advertised lines for the general store trade in north half or whole of Saskatchewan; well connected with general stores; own auto and have warehouse and show rooms. Will furnish bonds or references. Box 42, Sanitary Engineer.



The Evidence Is There

The big feature of the Stack Gas Water Heater is readily apparent.

Your arguments may be clinched by simply opening up the Heater. Those near perpendicular copper tubes will convince your customers. They can see at once that the water is subjected to intense heat. They will understand how small columns of water will heat quicker than in a large coil. The fact that the *Stack Gas Water Heater* heats water in one minute will make sales for you. You will have no trouble convincing your customers that this is the best heater on the market to-day.

Display card sent on request.

The James Morrison Brass Mfg. Co., Ltd.

93-97 Adelaide Street West - TORONTO

This syphon is made in one piece. It has no joints.

YOUR SYPHON

THE success or failure of your domestic sewage disposal system depends to a very great extent upon your syphon. If that fails your whole system is a failure. You cannot afford to take risks, therefore install "ANTHES" syphons.

The "ANTHES" syphon is superior because it is cast entirely in one piece, so having no joints to leak. It is the only syphon which operates on natural law.

Let your syphon be "ANTHES"

Men Worth Reaching

THE SANITARY ENGINEER, Plumber and Steamfitter of Canada, was established in 1907. The subscribers represent the most progressive members of the sanitary plumbing and heating trade in Canada. The paper is issued twice monthly, on the first and fifteenth of the month. Circulates in all provinces of Canada and also in Newfoundland. There is no waste circulation on SANITARY ENGINEER, because subscribers buy the paper for business. The advertising pages are read closely by the largest buyers of sanitary and heating goods in Canada. These men buy for business as well as for private consumption and therefore represent the best class of readers. When you advertise in the SANITARY ENGINEER you are assured of an attentive audience, who are looking for information about your goods and your method of doing business. Cost of advertising is very moderate indeed. We will gladly supply detailed information regarding rates, circulation, etc.

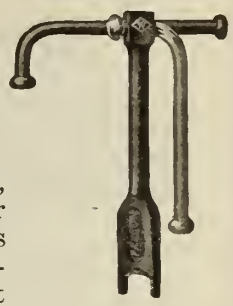
Williams' "Falcon" Drop-Forged Waste Plug Spanner



THE old adage tells us, "Necessity is the mother of Invention," but makes no mention of the father; presumably he is "mere man." At any rate, we are rather proud to have "fathered" the invention of the useful and badly needed tool here illustrated.

It is far more efficient than any possible makeshift, and its folding handle allows it to be readily carried in the pocket. The dimensions of the "finger ends" make it universally adaptable to all sizes and forms of basin and sink plugs and grates. The tool is hardened for severe service. Descriptive Booklet on request.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

There's Something about an Original that Can Never be Imitated!

IF you've ever heard Harry Lauder sing his Scotch songs you could tell an imitation with your eyes shut.

You've seen Charlie Chaplin do his stunts—do you think an imitator could fool the people?

Whether it's real diamonds or paste —whether it's pure gold or brass—an imitation is simply an imitation—**and nothing else.**

That's why the thoughtful steamfitter isn't going to fall for anybody's talk about something "just as good" as "X" Boiler Liquid. He knows that for positive results it is safer to stick to the original. An imitation of the genuine "X" may look like it—but that's all. Patents are allowed on the "X" Liquid process. Its quality **can't** be imitated. Imitations of the genuine "X" Liquid cause foaming. **"X" will prevent foaming.**

No fitter can afford to experiment with his profits. When you get a leaky or cracked boiler job you want to know that you can send any man to that job —have him finish it quickly—otherwise there's the kicking, the arguing and the time-wasting that is utterly useless from a money-making standpoint.

Over 25,000 steamfitters now know that "X" Liquid is the **only** scientific process for repairing leaky and cracked boilers—and for making them LEAKPROOF—RUSTPROOF — AND SCALEPROOF. They know that with "X" they make three times the profit that they could by dismantling and welding.

And they wouldn't risk their reputation experimenting with an imitation.

"X" LABORATORIES

636 Washington St. Boston, Mass., U.S.A.

Have You Taken Down Your Sign?

A prominent merchant who has made a great success of all branches of his business has said that withdrawing advertising from a good trade paper is like taking down your sign. Advertising to the trade you serve is business insurance, but premiums must be kept up or the policy will lapse.

There never was a time when the trade was keener for business information. That is why the advertising pages of the SANITARY ENGINEER are being followed so closely at the present time.

Plumber and Steamfitter of Canada
VOL. XIII. PUBLICATION OFFICE, TORONTO, AUGUST 1, 1919 No. 15.

Empire Service

A new building season is opening up. After five years of more or less retrenchment in general building and construction work, the Canadian building trades are commencing to catch up on work that has been left undone—work laid aside for more pressing war duties.

This will impose many new problems on the plumbing, sanitary and heating interests, but here is where we offer our services—BESIDES SUPPLYING COMPLETE LINES OF PLUMBING, SANITARY AND HEATING EQUIPMENT, we send our engineers to assist you solve any complex problems that may confront you.

Your problems are our problems, too. It may be the equipment of a new building with the very latest types of plumbing and sanitary facilities. We can help you plan this work. It may be that a building must be refitted—a water pressure system may be needed, or heating facilities found necessary. We offer you expert advice, and can supply EVERY NEED.

Write us for our special catalogue. Specify your needs. We can be of infinite service to heating and sanitary engineers. We also guarantee prompt delivery.

"Dual" Mixer

A valve that really mixes Hot and Cold Water, and maintains a uniform mixture.

For ease of operation, simple construction and easy installation, it has set a new standard of efficiency.

Cold Water must be turned on first, no possibility of scalding.

Made in several forms for Showers, Sprays, Operating Rooms, etc.

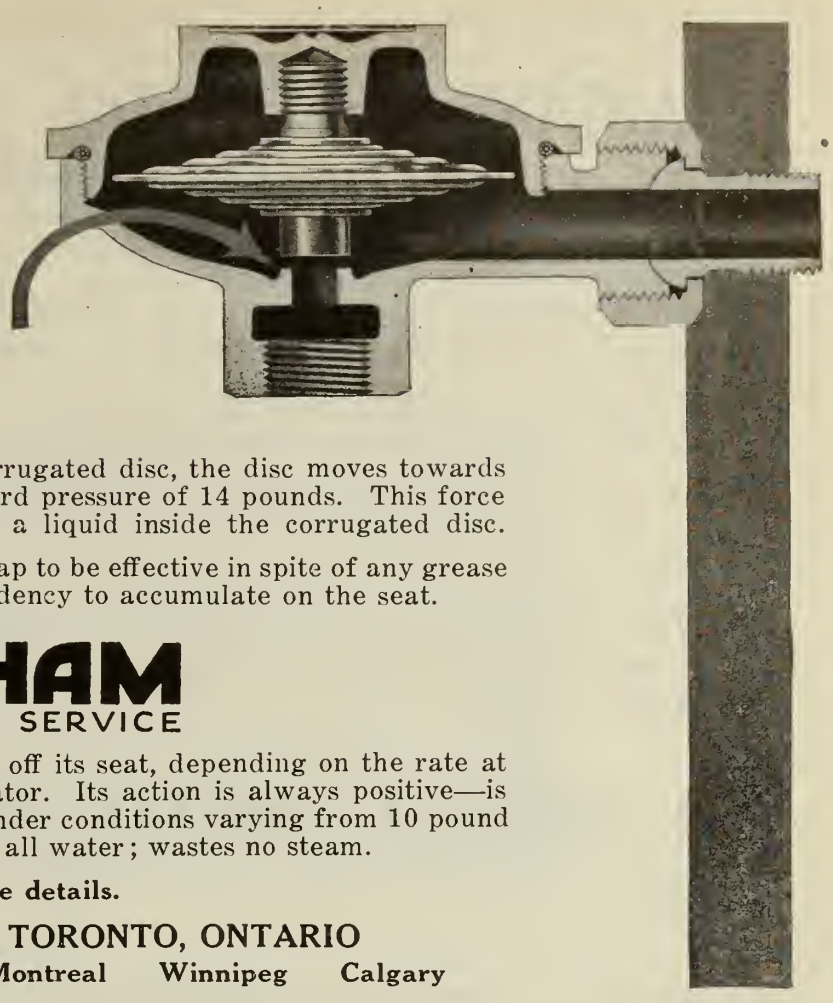
At the well-known works of Messrs. Brunner, Mond & Co. these valves provide baths for 2,500 employees.

G. & W. G. GUMMER, LIMITED

Manufacturers of every description of

Engineers,' Plumbers' and Sanitary Quality Brassware

14 Lbs. Pressure downward



AS soon as steam strikes the sensitive corrugated disc, the disc moves towards its seat and exerts a maximum downward pressure of 14 pounds. This force is exerted uniformly by the vaporization of a liquid inside the corrugated disc.

This downward pressure causes the trap to be effective in spite of any grease and foreign matter which might have a tendency to accumulate on the seat.

The DUNHAM HEATING SERVICE

In action, the disc is alternately on and off its seat, depending on the rate at which the steam is condensed in the radiator. Its action is always positive—is never sluggish—and can be depended on under conditions varying from 10 pound pressure to 15 inches of vacuum. Passes all water; wastes no steam.

Write for complete details.

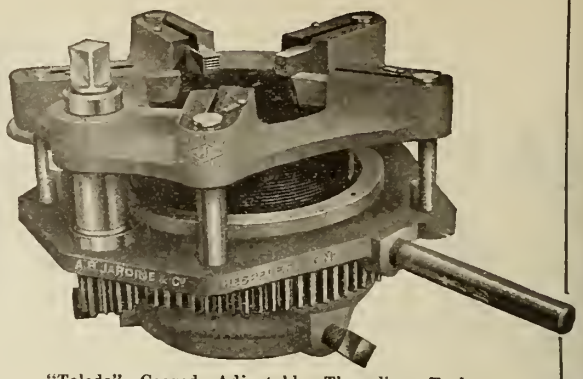
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity 2½ to 6 in. inclusive. Weight, 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

"Standard"
"Perfection" Built-in Baths

Made in One Piece Enamelled All Over

These Baths represent the last word in design and finish, and are made to build into Right or Left Hand Corner or into a Recess.

The "Perfection" Built-in-Bath is only 17½ inches high, therefore convenient. It builds into walls and floors, the absence of all dust-collecting cracks and corners meaning bathroom sanitation.

Made in 5 and 5½ foot sizes.

Illustrations on request.

"MADE IN CANADA"

The Secret of the Strikes

Most Canadians are asking "What is the cause of the 'Great Unrest' "? Is it the fault of labor—or of capital?—or is it the result of German propaganda? Do you know of the real reason for the labor disturbances in Canada, and elsewhere? Are YOU thoroughly familiar with the ins-and-outs of the plans which threaten a world-wide "tie-up?" This is something that should be understood by every Canadian. And every Canadian should read "The Secret of the Strikes," by Lieut.-Colonel J. B. Maclean in the August issue of MacLean's Magazine. It is brimful of startling and authoritative information regarding this great problem. Read it carefully. It starts on page 33, August MacLean's.

"The Lecturer At Large"

Stephen Leacock is one of the continent's greatest humorists. "The Lecturer at Large" is one of the best humorous sketches that he has written. It is made up of what he terms "a few painful reminiscences of the platform" in the course of his lecturing up and down Canada. Get your family around you and read the sketch aloud—it's a rare treat.

Other Big Features

"A Party in the Making." By J. K. Munro. Illustrated by William Casey. An article on the political situation, giving a great deal of inside information with reference to recent developments at Ottawa.

"Solving the Problem of the Arctic." By Vilhjalmur Stefansson. The fifth instalment of his story of the five years' explorations that he conducted for the Dominion of Canada.

"The Unspoiled Country." By Harold C. Lowrey. A descriptive article of a part of Canada which is little known to Canadians generally, Temagami.

"Petite Simunde." By Arthur Beverley Baxter. Illustrated by E. J. Dinsmore. A charming romance of the war. The author will be remembered favorably for his "Mr. Craighouse of New York, Satirist."

"The Seven Blue Doves." By W. A. Fraser. Illustrated by Charles L. Wrenn. The fifth of the Bulldog Carney series and in some respects the best. It is a mystery story.

"His Majesty's Well-Beloved." By Baroness Orczy. Illustrated by C. F. Peters. The second instalment of this splendid romantic novel of the colorful era of Charles II.

"LIVING BETTER" and "A BETTER LIVING"

A Little "Straight Talk" to the Canadian Plumbing Trade

LIFE IN CANADA TO-DAY contains possibilities unheard of by former generations in this or any other country. Studies in comparison of opportunity in different countries bring the student back every time to the pointed fact that **CANADA** right now offers vastly more advantages to the ambitious man than can be found under any other flag.

CONDITIONS IN THE HOMES OF THE PEOPLE touch the very root of national life and prosperity. Looking backward a brief space of twenty years in any community in Canada, what wonderful differences are apparent in methods of sanitation and heating. By this one gauge, probably more than by any other, can be measured the advance of vital elements which daily and hourly affect the life. health and happiness of the individuals who make up the nation.

THE TEACHER, THE BANKER AND THE PLUMBER have all had the closest association with this progress of civilization, and we speak no flattery, but merely assert an evident truth in stating that of these the **PLUMBER** has been called upon for as much exercise of heart and brain as has any of the others. Not alone in equipping new residences, factories and other buildings has the **HEATING AND SANITARY** expert been of vital necessity, but his services are even more urgently required in removing out-of-date equipment from older or already built houses and places of business, and replacing these by modern installations which mean so much in the movement toward **"LIVING BETTER."**

OPPORTUNITY KNOCKS AT THIS DOOR. She calls the modest plumber in every Canadian town or city to a high ideal of **SERVICE.** Where the Canadian plumber gives his **OPPORTUNITY** enthusiastic welcome and moves forward to assist in the great movement for health and comfort, he can be assured with certainty of **"A BETTER LIVING."** If he combines with **SERVICE** the high elements of "Efficiency" and "Quality," there can be hardly any limit to his possibilities.

"QUALITY," "EFFICIENCY" and **"SERVICE"** together form the motto of the CANADIAN BRASS COMPANY. This firm strives constantly to assist the Canadian plumber toward solving his problems and supplying his needs so that the utmost of satisfaction in every particular may result.

Cast Iron Drainage Fittings

Design.—These Fittings are specially designed for sanitary plumbing for use with wrought pipe. They are made with a shoulder which engages flush with the pipe, thus ensuring a free continuous flow as the inside diameter of the Fittings and pipe are the same—see cuts. Fittings are tapped pitched to give a flow of ¼" to the foot.

Uses.—1. Drainage Fittings and wrought pipe make a most desirable substitute for Cast Iron Soil Pipe and Fittings for sanitary installations.

2. For vacuum cleaning systems and sprinkler installations they can be utilized advantageously as an unobstructed flow is assured.

3. Drainage Fittings can be used in place of the regular Long Sweep Fittings as they are made in both long and short sweep and can be tapped pitched or straight.

Advantage.—The improved appearance and decided benefits derived from any system having all screwed joints instead of caulked joints will be readily appreciated. Considerable time is also saved in making connections and in many cases screwed joints can be made quite easily in positions where caulking would be most difficult.

Advertising Plumbing Material

One of the most successful Advertising Campaigns of Plumbers' material was conducted by a firm in the United States manufacturing a Plumbing Specialty, and much of its success can be attributed to the fact that it appealed to the public principally through the Master Plumbers.

Plumbing is one of the very Trades in the Building Industry where the services of an expert workman are necessary for the proper operation of the fixtures used in the installation. No matter how good the fixtures are they never give satisfaction unless they are properly installed.

An Advertising Campaign, to be successful, must therefore have as a basis a thorough understanding and perfect harmony between the Manufacturer, the Jobber, the Contractor and the Consumer, and any effort to interest the general public that does not take all these factors into consideration cannot be successful in the fullest sense of the word.

Our Company is engaged in the manufacture of Plumbers' enamelware. Naturally our first thought is to interest the Plumber and the General Public to the advantages of using PORT HOPE enamelware; but our interest does not stop there. We recognize that we must go further than that if we expect to obtain results, and assist in taking part in every enterprise that will extend, promote and develop the sale and general use of more sanitary fixtures. Nobody, these days, doubts the efficacy of Advertising, but there are many ways of Advertising and perhaps one of the best is that method suggested by a Master Plumber, who said that advertising of Plumbing material should be general in its application and educational in its character.

The Public want to know more about sanitary fixtures, their manifold uses and above all their proper cost. The lack of proper publicity prevents thousands in the rural districts from enjoying the comfort of modern Bathrooms, and in urban districts from renewing and replacing old and worn-out sanitary fixtures.

It is not the intention of the writer to suggest any particular method, but it is a question which should be carefully considered from the Manufacturer's and Plumber's point of view, and should, properly speaking, be one of the subjects which should engage the attention of every Master Plumbers' Association.

It is quite certain, however, that an expenditure of say One Hundred Thousand Dollars a year spent in an Advertising Campaign with copy intelligently directed and properly prepared, would produce results that would pay subscribers many times over the amount of their subscription, and in Canada that would only mean a contribution of about Forty Dollars a year from each man engaged in the business.

To the actual profit in cash must be added the real value that would come from the "Get-Together" idea. Not only would the public be educated, but the Manufacturer and the Plumber would get better acquainted, and by a proper understanding of requirements there would be a concentration of ideas, a standardization of patterns and equipment, a greater demand for Plumbing material, a lower cost as a result of larger productions, and generally a satisfaction which would make it a real pleasure to do business.

We would like to help in the good work.

McFall Allegations Stir Up Trade

Probe Welcomed in Some Quarters—Others Say There is Nothing to It—Statement by Jas. Hardy, Secretary of Association

NOT for a long time has more interest been taken in the trade in charges made at Ottawa than in the allegations made by Dr. McFall, the Cost of Living Commissioner, that a combine is responsible for advancing prices of all kinds of sanitary and plumbing supplies. Suitable action, Dr. McFall states, has been recommended, and this is taken to mean that an investigation is likely.

Close inquiry made by SANITARY ENGINEER among those in the trade shows that an investigation into the prices they are being charged for goods would be very warmly welcomed.

The views expressed by Frank R. Maxwell, president of the Dominion Society of Domestic, Sanitary and Heating Engineers, reflect those of many members of the trade:

Would Welcome Probe

"I know I am voicing the views of the members of the association and the men in the trade all over the country," said Mr. Maxwell to SANITARY ENGINEER, "when I say that the installers would welcome an investigation. We will give every assistance we can in clearing up this matter. To my mind there is no doubt that there is profiteering somewhere. I will be glad if the manufacturers and jobbers can prove themselves clean, but I do not know how they can.

"The men who are doing the installing, and the men who work for them are not getting the profits. I wish they would come to my shop and investigate. My books and my shop are open to anyone who is interested. The same will apply —I think—to all in the trade. The man who is a genuine man and not a shark is not getting more than he is entitled to. Any fair-minded person will admit that the installer is entitled to a fair profit on his work and our books will show that that is all we are getting, in fact some of the men are not getting what they are entitled to."

Cites Some Instances.

As an instance of how prices have jumped Mr. Maxwell cited range boilers. Before the war, he said, they could be purchased by the trade at $3.75. Now they are costing more than $11.

"Is there any justification for this?" said Mr. Maxwell. "Take enamelware, which advanced recently, as another case. Is there any real reason why this advance should be made? The manufacturers may say that labor costs are to blame. That is a favorite plan just now to answer high prices or increases in prices. The manufacturers have not advanced wages anything like they have advanced the cost of goods and in many lines they have not had to advance wages at all, as the men are out on strike, and goods that are being sold now at high prices were made months ago at wage scales prevailing at that time.

Too Many Profits

"There are too many profits before the goods get to the retailer," said Mr. Maxwell. "There are too many commission houses each getting its percentage. Another reason that makes prices high is that the jobbers encourage piecemeal buying instead of buying in bulk because they make a lot more money selling in that way. The method of delivery is another factor in making goods cost more. I am a firm believer in every master plumber having goods delivered to his own shop. As things are now you can call up a firm and have stuff delivered to any part of the city. This all costs money. I know of one jobbing firm in Toronto whose cartage costs each year are close to $10,000.

Another Big Saving

"If each master plumber had the goods delivered to his shop it would make for a saving in another way also. When work was being started on a job all the material would be assembled and the plumbers when they went to the job could go right ahead. Now they frequently have to wait until some material is delivered. Even if only a man and a boy are kept waiting it does not take long for half an hour to roll around and that means 75 cents. There is too much time wasted altogether by the present plan and it has to be paid for."

Mr. Maxwell also complained of the methods followed by the jobbing houses in granting credit. Anyone can get unlimited credit, he stated, if the builder goes security. As a result, he says, there are big losses often and these have to be made up.

Must Learn Business

"The jobbers," said Mr. Maxwell, "should deal with this question of granting credit in a proper way. A man should be made to learn to finance his first job instead of getting somebody else to do it for him. It will make him a better business man and will start him in the right way of conducting his business."

Another injustice pointed out by Mr. Maxwell was the placing of some firms on the jobbers' list because they bought in quantity. He explained that if a firm went in and bought a large quantity of goods for immediate reqirements it was entitled to a reduction, but this plan, he alleges, is not followed. Because some firms who buy a lot of goods spread their purchase over a year, taking the goods as they need them, is no reason why they should be shown a preference over others in the trade, he says. Nearly all the small shops, he stated, buy through the jobbers.

Production Limited.

Mr. Maxwell declared that in his opinion production is being limited because of manipulation.

"What we need," he said, "is more production, but will we get it? Will any manufacturer or anybody else produce twice as much for his present output as he could for twice as much? The way prices are being raised on everything just makes a circle which hits everything. If you get more money and have to pay more money for everything, all we are doing is to exchange money. Take foodstuffs, for instance. Is there any reason for the prices things are? Probably never in our history has there been so much garden stuff raised. During the war people learned to grow a lot of the things they needed and there are thousands of gardens to-day that were not in existence a couple of years ago. But was foodstuff ever higher? I say it is a hold-up, purely and simply a hold-up,

and the cold storage firms are to blame for some of it.

Up to the Government

"In my opinion the solution lies in the Government taking action to make the cold storages put the goods they have on the market in a reasonable time. At present the cold storage firms buy up all the stuff and it reaches the consumer just when the cold storage owner feels like releasing it. If he knew he had to put these goods on the market in, say, thirty days, he would sell it for a lot less than if he is allowed to carry it for months. I believe there are a lot of firms who will deliberately let foodstuffs spoil rather that sell it at a little lower price."

Statement by James Hardy

James Hardy, of Jenkins & Hardy, when asked for a statement regarding the allegations of Dr. McFall, declared that there was no jobbers' association. There had been one, but at a meeting held on November 21, 1916, it became non-existent as the result of a resolution passed, and it was decided that its interests would be looked after by an association, of which Mr. Hardy is secretary.

Mr. Hardy was asked if it were correct that a few weeks ago the association had its agreement considered by a solicitor and changes made to make it legal. Mr. Hardy stated that what really occurred was that it came to the notice of the association that certain jobbers were allowing an advantage of ten per cent. to certain men in the trade. This matter was taken up with Mr. Johnston, the legal adviser, and it was suggested that this was not the proper thing for the jobbers to do. Mr. Johnson agreed with this view and as a result a letter was sent to the jobbers advising them that all those in the trade must be placed on an equal footing, and no ten per cent. advantage or any advantage allowed to anyone.

Fear No Investigation

Mr. Hardy stated that the manufacturers were in no way concerned with the allegations of Dr. McFall and that there was no need of making any statement on their behalf. If they were called to testify at any investigation that might take place their books would show that they had not been making exorbitant profits.

Mr. Hardy stated that he thought Dr. McFall's action was somewhat high-handed and that as far as he was aware Dr. McFall had not in any way made any effort to secure information from the manufacturers or jobbers.

"Does he think he is going to put all these firms out of business by making statements of this kind," said Mr. Hardy. "It looks to me as if, perhaps, he is going after some office and wants to bring his name before the public and make a big man of himself."

Asked if business had been good lately, Mr. Hardy said: "It has been good and will be all right if some fool does not go and spill things."

Makes No Statement

Asked to give an official statement for publication to the trade, Mr. Hardy said all that it was necessary to say was that there was no jobbers' association. Pressed further for a statement he said he would prefer to consult Mr. Johnston, the lawyer, and tried without success to get Mr. Johnston on the telephone.

One manufacturer declared that no one in the trade had been responsible, in his opinion, for having started any move for an investigation at Ottawa. On being told that some of the sanitary engineers said they would welcome a probe into prices they were being charged, this manufacturer said that he did not believe it and added that the plumbers themselves were charging the public high prices compared with what they bought the goods for.

Comments in the Daily Press Harmful to the Trade

A great many comments have been appearing in the daily press regarding the statements of Dr. McFall and many of them are harmful to all branches of the trade. The following are typical views expressed in news and editorial columns and indicate the attitude that is being encouraged in the minds of the public.

Under the heading "Robbery Less Offensive Than Plumbers' Methods," the Toronto Telegram says:

"The report of Dr. McFall, Dominion Cost of Living Commissioner, intimating that a combine, international in its scope, is enhancing the prices of all kinds of sanitary and plumbing supplies, the jobbers, through whose hands the trade is forced, sometimes taking as high as 25 per cent. for themselves, had little news in it for J. Walter Curry, K.C., who prosecuted the combines in Toronto fourteen years ago. Dr. McFall optimistically recommends 'suitable action.' Mr. Curry says that his prosecutions failed to quash the combines because of lack of sympathy 'higher up.'

"'The evidence in those prosecutions showed that the combines were international in their scope then, and I have no doubt they have been ever since,' said Mr. Curry this morning.

"He stated that those convicted had been fined, and had paid their fines.

No Support

"'The prosecution did not quash the combines?' he was asked.

"'How could they?' he asked. 'How could the prosecutions quash the combines when there was no sympathy behind me, no support in the prosecutions, and when the cases went to the courts on the other side there was no sympathy. There was nothing to do but to resign.'

"'Was that the cause of your resignation?'

"'Yes.'

"In June, 1908, Mr. Curry publicly declared that combines were extorting from the people of the province $3,000,000 a year. The late Hon. J. J. Foy, then Attorney-General, in reply suggested that a number of the combines originated in the Province of Quebec, and that the Attorney-General of that province should be approached. Mr. Foy said that a number of combines were in the hands of counsel; in connection with the alleged tack combine, he had been advised by eminent counsel that it would be impossible to secure a conviction.

Tarred With Same Brush

"Mr. Curry got just as little sympathy from his political friends when he was one of a deputation that called on Hon. W. S. Fielding in Ottawa. Mr. Curry stated on that occasion that, while Crown Attorney in Toronto, evidence was brought before him which showed the existence of 100 trade combines in Ontario, which collected millions of dollars yearly in unjust profits. He asked for a special officer to prosecute combines, and was told by the Liberal Minister that many difficulties stood in the way, and it had been decided to leave the matter in the hands of the Crown authorities of the various provinces. Remedy could be had under the Criminal Code.

Prosecuted

"In October, 1905, the Attorney-General of Ontario prosecuted the Master Plumbers and Steam Fitters' Co-operative Association. They were charged with stoppage of supplies, checking of trade, prevention of manufacture and control of prices. On November 14, after the full examination of papers and records seized at the headquarters of the two organizations, some eighteen master plumbers were arraigned under the instructions from the Attorney-General on a charge of conspiracy, and during the trial it was found that $20,000 had been distributed among the members as a result of certain combine arrangements, while newspapers stated that prices in the city were double what they were when the combine started operations.

Imposed Fines

"Justice Clute, on December 7, imposed a fine of $5,000 on each of the indicted associations, and individual fines ranging from $250 to $500 on eight master plumbers. In his judgment Justice Clute said that they took from the public money to which they had no possible claim. Of the two offences he thought robbery the least offensive. He found that the organization, while not affiliated with the United States' association, was in such close touch with it that it was able to secure assistance there at any time, either in keeping out good or in any other way.

"Dr. McFall, in his report given at Ottawa yesterday, says: 'At this time, when the excessive prices of building materials are working such hardship, the activities of this combine are particularly pernicious.'

"It is intimated that the combine is international in its scope, and includes both manufacturers and jobbers. The Commissioner says that 'by means of this combine practically all plumbing supplies are forced to go through the hands of jobbers, who frequently take as much as 25 per cent. or even higher for themselves, in spite of the fact that the plumbing trade, which is now attempting to free itself from this burden, considers the jobbers to be an unnecessary factor in the trade.

"'Cumulative evidence obtained over a protracted period is indicative of similar conditions prevailing in many other lines. Infractions of the law have been disclosed in the matter of articles of clothing and some of the most important foodstuffs, as well as less vital articles in domestic consumption.

"'Cases have also been prepared to prevent unfair trade practices, which are being exercised to forestall the operation of measures which would greatly reduce the cost of living. Suitable action,' said Dr. McFall, in conclusion, 'on these cases has been recommended.'

300 Per Cent. Profit

"A west end plumbing man, who does a lot of general contracting, told the Telegram that Dr. McFall's report hardly scratched the intolerable conditions under which the 'plumbers' trust of Canada' operates. He said that the combine in plumbers' supplies

was the tightest on the continent, and the 'trust' had every point in Canada down to such a system that advances of 300 per cent. had been made in many lines during the past two years.

"'Bath tubs we got three years ago for $14.50 we now pay $42 for. Kitchen boilers cost in 1916 $4.25; they are now sold at $17.75,' he said."

The Toronto Globe says editorially:

Combines, but Who Cares?

"The Canadian people will hear with more cynicism than surprise the charge of the Cost of Living Commissioner, Dr. McFall, that a combine is advancing prices in all kinds of sanitary and plumbing supplies.

"'Cumulative evidence obtained over a protracted period is indicative of similar conditons prevailing in many other lines,' adds Dr. McFall. This is not a revelation. The people have long known it to be true. The authorities upon whom the duty rests of enforcing the law against combines have long known it to be true. The only novelty is the fact that a public official says it is true. Years ago a certain Crown Attorney in Ontario showed a similar curiosity, and actually proposed to turn the searchlight of a public trial on a number of concerns indicted as combinations in restraint of trade, but the Ontario Government rebuked his zeal, and a long peace ensued. Nothing could disturb the Seven Sleepers at Queen's Park, and the Attorney-General was the most somnolent of all. Even judgments of the Bench that the Criminal Code had been violated did not wake him up.

"The Federal Government has the power to reduce the tariff when a combine shelters itself behind customs duties, but some person with a grievance must take the initiative, and he may hesitate to incur the enmity of a powerful combination if he is in the same trade. A Provincial Attorney-General requires no private complainant. If he suspects the law is being broken it is his duty to try to collect evidence. If he has evidence he is untrue to his trust if he refrains from prosecution. The constant war-

Are You in Business for Fun or Profit?

Good Money to Be Made Out of Handling Electrical Fixtures and Utilities Along With Plumbing Goods, Says E. S. Coppins, of Woodstock, Ont.—Says Plumbers Must Work Together to Improve Conditions Generally.

Based on an interview by C. E. PARSONS, of Sanitary Engineer, with E. S. Coppins, of Woodstock, Ont.

WHEN Woodstock, Ont., became the distributing centre from which hydro power lines were built into many of the rural sections an opportunity was presented for handling electrical goods and supplies that is perhaps one of the best in the province. E. S. Coppins, plumber, was one of the first to see the chances and to take advantage of them. The Woodstock field is an especially attractive one, because of the large number of big milk factories centred in it. This means that thousands of farms are engaged in dairying that every morning they haul all the milk they can secure to the factories and that they get paid regularly and at good prices for it. It is one of the richest dairying sections in the province of Ontario, and the farmers are not only prosperous, but up-to-date. It is said that there are more fine dairy barns, lighted throughout by electricity, in Oxford county than in any similar area in Canada Some of the farmers have gone a step further. They have installed electrical milking equipment. While they were fixing up their dairy barns in this manner, they did not neglect their homes, and as fast as the power lines were completed they connected up with them, installing electric lights and doing as much work as they could by electricity.

Right After Business

All this progress meant some mighty good business for the merchants who went after it. Mr. Coppins was one of the first to start cashing in. He has always worked along certain definite lines in regard to his shop. One of his principles is that there is no better way of selling goods than by showing them. Another is that all goods and the store and shop be kept neat and attractive always. There are in Woodstock's business section some very attractive and well arranged display windows, but not many of them carry a broader appeal to prospective buyers, especially those wanting electrical or plumbing equipment, than that of Mr. Coppins'. His window display is changed every week, and he aims to continually keep an attractive showing of really serviceable goods before the people. He keeps his window shining, makes the most of the natural attraction electrical lines have for display purposes and always has a good variety designed to carry a wide interest. In doing this he has in view both the city and country trade. The farmers are in town in great numbers on some days, and Mr. Coppins always keeps something in his windows that will interest not only the farmer, but his wife.

View of a window display of electrical fixtures and household appliances recently put in by E. S. Coppins, Woodstock, Ont., from which excellent results were obtained. The arrangement is neat and decidedly attractive.

Brings the Business

"I have no better selling force than my show window," said Mr. Coppins to SANITARY ENGINEER. "It brings excellent results and brings them continually. People come right into the store and ask about the lines we show. Very often it will be some farmer or his wife who wants to find out about some electrical goods. Maybe they live a dozen miles out and are planning to remodel their home, or to install some piece of labor-saving equipment. The next caller may be a city woman who wants to know

General view of the interior of the display rooms of E. S. Coppins, Woodstock, Ont. The use of tables for the display of electrical household appliances, table lamps and bathroom fittings has been found very effective. To the left, counter display cases are well used. In set is the genial proprietor himself.

about an electric washer or an electric stove. And so they come. We get a lot of business that is directly traceable to the show window."

The same idea regarding display is carried out by Mr. Coppins in his store arrangement. He believes thoroughly not only in carrying a quality stock, but in letting people see what he has. Electric lamps, for instance, are shown not only on neat display tables, but at conspicuous points around the store, where they are certain not only to attract attention, but show to advantage. On another table may be seen electric irons, toasters, and other lines. At other points in the store there are displays of bathroom fixtures, electric stoves, gas heaters and other lines in which those who want to improve their homes are interested.

Get Splendid Results

"We get splendid results from our display tables and from our store display," said Mr. Coppins. "People will often come in to look at plumbing goods or see about electrical fixtures and get interested in an electric stove, an electric washer or some other goods. I have found from experience that it pays to keep one's stock out where people can look it over, and ask about it, and also to keep it looking its best. People like to look at new goods. If they pick up anything that is dusty or mussy-looking very often they get the idea that it has been in stock for a long time, and must be a poor seller, and lose their interest in it. I do a big country trade, and I find the farmers of this whole district are right up-to-date. They want the best there is and they are willing to pay for it. They are continually making improvements that will make their homes more comfortable or that will lighten their work. There is a lot of really good business in handling electrical fixtures and electrical utilities. Many of these lines practically sell themselves. People are interested in them right from the start, because they have either read about what they will do, have seen them in operation at some neighbor's, or have been told by somebody how much time and labor they will save. Take electric irons, for instance. No woman who has ever worked with an electric iron wants to be bothered ironing the old way.

Others Want Them

"The farmer's wife who has an electric iron or a washer or some other device never tires about telling her neighbors about it," continued Mr. Coppins. "They come over and see the article work. They can see that it saves them time and real drudgery, and naturally they are never satisfied until they get one. When they get an iron they want a washer, when they get a washer they want a cleaner or some other labor-saver, and so on. All this means good business for the dealer. I have found that handling these lines works in splendidly with my general plumbing business. There are sometimes slack seasons in plumbing. If I did not have the store business to help out I might often lose a good deal of money through being unemployed, through no fault of my own. Now, if I am not busy plumbing, there is always something doing in the store. All these lines carry a good profit, and as I would have to have the shop anyway, for my plumbing business, they cut down my overhead and give me a chance to make some money.

Little Co-operation

"One of the troubles with the plumbers," stated Mr. Coppins, "is that they will not work together. There are too many of them cutting prices, and they often end up by discovering that they have worked hard and not made any money. If they would work together they could get results and better conditions that need improving. Take for instance, the matter of the wholesales selling direct to farmers. They do this right along. If the plumbers of this district stood together and would not buy from the firms that sell to farmers and others it would not be long before the wholesalers would stop it. The plumbers should work together for their own protection. Here in Woodstock there is nothing to prevent an outsider coming in and taking a contract. If we stood together and worked for it, we could go to the council and do as they have done in some other cities, get a by-law passed making it necessary for any outsider to pay a license before he could take local work. While this might not stop the outsider altogether, it would at least help keeping them out, and it would show that we were a force in the community, and watching our own interests.

Better Conditions

"The plumbers not only of Woodstock, but of all Ontario and of all Canada," continued Mr. Coppins, "should work together for a standard plumbing code. All plumbing should be installed under a code of this kind. It would make for better

English and American Water Softeners

A Description of Several Types of Water Softeners From Which a Good Understanding of Their Operation May be Obtained—The Article Describes Several Types

By F. C. P.

THE accompanying drawings, Figs. 1, 2 and 3, show the carburetor of Wright's improved water softeners, developed from the designs of Player and Weddell at Tipton, England. The drawings, Figs. 2 and 3, show the details of the automatic gear and trip gear of this English water softener, considering the automatic inlet valve "A," Fig. 2. The float rod is adjusted so that the water is cut off below the overflow level. The dividing box "B," is set level so that the water flows over it in a film of uniform thickness. It divides the water into two or more parts. The division is controlled by an adjustable slide, "C," so that any amount of water can be caused to flow through the wheel. This is what controls the exact proportion of re-agent passing into the softener.

It will be noted that the water wheel, "D," is mounted on ball bearings, "E," which are kept well packed with grease. There are two chains and wheels,"F"and "G," one on either end of the shaft. One of these is geared to a chain wheel driving the stirrers, "H," in the re-agent tank, which keeps the mixture stirred. The other chain wheel is geared to drive a bevel gear.

The re-agent supply measure, "J," is clearly shown; the water wheel, "D," gradually lowers the re-agent supply pipe by means of the screw, "K," and allows the mixture of lime and soda to overflow in proportion to the quantity of water entering the plant. The bevel pinion, which operates this screw gear, slides on the spindle and is controlled by the position of the trip gear as shown on drawing, Fig. 3. As the screw lowers, the trip gear comes into operation at a certain point, withdrawing the pinion from the bevel wheel, so that when this has been withdrawn the water wheel no longer operates the screw. This should be adjusted by means of the nut, "L," so that the pinion is withdrawn before the bottom bracket "M" comes into contact with the agitators, and also before the long screw, "N," has been unwound off the nut, "O." When the overflow pipe has reached this point it is very near the bottom of the tank, and it is time to recharge it.

In charging, the first thing to do is to wind the screw by the handle provided, so as to lift the overflow pipe to the top of the tank. During this time the pinion is held out of gear as it will be impossible to wind against the water wheel. The oil lever is examined, and it will be noticed that the screwed spindle, "N," is hollow. When the screw is at the top of the tank, it is filled with oil to the top of the spindle by pouring oil down the hollow shaft. In starting the plant to work a definite number of pounds of lime and soda per inch deep in the re-agent tank is determined upon. The lime and soda are weighed and placed in the lime-slaking box, and sufficient water added to dissolve the soda and make a thin limewash, which is passed through the strainer, down into the re-agent supply tank, and the latter is filled to the necessary level with water, to produce the standard solution. The overflow pipe is then lowered until the re-agent is just commencing to overflow, when the water is turned on again and the plant is put into ordinary work.

The bottoms and bits of lime which pass into the re-agent with the charge

DETAIL OF AUTOMATIC GEAR.

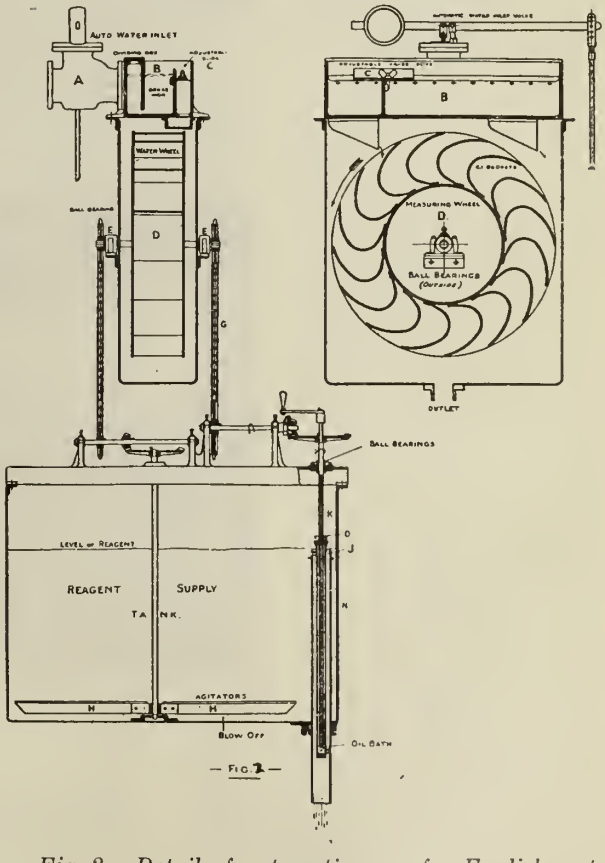

Fig. 2.—Detail of automatic gear for English water softener.

are not allowed to remain in the supply tank indefinitely. This is emptied and swilled out at frequent periods. Particular care is taken that any accumulation around the rising and falling pipe is removed. The gland in the bottom of

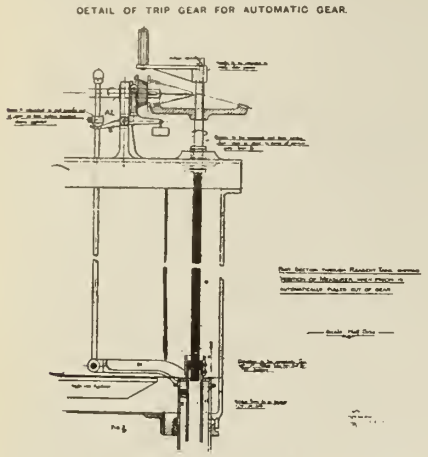

Fig. 3.—Detail of trip gear for English water softener.

the tank through which this pipe works also receives attention.

In working the plant a constant feed is maintained so far as is possible. The re-agents are carefully added and this is done whenever necessary. Frequently water softeners are very badly neglected and allowed to run sometimes for hours, and even days together without any re-agents being added to them. Another very common fault is to tip re-agents in in indiscriminate quantities. They should be accurately weighed and great care should be exercised in doing this.

In testing the hardness of the water the apparatus required is a 70 c.c. pipette or measure, 2 burettes to hold about 25 c.c.'s, an 8 oz. stoppered bottle, a white dish to hold not less than 150 c.c., and a small glass stirring rod. The re-agents required are Clarke's soap solution, decinormal sulphuric acid, and small bottles of silver nitrate and methyl orange. The water to be examined should be quite clear. If it is not it should be passed through an ordinary filter made from blotting paper in a glass funnel. Assuming the test to be of the softened water from the plant, three tests are required. To a few drops of the water on a white tile one drop of silver nitrate solution is added. There will always be a precipitate formed, but if it is white it will intimate that there is sufficient lime being used. If it is the palest tinge of yellow it will intimate that the quantity of lime being used is correct; if it is deep yellow or brown, too much lime is being used. In testing it is pointed out that to a fresh sample of 70 c.c. of water in an 8 oz. bottle it is necessary to add solution to a little at a time and shake vigorously after each addition until a permanent lather is formed. If 6 c.c.'s of soap solution will produce the lather, the water will be softened to 5 degrees. Clarke (i.e., it is always 1 degree softer than indicated by the soap itself). If a smaller quantity of soap is required the water is softened below this degree. If a larger quantity of soap is required the water is imperfectly softened and more re-agent will be required. The lather should hold for a considerable time when the bottle is at rest. If it disappears in two or three minutes, it is not permanent and more soap solution should be used. Another 70 c.c. of water should be filtered through a paper filter and run into a white dish. One drop of methyl orange should be added and decinormal sulphuric acid added a drop or two at a time until the sample just commences to turn pink. The number of c.c.'s of acid used should be noted. This should be multiplied by 5 and the result is the total alkalinity of the water in grains per gallon. This should not be much in excess of the hardness indicated by the soap test. If it is, re-agent, usually soda, is being added in excess and consequently wasted.

In the accompanying illustrations, Figs. 4, 5 and 6, may be seen several

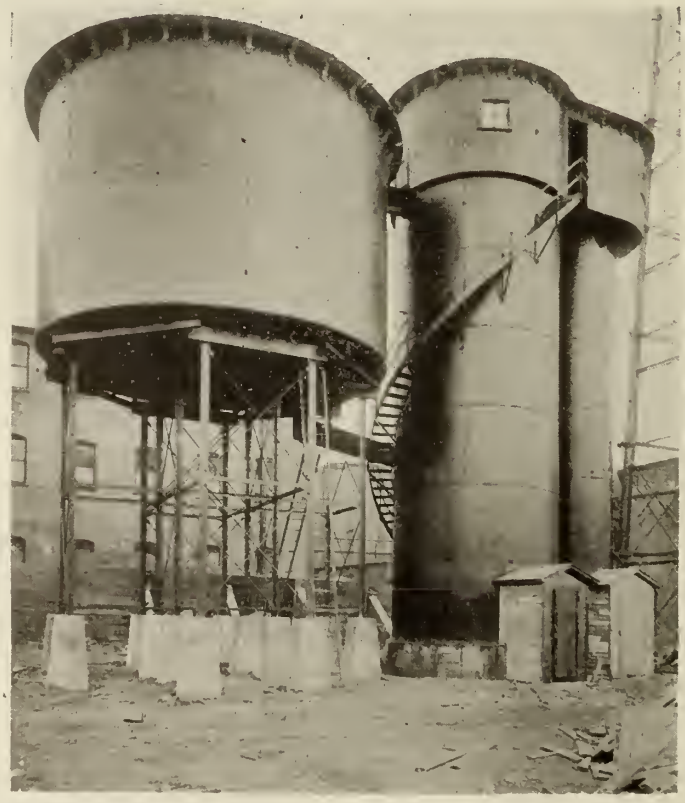

Fig. 4.—12,000 gallons per hour "Eureka" water softener working automatically in connection with a 50,000-gallon storage tank.

American water softeners of the Eureka type, developed at Mishawaka, Ind. The photograph, Fig. 4, shows a large water softener of a capacity of 12,000 gallons per hour, working automatically in conjunction with a 50,000 gallon steel

Fig. 6.—6,000 gallon per hour Eureka water softener treating water for the Lockport Paper Co.

storage tank of the Felters Co., of Lestershire, N.Y.

Two smaller American water softeners, of 3,000 gallons and 6,000 gallons per hour, may be noted in photographs, Figs. 5 and 6, the former being used for treating canal water for the Lockport Paper Co., at Lockport, N.Y., and the latter at the Lehigh Valley Silk Mills, at South Bethlehem, Pa.

The American automatic water softener and purifier is arranged so that the water may be supplied to the inlet valve in the tank either by pressure or gravity. A constant head is maintained in this tank, and the weight of the water falling on the wheel furnishes all the power required to actuate the plant. A portion of the raw water is diverted from the tank to a saturator where a clear lime solution of constant strength is manufactured. In this method none of the impurities in the lime come in contact with the water to be treated, thus there are no lime particles to go over into the piping and boilers. The alkalinity of the purified supply is practically nil so that there is not only no danger of foaming in the boilers, but the water is eminently suitable for all kinds of high-class work such as in laundries, wool-scouring, dyeing, etc.

There are provided a series of spiral plates to accelerate the precipitation of the impurities as the water travels up

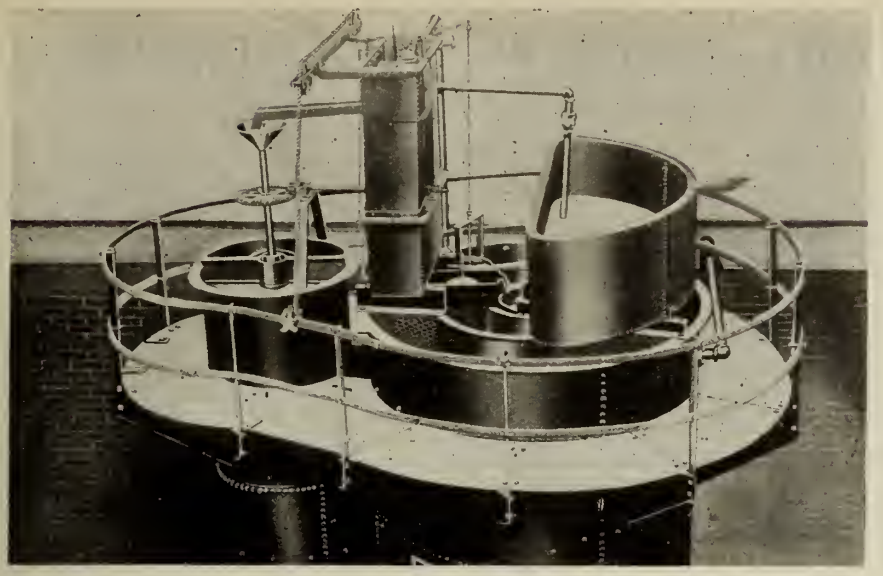

Fig. 5.—Details of mechanism of 3,000-gallon water softener.

wards after the chemical reaction has occurred. The sludge deposited on these plates gravitates into the cone, from whence it is flushed to the sewer by simply opening valve for a few seconds daily. After leaving the spiral accelerators the water passes through a wood fibre filter into a reservoir, from which point it is drawn off for use, all scale-forming matter and mud having been removed. The machine starts and stops automatically as water is required and will supply any quantity up to the rated capacity. The only attention necessary is about 20 minutes daily, which can be given by the engineer or other responsible employee without interference with his regular duties. It is never necessary for any purpose whatsoever to enter the machine.

In considering the water question, it will be stated that in converting water into steam there is, under the most favorable conditions, a great waste of heat energy. To minimize this loss has been the aim of mechanical men and inventors ever since the adoption of steam as a motive power. Heaters, stokers, economizers, pipe coverings, all tend to conserve the energy produced by combustion and to convert it into a potent factor. Manufacturers recognize these accessories as modern developments in steam engineering and consider them good investments.

Even at this age of advanced economies, when every department is closely scrutinized by experts to discover leaks and methods devised to lessen the cost of manufacture, it is marvellous that until the present day the very essence of economical steam generators, a non-scaleforming feed water should have escaped scientific treatment. Practically all natural waters are impregnated, to a greater or lesser extent, with soluble metallic salts, which tenaciously attach themselves to the boiler tubes and shell as the water is evaporated into steam, thus forming a cement coating that not only persistently resists removal but is also a non-conductor of heat. The extent of this non-conductivity is better appreciated when it is understood that most feed water contain (in addition to other solid matter) considerable quantities of magnesia, which is extensively employed in pipe coverings to prevent the transmission of heat.

In many cases, after poison in the form of impure waters has been injected into the boiler, antidotes (boiler compounds) are administered in a vain endeavor to offset or neutralize the action of the poison. The compound cannot keep the impurities out of the boiler, and its most perfect theoretical action would only convert the solids into sludge, but it does not even do that, as engineers will testify. Aside from many of these, medicines have a baneful effect, causing leaky tubes, foaming.

Mechanical cleaners are expensive to operate, both as to power and labor required, and the more inaccessible parts of the boiler are never reached. In many plants a force of men are continually at work drilling out tubes. Exhaust steam feed heaters can remove from water only the carbonates (lime) as these are held in solution by carbonic acid gas, which is expelled by ordinary boiling at atmospheric pressure, and the carbonates, being thus released, are partially precipitated in the heater. The sulphates, however, which form the hardest kind of scale, are not affected in the heater, and pass on into the boiler, where they are precipitated by the high temperatures attained under pressure.

It is maintained that the utilization of waste steam for heating feed water is of vast economic value, but the supplying of non scale-bearing water to the boiler is of much greater importance. The manufacturer is eternally studying how to reduce operating expenses, and scrutinizes with microscopic care every department in his factory. He is now tackling the power centre and must recognize that economy and efficiency in the boiler room must be be of the most approved design.

McFALL ALLEGATIONS

(Continued from page 15)

fare on the trusts in the United States contrasts with the lethargy of the Canadian authorities. The abuses in Canada are relatively as great, but our Governments are afraid of Big Business.

Dr. McFall says that infractions of the law have been disclosed in the matter of articles of clothing and some of the most important foodstuffs. If the laws have been broken, why are the lawbreakers not brought to trial? People have a vivid recollection of the orgy of profiteering in the early stages of the war. They recall the disclosures of "that man O'Connor," who preceded Dr. McFall as an official sleuth, but was withdrawn because he was too hot on the trail of powerful interests. The evidence before the Cost of Living Committee of Parliament is also fresh in their minds. But they have yet to see a profiteer punished, or a combine dissolved."

Says McFall is Right

Under the heading "McFall is Right," the Hamilton Spectator says:

"Local retail plumbers state that they are perfectly aware of the fact that there is an elaborate combination which is responsible for the ever-increasing cost of plumbing and sanitary supplies, as asserted by Dr. McFall, the Cost of Living Commissioner, in a statement made public yesterday. Dr. McFall denounced the activities of this combine at a time when the excessive prices of building materials were working a hardship, as pernicious.

"'Of course, it's not the retailers he is getting at,' said Norman Clark; 'but it is common knowledge that the manufacturing and jobbing end is governed by a combine—just the same kind of combine as exists in all lines of manufacture. It is common knowledge that all manufacturers are protected in this way. As for the jobbers, they are out to make a living, the same as the rest of us.'"

A Toronto View

The Mail and Empire, Toronto, says editorially: "If what the Cost of Living Commissioner says about a plumbing combine is true, the new Court of Commerce has work piling up for it. The evidence that the Commissioner has collected in this and other cases should be made available to the court as soon as it is ready for business. If high prices are evidence, there has been a plumbing combine for many years."

BUSINESS FOR FUN OR PROFIT

(Continued from page 16)

homes and better health, and that is one national standpoint we can work for. The plumbers should take a leading part in matters of this kind. People expect them to know all about it. Take the mere question of bathrooms, for an example. Far too many people in planning their homes, stick the bathroom away in some dark corner or any old place where they think it will be out of the way. Many of the bathrooms in houses to-day are a positive disgrace. The bathroom should be one of the very best rooms in the house, bright and clean and attractive. It is a simple matter to make it so and not expensive. Somebody must take the lead in improving matters and who should do it but the plumbers? It is their game and if they would go after it it means a lot of good business for them. There are any number of installations that are now out of date and that should be replaced. All these things are matters for the plumbers to work together on and there are many others that would naturally suggest themselves.

(Continued on page 27)

Burning Steam Sizes of Anthracite

WITH OR WITHOUT ADMIXTURE OF SOFT COAL

Based on an article by William P. Frey, Fuel Engineer.

One of the most effective means of promoting fuel economy consists, frequently, in the substitution of a cheaper for a more expensive fuel. This bulletin describes briefly what modifications of furnace design and operation may be made in order to insure efficiency in burning mixtures of anthracite and soft coal in furnaces designed for one or the other of these two varieties of coal.

This is the third in the series of Engineering Bulletins issued by the United States Fuel Administration in collaboration with the Bureau of Mines, Department of the Interior. This series is receiving very favorable comment. In the next series the first instalment on "Saving Fuel in Heating a House," will appear. This article covers this phase of the question thoroughly and should appeal to every heating engineer.—EDITOR'S NOTE.

THIS bulletin describes, in the simplest terms, how to burn steam-size anthracite, or mixtures of this, with soft coal so as to get the most steam from the least fuel.

While the essential difference between the burning of anthracite and the burning of soft coal consists, in the case of anthracite in the use of a somewhat smaller volume of air per pound of fuel and a stronger draft, slight alterations in the method of firing and in the furnace, designed for one or the other fuel, are also necessary in case mixtures of soft and anthracite coal are used.

Just what volume of air and what strength of draft must be used to burn any particular fuel in any given furnace can only be determined by actual trial and, being once determined, must be maintained as long as the particular fuel is used.

Sizes of Anthracite Used For Steam Generation

There are four of these sizes, commonly known as "buckwheat" and generally classified as follows:

TABLE 1

Size of Coal.	Size of round mesh over which screened Inch	Average heat values per pound of coal B.T.U.
No. 1 Buckwheat	5/16	12,250
No. 2 Buckwheat (rice)	3/16	12,000
No. 3 Buckwheat (barley)	3/32	11,500
No. 4 Buckwheat	3/64	11,000
No. 5 Buckwheat	3/64	10,000

The curves (Fig. 1) give the approximate British thermal units per pound of anthracite of known ash content.

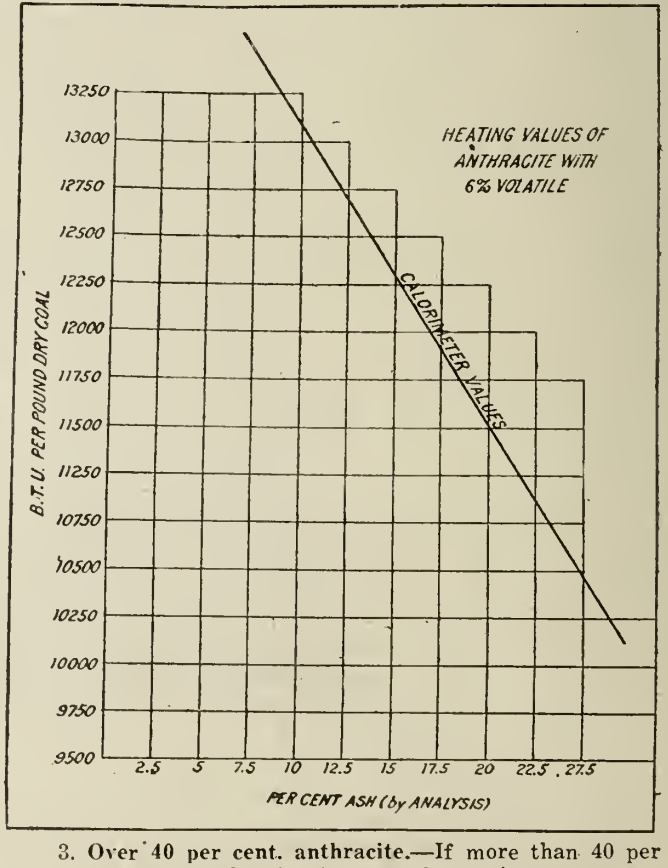
A mixture of these sizes known to the trade as "boiler fuel" is sometimes used. No. 3 of good quality can be and is burned with excellent efficiency under proper hand-fired conditions. No. 4 is not so suitable for hand-fired furnaces.

Furnace Equipment Required For Burning Various Percentages of Steam Anthracite and Soft Coal

1. **Twenty per cent. anthracite.**—With ordinary furnace equipment designed for soft coal, up to 20 per cent. "buckwheat" or fine sizes of anthracite may ordinarily be burned without any change of equipment or firing practice. Owing to the fact that most boiler furnaces are operated below their normal capacity on soft coal, the above percentage of anthracite can be added without decreasing the capacity of horsepower output of the boiler plant.

2. **Twenty to forty per cent. anthracite.**—If a greater percentage of anthracite screenings, 20 to 40 per cent., say, is mixed with the soft coal, it will be necessary, in order to obtain full boiler horsepower, to produce air pressure under the grate. One of the simplest and best methods of obtaining the necessary pressure of one-half to 2 inches in the ash pit, is to install a blower of the turbine type for each boiler. Such a blower may be installed very easily and quickly since it may be fitted into the side wall of the ash pit. It should not use over 3 per cent. of the steam developed by the boiler when operating at full capacity. The cost of a steam turbine blower is approximately $200 for a boiler of 150 horsepower or more.

A steam jet blower may be used instead of the steam turbine blower above mentioned. This is cheaper, and the more economical types of steam jet blowers are quite satisfactory in producing the desired results. In purchasing a steam jet blower it is most important to investigate its steam consumption. The best type of these blowers will operate on about the same steam as that required by the turbine blower, whereas the poorer ones may take from two to five times that amount of steam, in which case they should not be installed. The cost of the steam jet blower should be from $50 to $75 or more for a single boiler of 150 horsepower and up. The turbine blower, or the steam jet blower, should be controlled by means of an automatic draft regulator of the "partial throw" type, in order to obtain efficient results, although fair results are obtainable by hand regulation.



3. **Over 40 per cent. anthracite.**—If more than 40 per cent. of small anthracite is used the equipment recommended is forced draft plus "buckwheat" grates and a good automatic draft regulator.

The grates should vary in the matter of diameter of air openings, draft area, and total surface in accordance with the specific fuels used and their proportions in the mixture.

Some plants are able to run efficiently on 100 per cent. of a good quality of fine anthracite if properly equipped for this purpose. The table given below furnishes additional data as to mixtures of various sizes anthracite and soft coal that may be burned under different conditions of draft.

TABLE 2.
Proportion of Soft and Hard Coal to be Used.
(For hand firing.)

		Soft. Per cent.	Hard. Per cent.
No. 1 Buck	(Forced draft	30	70
	(Natural draft	40	60
No. 2 Buck	(Forced draft	40	60
	(Natural draft	50	50
No. 3 Buck	(Forced draft	50	50
	(Natural draft	65	35
No. 4 Buck	(Forced draft	65	35
	(Natural draft	80	20

Mixing Soft With Anthracite Coal

Proper mixing is most essential. It can be done either by delivering in a wheelbarrow alternate and predetermined portions of the two kinds of coal, and then mixing by not less than two "turnovers" with a shovel before dumping in front of the furnace, or, on a larger scale, by a similar delivery of carload lots to the coal tipple.

Grates

Grates for the fine sizes of anthracite have small air openings which vary in form from round holes, as in the pin-hole grates, to elliptical holes and straight slots, the width of slot or the diameter of the hole varying from ⅛ of an inch up to 5-16 inch. The percentage of draft area through the grate would vary from 3 to 30 per cent.

Stationary, shaking, or dumping types of grates for burning the fine sizes of anthracite may be obtained. The dumping and shaking types facilitate the cleaning of fire with less drop in steam pressure, which is an important feature. A large ash pit is advisable so that fires may be cleaned by dumping or shaking grates, without the necessity of opening the ash-pit doors more than once in 24 hours. The ash-pit doors with forced draft are, of course, sealed to make them air-tight, and, therefore, the less often they have to be opened the better. Or still better, separate the undergrate air chamber from the ash pit and install a dead plate in front of grates to dump ashes.

Owing to the slower rate of combustion, the grate area for small sized anthracite is made larger than for bituminous coal in order to develop the same horsepower, except in cases where the soft coal boiler already has an unnecessarily large grate, which is ordinarily the case. The relation of the grate area to the heating surface is also of importance. This relation is shown in Table 3.

TABLE 3.
The Relation of Grate Area to Heating Surface.

For No. 1 buckwheat, 1 to 40.	For No. 3 buckwheat, 1 to 30.
For No. 2 buckwheat, 1 to 35.	For No. 4 buckwheat, 1 to 25.

The fuel bed should not be less than 6 feet from any point of the boiler-heating surface.

There should be from 2.5 to 3 cubic feet of combustion space to 1 square foot of grate area.

Another detail of furnace construction which is important is that of the division of the heating surface into the so-called passes.

As the furnace gases in passing from the fuel bed to the stack are continuously cooling, their volume is consequently decreasing continuously so that the area of the passes should be diminished in the same proportion to cause a uniform flow. The relation between the area of the various passes should be so as to include total boiler-heating surface about as follows: First pass, about 43 per cent. of total heating surface; second pass, about 32 per cent. of total heating surface: third pass, about 25 per cent. of total heating surface.

As the width of the gas passage is uniform, the necessary reduction in the volume of the passes is made by reducing the thickness of the gas stream about as follows: In first pass, from 100 to 68; in second pass, from 68 to 52; in third pass, from 52 to 50.

Firing

Anthracite coal must be fired evenly in small quantities, and at frequent intervals, the intervals of cleaning depending upon the nature of the coal, rate of combustion, and the skill in spreading thinly and evenly.

The leveling bar must be used sparingly, and only for the purpose of keeping the fuel bed level and to keep the thin spots covered up.

As a rule it is bad practice to let a fuel bed of No. 1 "buckwheat" grow thicker than 8 inches and No. 2 "buckwheat" should not go over 10 inches, preferably not over 6 or 8 inches, respectively.

Where an automatic damper regulator is installed, it is important that coal be supplied to the fire in proportion to the air supply; that is to say, as the blower speeds up the firing should also be speeded up and as the blower slows down the rate of firing should be decreased.

Efficiency—The Means of Promoting It

With a good grade of steam anthracite, it is possible to obtain almost as high an efficiency as with bituminous, provided the equipment and operation of the plant are suitable, and very frequently, moreover, large savings in cost of fuel to generate steam are effected by substituting steam sizes of anthracite for the more expensive bituminous coal. The best results cannot be obtained unless the changes indicated are made so that the furnace becomes efficient for the anthracite. It is extremely important in burning the steam sizes of anthracite to provide against a large excess of air to the fire. The ideal way to burn this fuel is to use undergrate draft and to throttle the uptake damper to a point where the volume of air will be reduced to a minimum for proper combustion. The necessary pressure for penetrating the bed of fuel is supplied by means of the blower, and the volume is regulated by means of the uptake damper. With this equipment an automatic regulator should be connected for the purpose of controlling the draft in accordance with steam requirements, all of which is ordinary standard equipment which may be obtained for the purpose.

It must be emphasized that the greatest loss in burning the fine anthracite is on account of too much air for the fire, and the principal way to keep this air down to a proper minimum is by using the uptake damper, throttled as much as possible so as to produce the highest Co_2 without the formation of unburned gases. Loss from this source is much less probable than in the case of soft coal, with its high volatile content, so that with good installations, the CO_2 may be run at 15 or 16 per cent. under correct supervision and regulation. This percentage of carbon dioxide indicates that practically no more saving can be made by closing the damper still further.

The boiler setting, of course, should be made tight and kept tight. The draft or "suction" over the fire should be kept as low as possible; under ordinary conditions this should run between 0.10 and 0.25 of an inch, water gauge.

Summary

A boiler plant, designed for soft coal and operating on natural draft is capable of using 20 per cent. of steam sizes of anthracite mixed with soft coal without material loss in efficiency, and without change of equipment, provided, sufficient grate surface is available, and this is usually the case. Still higher percentages of fine anthracite may be mixed with the bituminous, provided, certain changes are made in the furnace equipment.

Between 20 and 40 per cent. of small size anthracite may be burned with bituminous, by installing a blower in order to create the necessary draft pressure in the ash pit to penetrate the bed of fuel.

EDITORIAL COMMENT

GET AT THE FACTS

AS a result of Dr. McFall's statements, many items have appeared in the daily press, in both the editorial and news columns, which not only reflect on the trade but are harmful. What affects one branch of the business has a direct effect on all, especially in the minds of the general public. To the average man in the street, manufacturer, plumber and jobber, all mean the same thing. In his statement, Dr. McFall singles out the jobbers. The great mass of the public who read Dr. McFall's remarks do not know what a jobber is. To such people, and there are thousands of them, Dr. McFall's remarks simply mean that the plumbers are a lot of pirates and profiteers. Dr. McFall did not say this at all, but accuses the plumbers of being the victims of the jobbers. The wrong impression that gets abroad regarding the man in the trade is unfortunately heightened by the fact that the plumber has been made a joke of for a long time by certain funny papers and other papers. This is unfortunate because the plumber does not deserve it and also because he has, in the great majority of cases, taken all such unnecessary remarks without defending himself. If a man called a plumber a robber, the plumber usually let it go at that without coming back at the party. In connection with the statements of Dr. McFall, it is important that all the facts should be obtained and made public. As will be seen on another page in this issue, Frank R. Maxwell, president of the Dominion Association of Domestic Sanitary and Heating Engineers, speaking on behalf of the men in the trade, declares frankly that the installers are not getting the money and invites an inspection of his books at any time. Others in the trade take the same stand and it is perhaps significant that all are willing not only to throw their books open to anyone interested but offer to assist the Dominion authorities in clearing up profiteering, if any exists. This attitude of the men in the trade indicates a new spirit and one which should be encouraged. It may be that in the future when a plumber is charged with being a robber that he will come right back and either make the accuser prove something or keep quiet. The plumber has a distinct and very useful work to perform. His work is largely responsible for not only the comfort but the good health of the home. Considered either individually or nationally, these are of real importance. Without the plumber the larger centres of population would quickly be ravaged by all kinds of diseases and the average home would return to conditions that existed a hundred years ago. If the men in the trade are, as Dr. McFall alleges, being made the victims of the jobbers, the whole country should know it. This is only fair to the trade. If, on the other hand, there is nothing in the charges of Dr. McFall, a gross injustice has been done the jobbers and they should be set right in the eyes of the public. All the facts should be ascertained and made public.

HOUSING DIFFICULTIES

NOW that many of the Ontario municipalities have called for tenders under the Housing Commission's plans some interesting developments are taking place. In a great number of cases it is found that the tenders are high. Many of them are so high that the local housing committees are endeavoring to get local contractors and in some cases outside contractors to figure. Others are trying to revise their plans. This whole situation is interesting in that it reflects the advances that have taken place in prices. When many of these housing plans were formulated, not long after the armistice was signed, there was a general impression in the minds of the public that prices were going to come down. Many of the figures in connection with the plans were based on prices prevailing early in the year. Six months has seen a lot of changes in prices but as far as building materials is concerned they have been upward and not downward. This is one reason why the housing committees are getting figures that are so far in excess of their estimates. Not only have commodities such as lumber, brick, hardware, glass, etc., advanced, but wages are higher and working days shorter. There are new conditions also which were not considered when the plans and estimates for the dwellings were secured. It is questionable if the efforts of the committees to lessen the cost of the dwellings is advisable and hardwaremen might do well to use all their influence against any move of this kind. As the houses stand they were designed to meet reasonable demands at the lowest possible cost. Any further paring is likely to result not only in really "cheap" houses being erected, but in the building of dwellings which in five years or even

less will look just as cheap as they are and will be unsatisfactory to their owners and unsaleable. According to one report in a daily paper regarding some dwellings which were gone ahead with, "The cheap design and the cheap materials used seem to be the one great cause of comment. One returned veteran points out that the sides are being stained only where the specifications call for two coats of linseed oil." This is merely a comment before the buildings are finished. What will be said after the houses have faced the wear and tear of five summers and winters? The trade can do a lot to check troubles of this kind by standing out now for the erection of good homes and no skimping of materials to slightly lessen the cost.

CONCERNING INSURANCE

HAVE you enough insurance on your store? This does not mean that SANITARY ENGINEER is trying to sell insurance, but the question is prompted by what those in touch with many retail merchants tell us about the small policies held by many firms. Many serious losses are constantly occurring because merchants do not adequately protect themselves. You have a good store and a good stock and a business that has taken time to establish. You probably reckoned the replacement cost when you put on the insurance and acted accordingly. But have you ever stopped to think what your replacement cost would be now? The buying price of many lines of supplies has greatly increased. Has your insurance kept pace? You may say you are willing to take a chance and be covered on your initial investment. Well that is your own affair, but there is a real situation here that cannot be overlooked. A stock that has been in only a short time could not be replaced now for a good deal more than it cost. Many lines are still advancing. You can figure out everything for yourself and it may surprise you to find out how much the difference is. The point is, if a fire should wipe out your store to-night, would your insurance policies protect you? This is a point that should not be overlooked.

HENRY FORD IN COURT

IN a large number of the daily papers there have appeared editorial comments, some at considerable length, concerning what Henry Ford has said and admitted in the witness box in his suit against the Chicago *Tribune*. No doubt Ford has told enough to make it certain that he is not a keen student of political science nor historical matters.

These articles for the most part are concerned in taking a fall out of Henry Ford, largely because he admitted he did not know at times what he was talking about.

Are there never occasions when the same daily papers discuss subjects in a way well calculated to make the informed reader see they do not know what they are talking about?

Many Canadian editors discuss the problems of the British navy, and many of them have never sniffed salt water.

They pile into long-distance discussions at times of semi-technical matters in a way that shows how barren they are of even the fundamentals of their subject.

Why not take Henry Ford in his own back yard, namely, as a manufacturer and an organizing genius?

Why not take him as an employer who long ago put in a $5 per day wage, then a $6 and $7?

It is somewhat of a knot-hole vision to size up a successful man entirely on a matter and in a field where he is admittedly not a specialist.

THE OUTGOING ALIENS

FEW people, according to manufacturers, realize the effects that the steady stream of emigration from this country back to Europe is going to have on production. Ever since it became possible for these men to get boats home they have been leaving in hundreds. Because little was known about them or the work they did no attention was paid to them in ordinary times. Now, however, with business resuming normal conditions and factories endeavoring to speed production to supply markets that are bare the alien is getting conspicuous by his absence. A large manufacturer of sanitary appliances stated to SANITARY ENGINEER that he did not know what he was going to do to get unskilled labor. Scores of the men who have gone home to visit relatives from whom they have not heard for five years, did all kinds of hard, heavy jobs that Canadian workmen will not touch no matter what wages they are offered. It is quite true that they were unskilled, but even so, their work was very necessary. Not a few firms requiring manual labor are looking over their thinned ranks and wondering just how they are going to handle the orders that are coming in with every mail. From a sanitary engineer's standpoint the situation indicates that production may be greatly delayed and that orders are likely to remain unfulfilled because manufacturers will not have the unskilled help to get the work out as fast as usual. No trades will be hit harder, it is stated, than the metal trades, because of the large amount of heavy work involved. The exodus of aliens from the United States is hitting Canada in another way also. Because among the thousands who have left, there were more than 40,000 coal miners, the output of coal is many millions of tons short. This is a situation also that is causing manufacturers who have not been able to get any large supplies in food for thought. All these things affect all business, and especially the plumbing business.

Toronto Society Picnic at Island

Tenth Annual Outing Was Attended by More Than 300 and Was a Splendid Success in Every Way—Sports Keenly Contested—Two Fast Ball Games Feature of Program

ISLAND Park has seen some merry crowds, but seldom has more real fun been packed into an afternoon than was enjoyed at the tenth annual picnic of the Toronto Sanitary and Heating Engineers. It was the first outing held under the auspices of the Toronto organization since 1916, on account of the war. The Toronto boys turned out en masse and with them came their wives and families. In all there were over 300 on the picnic grounds at Island Park when Frank R. Maxwell, president of the Dominion Association, who was made official announcer as soon as he arrived, started the races.

Weather Was Ideal

The weather was ideal for the picnic and everyone had the best kind of a time. It was a real old-time, get-together sort of affair, where old friends, who had not seen each other for a year or more, renewed acquaintance and ran races against each other, and played ball and enjoyed life generally, and forgot for the time that there was any such thing in the world as business. Among those at the Island were several of the "boys" who heard the call of the Empire and have only been home a short time after serving "over there." Needless to say that these were given an especially warm welcome.

No Race Suicide

It was manifest very early in the proceedings that there is no race suicide among the sanitary and heating engineers. As healthy and as husky a lot of boys and girls were on hand for the opening of the races as can be found anywhere, and maybe they didn't have all the fun that a crowd of carefree youngsters out for a good time can have. They raced around, and played ball, and ate ice cream cones and peanuts and candy as only children can. However, it was not only the young folks who had a good time. There was not a dull moment for either young or old during the whole afternoon and the older folks enjoyed themselves in their own way quite as much as anybody.

The Sports Program

The sports were started by a race for girls six years old and under. There were any number of contestants, some shy, some eager, and some wondering just what it was all about, but they all ran and it was worth while going over to the Island to see how happy they were when each was presented with a doll. Then came a race for the boys six and under, and every lad on the grounds who was eligible contested. They ran just as fast as their small legs would carry them and enjoyed the fun immensely. They enjoyed also the presentation which followed, each little fellow receiving a pail and shovel with which he could play in the sand.

Some More Races.

Girls of eight and under raced next, and just how fast they went may be gathered from the picture on the following page. They went so fast that the camera man could not catch them distinctly. Each girl was presented with a rubber ball and bat as a prize. Then came a race for boys under eight, and each lad was given a baseball and bat.

The winners in the other races were as follows:

Girls' race, 10 and under—1, Evelyn Menzies; 2, Beatrice Williams; 3, Marjorie Baker.
Boys, 10 and under—1, Jack Foster; 2, Jack Regan; 3, Ernest Hymers.
Girls, 12 and under—1, Beatrice Williams.
Boys, 12 and under—1, Jack Regan; 2, Howard Bell; 3, Louis Smith.
Girls, 16 and under—1, Mamie Smith; 2, Minnie Smith; 3, Rose Goodman.
Boys, 16 and under—1, Christie Menzies; 2, Wilfred Menzies; 3, Clarence Imber.
Single ladies' race—1, Mamie Smith; 2, Ruth Davis; 3, Minnie Smith.

Some Classy Baseball

Not in some time have spectators at the Island seen two classier games of ball than were played. It was freely remarked in the crowd that cheered the contestants that any time Manager Gibson of the Leafs wants to bolster up his team to win the pennant he can find "real" material among the sanitary engineers. The practices they have been having all summer stood some of the players in good stead, and they ran bases, batted and fielded like old-timers. In the first game between the sanitary engineers and representatives of the wholesalers, the latter nine did not have a look in, the sanitary engineers romping away with the victory by 19 to 4. Booth, who was in the box for the sanitary engineers, scored five runs himself, and Byrne, who did the catching, crossed the plate three times.

The teams lined up as follows: Sanitary Engineers: Pitcher, Booth; catcher, E. Byrne; first, J. Little; second, Griffith; shortstop, E. Winpenny; third, Purdy; right, H. Cohen; centre, E. Ramsay; left, G. Lynch.

Wholesalers: Pitchers, Glendenning and Darling; catcher, Staneland; first, G. Darling; second, J. Young; shortstop, Reading; third, J. Doughty; right, Horgood; centre, Sutheriand; left. G. Qua.

The Second Game

The second game was a much more even contest and took place between a team composed of sanitary engineers and representatives of the manufacturers. At the end of five strenuous innings both teams had had enough, and as each had scored nine runs it was decided to call it a draw. The teams lined up as follows:

Sanitary Engineers: Pitcher, Louis Palter; catcher, Walter Benson; Baker, Carburry, Le Groh, Warburton, Hall, Ruddick, McMinn, Weinraub.

Manufacturers: E. Quinn, pitcher; E. Cook, catcher; Addy, Mitchell, Cole, Stinson, McDonell, Phillips. Frank Maxwell, who umpired, gave general satisfaction.

Following the ball games supper was served.

ON THE SIDE

Helped by Imagination

Officer—"You're the best fighter in the regiment. What's the secret?"

Private—"Whenever I went against the Germans I pretended that they were the customers that I used to have to take insolence from and to whom I wasn't allowed to say anything back, when I worked in the plumbing business."

Let's Hope So

Mrs. C.—I wonder where in the world the alarm clock has gone! I saw it on the mantel yesterday.

Mr. C.—It was there yesterday, but I heard it going off this morning.

Mrs. C.—Well, I hope it hasn't gone where you told it to go.

Slow Headway

Practical science makes slow headway because it has to overcome long-established habits, declares G. F. Frankland. Apropos the subject, he repeats a conversation which he overheard:

"Hey, Moike, and phwat do ye tink of these new sanitary drinkin' cups?"

"Not much, Pat. Soon and we'll have to spit on our hands wid an eye-dropper."

Effective

Fond Parent—Did you hear my daughter sing?

Returned Soldier—Yes.

Fond Parent—What did you think of her range?

Returned Soldier—I should say she ought to kill at three miles.

Mrs. Flatbush—I don't know what's the matter with my doughnuts. They always seem to be heavy.

Mr. Flatbush—Why not try making the holes in the middle larger, dear?—Yonkers "Statesman."

SNAPSHOTS TAKEN AT THE TORONTO SOCIETY'S PICNIC

1. *Ernie Quinn, representative of the Taylor-Forbes Company, Limited, scratching the base.* 2. *Finish of the race for girls 8 and under.* 3. *Boys under sixteen getting started.* 4. *The Belyea Bouncers, children of Roy Belyea.* 5. *Inspector D. Kirk enjoying an afternoon with "the boys."* 6. *The Press enjoying ice cream cones; Messrs. Parsons and Tindall of SANITARY ENGINEER, and Newsome of the "Sanitary & Heating Journal."* 7. *H. Ruddick, D.C.M., after being overseas nearly four years, proved himself a demon ball player.* 8. *George Baker, at bat, has just sent a long one to the outfield.* 9. *Girls, 8 and under, getting ready for a start in their race.*

BURNING STEAM SIZES OF ANTHRACITE

Continued from page 21

When over 40 per cent. of fine anthracite is burned, it becomes necessary or advisable to change to grates of smaller air openings, and also having smaller percentage of draft area and usually of larger total area.

With a given draft pressure or height of stack less horse-power will be developed from a boiler which substitutes 100 per cent. anthracite for bituminous, unless a blower is installed and the grates changed to suit the new conditions.

The steam sizes of anthracite burn more slowly than bituminous owing partly to the greater resistance to the passage of air through the finer fuel and partly to the very low content of volatile matter in the anthracite; consequently, in order to get the same horsepower out of the boiler, means must be provided to burn the anthracite at a sufficient rate so as to develop the same amount of heat as before with the bituminous. Owing to this slower rate of combustion of small anthracite coal, it is necessary to use a larger grate surface than with bituminous if the boilers are to be run at maximum rating, even when forced draft is applied.

The time has passed forever when efficiency in the use of fuel can be regarded as a matter of choice. You must either save more fuel which you can do easily, or you must continue to lose more money which you will do inevitably and needlessly. You can not pick or choose between these alternatives; you must take one or the other of these ways, for there is no middle course.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

NEW FIRMS

W. N. Adair, of Wingham, Ont., has opened a plumbing and steamfitting shop at Kincardine, Ont.

NEW COMPANIES

London Clay Products Company, Limited, head office London, Ont., capital $50,000, plans to manufacture and deal in sewer pipe, tile and building materials.

Wolverine, Limited, capital $60,000, head office Toronto, has been granted a Provincial charter and plans to acquire the business now carried on by the Canadian Wolverine Company, Limited, manufacturers and dealers in plumbing supplies. H. G. Waterman and E. T. Needham, of Toronto, are officers of the company.

OBITUARY

The death occurred at Barrie, Ont., of James Archer, superintendent of steamfitting for the Grand Trunk from Belleville to North Bay. He was a former resident of Port Hope, Ont., where he learned his trade with the late J. W. Quinlan.

Joseph I. Ferrier, aged fifty, a resident of Toronto for thirty years and for some time engaged in the plumbing and tinsmithing business, died at his home, 881 Manning avenue, following a long illness. Besides his wife he leaves two sons, Roy and Reaford.

Thomas S. Head, aged 70, for forty-five years in the plumbing business in Toronto, died at Ste. Anne de Bellevue from the effects of a cerebral hemorrhage. He had been ill for about two months with heart trouble and went to visit recently with his brother-in-law. The funeral was held from the family residence, 516 Dundas St., to St. James' Cemetery. Besides his wife, Mr. Head leaves three sons, William and Allan of Toronto, and Thomas L., overseas. A fourth son, Charles R., was killed in France.

TRADE NOTES

Work on a new sewage disposal station to cost $50,000 will be commenced at once at Dundas, Ont., the council having awarded a contract to F. F. Fry.

Chatham, Ontario, is going to have its waterworks system inspected by the chief engineer of the Provincial Hydro-Electric Waterworks section in the near future.

Peter Shiells, of Kincardine, hardware, stoves and plumbing, is giving up plumbing and steam fitting and will devote his entire time to hardware.

TENDERS

The Quaker Oats Co., Ltd., plans the erection at Saskatoon of a new plant to cost $250,000.

Dr. T. Manning, Sarnia, Ont., is preparing plans for the erection of eight dwellings at London, Ont.

Peabody's Sales Corporation, Ltd., Walkerville, Ont., contemplates building a $500,000 addition to its plant.

J. M. Morrison, Drinkle Block, Saskatoon, will call for tenders shortly for $12,000 residence.

R. Webber, P.O. Box 11, Windsor, Ont., will let contracts for plumbing and heating for two residences costing $4,000.

T. J. Medell, 100 Albertus Ave., Toronto, will let plumbing and heating work in connection with new residence.

Wesley Ham, Fergus, Ont., wants prices on all plumbing and heating goods for three new residences he plans to erect.

Tenders will likely be called shortly for erection of technical school and addition to high school at Sault Ste. Marie, Ont.

Louis Wiles, 466 Annette St., Toronto, has foundations in for three dwellings to cost $10,000, and will let plumbing and heating work.

George Lucas, 5 Playter Crescent, Toronto, will let plumbing and heating contracts in connection with two residences, cost $6,000.

R. Muir, 115 Chester Ave., Toronto, will let plumbing and heating contracts in connection with residences being erected at a cost of $15,000.

Tenders will be received until August 12, for the erection of a public building to cost $30,000 at Indian Head, Sask., for the Dept. of Public Works.

Tenders will be received until August 8, for the erection of a nurses' home to cost $15,000 in connection with the Charlotte Englehart Memorial Hospital at Petrolea, Ont.

P. L. W. Dupre, 15 St. Lawrence Boulevard, Montreal, is preparing plans and will call for tenders shortly for the erection of an apartment.

The General Motors Co., of Canada, Ltd., contemplates erecting fifteen residences at Oshawa, Ont., R. S. McLaughlin, Oshawa, president.

H. C. McDonald, Timmins, Ont., secretary of the Housing Commission, wants prices on all plumbing and heating goods for dwellings it is planned to erect.

John M. Lyle, 19 Avondale Road, Toronto, is preparing plans and tenders will be called shortly for a new bank to cost $50 000, at Preston, Ont., for the Bank of Toronto.

Tenders will be received until August 8, by the Dominion Canners, Aylmer, Ont., for all work in connection with a process room, engine and boiler house for a new cannery being erected at Strathroy, Ont., at a cost of $125,000.

Greene, Swift & Co., London, Ont., will call for tenders shortly for the erection of a reinforced concrete addition to their factory, also engine and boiler house to cost $30,000.

S. J. Wilson, secretary of the School Commissioners, Halifax, N.S., will receive tenders until August 30, for all work in connection with four new schools to be erected.

Coon & Son, Excelsior Life Bldg., Toronto, are preparing plans and will call for tenders for new technical school at Sarnia, Ont., to cost $250,000.

Tenders are open for all work in connection with the erection of a $50,000 creamery for the Saskatchewan Co-operative Creameries, Ltd., at Melfort, Saskatchewan.

WILL CONTAIN PUBLIC LAVATORY

A feature of a free air station that is being erected by the Imperial Oil Company at the corner of Bloor and Dundas streets, Toronto, at a cost of $20,000, will be lavatory accommodation for the public. The building will encroach eight feet on civic property and this was the cause of some discussion in the council when the question of granting a permit came up. It was finally decided that permission be granted on condition that the company agree to remove the encroachment on a month's notice, guarantee the city against damages and pay a rental for the property.

A CORRECTION

David K. Trotter, secretary of the Master Plumbers' Association of Montreal and vicinity, was inaccurately designated in the July 1 issue of SANITARY ENGINEER as secretary of Local Union No. 144, Montreal. This error inadvertently appeared on page 26 in connection with a report of a letter Mr. Trotter had written to the "Gazette."

A. S. OF S. E. ANNUAL MEETING

The annual convention of the American Society of Sanitary Engineering will be held at the Hotel Winton, Cleveland, Ohio, on September 15, 16 and 17. Among the matters to be taken up will be the establishment of a national code on sanitary installation. A number of papers on practical subjects will also be given.

NEW SEWAGE PLANT FOR BORDER CITIES

After several months' work the contractors have just finished construction of an entire new sewage syste mconnecting Ford, Walkerville and Windsor, and which will eliminate the dumping of the sewage into the river above the Windsor Water Works intake. The work cost $120,000 and was done by local men.

MAY BUILD NEW RESERVOIR

The authorities at St. Thomas, Ont., are preparing to solve the water shortage that exists there and have two plans under consideration. One is the construction of a new reservoir at a cost of $50,000, and the other is a storage dam, which would cost $85,000.

SAILS FOR ENGLAND

W. H. Cunningham, manager W. H. Cunningham & Co., 183 Church St., Toronto, has sailed for England on the Corsican and will visit England and Scotland for the purpose of conferring with firms who are represented in Canada by W. H. Cunningham & Company. During Mr. Cunningham's absence the business will be in charge of Mr. W. S. Hill.

RESCUES LITTLE CHILD FROM BURNING HOME

Crawling on his hands and knees into the burning home of Mrs. Burchell at Galt, Ont., B. Bennett, of the plumbing firm of Bennett & Scott, rescued her youngest child. Mrs. Burchell, whose husband is overseas, goes out to work during the day and left her three little ones at home. In some way the frame dwelling got on fire. The older children got out all right, but the youngest was in bed. Mr. Bennett, who was nearby when the fire was noticed, made his way through the house, which was filled with smoke and flames, and brought the little one to safety. Not only this, but he started a fund for Mrs. Burchell, who lost everything, as her home was completely destroyed.

BUSINESS FOR FUN OR PROFIT

(Continued from page 19)

"The trouble with too many of the plumbers," Mr. Coppins said in conclusion, "is that they can't get away from plumbing. They can't see a thing but plumbing, and they work away for years, and work hard, too, and make little or no money. What they need is a broader outlook and especially a broader outlook in regard to business. There is good money to be made by combining plumbing with merchandising, and one helps the other. By getting into merchandising they will become better business men, because they simply cannot help it and stay in business. If they are handling stock they have to know what goods they need, what they sold, etc., and keep some sort of records of turnover and expenses. A lot of the plumbers to-day have no idea at all about business methods, and they will never make the money they should make and can make until they get this business idea."

CATALOGUES and BOOKLETS

Catalogue No. 3, issued by the Josam Manufacturing Co., of Cleveland, Ohio, contains twenty-four pages, attractively illustrated, listing the various lines of drains manufactured by the firm. Copies of this catalogue will be forwarded to readers of SANITARY ENGINEER upon request.

NEW MUELLER CATALOGUE

H. Mueller Mfg. Company, Limited, Sarnia, Canada, have issued catalogue "A," featuring water, plumbing and gas brass goods. The catalogue is a handsome book of 275 pages, splendidly illustrated and printed on good quality paper. The company states that through the expansion of the Mueller lines, coupled with the company's policy in standardizing and eliminating duplication, it has been found necessary to establish an entirely new set of plate numbers for the firm's products. With the exception of tapping and drilling machines every article in the catalogue has a plate number preceded by the letter "A." The company emphasizes that goods should be ordered by the plate number prefixed by the letter "A," not by the name of the article. The figuring of cost has been greatly simplified by the adoption of per piece price list almost exclusively. At the back of the catalogue is a telegraph code, which makes it possible to wire an order at slight expense. The new catalogue precedes all previous Canadian catalogues, booklets, etc. The catalogue was compiled and edited by the advertising department of the company at Sarnia, Ont. Copies will be supplied to the trade upon request.

THE ALLPRISER

The Allpriser, which has just been issued by Kenneth B. Allison, 668 Yonge St., Toronto, is a flexible leather book, 7 by 9, containing approximately 150 pages, loose leaf. It is especially prepared for the plumbing and heating trades. According to Mr. Allison the book includes a list with net prices of all staple every-day articles at a glance. Included with the Allpriser is a regular service of price sheets, said to be compiled and revised every time a price change takes place. It is claimed that the use of this book will eliminate loss through guesswork, reduce overhead expenses, and assist in many ways to create greater efficiency in both buying and selling methods. All products listed in Allpriser are indexed alphabetically, and at the same time placed in a class number, which may be readily consulted in the numerical index. The front index consist of thirty pages, and this is followed by 25 classes. The book contains a vast amount of practical and valuable information, and with the continued price change service should prove valuable to the trade.

PICNICKED AT TASHMOO PARK

The annual picnic of the H. Mueller Mfg. Company, Ltd., of Sarnia, and the Mueller Metals Company, of Port Huron, was easily the most successful outing in the history of these two organizations. It was held at Tashmoo Park. The sports programme included no less than twenty-seven events. Special arrangements were made to entertain the former employees of the Mueller plants who worked on munitions during the war, Reception committees headed by O. B. Mueller, president of the company, and C. G. Helby, general superintendent, was at the dock to welcome these men.

Montreal Plans Closer Supervision of Plumber Licenses

Under New By-law All Applicants Must Pass a Specified Examination Showing Their Fitness to Practise — Good Results of Dominion Convention Already Apparent.

IT will be most welcome news to master plumbers in Montreal that the civic authorities are intending to require a more rigid examination of all those who would pose as plumbers. To this end it is proposed that By-Law No. 318 be replaced by By-Law No. 571. Under the arrangements contemplated it will be essential that applicants pass a specified examination showing their fitness to practise as plumbers. On this Board will be a representative of the Master Plumbers' and the Workers' Associations, and with them, conjointly, will sit the city sanitary engineer. An examination must be passed before license will be granted. Copies of the proposed by-law have been distributed to the various organizations for their comments and suggestions. Among those receiving this are the Builders' Exchange (with which is affiliated the Master Plumbers' Association), Architects' Association, Canadian Institute of Civil Engineers, Journeymen Plumbers' Association, and the Canadian Firewriters' Association.

This is an excellent move and one in which all master plumbers will take a decided interest. The plan follows closely the ideals borne out in the recent convention held at Montreal in June.

Heating and Ventilating

STEAM

Ninth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the ninth of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on "Steam" a most interesting and illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the design for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The tenth article of the series will appear in the next issue.

WHAT is steam?

In answering this question we must ask the reader to take an imaginary journey with us to the field of elementary physics, and when there experimenting look into certain of the properties of steam with the purpose of coming to an understanding of what the terms used in the making of steam tables really mean.

To the mentally energetic the marked distaste of the average mind to look below the surfaces of the arts, the sciences and the occupations of man, is a mystery that continues to grow until the realization comes that the handicap is due more to a lack of imagination than to any phase of a mental laziness. And the imagination we refer to is not that quality of the mind that carries its possessor away on wool-gathering expeditions, but rather the gift that enables its owner to follow the author of dry descriptive matter through passages that should visualize in the mind those things that are hidden from the eye.

Now we refer to the imagination because more especially in this article than in any of the preceding ones it will be necessary for the reader to exercise his imagination in coming to a definite understanding of the subject under this heading. The strain on the imagination must of a necessity be great, whereas here we lack the actual experimental materials and the personal contact.

When writing of matters of a technical nature there is on one hand the temptation to consider that the standard of average education is high enough to make any reference to matters of elementary science seem almost impertinent, and on the other, when in the effort to avoid the error, for it is an error, an attempt is made to take up such matters at the very fundamentals, the danger of falling into a discussion of non-essential phases of natural science must be apparent.

Therefore if this article seems to go too far into details for one man, and not far enough for another, understanding this, they will not blame the author too much for what appears as an incomplete explanation or an unnecessary elaboration of a simple detail.

For the first step in our experiments we are to assume that we are making the experiments at a level, uniform with a mark set half way between low and high sea tides; we do this because at this level there is a pressure of 14.7 lbs. of atmosphere per square inch, and this pressure of 14.7 lbs. is the standard worked from and to for convenience in defining tables and establishing certain laws. We are to have a vessel containing exactly one pound of distilled water and the water is to be at a temperature of 32 degrees above zero F. We place this vessel on top of a fire and as the heat from the fire is transferred through the bottom of the vessel to the water the following action takes place: First the air contained in the water is driven off (the vessel is to be open to the atmosphere) then the water in the bottom of the vessel being heated expands and, of course, being lighter for its bulk than the water above, rises to take the place of the colder and heavier water descending. This action of circulation keeps up until the water reaches a uniform temperature of 212 degrees F., from then on it starts to make steam and keeps steaming without any rise in temperature until every particle of water is evaporated from out of the vessel.

Now when we refer to the data given in the first article of this series, we note that it takes one b.t.u. to raise one pound of water one degree, and knowing that the water, before it started to boil, had risen in temperature from 32 degrees F. to 212 degrees, we can estimate that it took just about 180 b.t u.'s to affect the change in the temperature condition of the water before it started to boil.

We cou'd have found had we taken its temperature, that the water during the time that evaporation was taking place was not increasing any in temperature, but we would also have noticed from the appearance of the water that certain elements that entered into the make-up of the water were becoming separated from and dashing up through the water above, when overcoming the weight of air, they were rising in the form of a gas or vapor, thus, water changed by heat into a gaseous state is steam.

If, instead of leaving the top of the vessel open to the atmosphere we had placed a cover on the vessel with a weight on top, the water would not have given off steam at a temperature of 212 degrees. We would have found that the temperature of the steaming point was proportioned entirely to the size of the weight holding down the cover. If the weight was, say 60 lbs., the temperature of the water would have to be raised to about 307 degrees before any evidence of boiling would take place.

Or if we, instead of placing a weight on the lid. had arranged to exhaust the air from between the lid and the water in the vessel. the action of boiling would take place at a much lower temperature than 212 degrees F., how much lower

would depend on how much weight of air we had taken off the water. If we had managed to get the air removed from the vessel so that instead of 14.7 lbs. of atmosphere pressing down on top of the water there was what might be termed one pound of atmosphere above an absolute vacuum, the water would boil at a temperature of 102 degrees.

From these experimental conditions we have found that the temperature at which water boils is controlled entirely by the pressure that the water is subjected to.

There is also another thing that we might have noted in our experiments, and that is the quantity of heat or the number of b.t.u. required to boil away the whole pound of water contained in the vessel, and if our experiments included an investigation of how much water could be heated by the steam evaporated from a pound of water we would find that it took just the amount of heat to evaporate the pound of water from 212 degrees to steam as it would take to raise 966 lbs. of water one degree. Therefore there would be 966 b.t.u. used in changing the water at 212 degrees to steam at the same temperature.

The amount of heat that is required to evaporate one pound of water at 212 degrees entirely into steam is called latent heat.

The amount of heat that it takes to raise the temperature of the water from 32 degrees above zero to the boiling temperature is known as the heat of the liquid.

The latent heat added to the heat of the liquid gives us what is known as the total heat.

The total heat required to evaporate one pound of water from 32 degrees F. is 180 b.t.u. (heat of liquid) added to 963 b.t.u. (latent heat) =1146 b.t.u. (total heat.)

It might appear that because the pressure above that of atmospheric pressure raised the temperature of the steam and the water confined in the vessel, an increased pressure must mean a corresponding higher temperature of all of the properties of the steam, but this is not so, for while it is true that as the pressure increases the heat of the liquid increases in temperature, actually there is less heat required under the increased pressure to evaporate the water from the higher heat of the liquid than was the case when the experimntal vessel was open to the atmosphere. For instance: a pound of water condensed from steam at a temperature of 417 degrees F. and at about 285 lbs. pressure above atmosphere, only gives up 818 b.t.u., whereas a pound of water condensed from vapor at a temperature of 102 degrees and a pressure of one pound above vacuum gives up 1,042 b.t.u. However as it only takes 70 b.t.u.'s to raise the temperature of water from 32 degrees to 102 degrees the total heat is in this case 1,043 b.t.u. (latent heat) plus the 70 b.t.u. (heat of liquid)=1,113 b.t.u. (total heat.)

The heat of the liquid for steam at 417 degrees is 390 b.t.u. The total heat is the 390 b.t.u's added to the 818 b.t.u's (latent heat) = a total of 1,208 b.t.u., is while the reader will understand that steam condensed at high temperatures contains less heat than steam condensed at lower temperatures the total heat is greater.

The reader should understand from the explanations here given why heat transference is more rapid at low pressure than with high pressures.

There is also another term used in connection with steam tables, viz., saturated steam. This term expresses the condition of steam when it is at the same temperature as the water from which it is generated. The term saturated steam does not mean that the steam is wet, in fact that steam may be entirely free from water, but if it is at the same temperature and pressure condition as the water from which it came it must be considered as being saturated.

Steam could be separated from the water and then heated, just as other gases may be heated. Its temperature could then be raised higher than the boiling point of a corresponding pressure. We call steam in this condition super-heated steam, and it takes just about half of a b.t.u. to raise the temperature of one pound of super-heated steam one degree at a uniform pressure.

Steam keeps decreasing in volume as its temperature is raised. For instance, steam generated from water at 1 lb. above absolute vacuum fills a volume equal to more than 20,000 times that of the water. Steam generated from water at atmospheric pressure fills a volume equal to about 1,600 times that of water, while steam generated from water at a temperature of 4,170 and a pressure of 285 lbs. above atmospheric is equal only to a volume of about 96 times that of the water.

The thorough understanding of the properties of steam is of the greatest value to an engineer in making a decision regarding the adaptability of a pressure or vacuum heating plant to the conditions of installation that may confront him.

It is, therefore, of the greatest importance that he carefully read and re-read everything that he can lay his hands on regarding this subject, and in his reading refuse to remain content until he is in a position to thoroughly pick to pieces and analyze every system of steam heating clear back to its basic principles.

Ventilating the Modern School

Eighth Article of Series Written Especially For "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

WHILE there has rarely been a problem confronting the ventilating engineer in the practice of his art that did not bear upon its face its own evident solution, there have been too often in the past hampering influences imposed upon these men either by way of insurmountable material conditions or by the authority of some incompetent person.

Such a state of affairs was not alone peculiar to the problem of school house ventilation, but one that seems to be persistently present whenever a ventilating engineer was called into consultation.

Up until the time of owners of manufacturing plants discovering that the money spent on an apparatus for the maintenance of a certain standard of air purity in the building paid great dividends, and until the owners of theatres realized the importance of removing foul odors from their buildings, the profession of the ventilating engineer was looked upon more or less as one that provided a cure for an evil that did not exist. But since that time the owners of buildings requiring high grade ventilating plants have increased in number, and as each year more money is invested in ventilating apparatuses, there naturally follows a demand for an efficiency surpassing that obtained in the older ventilating plants. This has resulted in the ever increasing refinements of apparatus, so that now when a school board, or their engineer wishes to value a particular specialty they do not, as in the past, have to depend on theoretical knowledge done, but can, without much trouble, secure access to plants where such specialties are in use.

When inspecting some buildings where ventilating plants appear to be installed, the visitors may be disappointed in their expectation of seeing anything of value. They may be so unfortunate as to be in a building where the putrescent air is a sufficient explanation of the falling receipts of the box office. The visitors should understand that while some owners of places of public amusement have been very extravagant in the matter of paint and plaster, they have also been notoriously penurious where it is necessary to spend a few dollars that did not make much of an impression on the eye. It took the painful necessity of seeing the public pass by the box office to make these men realize that the condition of the air in the building was an offence to their potential patrons, so when a school board pays a visit to such a place they may find, as well as an antiquated ventilating system, an owner sitting and bemoaning the meanness that prevented the installation of a complete ventilating plant in his building.

The owner's fault was not always the root of the evil, for at times these owners were guided into their disastrous experiences by an architect who desired to save some money on the essentials so that he might spend it in a joyous ex-

uberance of meaningless balustrades, cartouches and other excrescences on the face of his aberration. Thanks be, the common sense of the dividend seeker has overcome the desire of such an expression of insincerity, and the public may now enter the principal places of amusement without the fear of being poisoned by the pestilential atmosphere of the place.

One almost may be sure that a poorly ventilated building is not a monument to the poverty of ideas on the part of the engineer so much as an indication of the poverty of the owner's purse or the selfishness of some individual that has been unfaithful to his trust.

When one aspires to a position of authority he must be able to look over a broader field of human knowledge and endeavor than that confined entirely to his own work. The possession of perfect tools is no implication that a man is a finished workman. Tables, formulas and so forth are only tools, and the possessor of these tools must be fitted to handle them by the mental growth corresponding to the manual skill developed. The equipment necessary to make an engineer consists more in the ability to take a broad view of his problem than it does in the mere mechanical skill necessary in making designs according to fixed rules.

The reader might believe that it would suffice to present the necessary tables and data in an article of this kind leaving the writing of the subject of education to a series of articles bearing only on that matter.

Education to many means a sort of thing that can be procured from books and schools, losing sight of the fact that education is only a guide to set a man on the road he must travel for himself. The guiding may prevent him from wandering into pitfalls, but sometimes if he holds fast to his guide, depending not in any way upon his own powers of observation he will seldom explore the bypaths that lead to a greater knowledge than that found along the beaten path.

Books may point the way but observation must be developed, as it is only through carefulness thus acquired that the ability is given to lay out work in a systematic way, neglecting no detail that spells success and incorporating nothing in the design without a cheerful willingness to dig for more than a superficial understanding of its value.

The object of writing of incomplete and necessarily imperfect ventilating systems is that we wish to emphasize that the ventilating engineer must not be satisfied to model his design wholly on what has been already done in his art. The man who wishes to stay at the top of his profession must continually step abreast of the times, and, while using as much of his predecessors' experience as he can obtain must not be satisfied to continue practising along lines that are obsolete. Another thing he must learn is that many of the ventilating systems now in existence are only cheap substitutes for what he will be called upon to install in the future.

There are scores of buildings that he may visit where he will see the most complete installations made for the conditioning of air and the conveying of that air to the rooms in the building. And in many cases he will find that while every detail of installation has been carefully considered up to the point of the escape of the foul air that the system of extracting the foul air is of the crudest type.

There is one school building the writer has in mind where the heating plant is a very good quality of its kind. The fan driving the air into the building is, if anything, too large for its purpose. The coils heating the fresh air are well proportioned and installed. The channels through which the fresh air travels are of the proper size and located in accord with the best principles of such work. But in this school the vent flues are carried to a loft under the roof where they deliver the foul air to escape through such accidental openings as may be found between the rafter feet and the cornice.

Do you think such a building is ventilated?

By no stretch of the imagination can the writer come to believe that the man who designed this system is satisfied with the results. Oh no, he was not responsible for the stopping off of the flues below the roof. This was a feature improving the chance of saving coal and was suggested to the school board by a wiseacre who fires a couple of furnaces in a church nearby.

Then over on the other side of the town there is a school where the conditions are about the same, but with the exception that the ventilating flues are carried right up to and through the roof. Is this a satisfactory way of extracting foul air? Well, it is a common way, but by no means a correct one. Here is what happens on a fairly windy day when the plenum fan is working away to the capacity of delivering 1,500 cubic feet of air per minute to each class room in the building: The rooms on the windward side receive only 1,200 feet of air through the fresh air faces and lose about 2,000 feet through the foul air vents; on the lee side of the building the rooms receive through the fresh air faces 1,900 cubic feet per minute, and the vents only pass 7,660 cubic feet of air in the same time. These figures vary with the velocity of the outer wind currents, proving that natural conditions can play havoc with the distribution of fresh air even in a mechanical ventilating system when every detail of the equipment is not noted and taken care of in the engineer's design.

In experimenting with a plant of this kind it was not found that the stopping up of the fresh air opening into the room had any appreciable effect on the diminishing of the quantity of the air escaping through the ventilating ducts. The only way that a normal condition could be established was to regulate and set dampers in the vent flues. It is hardly of any use placing hand regulated dampers in the vent flues, because of the remote chance of getting a janitor who is willing to go around adjusting these dampers as the direction and velocity of the wind changes. The best thing that you can do is to place light counterbalanced automatic dampers in the flues; setting these dampers in such a way that an air velocity increasing above a certain point may throw these dampers far enough over to partly close the openings.

The use of an exhaust fan will make it easy to regulate the dampers on the foul air outlets, but it must be borne in mind that the use of an exhaust fan alone, or in combination with a plenum fan, and without the use of automatic dampers, will not provide for the proper balancing of the air pressures in the building at all times regardless of the conditions of exposure.

In flues where the force of gravity is the power used in moving the air check dampers must not be installed down close to the base of the flue. Such dampers must be installed close to the top of the flue or flues, as otherwise the quantity of air escaping into the flue is hardly large enough to offset the counterbalancing weight of the cold air above and the result is a back draft.

In a later article we will give some suggestions regarding methods of cutting the cost of installations without leaving out certain of the most essential parts of the apparatus.

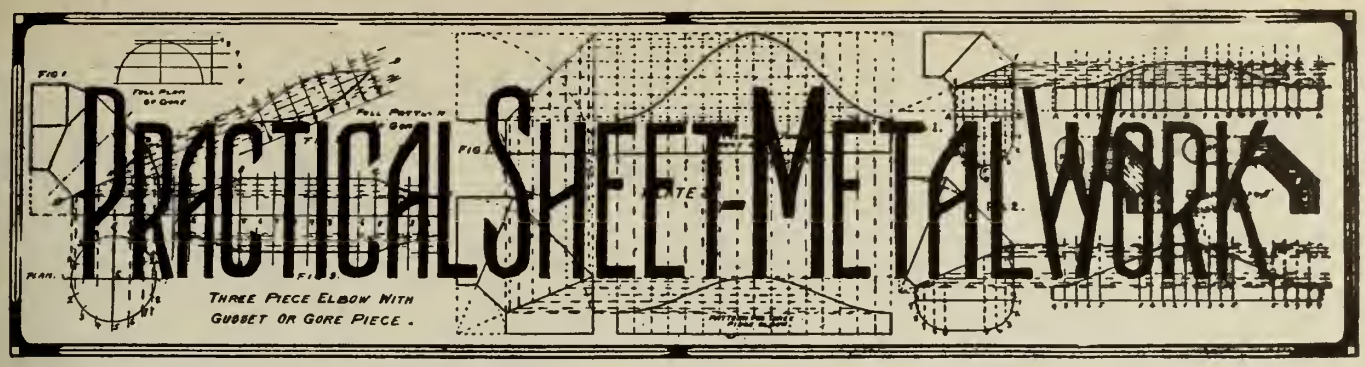
FRANK STOCKDALE LECTURE

Owing to lack of space, the concluding address by Frank Stockdale before the Retail Merchants' Association in convention at Regina has been withheld until the August 15 issue. This address will be on "Meeting To-day's Competition," and brings out many interesting points on the need of studying conditions and evolving new methods of doing business. Watch for it in the August 15 issue of SANITARY ENGINEER.

HANDLING COMPLAINTS

When complaints are made to you of goods or service, how do you handle them? Rudely or with the grace that will make out of the complaint a business builder? I believe a complaint handled properly can be made of great service to the store in so satisfying the customer that the treatment received will make for good will.

I saw a young man recently who was listening to an irate woman making a complaint. Instead of answering back and thus adding fuel to the flame, he listened until the lady had finished, and then tactfully called some one in authority, to whom he gave a synopsis of the complaint. In a few minutes the angry customer was smiling and a customer was saved. If the man had answered, or rather, argued with her, undoubtedly there would have been trouble. It pays to be tactful.



MUCH has been said about the enormous fuel waste that is taking place in Canada, but with the exception of one or two authorities very little has been said as to how fuel can be saved. Some have advised how a furnace should be operated, and have given reasons thus and so. But oftener than not most of this information is only of value providing that the furnace is properly installed and of a proper size, also it has been assumed that chimneys and smoke pipes have been O.K.

It would be safe, however, to say that at least 30 per cent. of the troubles with heating systems is due to poorly-constructed chimneys, and, in many cases, these can be remedied by adding a good type of chimney top.

A number of illustrations are here shown in connection with chimney caps and chimney construction. In our Canadian climate more care should be exercised when building chimneys. Many a furnace is installed that, do what one may, will never burn properly, and will not give off enough heat. When an extension to a chimney is made by adding a galvanized pipe as shown at A, plate 23, it should be installed in such a way as to protect the chimney top.

Fig. C shows how a chimney may be protected from cold and made much more effective if constructed in manner shown. It will be noted that where a chimney projects from the building line, at least one-half of the chimney is too much exposed, and particularly so when simply a single brick is built up on the outside.

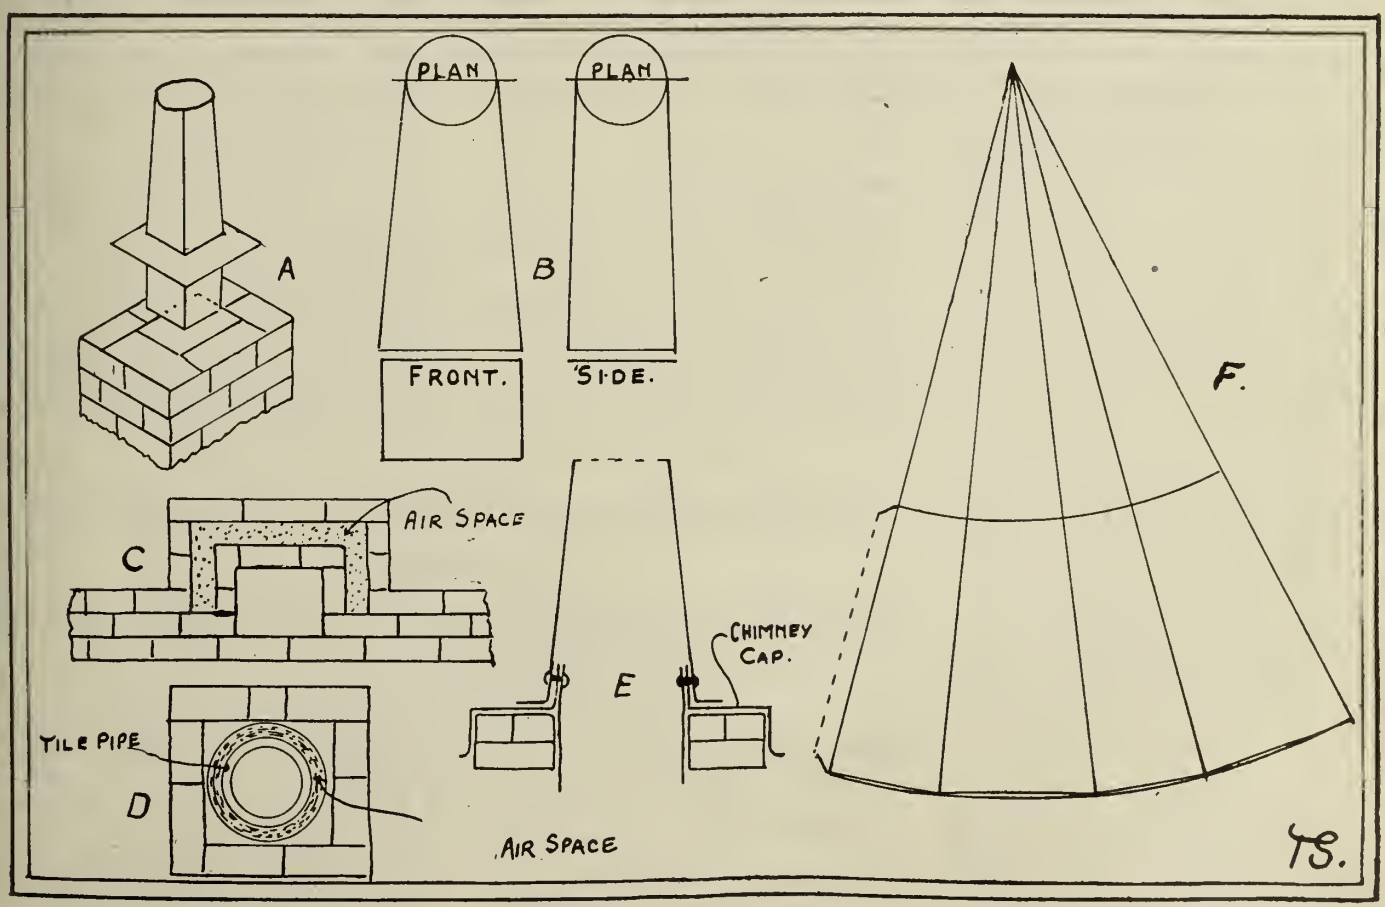
An air space or asbestos coating should be by rights inserted in such a chimney and it would result in better draft and less fuel consumption. Fig. D shows another design of chimney which is a very effective one, and one that is becoming very popular. It is a well-known fact that a round chimney is much more efficient than either a square or rectangular one.

Then again with a round pipe chimney that is smooth as well as furnished with an air chamber its effectiveness is greatly increased as stated before when an iron extension is placed on top. In this case there should be some protection for the brickwork, because winds and vibration caused by heavy traffic, etc., will very often cause the top layers of masonry to become loose. Fig. E shows how a chimney may be protected.

Fig. F is a full pattern of extension pipe shown in Figs. A and B, and is self-explanatory.

In conclusion the writer is of the opinion that one of the most important conditions precedent to a furnace being installed is to be thoroughly satisfied that the chimney is suitable for the furnace, and seeing that this work is done long before the furnace is installed, it is often necessary to decide upon the style of furnace before the chimney is built.

One very common trouble with furnaces, no matter of what kind, hot water or steam, is very often traced to poor chimneys. Sometimes they are not



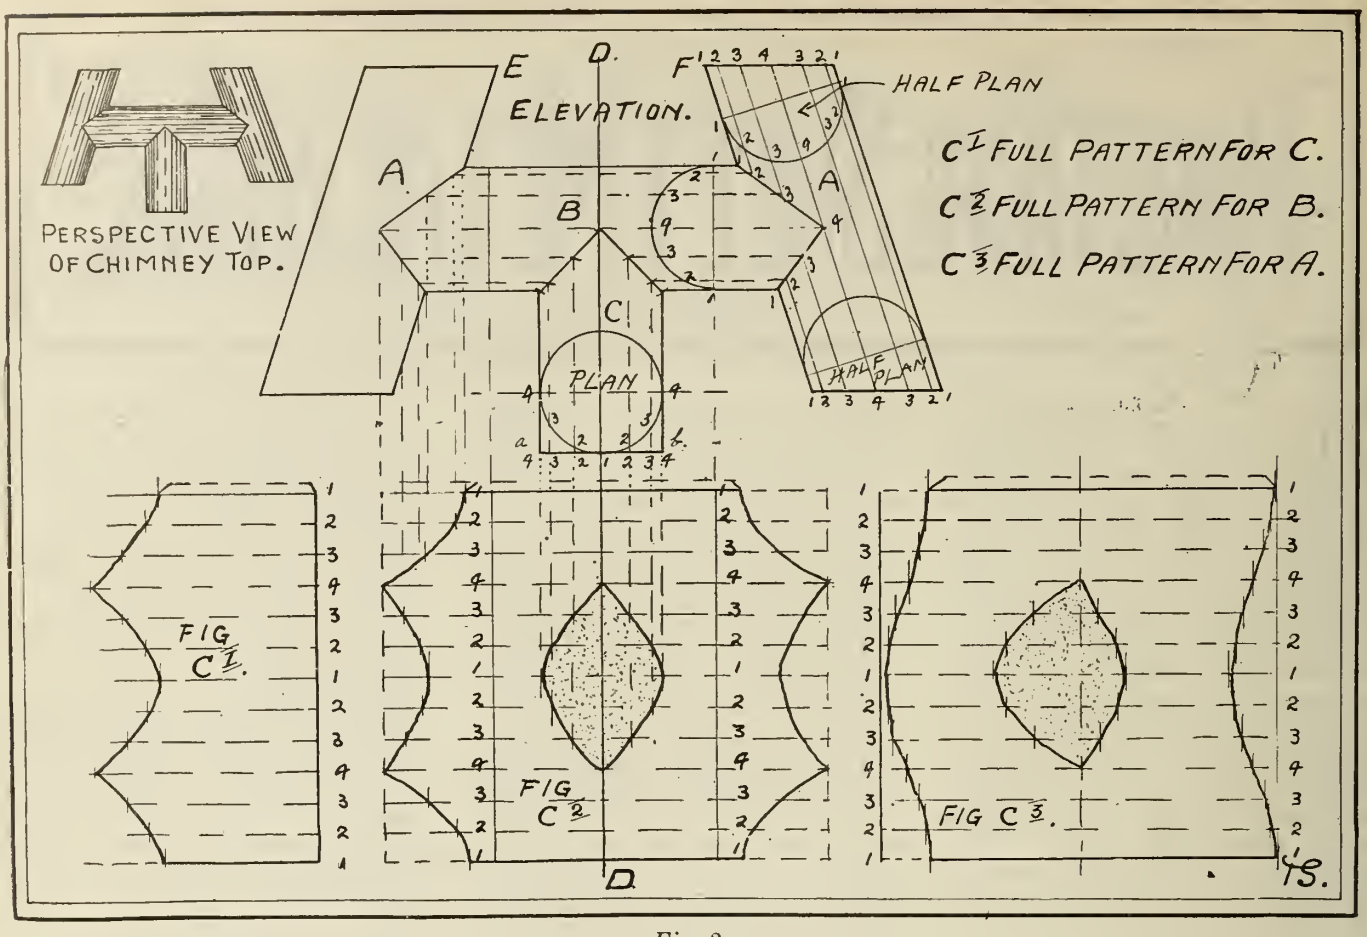


Fig. 2

properly built, not large enough or have some obstruction at or near the roof.

Many times it has been found that a taller building has been erected possibly after the furnace has been in operation, or it may be that the taller structure was first built.

The chimney top here described in Fig. 2 and for which patterns are to be developed has proved very satisfactory. The first the writer constructed was required owing to the fact that a tall building was built nearby after the furnace had been in operation for several years, and up to that time had given splendid service, but when the taller building was erected trouble began.

Since then several of the tops described have been fitted up to existing chimneys, and have resulted in a great improvement.

The principle of this chimney top is that when a wind blows even against the taller building the draft is forced through the pipes AA either up or down and in any case this draft causes a suction on horizontal pipe B, and prevents a down draft. As to size, the pipes should all be the same diameter.

In developing the patterns, the elevation and plan is first drawn as shown. Pipe C enters the chimney and may be fitted to a square to round piece which should not have less cubic contents than C.

Next divide plans of each pipe as shown into twelve equal parts, using only the four figures 1, 2, 3, 4, and repeating same. Next draw a vertical line DD, through centre of pipe C and B, which should be the true centre of the elevation. Now determine the diameter of chimney top. The length of pipes A should never be less than three times their diameter, four times is preferable, and the distance between point EF should never be less than the proportions shown, say one and seven-eighths of the diameter with a pitch of about 60 degrees.

It will be noted that as all pipes are equal in diameter the eight mitres are all in the centre of each pipe, therefore, it would be well to centre each pipe, draw three half plans of A and B and full plan of C, then draw the mitres.

Next draw dotted lines through the half and full plans at points 1, 2, 3, 4, 3, 2, 1, cutting each mitre as shown, all lines of which must be parallel with the outlines of the elevation.

Next draw a vertical line as shown in Fig. C¹ and divide it off into twelve equal parts 1, 2, 3, 4, 3, etc., from these points draw as many horizontal lines. Next take the compass and transfer the measurements from line a b in pipe C, and mitre, C, B, to the stretchout line, Fig. C¹, cutting each of the dotted lines which bear their corresponding figures. By connecting these points the pattern for pipe C is developed.

The patterns for Figs. C² and C³ are developed in a similar manner, as also are the holes in the various patterns. The one stretchout line can be used as in the case of Fig. C¹. Allowance must be made for joining the mitres, but the pattern of the hole is well to be cut a little small at first, because it can always be fitted, whereas if cut too large there is nothing but making up another piece that will do. The joints of such a top must always be tight so as to make it as effective as possible.

Test Case May be Made Out of Charge Laid at Stratford

Hardware Dealer is Convicted and Fined Nominal Sum for Breach of the Plumbing By-Law—Fine is Paid, But Under Protest

A CASE which has aroused considerable interest in Stratford, Ont., was heard before J. A. Makins, P. M., in conection with an alleged breach of the plumbing by-law.

The Stratford "Beacon" says:

In the police court this morning Mr. B. F. Kastner was convicted and fined $1 and costs for a breach of the Plumbing By-law. Mr. Kastner, who conducts a hardware store on Wellington street, sold a washing machine and coal oil stove to a Mrs. Vipend, Caledonia street. One of his employees who looks after any repairs, delivered the articles, and as the

coal oil stove was to replace the coal stove, to which the hot water pipes were attached, Mrs. Vipend asked John Redding, who worked for Mr. Kastner, if he could change the pipes, from the coal stove to the furnace. This, Mr. Redding consented to do, not thinking it was a breach of the plumbing by-law. Building inspector Dixon was advised of this and investigated the matter with the result that Mr. Kastner was prosecuted.

Several witnesses were examined, including Harry Peter, who is a plumber and gave evidence that the work done by Mr. Redding came under the head of plumbing.

Mr. Redding was called and stated that this was the first job of this nature which he had done, but he did not believe it to be a plumbing job.

Mr. Kastner was the only witness for the defence. He stated that he was not a plumber, and he knew nothing about the job in question. "Mr. Redding," he said, "had charge of the repair work, but I gave him instructions not to do any plumbing work."

In summing up the evidence, Magistrate Makins came to the conclusion that the case was a breach of the by-law, but believed that it had been done unintentionally. The Building Department did not wish a heavy penalty imposed, but merely wanted a ruling on the case. The Magistrate therefore imposed the above fine.

Mr. F. H. Thompson, K.C., who appeared for the defendant, asked for a certified copy of the evidence as he intended to test the case further. The fine was paid under protest.

W. G. Owens, city solicitor, represented the city.

Asked, following the case, whether he intended to take out a plumbing license, Mr. Kastner replied, "No, if I am going to be brought to police court for the business I am running, I am going out of business."

MARKET CONDITIONS

Continued from page 36

tations of 10c to 10½c per pound over those prevailing seven days ago.

LEAD—The buying movement is very pronounced and the market rules with decided strength. An advance is shown in quotations this week, which now range from 7c to 7½c per pound.

ANTIMONY—There has been no actual price change recorded in the quotation of 10c per pound. The market, however, is firm, and a very good volume of business is being done.

ALUMINUM—Market changes are absent, with the price of 35c per pound still considered good. A little better movement is constantly apparent.

Not An Exclusive Report

DESPITE *the fact that* SANITARY ENGINEER, PLUMBER AND STEAMFITTER OF CANADA, *published a complete report of the big Montreal Convention almost two weeks before any other paper, one of our contemporaries came out almost two weeks after our report appeared, and stated that its report was "the official report furnished by the Society, exclusively to our contemporary."*

It was no doubt obvious to our readers in all parts of Canada that the complete report of SANITARY ENGINEER *published in advance of other papers was the first authentic report received by them. In order to prove, however, that there was no such thing as an official report furnished exclusively to a contemporary, we are going to reproduce letters from officers of the Association as follows:*

LETTER FROM PAST PRESIDENT

The Sanitary Engineer,
128 Bleury St.,
Montreal.

Gentlemen:—

Your letter of July 5, regarding report of the Convention received.

The only reports of the Dominion Convention of the C. S. of D. S. & H. E. given out are those which you have received and which were prepared by the convention stenographer. No authority was given by the Society to anyone to use the word "Exclusive" in connection with the reports. The representatives of the Plumbing Trade Journals have all been treated in the same manner.

We cannot thank you too much for the reports appearing in "Sanitary Engineer" of June 15. These are very complete and there have been many expressions of satisfaction here in Montreal from the Master Plumbers; especially is this case with our French-speaking members.

Yours truly,
A. Charette,
Past President of C.S. of D.S. & H.E.

LETTER FROM THE PRESIDENT OF DOMINION ASSOCIATION

The Sanitary Engineer,
143 University Ave., City.

Gentlemen:—

I thank you for drawing my attention to the fact that one of the trade papers is using the word "exclusively" in reference to our Convention proceedings. You can rest assured that it was not our intention to give any one paper that place of honor, and if so, I can assure you that we would not be so short-sighted as to throw down our old friend "Sanitary Engineer," which has in my opinion been the best friend that we ever had. You can make use of this which ever way you think necessary.

Yours very truly,
F. R. Maxwell.

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

AS predicted in the last issue of SANITARY ENGINEER, new and higher quotations are now in effect on many lines of brass goods. The advances range from eight to ten per cent. above former figures. In a few lines the quotations have not yet been announced, but it is stated that they will be higher. These increases all centre around higher prices of copper and increased wages is also a factor, it is stated.

New and higher prices are also named on two sizes of range boilers only, the thirty-five gallon and forty gallon, both standard and extra heavy. Quotations on all other sizes show no change.

In Toronto an early termination of the long standing strike of the metal workers is expected and with the return to work of some six thousand men and the resumption of manufacturing activity, it should not be long before the acute scarcity which exists in some lines should be relieved. It is practically impossible to obtain soil pipe or fittings. With any amount of business offering the situation grows worse every day. There is nothing yet to indicate what the basis of settlement will be, but it is generally expected that there will be a wage increase and shorter hours. One estimate of the advance in prices this will cause is ten per cent.

Some manufacturers are predicting a scarcity of enamelware. It is impossible, they state, to get unskilled labor for certain classes of work and production is being kept back as a result.

In general business is reported excellent, especially in the building trades. Each week sees a steady growth in the permits and many of the larger projects which will swell the figures greatly are developing. Continued activity for some time will be necessary, it is expected, to meet the need for housing accommodation.

TORONTO, August 2—All lines of brass goods are moving to higher levels and the changes that are already in effect show advances of from eight to ten per cent. over former quotations. Further additions to the list will be made shortly. For no particular reason apparently prices have been advanced on the 35 and 40-gallon sizes of range boilers, both standard and extra heavy. It is generally expected that prices of soil pipe and fittings will be revised upward shortly. There is an acute scarcity in several of these lines at present as a result of the metal workers' strike. An early settlement of the trouble is in sight, but if shorter days are granted and increased wages it will mean, it is expected, that prices will increase at least ten per cent. Considerable interest is being shown in the trade generally in the statements made at Ottawa by Dr. McFall, the Cost of Living Commissioner, regarding prices that are being charged. Further details regarding this will be found on another page of this issue.

No Changes Shown in Enamelware Prices

ENAMELWARE—Prices of enamelware are holding firmly and some manufacturers predict a scarcity of goods. It is practically impossible, they say, to obtain unskilled labor for some lines of work. A god volume of business is being handled and reports indicate that building activity is general all over the Dominion. A number of fairly large projects are developing and the outlook is for a steady demand through the fall months. Quotations on a number of the well-konwn lines are as follows:

Bath tubs, rill rim, 4, 4½, 5 feet, 24 to 30 in. wide		$35 30
Bath tubs, 5½ ft.		39 25
Basins, flat back, 14 x 15 in.		6 80
Do., corner, 15 in.		7 50
Sinks, roll rim, 18 x 30 in.		15 80
Sinks, flat rim, 20 x 30	$6 77	6.65
Do., 18 x 30	5 80	5 99
Do., 18 x 24	5 37	5 25
Do., 16 x 24	5 17	5 05
Do., 14 x 20	4 45	....
Closets, oak tank and seat	....	25 50
Do., enamel iron or white vitro tank	....	27 50

Four Advances Made in Prices of Range Boilers

RANGE BOILERS—Thirty-five and forty-gallon range boilers have been advanced, the new quotations being $13.50 for 35-gallon standard, $15.50 for 35-gallon extra heavy, $13.50 for forty-gallon standard and $1725 for forty-gallon extra heavy. Prices on the other sizes are holding unchanged. A good volume of business is being handled and prospects are that there will be a steady demand for range boilers for some time as there are a great many dwellings to be erected before the acute shortage at present existing at many points is relieved. Quotations are as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Soil Pipe Scarce, Advances Expected

SOIL PIPE, FITTINGS—There is every prospect of a settlement of the metal workers' strike and the resumption of manufacturing in lines which have been tied up for many weeks, with the results that stocks are lower than they have ever been. With a good volume of business offering manufacturers have been wondering where they are going to get the goods. One jobber stated that he has orders for goods for eight hundred houses and that it is impossible to make shipments in many cases. Resumption of manufacturing is expected to result in higher costs of production and this will mean advances in all lines. Quotations at present are as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	20%
Medium and extra heavy soil pipe, 4 in.	25%
Medium and extra heavy soil pipe, 2 in. to 6 in.	35%
8 in. extra heavy pipe and fittings	15%

PIPE FITTINGS

Cast iron fittings	20%
Plugs	35%
Bushings	35%
Unions, ¼" to 2½"	50%

Do., Class B, lb. net	0 22	0 30
Do., Class C, lb. net	0 14	0 21

10 *Per Cent. Advance in Brass Steam Goods*

VALVES—Prices which are from eight to ten per cent. in advance of former quotations are now in effect on brass steam goods. The new figures

W H O

STOOD BY THE PLUMBERS OF CANADA during the war and furnished them with goods during the most critical situation in the history of the trade?

NOT ONLY MADE MUNITIONS IN SUCH large quantities that an endless stream of shells was sent overseas to the men in the first line of defense, but kept on turning out Made-in-Canada quality plumbing brass goods for the Canadian trade?

NOT ONLY WAS THE FIRST FIRM in Canada to oversubscribe their quota in the Victory Loan of 1918, but also supplied plumbing goods needed by the Canadian merchants?

NOT ONLY DID THEIR BIT FOR THEIR COUNTRY at war, but fulfilled their obligations to their customers in Canada at the same time?

THE
H. MUELLER MANUFACTURING CO., LTD.
SARNIA, CANADA

We make Bibbs | Compression
Rapidac (quick comp.)
Self-Closing | **Basin Cocks,**

Bath Cocks, Bath Supplies, Basin Supplies, Sill Cocks, Wash Tray Bibbs, Curb Cocks, Corporation Cocks, Tapping Machines, Service Clamps, Ferrules, Regulators, Reducing Valves, Relief Valves, Water Strainers, Bubbling Fountains, Gas Cocks, Globe Valves, Forgings in Brass and Aluminum, Special Castings.

have not been received yet on two or three lines, but they will be higher. The advances centre around the higher prices now being asked for copper and also increasing labor costs. Business has only been fair as a result of cancellation of orders from overseas points for equipment on which brass specialties would be required. The home trade, it is reported, shows greatly increased activity. Marine orders at present are a little quiet. Quotations on brass goods are as follows:

Compression work, standard	44
High grade	40
Fuller work, standard	40
Basin cocks, No. 0 standard	35
Nos. 1 and 2	35
Bath cocks, compression	45
Bath cocks, Fuller	40

Radiator valves, removable seat, medium pressure	25

Wrought Pipe Prices Are Holding Firmly

WROUGHT PIPE—In some quarters advances are looked for in wrought pipe. No changes, however, have occurred so far. A good volume of business is being handled and manufacturers and jobbers state that the outlook is for a good trade all season. Quotations are as follows:

WROUGHT PIPE

Price List No. 40, July 4, 1919

3 inch	46 00	38 00
3¼ inch	.....	45 00
3½ inch	56 00	42 00
4 inch	70 00	54 00

Cotton Waste is Somewhat Easier

WASTE, OAKUM—Some changes are shown in the quotations on cotton waste with oakum unchanged. Business has been inclined to be quiet, but with an early settlement of the metal workers' strike in prospect an increased demand is likely. Cotton waste prices are: XXX, 18c per pound; XX, 16¾c; X, 15¾c; XC, 13½c; Japanese, 13c; those ruling on colored waste are: No. 5, 13¾c per pound; No. 1, 12¾c; No. 7, 11¾c; No. 1A, 10¾c; No. 1B, 9¾c.

Quotations on oakum are:

	Per 100 lbs.
Best American	$21 00 $22 00
Clipper, spun	..... 21 00
Do., unspun	..... 10 50
Plumbers' spun	..... 9 50

Sheet Very Firm; May Advance Soon

SHEETS, PLATES—There is a much firmer tone to the market on sheets and the possibility of either a strike or a scale of increased wages in the mills the first of the month provides an element of uncertainty hard to gauge. In the first case it will mean deliveries will be slowed up, and in the second probably higher prices. Business has been showing decided improvement and the possibility of being tied up for material by a strike is not a pleasant outlook. In the meantime prices are well maintained with a move upward a possibility.

14 gauge	4 85	5 10
16 gauge	4 95	5 20
18-20 gauge	5 80	....
22-24 gauge	5 85	....
26 gauge	5 90	....
28 gauge	6 00	....
3-16 inch plate	4 90	6 25
¼-inch boiler plate	4 50	5 80

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS.

10¾ oz.	$7 80	$8 10
U.S. 28	7 40	7 70
U.S. 26	7 10	7 40
22 and 24	6 95	7 25
18 and 20	6 80	7 10
16	6 65	6 95
12 and 14	6 50	6 80

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Market Very Firm For Lead and Zinc Lines

LEAD AND ZINC PRODUCTS—The market for lead is very firm and steady and advances may be made shortly. In the meantime prices show no change. A good volume of business is being handled and it shows every indication of increasing. Quotations are as follows:

Lead pipe, list, per lb.	$0 12½
Lead waste pipe, list, per lb.	0 13½
Do., over 8 inches, list, per lb.	0 14½
Above subject to discount of 10%.	
Lead traps and bends	15%
Lead wool, lb.	0 11 0 12½
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 12 0 13
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.	
Solder, guaranteed, lb.	$0 35 0 37
Solder, strictly, lb.	0 34 0 35
Solder, commercial, lb.	0 32 0 33
Solder, wiping, lb.	0 31 0 33
Solder, wire, lb.	0 35 0 40
Zinc sheets, per lb.	0 17

Old Materials Active and Prices Very Firm

OLD MATERIALS—With copper, lead and other materials increasing in value there is great activity in these lines in old materials. In fact all lines of scrap are showing increased activity and the market is much firmer. Light copper is marked up from 12 to 13¾, crucible from 15 to 18. Similar increases are noticed in heavy copper and copper wire. According to one dealer there is a much better feeling in the market, no matter how you look at it. There seems to be a conviction that things have definitely turned for the better. Business is good, and when we say that we mean just exactly what we say. We are both buying and selling in good volume. Foundries and mills in this country are taking on material more than for some time past. As far as the increases in copper are concerned there is a feeling that Germany will be in the market for a lot of this material and there is no danger of her dominating the situation. "The scrap metal market is better right now than it has been for a long time past," he concluded. Prices are as follows:

Dealers' Buying Prices—		
Tea lead	....	0 03½
Heavy lead pipe	....	0 05¼
Pipe scrap	....	6 00
Stove plate, per ton	....	13 00
No. 2 busheling	....	11 00
Yellow brass	....	0 09
Red Brass	....	0 16¾
Light brass	....	0 07
Scrap zinc	....	0 06
Heavy copper	....	0 18
Wrought iron, No. 1, per gr. ton	....	14 00
No. 1 machinery cast	....	18 00
Heavy melting steel	....	13 50

Copper, Lead, Spelter All Move Higher

INGOT METALS — Practically all along the line one can see how the increased demand which has become apparent during the last month is tending to strengthen the markets. Copper has responded very decidedly to the increased demand, and during the last week or ten days lead smelter and antimony have been ruling with a very firm undertone.

COPPER—The market has moved still higher and quotations here range from 25½ to 26c per pound. Buying has much improved, and it looks as though the accumulation of supplies, which it was feared would prove a drug on the market, will be rapidly absorbed.

TIN—No new feature marks the position of tin this week with quotations ranging from 55c to 56c per pound, unchanged figures.

SPELTER—The demand is not exceedingly large, but market maintains a firm position and an advance of ½c per pound is shown in this week's quo-

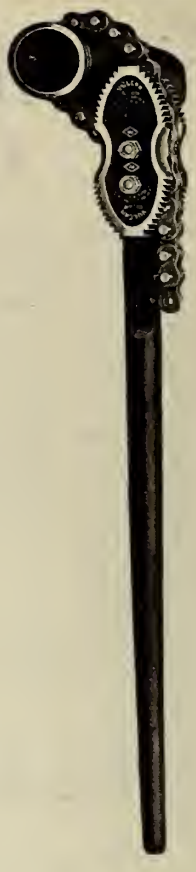
Mark of Proof Is Proof of Quality



There's proved and certified strength in every

WILLIAMS' IMPROVED "VULCAN" CHAIN PIPE WRENCH

Each and every Flat Link Chain is "proof-tested" to two-thirds of its listed catalog strength in a standard tension machine. To each chain so tested is attached the Gray Leaden Seal, illustrated above, and every Flat Link Chain leaving our works *must* bear this seal—the Proof of Quality—as evidence that it has passed our standardized "proof-tests."

Look for this Mark of Proof for it is Proof of Quality—it guarantees uninterrupted, severe service as well as safety to the operator. Williams' "Vulcan" Chain Pipe Wrenches are the *only* Wrenches which offer this certified assurance.

May we send you a copy of our descriptive booklet?

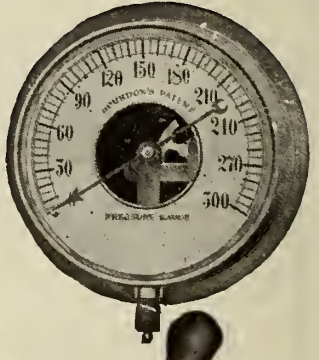
FIVE WORKS---OVER 3,000 EMPLOYEES

UNITED BRASSFOUNDERS AND ENGINEERS, LIMITED

EMPRESS FOUNDRY, CORNBROOK, MANCHESTER, ENG.



DURING THE WAR our plants were exclusively engaged on work of supreme national importance.

At the commencement of the new era we are pleased to announce that we intend to again direct our energies to the intensive production of:—

GUNMETAL and BRASS VALVES and COCKS.
STEAM, WATER and COMPRESSED AIR FITTINGS GENERALLY.
CAST IRON STOP and SLUICE VALVES.
SEMI-ROTARY PUMPS.
EXTRUDED BRASS and BRONZE BARS.
BRASS BOLTS and NUTS, STUDS and GENERAL TURNED WORK FROM THE BAR.
CAST AND MALLEABLE IRON COCKS and PIPE FITTINGS.
PRESSURE and VACUUM GAUGES.
INJECTORS and GENERAL JET APPLIANCES.
ENGINE GOVERNORS (Pickering, Proell, and Other Types).
SPRAYING MACHINES, for Insecticides and Lime-washing.
COPPERSMITHS' WORK.
"STELLA" BRAND ALLOYS: MANGANESE COPPER, SILICON COPPER, FERRO ZINC, PHOSPHOR COPPER and TIN, etc.

"UBEL" POST-WAR SERVICE

If you are interested in any or all of the lines mentioned, and are in a position to take a hand in the energetic distribution of the same, please communicate with us NOW to our Head Office, at above address.

Over 60,000 Daisy Hot Water Boilers Now in Use. Are *You* Selling Your Share?

Daisy Hot Water Boilers are easiest to sell because they have an established reputation for exactly meeting the requirements of the modern home.

Every Daisy you instal will help build bigger business by bringing repeat orders for installation in neighboring homes later.

WARDEN KING, Limited, Montreal

BRANCH OFFICE. 136 SIMCOE ST., TORONTO

Quaturn Ball Cock

Did you ever sell a **whistling, noisy Ball Cock?** It didn't advertise you very well, did it? And very likely your customer was not much pleased either.

Next time use Quaturn.

Because, under moderate pressure, they operate quickly, positively and noiselessly.

Because the working parts may be renewed when worn, without taking off the body, and they are interchangeable with all other Quaturn fixtures.

Because they close with the pressure and therefore tend always to close tighter, eliminating leaks.

Because a satisfied customer means more business for you.

ADVERTISING to be successful does not necessarily have to produce a basketful of inquiries every day.

The best advertising is the kind that leaves an indelible, ineffaceable impression of the goods advertised on the minds of the greatest possible number of probable buyers, present and future.

Introducing

ALLPRISER SERVICE

An automatic check on costs. No man in business to-day can "get by" with guesswork. Allpriser Service eliminates loss, reduces overhead, and keeps you constantly advised of costs. It puts you beyond the chance of selling a fitting for 10c that costs 12c. Such errors as this make staggering yearly aggregates.

Allpriser is a flexible leather-bound book 7 x 9, containing 150 pages (loose leaf). It is a Trade Cost book specially prepared for plumbing and heating. It includes a list showing net prices of all staple articles at a glance. Allpriser Service includes a regular service of price sheets revised to the latest changes.

This valuable service costs only $25.00 per year and soon pays for itself.

Kenneth B. Allison, 668 Yonge St., Toronto

PIPE AND THE PUBLIC WELFARE

By R. C. McWANE

A Book Just Off the Press

Every sanitary engineer should be the possessor of this book. It deals with pipe-making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service.

Price $1.00 Postpaid

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

Why Jenkins Bros'. Valves Are Superior

Fig. 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

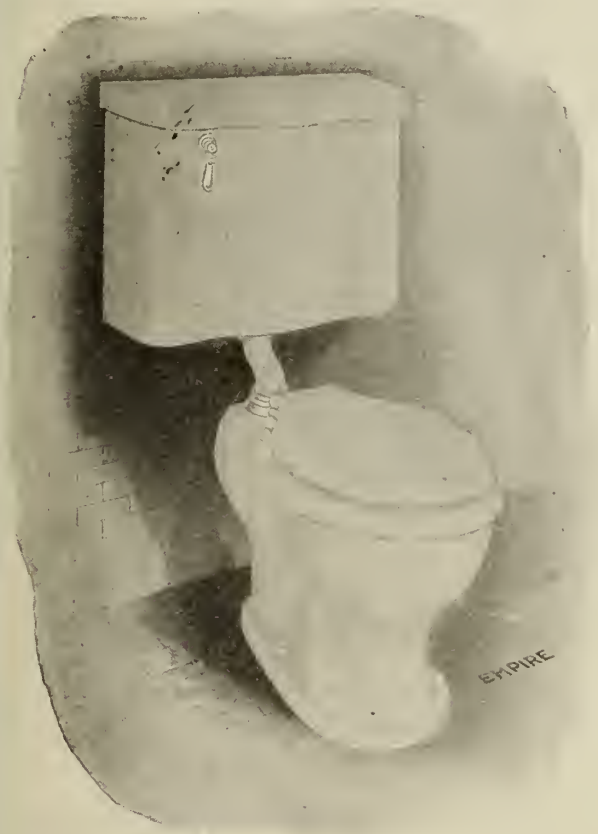
Sanitary Engineer
Plumber and Steamfitter of Canada
VOL XIII. PUBLICATION OFFICE, TORONTO, AUGUST 15, 1919 No. 16.

"Silentic" Was a Bold Step in Naming

It is a name that stands for a guarantee of silence.

The Empire Manufacturing Company has never fallen down on a guarantee, we never will.



Silentic—Plate A 22-D. Empire Vitreous China Double Wavered Lowdown Tank white pyralin coated "Action D" and 2" white pyralin coated offset connection.

The "Silentic" is as near silent as any sanitary fixture can be. Every sanitary engineer who has installed "Silentics" is ready to back us in our guarantee.

The scores of householders who have enjoyed the freedom from embarrassment, that the "Silentic" makes possible, are our best advertisements.

But silence is not the only selling point of the "Silentic." Note its handsome snow-white appearance —no nickle to tarnish and spoil its appearance. Like all our lines of plumbing the "Silentic" meets every requirement. All our sanitary fixtures must be absolutely efficient, non-corrosive, durable, *Sanitary,* or they do not leave our factory.

"What Difference Does It Make?"

A Little "Straight Talk" to the Canadian Plumbing Trade

THIS QUESTION comes almost daily to the ears of many a Master Plumber who is called upon to make estimates for the heating or plumbing requirements in a new building. "What difference?" whether low grade fittings are used in the hidden and unseen portions of the work; "what difference" if cheaper or "just as good" materials are introduced to save a few dollars?

IGNORANCE IS RESPONSIBLE, very often, for the creation of conditions which bring about loss of comfort, convenience and money. The man erecting a new home or business building is not educated on the subject of plumbing equipment and he is inclined to let his contract to the low-priced man regardless of some of the most vital differences which could exist.

IT IS "UP TO" THE MASTER PLUMBER to check this tendency. If he fails in his duty and falls into the temptation of using inferior equipment, he cheats not only the customer, but himself. The plumber who insists on the use of QUALITY fittings and material will be the winner in the end and will build up a name for reliability and EFFICIENCY.

THE POSSIBILITIES ARE GREAT in this very field. In many a Canadian home the idea of a new bathroom has been a dream long considered but never acted upon. The plumber who goes out after this trade can surprise his prospect with the ease and economy with which new facilities can be installed and the discarding of old and troublesome fixtures becomes a joy when higher grade materials are introduced. The cost need not be greatly advanced because it is often a matter of the plumber's understanding where to procure the best goods at the most moderate price. Such knowledge permits him to give real SERVICE.

"QUALITY," "EFFICIENCY" and "SERVICE" make the "DIFFERENCE." Every Master Plumber should make this motto, which is the guiding principle of the CANADIAN BRASS CO., his own. This Company always stands ready to assist by advice as to costs, grading and standards of equipment, always anxious to help the plumber to realize his best desires for SERVICE and his own prosperity.

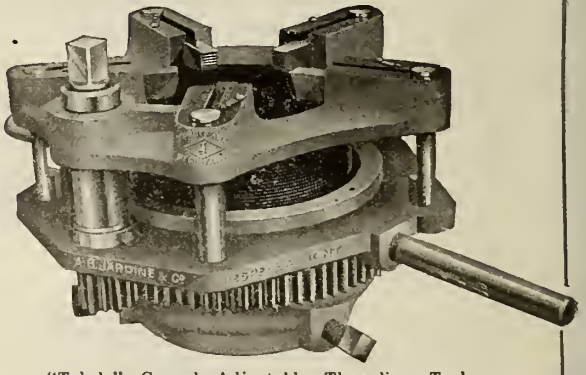
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity 2½ to 6 in. inclusive. Weight, 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

OFFICIAL BULLETIN NO. 3

OUR MEMBERSHIP

Provincial Societies will be composed of Local Societies and of individual master engineers from cities and towns where no Locals exist within their respective Provinces.

THE PROVINCE OF ALBERTA

Provincial Vice-president—James Marr, Calgary.

THE ALBERTA SOCIETY OF DOMESTIC SANITARY AND HEATING ENGINEERS.

OFFICERS:

President—R. J. Priestly, Calgary.
Vice-president—F. Hicks, Lethbridge.
Secretary-treasurer—Bert Phelps, Calgary.

EXECUTIVE COMMITTEE:

F. G. McKnight, Edmonton
J. Marsh, Medicine Hat.
F. Gothard, Wetaskwin.
E. J. Franklin, Tabor.

The craft in Alberta are urgently requested to affiliate with their Provincial Society and show that broad spirit of fellowship, for which the West is justly noted, by co-operating with one another to the end that the Sanitary and Heating Engineers of Alberta shall become 100% organized. Forward your name to Secretary-treasurer Bert Phelps, c/o Phelps Bros., Calgary, Alberta, or write to any of the above officers for particulars. Watch this page in each issue, and remember our motto—

ALL FOR ONE
and
ONE FOR ALL.

Yours for co-operation,
FRANK R. MAXWELL, President.

Finds One Line Helps Sell Another

D. N. Flander, of Ingersoll, Ont., Finds Selling Stoves and Tinware Helps the Plumbing Business and Keeps Himself and His Staff Busy all the Year Round—Plans to Take on More New Lines

Based on an interview by C. E. PARSONS with D. N. Flander, of Ingersoll, Ont.

"KEEP business humming" is the plan on which D. N. Flander, of Ingersoll, Ont., works. Stoves, plumbing and tinware are the foundation on which he has built so successfully that he is planning now to add a general hardware stock as well as electrical goods. In the meantime he is steadily increasing his turnover of stoves and tinware as well as looking after a plumbing trade that takes his men many miles out in the country. Ingersoll, it might be mentioned, is located right in the centre of one of the very richest dairying districts in Western Ontario. There are a number of condensers and milk factories within a few miles of the town. This naturally means that the farmers get cash for all the milk they haul in and every day they haul in large quantities. So much ready money means comfortable homes, well equipped dairy barns, up-to-date machinery and so on, and Mr. Flander is there to sell them the very best he can get in the lines he handles.

Insist on the Best

"The farmers of this district," he said to SANITARY ENGINEER, "have the money to spend and insist on having the best. If it is a stove a few dollars is neither here nor there; they want a good one. If it is plumbing, it must be the latest and the best. The same applies to tinware. Take dairy pails, for instance. Some days I sell as many as forty. I get one of the best dairy pails I can buy and then improve it by soldering around under the rim at the top. This is the point where a dairy pail always starts to go first. The farmers know this from experience. Many of them know also that the pails I sell them, soldered at the top, will outlast the others by a long way. They not only come to me for them, but they send their friends."

Keeping lots of goods out where people can see them is one of the best ways of keeping stock turning over, says D. N. Flander, of Ingersoll, Ont. Mr. Flander keeps his goods in spotless condition, and besides his shop display uses newspaper space regularly to tell the people of his district what he has to offer.

One Helps Another

Mr. Flander finds that carrying stoves and other lines helps his plumbing business. For instance not long ago a farmer came in to see about getting a stove. Mr. Flander sold him a good one and got talking to him about house improvements, bathrooms, etc., and finally sold him an outfit that cost $1,250. This is not an exceptional case at all. Mr. Flander has made many such deals.

"Stoves are one of my big lines," he stated. "The sales would average all of 200 a year. I find it a good steady business. I work on as nearly a cash basis as possible. Most of the farmers in this section are not only ready but willing to pay cash for all they buy."

Has Window Displays

As will be seen from the accompanying photo Mr. Flander keeps one of his show windows especially for stoves and the other for plumbing displays. In his store arrangement stoves are kept where everyone who comes in can see the stock and inspect it at will. On one side of the store the display of kitchenware and enamelware is made.

"The best way to keep the stock moving is to keep it out where people can see it," said Mr. Flander. "I try to keep everything as neat and attractive as possible. It makes a big difference in selling such lines as stoves and tinware. If the stoves are dusty people are quick to size up the whole store as being a second-rate affair. But if they are clean and shining and the tinware and enamelware is all looking its best they like to inspect it and most of the people who start looking things over are interested, and we sell them."

Want Combinations

"The great call lately," said Mr. Flander, in discussing his stove sales, "is for combination stoves. People want a first-class stove that will burn coal, wood or gas. I have sold a lot of these. A satisfied customer is one of our best advertisements. Many of the women who work with stoves bought in my store never tire of praising the stoves to their friends and they show them how they work and all about them. The other women naturally want a stove just as good and come in to see about them."

Mr. Flander has developed a good business in repairs of all kinds. This has grown so that now he keeps two men busy all year round doing nothing else but repairs. In a district like Ingersoll, where there is a lot of dairying equipment, such jobs as require the services of a tinsmith are frequent. There are also a lot of plumbing jobs to look after and also stove repairs to make.

Make Them Salesmen

In the plumbing repair work Mr. Flander aims to make every one of his men a salesman. If he gets a call for a repair job the man goes and looks it over and decides whether it would be best to make repairs or to install a new part. Then he reports to Mr. Flander and if, as is generally the case, the inspection shows it would be better to put in a new part than to attempt to fix the old, Mr. Flander takes the matter up with the owner.

"It is better for me and better for the owner usually to have a new part put in," said Mr. Flander. "Very often the part that needs fixing is old and worn out, and if it were fixed it would only be a short time before it would be giving trouble again. I explain all this to the owner and he can see for himself that I am advising him in his own best interests. It may cost slightly more to put in the new work, but once it is in he has a job that will not give him any trouble again for years. Most of the people understand this and appreciate any advice of this kind we give them. Very often when we suspect the job to which we are called is likely to be one in which a new part is going to be needed the man takes the part with him when he goes. I find that people almost invariably accept our recommendation as to what should be done, as they look to us to know.

Uses the Newspapers

Mr. Flander finds that newspaper advertising, backed by window and store displays, is one of the best ways of keeping his stock and his name in the minds of the public. He is a regular advertiser in the local paper and says he gets good results from his efforts. He usually uses a two column space, four inches deep.

In addition to handling 200 stoves and ranges a year, Mr. Flander has been selling from fifteen to twenty automatic oil stoves each season. He says that sales in this line are increasing. Mr. Flander in sending out stoves and ranges does not follow the plan of many dealers, that is, of putting the stove up in working order in the home. If the farmers or other buyers want the stove delivered and set up in their house Mr. Flander makes a charge for this.

APPOINTED ADVISORY ENGINEER

A. J. McPherson, of Regina, has been appointed advisory engineer to the Bureau of Public Health at Moose Jaw, Sask., in succession to the late T. A. Murray. Mr. McPherson will also act in an advisory capacity to the Local Government Board, and it is expected that, in the event of any action being taken in regard to the supplying of water to southern cities from the South Saskatchewan River, the superintendence of the scheme will be a part of Mr. McPherson's duties.

Provincial Board of Health Demands Complete Sewage Disposal System at Woodstock

IN connection with a new intercepting sewer that is planned at Woodstock, Ont., at a cost of $110,000, the Provincial Board of Health, after going into the matter has ordered that full provision must be made for the total disposal of the sewage. The original plan, as submitted by the city council for the approval of the Provincial Board of Health, did not include any provision for the disposal of the sewage, the idea being to provide first for the construction of the sewer and to leave the matter of sewage displosal for future consideration. When the plans were first submitted to the board they advised that convertible sedimentation tanks be added to the scheme.

Demand Complete System

At a later conference the provincial authorities declared, after going over the plans that it will be necessary for the city to install the activated sludge process of sewage disposal in connection with the intercepting sewage plan, and advise that the whole system be installed at the same time. The provincial authorities intimate that their approval will not be forthcoming until the complete scheme is provided for in the plans.

As it is necessary for the city to go ahead with the sewer plan without further delay, a writ already having been issued against the corporation in connection with trouble at Cedar Creek, and the added fact that this is the only way in which the approval of the Provincial Board of Health can be secured, the modified plans will be gone ahead with at once.

WILL LAY WATER MAINS

At a meeting of the Water Works Commission of St. Catharines, Ont., a by-law was passed confirming an agreement with the Township of Grantham for a water supply for domestic use in Niagara Gardens. Work on new mains will proceed shortly.

MAY CONSTRUCT BATHING POOL

In order to save the lives of children and reduce the death rate from drownings in the river, the city council at Sarnia, Ont., has under consideration a plan for the construction of a public swimming pool. Estimates of the cost are to be secured.

OFFICES IN NEW YORK

The general offices of the "X" Laboratories have been removed from Boston to 25 West 45th St., New York, and both the executive and sales departments will be located here. The factory remains in Boston, but the erection of another factory in or near New York is planned.

Putting "Pep" into Advertising

There is a Big Difference Between "Advertising" and "Publicity"—Real Advertising is the Greatest Business-Building Force Yet Discovered — Keep Your Copy Newsy and Full of Interest to the Buying Public

SOMEBODY has said that trying to run a business without advertising like winking at a girl in the dark, you know what you are doing but nobody else does. There is a whole lot of truth in this statement. The man who invests his money in a stock of goods today and then waits for people to come in and buy them may eventually dispose of them. But if he lets the people in his vicinity know that he has got in his stock and tells them all about what he has to offer, there is absolutely no question that his goods will move and keep moving, just in proportion to the advertising he does. Advertisements that are full of "pep" and have a real message to the buying public are not only read with keen interest, but have a real value in attracting buyers. Nothing that has yet been discovered will bring more business than advertising.

Value of Advertising

Remember that there is a tremendous difference between "advertising" and "publicity." Advertising is the life-blood of modern business. It has enabled those who use its forces intelligently to build, and build, and keep on building, an ever-expanding business. The great buying public, and that includes practically everybody, is interested in your message if you have got something of real interest to tell them. People will always read a well-written, catchy ad., while they will almost invariably pass over an uninteresting ad. with a mere glance. Some business men succeed in keeping thousands of people constantly on the look-out for their advertisements and they do it by keeping them interested. The people want to see "what So and So is advertising to-day." Ads. of this kind are always worth studying. They are worked out along certain definite lines and they produce certain definite results, the most important of which is bringing a constant stream of business.

Look over the ads. reproduced in connection with this article carefully. There may be a number of points in them that you can adopt with profit in arranging your own copy. Make your advertising message as simple and direct as possible. Illustrations lend value to ads. in which some special line is offered, as people always like to see a picture of what is offered. If you are going to use electros get good clear cuts, as smudgy cuts detract from an advertisement.

A Big Difference

One of the greatest differences between "advertising" and "publicity" may be shown very simply. A great many business men had the idea that if they used a very small space in their local paper and used it only occasionally they were advertising. Everyone has seen and can see even yet little one-inch spaces inserted maybe once a month, maybe once every three months, something along this line, "John Smith, Plumber, 66 King Street." The writer has often asked these men about insertions of this kind, what results they got and what results they expected, and what they thought about advertising. Their replies bear a remarkable similarity. In general they will tell you that their idea is to keep their name before the public. Some of them will even tell you that all they put the notice in for was because they felt it their duty to help support the home paper. Many of them will tell you that their "advertising" has not produced any very startling results.

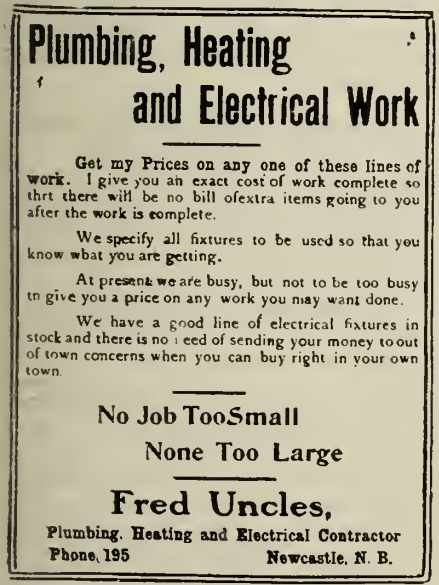
Have a Lot to Learn

These chaps have a whole lot to learn. To start with they haven't one idea of what real "advertising" is. They think because they buy space to the extent of $5 or $10 in a year that they are doing something. It is true that their effort, small as it is, is better than no publicity at all, but real "advertising" is as much bigger and better than the modern express train is ahead of the old-time stage coach. No man should expect to spend $5 or $10 a year for a bare announcement of his firm location, and business, and expect to build up a trade that will force him to erect a bigger shop. The men who have built up enormous businesses by advertising are the men who have used space and have used it conmoney, but they have taken in many times more than they paid out. These men did not try to move a Mogul engine with a toothpick.

Must Be Persistent

Advertising to be successful must be persistent. It is no use putting in an ad. two or three times a year. The firms that get results are those which keep their message constantly before the public. They never give people a chance to forget either the firm or what it has to offer and they make their messages so attractive that people look for them and are disappointed if they do not see them.

It takes time and care to look after "advertising," but the results are worth many times the efforts. Advertisements to "pull" must be varied. You may tell about the same line of merchandise each time, but you can inject into the ad. mat-



Plumbing, Heating and Electrical Work
Get my Prices on any one of these lines of work. I give you an exact cost of work complete so thrt there will be no bill ofextra items going to you after the work is complete.
We specify all fixtures to be used so that you know what you are getting.
At present we are busy, but not to be too busy to give you a price on any work you may want done.
We have a good line of electrical fixtures in stock and there is no need of sending your money to out of town concerns when you can buy right in your own town.
No Job Too Small
None Too Large
Fred Uncles,
Plumbing, Heating and Electrical Contractor
Phone, 195 Newcastle, N. B.

This is a good straight from the shoulder appeal, the kind of a talk that will interest every householder or others who have plumbing or electrical work to do and are looking for service and efficiency. An ad. of this kind should produce excellent results and establish confidence in the proprietor and his shop. The reproduction is half the size of the original ad.

How about a Bathroom in your House?
Why not let us instal a pumping outfit as illustrated here so that you will be saved the trouble of pumping water for the stock while you are busy in the field.
Haying will be here in a few weeks, hoeing and then harvest and to be relieved of the burden of pumping water will make it easier for you. Ask us to call and see what you require. We will be glad to do so.
Noble & Rich
SANITARY AND HEATING ENGINEERS.
Phone 538 London, Ont.

Going after business aggressively is one way of getting it. The ad. shown above is one used by Noble & Rich, of London, Ont., in papers in towns from 15 to 20 miles away. In this way they make a direct appeal to a rich farming territory, and secure a lot of out-of-town trade. The original ad. was twice as large as that shown above.

ter that will carry a wide appeal to the buying public in general.

How They Do It

There are different ways of doing this. Some firms adopt the plan of telling people about their goods, how they are made and what they will do and all about them. This is a very popular form of advertisement. Most people like to read about equipment and what it will do and how it is made and so on. Other firms adopt the plan of using attractive cuts, quoting prices and giving a short, snappy description. Ads. of this kind nearly always reach the people interested in buying at once and bring them to the store to ask for further information. Then it is up to the salesman to close the deal. Advertising of this kind has produced some splendid results. Another very effective method of producing sales is to feature some single line in each advertisement. For instance, bath tubs may be advertised. In this case an illustration of a handsome bath tub is shown. Along with it is an advertising talk about its value in the home, the service it will give, cost of installation and so on.

Like Illustrations

It is a good plan to use illustrations, but care should be taken to see that good cuts are secured. Everyone who is interested in the goods advertised likes to see a picture of what it is like. It is remarkable how people will carry in their minds pictures they have seen of goods advertised. It impresses them. If the price is given they almost invariably remember both the goods and the price. Any number of firms state that they have people come in from all parts of the country and ask for this or for that article which was advertised as such and such a price. If poor cuts are used the effect of a good ad. is spoiled, as the illustration is likely to turn out a mere blot instead of a sharp, clear representation of an article of merchandise.

A Big Advantage

One of the big advantages of advertising is in the wide territory that is covered, and covered thoroughly. Advertising works night and day. It never stops. Your ad. will be read by the man in the city or town, it will be read by the farmer's wife miles out in the country, and by buyers over a wide area. If the message is well written and newsy they will read it with interest. If it contains nothing but mere words the chances are they will merely glance at it and pass on to some ad. more interesting.

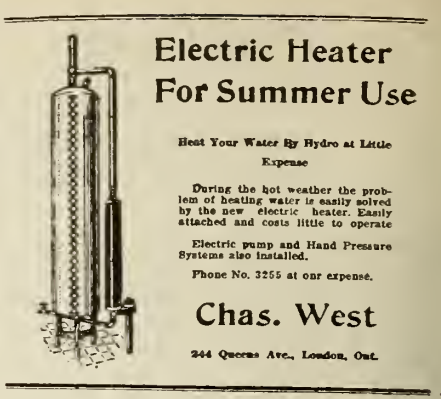
Sanitary and heating engineers who are located in towns and cities back of which are extensive farming communities should pay special attention to the messages they send out. The farmers are becoming big buyers of anything that will make their homes better. There is an enormous field in the farming districts for the sale of sanitary conveniences, bathroom equipment, water pumping plants and other lines. The farmers have the money to buy these things and they are buying them as never before and the dealer who stocks these goods and then lets the people know where they can get them is laying the foundation for some real business.

Pays to Be Aggressive

It always pays to be aggressive and never more so than in advertising. The buying public likes the merchant who shows that he is alive and has a real message for them. They will come to his shop and will talk about it to their friends, and come back again and again. This is why some of the firms who have not been afraid to advertise generously have reaped such rich rewards. These firms appreciate fully the value of having people look for their ads., of having them come to their stores regularly and of having them talk about the bathroom fixtures they bought from Jones, the electric iron they saw in his window or other things.

Do It Systematically

If you are going to advertise do it systematically. Set aside a definite amount of money each year for advertising and then see that your copy is changed regularly, and that each advertisement that goes in has something of interest. Remember that if you let the same ad. appear day after day, or week after week the effect on the buying public is somewhat the same as if you get apple sauce and bread and butter for breakfast, dinner and supper all through the week. Naturally you would lose interest in bread and butter and apple sauce, in fact, you would get sore at not having any change. The public is the same. You may tell them about the same things each time, but tell them in a different way.



Electric Heater
For Summer Use
Heat Your Water By Hydro at Little Expense
During the hot weather the problem of heating water is easily solved by the new electric heater. Easily attached and costs little to operate
Electric pump and Hand Pressure Systems also installed.
Phone No. 3255 at our expense.
Chas. West
244 Queens Ave., London, Ont.

This reproduction, which is half the size of the original, shows how Chas. West, of London, Ont., goes after out-of-town trade. The ad. was taken from an Exeter paper, Exeter, Ont., being thirty miles north of London. In the territory between many hundreds of farmers, who can easily obtain Hydro power, reside.

ADVERTISING AND A WOMAN

There was a man in our town
Who wasn't wondrous wise,
He thought that he could build up trade
And never advertise.

He never told his wife a thing
About his business, and,
Of course, as she was ignorant,
She couldn't lend a hand.

One evening when he came back home
His wife, a keen expert
In bargains, showed what she had bought
At prices cheap as dirt.

At once he saw that they were goods
From his competitor,
And with a gurgling cry of rage,
His voice arose for war.

"Now, John," she said in soothing tones,
When he had fired his shot,
"How should I know that these here goods
Were like what you have got?"

"I saw the advertisement in
The cars and thought that I
Could save you quite a little sum
On what I had to buy.

"And so I bought this lot of goods.
Like everybody buys,
With ordinary business sense,
From firms that advertise.

"If you had goods like these to sell,
You never told me so,
And as you kept it to yourself
How ever could I know?"

There is a man in our town,
Some wiser than he was.
But never do his ads. announce
His wife to be the cause.

—W. J. L., in *Fame.*

MORNING EXERCISES FOR THE TIRED BUSINESS MAN

Stand in the middle of room, raise arms slowly overhead, take deep breath and say "Damn the Government!" lowering arms in attitude of despair. Ten times.

Extend body flat downward on floor, cover eyes with hands, kick heels, think of the railroads and weep till dry.

Kneel, wring hands, meditate upon the labor unions and groan 150 times.

Assume sitting position, hands on hips, sway gently to and fro and concentrate on the Department of Trade and Commerce until a generous frothing at the mouth sets in. Till exhausted.

Collapse on floor. Grovel vigorously, think of the income tax and gnash teeth as in anger. Ad lib.

Note. — Observe this simple regimen every morning before breakfast and you will reach the office with most of the cares and troubles of the day already out of your system.—Adapted from Commerce and Finance.

Cartage Rates Are Increased

Three Big Railways Put New Schedule Into Effect on September 4th in Ontario and Quebec—Higher Wages for Employees and Shorter Working Hours Are Given as the Reason

ADVANCES in cartage rates in Ontario and Quebec which will affect a number of lines of hardware goods are announced by the three largest railways, the Canadian Pacific, Grand Trunk and Canadian National. The new rates will go into effect on September 4. Just what action the other railways will take is not yet known, but it is generally expected that they will also advance their cartage prices.

The railways give as their reason for revising the rates that the shorter hours demanded by employees and the higher wages they are now being paid make it imperative that cartage prices be increased unless business is to be carried on at a loss.

Affects Hardware

The hardware line on which advances will be made are as follows: conductor pipes, garden utensils, iron farm gates, woodenware, eavetroughing, stove pipes and elbows, lamp chimneys.

Advances which indirectly may affect hardware dealers are made in broom stock, and dry hides.

It is stated that even at the increased prices the cartage rates in Canada will be much lower than are in effect at American points.

As the cartage companies do not come under the jurisdiction of the Railway Board or any other bodies at Ottawa, no protests can be made by merchants or manufacturers. If they do not like to deal with the cartage companies they are at liberty to make any arrangements they wish for deliveries of goods.

The New Tariffs

The new tariffs provide for the following increases: On carload lots from 4½c per 100 pounds to 5c, and on less than carload lots from 6c to 7c per 100 pounds.

On "smalls," 300 pounds and under, the charge is raised from 25c to 30c per 100, and over 300 pounds from 35c to 40c, a straight increase of 5c per 100 pounds.

		Carloads	Less Carloads	SMALLS Minimum charge in cents for any one consignment	
		Cents per 100 lbs.		300 lbs. and under	Over 300 lbs.

A cartage service is maintained at the points shown in the above table and cartage charges are to be collected in addition to the freight charges the railways state. These cartage charges will be based on the actual weight subject to the minimum provided in the Canadian Freight Classification.

The details are shown in the table of rates reproduced. The rates to Bothwell, Chatham, Glencoe, St. Thomas, Thamesville and Tilbury on all shipments, to Hamilton, London and Windsor in carloads, and to London in less than carloads are the only ones that do not show an advance.

The cartage charges shown in the table herewith will not apply on:

(1) Freight carried under Canadian Freight Classification classified lower than fifth class.

(2) Freight carried under other classifications which may classify therein 5th class or higher, but which is lower than 5th class in Canadian Freight Classification.

(3) Freight weighing 2,000 pounds or over, per piece or package.

(4) Freight in bulk, carloads, classifying 5th class or higher.

(5) Freight for private house delivery.

Acid in carboys or demijohns, agricultural implements, ash sifters, baby carriages, baskets, baths, boats, bone black (in bags) brooms (straight shipments), churns, cream separators, doors, windows, door and window sashes and frames, including skylights and ventilators, metal or wooden empty packages and containers, new or old, except when K D flat, whether loose, nested or jacketed, in crates or boxes or otherwise; excelsior, furnaces and parts thereof; furniture, sewing machines, including clothes lockers, metal or wooden; glass in packages exceeding five feet in height or length; joiner's work, loose lumber and ladders, lamp black in bags, loose leather, machines and machinery of all kinds, portable buildings, scrap paper and scrap rubber in bags or uncompressed bales, safes and vault doors, screen doors and window screens, stoves and parts thereof, trunks, globes, glass and electric bulbs; iron and steel products exceeding twenty-five feet in length; trunks, empty or full; vehicles, automobiles, bicycles, motorcycles and parts thereof, including tires; washing machines.

F. H. Scholey, recently with F. H. Lepper & Co., Calgary, and for several years with Cotter Bros., of Winnipeg, has accepted a position as traveler with Metals, Limited, of Calgary.

Prevent Communicable Diseases

Federal Minister of Health Should be a Cabinet Minister, Declares President Arthur Rigby at Annual Convention of the Western Canada Sanitary Inspectors' Association—Many Important Matters Were Discussed at Saskatoon Gathering

"PERSONALLY I am of the opinion that the Federal Minister of Health should be a cabinet minister. We have ministers of agriculture, marine, public works, and other departments. These touch only sections of the community. Public health affects every person in every community. If we can only get the public to see this I expect to see a division for the prevention of communicable disease."

This view, expressed at the sixth annual convention of the Western Canada Sanitary Inspectors' Association by President Arthur Rigby, of Winnipeg, was listened to with the keenest interest by delegates and civic officials from Ontario, Manitoba, Saskatchewan and Alberta. The meeting was held at Saskatoon and lasted for two days.

President's Remarks

"During the past year," continued President Rigby, "as a result of the efforts of the Saskatchewan members of the association, a most important clause was inserted in the Saskatchewan Public Health Act, defining the status of a sanitary inspector as one recognized by our association. The Union of Municipalities of Manitoba also passed a resolution recommending the appointment of qualified men. Our present membership is sixty-three and we have twenty-seven associates.

Only Promises So Far

Strong efforts were made to induce the Manitoba Provincial Board of Health to appoint sanitary inspectors, or at least to see that municipalities appointed only qualified men. This board, apparently, unlike other provincial boards, is not seized with the importance of this work, and has not done anything in spite of the repeated promises of consideration."

Mr. Rigby gave a brief outline of the progress made by the association since its inception in Regina in April, 1912. At that time a temporary constitution was drafted and officers chosen. He also spoke of the Great War, the work done by Canadian soldiers, and the work to be done in the period of reconstruction.

Spirit of Service

"So much for the past," continued President Rigby, "and now what is our object for the future? I have made reference to those members who paid the supreme sacrifice. I wonder if for the future we might not catch some of that spirit of service which these men so ably exemplified in life and death.

"An old Greek orator, speaking of their dead, after one of their numerous wars, said: 'These men gave their bodies for the commonwealth and received for his memory, praise that will never die. And with that the grandest of all sepulchres—not that in which their mortal bones are laid, but a home in the minds of men, where their glory shall remain fresh to stir speech or action as occasion may call.'"

Importance of Prevention

President Rigby thought that the members of the association were too modest, and that they should never lose on opportunity to impress on the powers that be, through their health officers, health committees, and the minister of the crown having the direction of public health affairs, the importance of the prevention of diseases; and that, while all honor should be given to the realm of curative medicine, it should be recognized that prevention may render a considerable part of that service unnecessary.

During the war 22 members of the association enlisted and five made the supreme sacrifice.

Urges Co-operation

At the afternoon session Dr. Arthur Wilson, Medical Officer of Health for Saskatoon, gave a splendid paper entitled, "A Vision of Public Health." He emphasized the extremely important results which would follow better co-operation between the health officials and ratepayers which he believed would redound to better conditions in every city and town.

In order that diseases and epidemics may be prevented, he asked that the local health officers get in close touch with the inhabitants of the town or city where they are employed, in order that the public in general will be better educated in the means which will prevent communicable diseases.

Home Comes First

An interesting discussion on housing conditions was led by E. W. J. Hague, Assistant Chief Sanitary Inspector of Winnipeg. In his discussion of the subject of housing, which is now occupying the attention of the Dominion, Provincial and local Governments, Mr. Hague stated that the home comes first, and if the homes are unclean no community will have good citizens.

"Society must teach the child to be cheerful, for if he grows up in an atmosphere of filth he cannot be expected to be a good member of society," said Mr. Hague. "In the past, houses were usually built to sell, not for the chief purpose of housing a family."

Must be Sanitary

Mr. Hague urged that some plan should be evolved whereby the municipality be empowered to construct houses which could be sold to the working man and that the houses be built on sanitary plans. He also insisted that before a newly-constructed house is allowed to be occupied that it be inspected by the health inspectors. In support of his contentions the speaker cited numerous authorities, the majority of whom had made a study of tenement conditions in the larger cities of the United States.

Working Men's Homes

Thomas Watson, delegate from Moose Jaw, urged that a movement be started the realization of which would enable the various municipalities to borrow money from the federal Government with which to erect homes for working men. He urged that the reason why money be handled by the municipalities was that it would prevent speculation. In order that the health of the Dominion may be kept better Mr. Watson said that no town sites should be allowed to be placed on ground which is low, regardless of whose material interests may be affected. He also emphasized the need of building lots which are of greater width than 25 feet.

See Filtration Plant

The second day of the convention opened by the delegates paying a visit of inspection to the city's filtration plant, through which the members were piloted by G. D. Archibald, C.E., city engineer. Later they went to the university and experimental farm and the public schools.

In the afternoon the delegates were taken for a practical demonstration of scientific house construction to the model "thermos" house in Nutana, which was thoroughly explained to them by Mr. H. Gauvin.

Two papers were read before the convention, "Garbage Disposal, Efficiency Combined with Economy," by S. E. Whiteside, A.R.San.I., Medicine Hat, Alta.; and "Sanitation at the Front," by R. M. Murray, sanitary engineer, provincial bureau of public health.

Tendered Banquet

The convention came to a close by a banquet in the Masonic Building, tendered to the visiting delegates by their Saskatoon fellows. President Rigby, of the association, proposed the opening toast, "The King," which was followed by a song rendered by Mr. Alexander

Saving Fuel in Heating a House

By L. P. BRECKENRIDGE and S. B. FLAGG

The total output of coal in the world during the calendar year 1913, according to a Government report,* was 1,443,393,052 short tons, and of this enormous amount 39.5 per cent., or 570,048,125 tons, was mined in the United States. Probably 10 to 15 per cent. of the coal produced in this country went to purchasers who used it largely for heating dwellings. The Federal Government uses a large quantity of coal for heating the many small buildings occupied by its various departments and bureaus, and is therefore directly interested not only in selecting proper fuels, but in obtaining the best possible results from their consumption. Because of this interest on its own account and the widespread interest of householders the Government some years ago conducted tests to determine the relative value, for use in residence-heating boilers, of several typical fuels.†

The value a householder gets from the fuel he burns depends largely on the character of the heating apparatus, the conditions under which it is installed, and the manner in which the fire is handled. The authors, from experience in firing residence-heating apparatus and from observing the methods employed by many who attend to such apparatus, keenly appreciate the importance of proper firing methods, and have written this paper in the belief that some general remarks on the selection, care and operation of residence-heating apparatus may prove of value to many who are interested in burning fuel in the most economical manner.

There is the first instalment of the fourth of the series of Engineering Bulletins issued by the United States Fuel Administration in collaboration with the Bureau of Mines, Department of the Interior. This series is receiving very favorable comment. In the next instalment on "Saving Fuel in Heating a House," "Factors Governing the Consumption of Fuel and Convenience of Operation" will be dealt with. This fourth article covers the saving of fuel in house heating thoroughly and should appeal to every heating engineer. There will be three instalments. Keep them all for reference. — EDITOR'S NOTE.

Fuels Used For Heating Residences

MOST people when fuel for residence heating is mentioned think of the particular kind that they are accustomed to use, but, of course, all people do not use the same fuel. Locality, climate, cost, and other considerations govern the choice, and the fuel used may be wood, anthracite, bituminous or subbituminous coal, lignite, peat, coke, oil, or gas. Even electricity may be used.

Wood

Wood is little use for heating residences except in those regions where it is plentiful and other fuels are relatively expensive. Some people in places where coal is the usual fuel burn wood in open grates because of the cheerful appearance of the fire, but the quantity of wood available for fuel is becoming less and less. Because of the relatively high percentage of water in wood—usually between 15 and 40 per cent.—the amount of heat obtainable by burning a pound of wood is relatively small.

Anthracite

Many people select anthracite for residence heating because it is clean, but additional reasons are its fairly high heat value, the relative ease with which a reasonable proportion of this heat value can be realized by heating apparatus, the easy control of the fire, and particularly the long period for which the fire may be left without attention. But anthracite is becoming more expensive and therefore its use is being restricted.

Bituminous Coals

The bituminous coals vary so much in composition and in physical characteristics that they can hardly be considered as one class. In general it may be said that the bituminous coals mined in the Eastern part of the United States are of higher rank than those produced farther west, having usually a greater heat value, less inert matter (or ash), less moisture, and a smaller proportion of gaseous constituents, or, as these are ordinarily termed, volatile matter. Bituminous coals also differ widely in coking properties; those mined in the Eastern States tend to coke or cake together when heated in the furnace, and with many of them the tendency is very decided, whereas coals of the same general class mined in some of the States farther west have little or no tendency to coke, and still other western coals have much the same coking properties as do the eastern coals. The bituminous coals constitute a large part of the fuel used throughout the country for heating purposes, for the reason that they are the most readily available and the cheapest fuel.

The different bituminous coals vary greatly in heat value, some of them ranging as high as 14,700 and others as low as 8,500 or 9,000 British thermal units per pound, a British thermal unit being the quantity of heat required to raise the temperature of 1 pound of water 1° F. Ordinarily, the heat value of a fuel is determined by burning a small quantity of the fuel inside a water-jacketed steel bomb containing oxygen gas under pressure. The heat generated by the burning of the fuel raises the temperature of the water surrounding the bomb and by knowing the quantity of fuel burned, the amount of water in which the bomb is immersed, and the rise in temperature of this water, it is possible to compute the number of heat units that 1 pound of the fuel will generate.

Subbituminous Coal, Lignite, Peat

Subbituminous coals, lignites, and peat are ordinarily used within comparatively short distances from where they are produced. Both the subbituminous coals and the lignites slack or break into small pieces on exposure to the air. This unfavorable feature and the further fact that neither of these fuels can be stored without danger from spontaneous combustion, as well as the usually low heat values, limit the area within which they can profitably be transported and used.

The peat bogs in the United States have not been largely utilized as sources of fuel, because of the abundance of fuels of higher grade. Most peat when dug from the bog contains 90 per cent. by weight of water, and the commercial processes of making peat fuel involve maceration of

*Parker, E. W., The production of coal in 1913; Mineral Resources U.S. for 1913, U.S. Geol. Survey, 1914, pt. 2, p. 783.

†For results of these tests see Randall, D. T., Tests of coal and briquets as fuel for house-heating boilers: Bull. 27, Bureau of Mines, 44 pp.

the wet peat, moulding into bricks, and drying by exposure to the air. Artificial drying in ovens or kilns is possible but is expensive. Because of the cost of preparing peat fuel and the abundance of other fuels in this country, it is probable that the use of peat for heating residences will not increase greatly in the near future.

Coke

The coke used in residence heating is obtained from three sources: (1) from retorts of coal-gas plants, as the residue after the gas has been driven from the coal; (2) from by-product coke plants, which are built to produce coke and to obtain gas and other by-products; and (3) from beehive ovens, which are built to produce coke only. In some places retort coke from coal-gas plants has long been used for residence heating, but until recently the quantity so used has been small. Beehive coke is not extensively used as a household fuel, but in some places the demand for it is considerable and its use is increasing. By-product coke ovens are increasing rapidly and household use of by-product coke is growing apace. Lack of information as to the proper methods of burning explains largely why coke has not been more generally used. Recently manufacturers and distributors of coke have done much to supply such information, and have emphasized the advantages of coke as a household fuel, the principal one being cleanliness.

Fuel Oil

The use of oil fuel for house heating, except in the small kerosene stoves employed by some people to supplement other means of heating, is confined almost entirely to those districts where oil is plentiful and the price of other fuel is relatively high. Oil-burning stoves are used with wickless ("blue flame") burners in which the fuel is vaporized after the stove has been given a preliminary warming. The distillate used in such stoves somewhat resembles ordinary kerosene but is slightly heavier. These stoves would hardly prove satisfactory for heating dwellings in localities where winters are severe, but they serve well in places where the climate is relatively mild and heat is required only at times and for a few hours at a time.

Gas

Gas is the ideal fuel. Within the last few years the use of gas stoves for cooking has not only become common, but in many cities is displacing stoves using other fuels. Lower prices for gas are largely responsible for this increase, but convenience and cleanliness are factors of possibly equal importance. The gradually increasing cost of anthracite is causing not a few people to consider gas as a fuel for residence heating and it is probable that the use of gas heating appliances will increase. In some localities natural gas is so cheap that its use is common and continues until the cost of transportation from distant fields makes the price of this fuel prohibitive.

Heating With Electricity

Electricity is little used as a principal means of heating dwellings, except in those localities where hydro-electric plants have been erected in connection with irrigation projects and the demand for current for power and lighting is still too small to make an economical load for the generation station, thus making advantageous the sale of current at a low rate for heating purposes. If, as sometimes happens, the cost of coal or other fuel for domestic heating is high in such localities, it may be possible to heat by electricity without great increase of expense and with a minimum of work and inconvenience. Under conditions other than those just mentioned, the cost of heating by electricity, except for short periods when a supplementary means is required, will probably for some time be high enough to prevent a large use of electric heaters. The reason for this is that in present methods of generating electric power in large stations the heat derivable from a certain amount of electric energy is only a small part—between 7 and 20 per cent., according to conditions—of the heat represented by the solid or liquid fuel required to drive the generators. In other words, the conversion of fuel energy into electrical energy involves such large losses that most people for some time to come will not use electricity for warming dwellings.

Advantages and Disadvantages of the Different Fuels

Some of the advantages and disadvantages of different fuels for residence heating have been mentioned. These and some others that have not been stated are summarized in the following table:

Advantages and Disadvantages of Various Fuels and of Electricity..

Fuel.	Advantages.	Disadvantages.
Wood	(a) Cleanliness, (b) cheerful fire, (c) quick increase of heat, (d) cheap in some localities.	(a) Low fuel value, (b) large storage space necessary, (c) labor [illegible], (d) scarcity, (e) does not hold fire long, (f) unsteady heat.
Anthracite	(a) Cleanliness, (b) easy control of fire, (c) easier to realize heat in coal than is the case with other coals, (d) steady heat.	(a) High price, (b) difficulty of obtaining, (c) slower response to change of drafts.
Bituminous coal	(a) Low price, (b) availability, (c) high heat value (in the best grades), (d) low percentage of inert matter (in the best grades).	(a) Dirty, (b) smoke produced, (c) more attention to fire and furnace necessary than with anthracite.
Subbituminous coal and lignite	(a) Relatively low price, (b) availability (in some regions), (c) responds quickly to opening of drafts.	(a) Slakes and deteriorates on exposure to air, (b) takes fire spontaneously in piles, (c) heat value generally low, (d) heat in fuel difficult to realize, (e) fires do not keep well, (f) gases generated over fire pot sometimes burn in smoke pipe, causing excessive heating.
Peat	(a) In general, the same as for wood	(a) Low heat value, (b) bulkiness.
Coke	(a) Cleanliness, (b) responds quickly to opening of drafts, (c) fairly high heat value.	(a) Bulkiness, (b) liability of fire going out if not properly handled, (c) fire requires rather frequent attention unless fire pot is deep.
Oil	(a) High heat value, (b) immediate increase of heat, (c) cleanliness, (d) small storage space necessary.	(a) High price, (b) difficulty of safe storage.
Gas	(a) Ease of control, (b) cleanliness, (c) convenience, (d) immediate increase of heat.	(a) High price in many places.
Electricity	(a) Every advantage ...	(a) High price.

Methods of Heating Residences

Fireplanes

The first fuel and for centuries the chief one used in residence heating was wood. Heating and cooking operations were often combined and the old open fireplace with its immense chimney served for both purposes, although in spite of some obvious advantages it was not adapted to produce economically and efficiently the heat needed for either. The need of improved devices was probably more keenly felt in cooking than in heating, and the use of stoves for cooking became quite common while the open fireplace, in a modified form, was still employed to heat the house.

In any open fireplace, however, close control of the combustion of the fuel is difficult; and large volumes of air not necessary for combustion are, after being heated, carried up the chimney and must be replaced by cold air from outside, which must be heated in turn. One of the most important considerations in economically utilizing any fuel is proper regulation of the volume of air supplied

the fire. A familiar illustration of this fact is afforded by the mantle burner for gas lighting. In the best makes of these burners there is provision for controlling the supply of both gas and air, the most intense heat, and consequently the best light, being obtained when the supply of both air and gas is properly adjusted.

Stoves

Stoves with dampers in the smoke pipe and with draft slides in the fire and ash-pan doors afforded some regulation of the air supply and in addition served to confine and ocnserve the heat generated so that it could be more effectively utilized. Stoves were developed for burning not only wood but also coal, oil, and gas, although the invention and perfection of more desirable types of heating apparatus served to check the improvement of stoves in this country. In the United States, owing to the comparative abundance and cheapness of fuel, the demand in residence heating has been not only for a high temperature standard but also for greater convenience of operation and perfection of control. In foreign countries much less use is made of what in this country are considered the best methods and equipment for residence heating, but, on the other hand, stoves have been more highly developed there. Some foreign stoves burning what is considered in this country much poorer fuel offer almost the same perfection of control and ease of operation as the anthracite "base burners" or self-feeders," formerly so popular.

Hot Air, Steam, Hot Water

The next step toward greater convenience in heating residences was the substitution of one fire in the cellar or basement for separate fires in each room. To convey the heat from the point of generation to the rooms, three general systems have been developed—air, steam, and water heating.

Hot-air Heating

The simplest apparatus for heating a house, as well as the cheapest in first cost, is the hot-air heating system. The air to be circulated, taken through a duct from the outside of the building or from the lower part of the house, passes through the air passages of the furnace, which are heated by the fire or the hot gases from it, and then is distributed through pipes and registers to the rooms to be heated. The air in the circulating pipes is expanded by heating and becomes lighter than the air that enters the furnace passages or the air in the rooms, so that when the registers are open and the furnace is in operation a stream of heated air enters each room.

As the warm expanded air leaving a register can hold much more moisture than the cooler denser air that entered the heating passages of the furnace, it has a drying effect and may cause cracking of furniture and woodwork in the rooms heated. To reduce the dryness of the air, moisture may be added to it by evaporating water in the hot-air passages of the furnace or in other ways.

Difficulty may also be experienced in heating an exposed dwelling by hot air on a cold, windy day. As the rooms are warmed by the movement of heated air, that is, by the convection of heat, there is more tendency for the windward side of a house to be cold and the leeward side to be warm than when the rooms are warmed, at least partly, by direct radiation from steam or hot-water radiators. Limitation of trouble from this cause will largely depend on how well the house is built.

Steam and Hot-water Heating

When steam or hot-water heating is to be used radiators are placed in the different rooms, usually near the windows, and these are connected with the steam or hot-water boiler in the basement by means of suitable piping. Steam radiators may be smaller than hot-water radiators and yet give off more heat, because the temperature of the steam radiators usually will exceed 212° F., the exact amount depending on the steam pressure in the radiator, whereas hot-water radiators will usually have a temperature between 90° and 180° F.

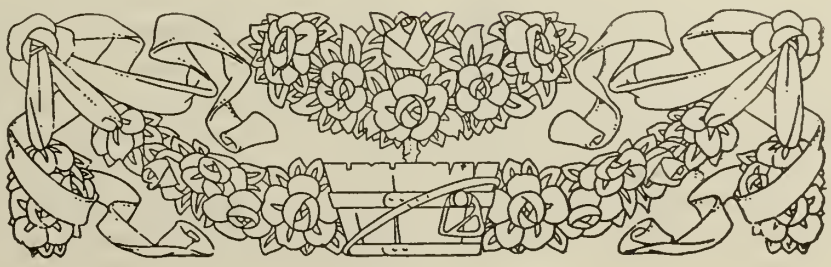
For warming a given space, the first cost of a hot-air system of heating will be less than that of either hot water or steam, largely because of the cost of the radiators, and the initial outlay for steam heating will be less than for hot water. The relative costs of operation, however, are apt to be in the reverse order, although the differences in operating costs will be problematic.

One of the desirable features of a hot-water heating system is the possible range in temperature of the water, enabling the heat to be varied according to needs. Such variation is not possible if the house is heated by the usual low-pressure steam system, neither can the output of a steam radiator be reduced by partly closing the valve, as is possible with a hot-water system, unless the piping and fixtures are rather elaborate. On the other hand, a steam heating system can respond to sudden demands for heat much more quickly and the radiators required are somewhat smaller.

Factors Affecting Design of Heating Apparatus

In the development of new types of heating devices or in the improvement of existing types, the chief factors influencing design are two. The first is maintenance of more satisfactory temperature conditions with the same or less inconvenience of operation, manufacturers of heating appliances endeavoring to produce heaters that will go for longer periods without attention, or can be given necessary attention with a minimum number of trips to the basement. The second factor is the desire to utilize more effectively the available heat in the fuel. Owing to the abundance and relative cheapness of fuel in this country, the incentive to efficient utilization has not been strong, but as the cost of fuel and of other necessaries increases, economy and efficiency will receive more and more attention. Inasmuch as the design of the apparatus is only one of the elements that determine the annual fuel bill, the factors that govern consumption of fuel and convenience of operation are considered here.

Continued in next issue.



EDITORIAL COMMENT

MORE BATH TUBS NEEDED

A HOUSING survey made in one block in the crowded section of New York by the State Reconstruction Commission recently showed that there was only one bath tub in forty-three tenement houses in which 1,700 people were living. This is a state of affairs which calls for action and the sanitary engineers ought to line right up behind the civic authorities and see that something is done. Conditions such as this cannot make for clean living and without clean living good health is impossible. Nothing is given out regarding the sanitary arrangements which existed in this area. They were probably so much better than the bathing facilities that no comment was necessary. It is a fact, however, that in a great number of homes, far more than the average individual would believe, there are no adequate sanitary conveniences and no bathrooms. This is bad enough in any place but in the big cities, where people live so crowded and where there are so many small children, the results are seen unmistakably in the high death rates. There is a big opportunity for the newly-formed Health Department at Ottawa and the local Boards of Health and the municipal councils to co-operate and enact legislation that will minimize the dangers resulting from lack of proper and necessary conveniences in every home. Nothing is of more importance to a country than the national health, or to a community than the health of the individuals comprising it. No reasonable precautions to safeguard public health should be neglected and when the small cost of installation compared with the years of comfort and service that sanitary installations give is considered, there is not the slightest excuse for any home being without proper equipment. There are unfortunately in every community certain tight-fisted individuals who will buck every move to make things better because it costs a little money. The only way to deal with these people is by having by-laws passed and then enforcing the by-laws. Case after case where tenants are suffering because landlords will not provide accommodations have been reported in Canada. Sooner or later every home should have the sanitary conveniences required and it should be one of the first duties of the authorities to see that this is looked after.

CIVIC DILLY DALLYING

ALTHOUGH the Board of Health at London, Ont., some weeks ago recommended to the City Council the appointment of James Young as city inspector nothing has been done except that the Council referred the matter back to the Board. Now the Trades and Labor Council are taking the matter up and state that they are opposed to delaying the appointment any longer. In some quarters, it is believed that the action of the Council has been taken with a view of delaying the matter and if possible having it laid over this year and sent on to next year's council. Mayor Somerville questions where the money is to be secured for paying the plumbing inspector's salary.

This is another example of the manner in which civic authorities trifle with public health matters. The Board of Health has made a recommendation and the Board of Health is supposed to know its business. If there is a serious outbreak of disease the Board of Health will get the blame. One of the most important safeguards of public health is proper plumbing, especially sanitary equipment. If the city of London is like many other Canadian municipalities where there is no plumbing inspector, conditions are likely to prevail that would shock many people if they knew such conditions existed. The idea of quibbling over the inspector's salary, a couple of thousand dollars a year at the outside, strikes one as rather penny wise and pound foolish, especially when an epidemic might easily result that would cause many deaths and put the city to thousands of dollars of expense.

KEEP AN EYE ON THE FARMERS

ALL over Canada farmers in thousands are busy saving a bountiful harvest that will bring to them many millions of dollars. The farmer has always been a big buyer, but under present conditions, with an unlimited demand at high prices for everything he can raise, he has literally money to burn. Thousands and thousands of dollars will be expended in house and barn improvements, in installing water systems, in buying new and improved equipment, installing bathrooms and sanitary equipment, new modern heating systems, and labor-saving

electrical devices. One thing the dealer must always keep in mind and that is that the farmer has got the money. He can afford the best and if the goods are shown to him and explained to him and it is made clear why a water system is going to make things better, or how an electric vacuum cleaner will save his wife time and drudgery he will buy. The farmer, in the next few months, is going to be the biggest buyer in the whole Dominion, and there are endless opportunities for the live plumbing and heating contractor to render him real service and sell a lot of goods. The man who gets the trade will not be the chap who sits down and waits for it to come to him, but who gets busy and interests the farmer in what he has to offer. On another page of this issue of SANITARY ENGINEER it is shown how some firms are reaching out after business through the medium of attractive advertising. This is one way of quickly and effectively reaching a wide territory. Another way is to have an attractive shop and window display. A manufacturer recently stated to SANITARY ENGINEER that there is big business for the man even in the smallest country town who systematically checks up the homes in his district that need equipment and then proceeds to sell it to them. He declares that the owners of the houses without modern equipment will welcome the dealer and buy from him provided he shows them that he has the real goods to offer and knows how to sell.

THE PASSING OF ANDREW CARNEGIE

IN the death of Andrew Carnegie, the world loses a figure that has been of outstanding interest for many years. He will be remembered in the years to come not so much because of his connection with the steel business, nor because he made a fortune that runs into the hundreds of millions but because of his work for young men. In his youth Mr. Carnegie was so poor that he was deprived of the advantages of good reading, and one of the first things he did upon gaining great wealth was to lay plans by which everyone who desired could improve themselves by reading. His gifts in the shape of libraries were not confined to the United States. There are many of them in Canada and in other countries. Just how many millions he gave for this work is not known but it was his earnest desire that all young men should have the opportunities for good reading that he longed for so earnestly when he was a youth and was denied. Mr. Carnegie also gave large sums for the establishment of parks and he was always a generous supporter of educational projects. It is estimated that he gave away in various projects $350,000,000. Just how much he was worth is not known but when he sold out to the Steel Corporation he received $500,000,000 in bonds. Mr. Carnegie laid his success to the fact that he was able to pick men more clever than himself to work for him and he frequently declared that if it came to a choice of losing his money or his partners he would rather lose the money. To young men his advice always was: "Start poor, lean on nobody, assume responsibility and always be ambitious."

A SCOOP

A CONTEMPORARY in an "outburst" caused by SANITARY ENGINEER scooping the Montreal Convention to the extent of publishing the report two weeks in advance of our contemporary, refers to our report as the hash which preceded the meat. It has been our experience that the real meat is generally served first, and the hash is made-up from the left-overs, which after a process of grinding, along with a mixture of other ingredients, is made into hash. The hash is generally palatable, but most of our readers prefer the fresh meat and that is why we publish the news while it is fresh, rather than canning it in cold storage for a couple of weeks before serving. The letters from the president, and immediate past president of the Dominion Association, published in last issue, are self-explanatory, and make it quite obvious that SANITARY ENGINEER'S prompt and extensive report was greatly appreciated by the trade. The report was secured and written by our own representatives, two of whom were in attendance at the Montreal Convention.

Says Association Price Prevails

Plumbers Are Told This Every Day When Asking for Quotations, Says Thomas J. Minnes, of Brantford, President of the Ontario Society of Domestic Sanitary and Heating Engineers in Discussing Dr. McFa ll's Charges

WHILE nothing further has been heard from Ottawa yet regarding the charges made by Dr. McFall, the Cost of Living Commissioner, the matter continues to arouse much interest in the trade. Many of the sanitary and heating engineers as stated in the last issue of SANITARY ENGINEER would welcome a probe into the situation in order to clear the air. As matters stand at present the men in the trade are suffering a good deal from what has appeared in the daily press, editorially and otherwise. This is to a great extent due to the fact that the general public fails to differentiate between the man who does the installing, the jobber, and the manufacturer. To the great mass of people they are all one, and the sanitary and heating contractors feel that they are suffering for the sins of someone else. Many of them state that they will gladly lend whatever aid they can in clearing the matter up and that as far as they are concerned their books are open for inspection at any time.

Is the Matter Dead?

Some of the manufacturers express the view that the whole thing will be dropped and that nothing more will be heard of it. Just what this opinion is based on is not stated.

Thomas J. Minnes of Brantford, Ont., president of the Ontario Society of Domestic Sanitary and Heating Engineers, writes to SANITARY ENGINEER as follows regarding the charges of Dr. McFall:

"Yours to hand asking for my views regarding Dr. McFall's newspaper accusation of manufacturers and jobbers of plumbing materials being in combine.

Association Price

"It is rather a strange request to be made of a master plumber, there being no connection between our class and the man higher up. It would, therefore, be quite unbecoming of me to attempt the offering of an alibi on their behalf, and in event of attempting the same, am sure the said attempt would fall down miserably when one is told every day, upon asking for a quotation on plumbing ware, that the association price prevails.

"Ask any drummer in the line, consult the manufacturers' or jobbers' net prices or discounts on anything from a sink bibb to a bath tub, or from an air vent to a 48 in. sectional steam boiler. Any man who can read can make this accusation as easily as Dr. McFall.

Is Behind Times

"I am afraid the Doctor is many years behind the times. Possibly the Doctor has needed some plumbing goods and sought to buy them direct, and upon being quoted the same price from a half dozen or so jobbers, thought he "smelt the rat."

"Be it understood that I have no other motive or reason in answering your letter than that it may reach the eyes of some of the retail and contracting plumbers, who have been passing the buck for the man higher up for some time, and that he may wise up to the part he has been playing in helping those in question to fatten their batting averages at the expense of the public, without a fair return for the part he has taken.

THOMAS J. MINNES

Of Brantford, Ont., President of the Ontario Society of Domestic Sanitary and Heating Engineers. Read what he says about the charges made by Dr. McFall.

How Do They Do It?

"My greatest fear is that, in event of Dr. McFall making an investigation he may carry it on to the contracting plumber and, finding the shortage of any profits, would demand by what means he obtained a livelihood. It seems to me there are many in the trade who would have a time of it trying to prove an alibi of any suspicion that might be created. However, there is one consoling fact in that the plumbing manufacturers and jobbers are not alone in the envious position which they hold, for it is conceded by most everyone that Canada is in the grip of the greatest combines ever known, no other country excepted.

Causes Unrest

"Figure out any article you wish to purchase by getting the American price, plus duty and war tax, and you have the prevailing Canadian market price, irrespective of cost plus profit. When we see and know the prevailing circumstances, is it any wonder that we have such a tremendous degree of dissatisfaction and unrest?

Gets No Profit

"The one thing that is beyond my comprehension is the way the contracting plumber keeps mum and tries to beat the game with the high cost of materials on the one side, and the high wages on the other side, merely passing the buck on to the public without a legitimate profit to himself.

"If any plumber would take time to think and figure for himself, he would soon see the role he is playing—selling goods for those who protect themselves and worrying about paying his men from $30.80 to $35.20 for 44 hours' work, while he is working many more hours, so that if it were figured at the same rate he would be surprised to find that he was not even making the union scale of wages out of his so-called profits.

"How much longer is he going to pass the buck?

"Yours truly,
"T. J. Minnes."

PREVENT COMMUNICABLE DISEASES

Duguid. The toast "Canada" was proposed by E. W. J. Hague, of Winnipeg, and replied to by Alderman Howard McConnell, of Saskatoon, who represented the city government throughout the convention. Mr. Alan Hancock gave two recitations during the banquet.

"Our association" was proposed by Mr. Cartledge, of Moose Jaw, and replied to by Thomas Watson, provincial sanitary inspector for Saskatchewan. The toast was followed by another song by Mr.Duguid. W. E. Stanley, Fort William, proposed "The City of Saskatoon," to which toast W. H. Appleton, of Saskatoon, made a fitting response. The last toast of the evening was "Absent Members," proposed by A. M. S. Allan, of Regina.

Short was the passage through this vale of care,
By concrete roads that autos used to wend;
But now we travel by the route of air—
A dead engine! we reach the journey's end!

Good Profits in Electrical Fixtures

Brisk Demand For These Goods as Result of Building Boom—Many Sanitary Engineers Taking Advantage of Opportunities Offered—Carrying the Stock to Show Home Builders Good Method of Clinching Sales.

THE splendid revival in building that is now in progress all over Canada opens up opportunities for selling electrical fixtures that many sanitary engineers are cashing in on. Every week sees a big jump in the building permits and it is very significant from the point of view of the man who handles fixtures that a very large percentage of the construction work now under way is for homes of a better class, that is, homes in which there is an opportunity to sell electric fixtures. As has been shown in recent issues of SANITARY ENGINEER, many of the sanitary engineers have been going after this business, and going after it most successfully.

Successful Methods

A case in a Western Ontario town is typical of what is happening in other places. In this town there were two firms handling electrical fixtures, one a regular electrical dealer and the other the sanitary engineer. Owing to conditions in the past four years building has not been brisk and neither wished to put in a very extensive stock. After sizing up the situation carefully this Spring and getting a line of what building was likely to proceed, the sanitary engineer decided to get ready for a greatly increased business. He not only put in a stock of fixtures which was calculated to meet the requirements of his town, but he put them right up in front of his shop and had them connected so that when people who were building homes came in he could show them exactly how the goods would look when installed.

Getting the Business

The stock of fixtures makes a fine showing in the store in connection with the other goods and at night when they are turned on the display is especially effective.

The electrical dealer, who is the only rival of the sanitary engineer, outside of the mail order houses, decided that instead of carrying a stock he would sell from the manufacturers' catalogues. The electric man and the sanitary engineer had practically equal opportunities as far as getting after the business at first went. They both knew most of the parties who were building, and from a sales point it simmered down to a question of whether the goods could be sold from the catalogue or from the stock in the plumbing shop.

The Lion's Share

Up to the present time the sanitary engineer has been getting away with the lion's share of the business and he attributes his success to the fact that he not only had the stock to show people when they called, but that he let them know he had it, by doing some advertising. He has had to meet some competition from the mail order houses, but has had no difficulty in more than holding his own every time. In this he was helped by the fact that one builder who ordered from a mail order catalogue got goods that were not at all like those he thought he was going to get. This man was not classified and he did not fail to let other people who were building know that the mail order firm goods were not what he had expected.

Sees Good Business

There is a lot of good business to be had all over the country in handling fixtures. One important consideration for sanitary engineers to keep in mind is not to stock up with goods that are either too expensive or too cheap for the people to whom they expect to sell. It is necessary to study this situation carefully and find out all about the class of houses that are being built.

A manufacturer stated to SANITARY ENGINEER that a mistake some dealers make is in not carrying sufficient stock to completely supply a prospective customer.

"Many of those who are building," he said, "want to have the same kind of fixtures in every room in the house. Some dealers have lost business by not being able to fill orders of this kind."

Outlook is Good

While it is difficult to forecast the extent of the building that will go on, those who have obtained from architects and contractors views as to prospects, state that the outlook is good. There is no question about the scarcity of dwelling houses in Canada. This shortage is general from coast to coast. The building that is already under way will not begin to meet the needs. The building program which got under way in the Spring has been developing steadily and there is every indication that it will continue to expand all the rest of the year and go on an even more extensive scale next Spring. Architects are very busy. Many of them have handled more work in the past eight or ten weeks than they have had to look after in five years.

Prices Not High

While prices of building materials have advanced the increase is not even proportionate to advances that have been made in other lines. As far as electrical fixtures are concerned there is little doubt that advances will be made shortly. Copper and brass have gone up and with all-round increases in wages the manufacturers say there is only one thing for them to do.

In Toronto the employees of one firm have been on strike for some weeks, having gone out with the metal workers. When the strike began this firm had on hand a large stock of electrical fixtures. Business has been so good that the stock at the present time is nearly depleted in many lines, and orders are being received constantly from all over the country.

Buying Good Goods

The opinion seems general in the trade that while there is not an extensive demand for really high priced fixtures there is a steady demand for medium priced goods of good quality. It is important to consider this when arranging to purchase a stock. The average person does not aim to buy some new electric fixture every day, and if the dealer can show him something of attractive design and good quality at a medium price there is little difficulty in completing the sale.

ELECTRICAL DEVELOPMENT ON FARMS NOTED

A significant feature of Western Canadian development that promises well for future electrical business is that farmers who are building new homes in the older and more populated sections are invariably having their houses wired for electrical lighting. This was the statement of Mellett & Co., Wetaskiwin; of the Red Deer Plumbing Company; of Allen Pettifer, Olds, Alta., and in fact of practically all plumbing and electrical experts met with during a trip embracing the greater part of the prairie country.

The lighting of farm homes by electricity has reached the point in Western Canada where it is desired by most good farmers. They have seen the various styles of lighting plants in operation in the homes of their neighbors and have become educated to the idea. Particularly are they impressed with the labor-saving results of using electric power for pressure systems, and for operating the various form of machinery used on the farm.

This year the farmers are not purchasing to the same extent as last season, owing to crop conditions that are not up to expectations, but a very extensive business is certain for the future.

Meeting To-day's Competition

Specialty Store the Store of the Future—With What Are You Competing?—Buy in Cold Blood, Sell With Enthusiasm—Limit the Lines But Give the Assortment

THIS is the fourth and concluding address delivered by Frank Stockdale, the noted business expert, in connection with the Saskatchewan R.M.A. Convention, as reported by the special representative of SANITARY ENGINEER.

The series of lectures has been followed with great interest and the points brought out in this lecture on "Meeting To-day's Competition" are worth careful perusal. Mr. Stockdale says that whereas to-day in the West, competition is probably from the general store, the store of the future is the specialty store. He indicates that the retail merchant's creed should be "Buy in Cold Blood and Sell With Enthusiasm." There is something in it too—think it over.

"WHEN we start to define competition we want to know what kind of competition it is," said Mr. Stockdale, opening his address on the subject, and proceeding to outline competition under the following headings: 1. General stores; 2. Specialty stores; 3. Department stores; 4. Mail-order stores; 5. Chain stores.

"A great evolution is taking place in business," continued Mr. Stockdale. "Western Canada is a developing country and that makes a difference. One of the things in a new country is the rapid change which takes place when the country begins to get settled. Then you have not only changes in retail merchandising but the changes that take place between a new and an old community. The question in the average man's mind is which of the foregoing classes of store is the store of the future? This is not a very important question. Don't worry about someone else's kind of a store, it is the way you take care of the kind of a store you are running. As the country grows older there will be fewer general stores. There will be more specialty stores, and general stores will evolve into department stores.

Specialty Store the Store of the Future

"In the West your competition is probably the general store, and you will have to face it. The store of the future is the specialty store. Department stores are collections of specialty stores, and in many cases in the United States the advertisements of the various departments of the department store are run individually in the newspapers as if to advertise individual stores specializing on the lines advertised.

"We have general stores competing with general stores, chain stores competing with chain stores, etc., and all competing with each other.

"My experience is that there is ten times as much noise over a customer who goes to the mail-order house as there is over a customer who goes anywhere else out of your town. I know the seriousness of mail-order competition in some districts, but you have a way of measuring this competition, whereas you have no way of finding out the amount of goods brought into your community in the suit cases of your townspeople when they return from the cities. We must realize that we are going to beat the field, and whoever is in the lead we are going to beat them. The flypaper stage of business is passed. By this is meant the time when customers used to light and stick. Many business men made their money at that time in new districts. The mail-order house has been a big factor in eliminating the flypaper stage of business. People are not forced to buy at one place. People are travelling. Your competition to-day is nation-wide. You are not competing just with the fellow across the street or in the next town, you are competing with the best they have in Canada, and when you talk of the best in Canada you are talking about the best in the world as far as retail merchants are concerned. The big octopus you talk about is one of the best managed businesses I have seen.

With What are You Competing

"What are you competing with? Low prices, beautiful stores, high class salesmanship, or what? I think you are competing with a man or men who have the keenest and highest developed brains along the line of retail distribution that are to be found anywhere. Your customers are reading their literature each evening. Your customers are going into their stores every day and are being served by stores managed by the keenest brains in business. And the only reason that you are able to exist is because of your advantage of being on the ground. If you had to compete side by side you would not stand very much show until you revised your methods of business. We are getting along in a way without any retail preparation. One retailer who made money yesterday figures he is going to make it the same way to-morrow, but he has to find another way to make his money to-morrow. You made your money in competition with certain kinds of merchants, now your competition is becoming nation-wide and the only way to meet it is to study merchandising yourselves.

"The retail store is one of the biggest business propositions to-day. The great trouble with many retailers is that they think they know the game. There is nothing more fatal than this. Business requires more kinds of the higher grades of ability than anything else. I have sympathy for you when I think of the pitfalls along your path.

"A good retail merchant must be a good buyer and a good seller. A manager of things and a manager of people. Selling is divided into three sections: 1. Display; 2. Advertising; 3. Personal selling.

Buy in Cold Blood and Sell With Enthusiasm

"One of the reasons why we are having business done in bigger units is because we cannot find a man who can do all of these things well. This is the reason for the general stores, department stores, etc., because we have to get specialists to do this job. Very few of us are good buyers and good sellers. The retail merchants' creed should be: 'Buy in cold blood and sell with enthusiasm.'"

At this point Mr. Stockdale gave an illustration regarding buying and selling. An Ottawa, Ont., merchant who now manages one of the biggest stores in that city, and who a few years ago travelled the city with sample rugs on his back, made the following statement: "I never allow myself to become enthusiastic over goods that I do not own, but once I own them they become the greatest goods that were ever brought to Ottawa."

"Two-thirds of the merchants to-day buy with enthusiasm and sell in cold blood," continued Mr. Stockdale, "and the stocks of goods in their stores proves this is true. Why does a man buy with enthusiasm? Because there are men who make their living by supplying enthusiasm to a man when he is buying. Hotels and trains are full of them. A man could not get far as a travelling salesman unless he can impart this enthusiasm.

Limit the Lines But Give the Assortment

"One of the reasons that people trade with mail-order houses and go to the larger towns is not price, but assortment. Where you have lines criss-crossing you have a partial assortment—a little of everything but not much of anything. You should not carry too many lines and be unable to give what may be required in any one of them.

"As long as you depend upon the salesman telling you what to buy, as long as you refuse to keep stock record systems you are going to buy with enthusiasm and sell in cold blood, because you will be dissatisfied after you get them. The only way to have enthusiasm which you can cash in on is to generate it yourself. Any man who generates en-

thusiasm gets paid for it."

The following definition for efficiency was hereupon given by Mr. Stockdale as follows: "Efficiency consists in buying from a Hebrew and selling to a Scotchman."

"We have got to find some way to give time and attention to our businesses so that we can do some thinking. Our competitors are winning out because they have more mental ability.

"In meeting to-day's competition you have to meet men who know how to figure profits, manage things, and manage people.

Some Questions Answered

In the discussion that followed some interesting questions were raised.

Question.—"In taking goods from stock for expenses of the store, should they be charged at cost or selling price, and why?"

Answer.—"There are two expenses in selling. One is carrying expense and the other is selling expense. A moderate overhead charge should be added on to the cost of goods in stock. When you deal with figures, deal with facts.

Question.—"Should there not be a distinction made in regard to cash and credit customers in the matter of the price charged for goods?"

Answer.—"A distinction is being made between cash and credit customers. The cash-and-carry stores and the mail-order houses are two examples. The general practice is to put the goods high enough so you can charge high enough and yet give discount to cash customers. By doing this you are not adding anything to anybody—so that they can see it."

At the conclusion of this address Mr. Stockdale spoke a few words, impressing upon the assembled retailers the necessity of getting away from their businesses to avoid getting in a rut and becoming narrow-minded.

"Come to conventions, and don't come thinking that you are needed at home. If this is the way you feel, it is because you leave no organization behind you," said Mr. Stockdale. "I admire the man who has the ability to take a vacation. I make this recommendation for two reasons. One is because of the things you will have to do in your store before you can take a holiday. The store has to be in running order and needs organization. The men who come to conventions usually have good businesses. The successful business man is the one who works for his community. He gets a perspective and sees what the other fellows are doing."

Joint Freight Tariffs to be Lower

Important Ruling of the Board of Railway Commissioners Will Result in a Considerable Saving to Many Shippers

An important ruling which will have the result of lowering joint class freight tariffs and will apply on interline traffic between the Grand Trunk, Canadian Pacific and Canadian National Railways will go into effect about October 1, according to an announcement made by the Board of Railway Commissioners for Canada.

Approximately the order means that in future, where shipments have to be made over two lines, they will be carried for what would be the cost on one, the mileage being taken as the basis. This, it is stated, will result in a considerable saving annually to many shippers.

Upon reading the submissions filed on behalf of the said railway companies, the Canadian Manufacturers' Association, the Boards of Trade of Toronto and Montreal, Dominion Canners, Ltd., and others, and upon the report and recommendation of the Chief Traffic Officer of the Board, it is ordered:

1. That within the territory covered by the order of the Board No. 3258, dated July 6th, 1907, as amended, in what is known as the International Rates Case, and in conformity with the relevant provisions thereof, also with the station groupings of the respective companies as shown in their tariffs between points west of Toronto on the one hand and points east of Toronto on the other, joint tariffs of class rates be compiled to apply between stations on the Canadian Pacific and Grand Trunk Railways, the Canadian Pacific and Canadian National Railways, and the Grand Trunk and Canadian National Railways, respectively, on the basis of the so-called schedule "A" scale, with the addition of the following figures to be incorporated in the rates themselves:

Class	1	2	3	4	5	6	7	8	9	10
Cents per 100 lbs..	8	7	6	4	2½	2½	2½	2½	2½	2½

the rates so compiled to include the service of transfer from the one company to the other; subject, however, to a minimum joint charge of 100 pounds at the first-class rate, but not less than 75 cents.

2. That the joint class freight tariffs carrying out the requirements of this order be published and filed, so as to become effective not later than October 1st, 1919.

3. That the following be made the points of interchanfe of interline freight traffic between the said companies under the terms of this order:

Lennoxville, Montreal, Ottawa, Brockville, Peterborough, Toronto, London, Mount Forest, Orillia, North Bay, Actonvale, Ste. Rosalie, Renfrew, Kingston, Milton, Guelph, Woodstock, Tillsonburg, Inglewood and Essa (Utopia).

(Sgd.) H. L. DRAYTON,
Chief Commissioner,
Board of Railway Commissioners for Canada

Modern Plumbing System Installed in Memorial Town Hall

Installation in Town Where There Are No Sewers or Waterworks. Watch For It in the Next Issue

Details in connection with the installation of the plumbing equipment in the Memorial Town Hall, at the town of Lakefield, Ont., a place of 800, located on the Otonabee River, about nine miles north of Peterborough, will appear in the next, the September 1st issue of SANITARY ENGINEER. The article will illustrate and describe all floor plans, installations and the system of sewage disposal. There are no sewers or waterworks in the town and the complete plant, including well (but excepting the septic tank), will be contained within the building.

The second instalment on "Saving Fuel in Heating Houses" will also appear. This is one of the best yet of the series of Engineering Bulletins being published for our readers.

Then there is another heating article coming from N. A. Kearns, as well as a continuation of the series on "Ventilating the Modern School."

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

OBITUARY

The death occurred at Edmonton, Alberta, of J. A. Lockerbie, of the plumbing firm of J. A. Lockerbie, Ltd.

BUSINESS CHANGES

Perth, Ont.—Carson & Butler have succeeded Code & Chaplin, plumbers.

NEW COMPANIES

F. L. Cook, until recently electrical foreman with the Linderman Manufacturing Co., of Woodstock, Ont., and R. E. Kilpatrick, for the past five years with J. Filsinger, plumber, of Sarnia, Ont., have formed a partnership and opened a plumbing and electrical shop at Sarnia.

C. A. DUNHAM CO., LTD., EXPANDS

This company is carrying into force plans for the development of the sale of their line in England. C. A. Dunham, president of the company, has opened offices in London, and A. J. Assheton, formerly sales manager and heating engineer of Metals, Limited, Calgary, has been selected to handle the office and sales organization.

All of the Dunham products for this field will be supplied from the company's plant in Toronto.

The C. A. Dunham Co., Ltd., are building an extension to their plant and a new office building.

FAVORING CANADIAN GOODS MORE

Newfoundlanders are beginning to favor Canadian-made goods more than ever before. This is the opinion of John R. Anderson, manufacturers' representative, Montreal. Mr. Anderson has been over to the Island and stated that conditions there, as well as in the Maritimes, are very satisfactory from a business standpoint. St. John's, of course, is the centre of activity in Newfoundland and there is a good spirit abroad there in a business way.

PICNICKED AT GRIMSBY

The annual picnic of the United Association of Plumbers and Steam Fitters of Hamilton, Ont., held at Grimsby Beach was attended by many of the master plumbers and wholesalers, as well as the members of the association with their wives and families. A long program of sports was run off and as the events were keenly contested, the finishes and various events provided constant amusement for the onlookers. A feature of the afternoon was three baseball games. The first was won by the plumbers, who defeated the steamfitters 13 to 8. In the second the plumbers' helpers defeated the steamfitters' helpers 8 to 7. In the third game the journeymen defeated the master plumbers 12 to 10. The committee which looked after the arrangements and was responsible for the success of the day comprised J. Allen, A. Hunter, C. T. Rodgers, J. Harte, J. Kerr, P. Smith, T. Arthur, R. Lamb, W. Possum, R. Bowes, G. Smith, A. Smith, A. Bonner and H. Lucas.

PROVIDING MORE SEWERS

Surveys and estimates are being made by Engineer Wynne Roberts, of Toronto, for an extensive sewage system for the township which will provide drainage, etc., for Todmorden, Woodbine Heights, Barrington avenue and Dawes road. The estimates will cover a sewage scheme for the whole southeastern portion of the municipality.

It is stated by certain members of council that this work will be started at the earliest possible date and that those districts most in need of sewers would be given the preference.

BUILDING NEW WATERWORKS

As a result of more or less continual trouble from its water supply, and a serious outbreak of typhoid fever last year, the Water Commissioners at Chatham, Ont., have decided to proceed with the construction of a new system, which will provide an ample supply of pure water. The cost is estimated at $200,000. A report which was received on the old waterworks plant stated that it is now out of date, and the erection of a new filtration plan was recommended. The present plant, which contains out-of-date filters, is over-loaded, and certain recommendations were made by the engineer to improve the present supply until the new plant is erected.

The new plant will purify water, for domestic purposes, by a system of rapid sand filtration, and none of the present machinery will be used in the new construction.

MAY PROSECUTE BOARD

A threat to prosecute the members of the Parks Board at Brantford, Ont., was embodied in a resolution written and passed at a meeting of the Board of Health. It is alleged that the Parks Board has not provided proper conveniences at Mohawk Park. Mayor MacBride was the mover. Before any action is taken, however, members of the Board of Health will visit the park and make an inspection. An enquiry will be made to the city engineer re the frequent leakage of sewage matter into the Brantford canal. On the motion of T. J. Minnes and Mrs. Frank it was recommended that the tail race be filled in with selected garbage and the garbage department officials will be interviewed in this regard.

MAY USE CONCRETE MAINS IN BIRMINGHAM EXTENSION

A proposed extension to the waterworks system of Birmingham, England, at a cost of $2,500,000, embodies some features of interest. It is planned to construct a third pipe on the siphon sections of the aqueduct from the Elan Valley to Frankley, and to strengthen the present mains.

The aqueduct which connects Birmingham with the Corporation reservoirs of Mid-Wales is 73½ miles in length and consists of cut and cover tunnel and siphon pipe line. The sections in cut and cover and tunnel have been constructed to convey 75,000,000 gallons a day, the full estimated yield of the gathering ground, while the sections in siphon or pipe line are designed for six lines of pipes, two of which have already been laid, each having a capacity of 12,250,000 gallons per day.

Concrete Mains Suggested

But for the war the construction of the third pipe line would have been put in hand some time ago. That being impossible, the water committee completed all the preliminary work. In 1917 the committee reported that, in view of the liability to bursts to which cast-iron mains had proved subject, inquiries had been made respecting reinforced concrete, and the suggestion had been made that, as pipes of that material were not subject to the same limitations of diameter as those of cast iron, it was worth examination whether the provision of a main of double capacity might not be economically advantageous.

A Difficulty

When the proposal for a main of double capacity was first brought forward, the principal drawback was that it would be necessary to lay the double-capacity main over the whole length of the siphons before any augmentation of the supply could be secured. This difficulty

has now been overcome by means of a system of cross-overs designed by Mr. F. W. Macaulay, the Elan supply engineer, by which the new main can be carried out by instalments, sections being brought into use as they are completed without waiting for the construction of the main throughout.

Laid in Concrete

The present scheme is for the provision of such lengths of main as will be required for the passing of an additional 4 million gallons per day through the Severn and other siphons. The sections of the new main will be laid in reinforced concrete on the "Bonna" system, the diameter to be 60 inches, which is calculated to provide, when completed, a discharging capacity double that of each of the existing mains of 42-inch diameter. The total length of double-capacity main proposed to be laid is 9.17 miles. It is hoped that the work may be completed in time for use in the summer of 1921.

LETTERS TO THE EDITOR

These columns are open to contributions upon any topic of interest to the trade, it being understood that the views expressed are those of the contributors, and do not necessarily imply editorial indorsement. Names of contributors will be withheld, if desired, but name of writer must accompany correspondence as an evidence of good faith.

APPRENTICES.

Editor SANITARY ENGINEER:—I had a likely looking lad who had passed his Matric. come to see about learning the honorable profession of "plumbuming," a likely looking lad with more head above his ears than below them, and he wanted to know so many things that my head is still aching. He came at me like a cyclone. What opportunities does this honorable business offer? I told him if he studied hard and applied his best energies he would some day have a shop of his own. How many millionaires are there in the business? I could think of none so told him I had none on my calling list. What will I have to do to learn this business? I said serve five years. He comes back, "why?" To learn it all it will take you all that time was my answer. What wages do I get when learning? As I thought this kid should not be lost to the trade I said $9 per week first year and a raise of $2 per week each year. "Oh! he said, that is less than a common laborer. What do I get after I have learned the business? I said jours. are making 75c per hour. From the look of things when you are out of your time the scale will probably be $1 per hour. He came back with this, "How many men over fifty are working jour. work? " I said in the old days, when the boys used to take to the trade, old men were scarce as jours. What became of them? he asked. I said some went into busines, some took jobs as stationary engineers. Others, a few, a very few, become inspectors. How many jours. own tin lizzies or real cars? I could not answer this. How many do you know who retired on jours.' wages at 60 years of age? Again I was beat. He comes back with this. What are you trying to pull off? If I start a peanut stand and use all the brains and energy you say I have to for five years I shall have a good business, a car of my own and be better off than plenty of master plumbers. I thought this was the kind of lad the trade needed so tried another tack, and asked him if he did not want to be of service to his kind, to help make this weary old world better for his having lived here, and reminded him that if he learned the trade and followed it he would help to make generations yet unborn better physically and stretch out the life of man a few years longer, and better than that, let them enjoy health while living. He sat up and took notice, but said: "In the old days you used to perfect the profanity of the cub; as that is out of style what will you teach me instead, or how about taking a little time off the apprenticeship? Then the cub used to chase the growler with the new gasoline can and rustle for booze on repair jobs, also learn to fix beer pumps. As the booze is not used any more and I shall not have to spend time on learning them, how about taking another day or two off the total time I have to serve? In the old days the cubs' night school was in a room at the end of a bar, the floor was the drafting table and the chalk that used to mark the baseball score served to illustrate the fine points of the trade, for the cub. Who could save enough to buy a slant once a week for some old timer who looked for the cubs to pay their footing that way? As that is out of the question now where is the cub to learn? Have you any schools to replace it? Will you allow me the time I spend at nights learning this business on my total? Or will you pay for my instruction, and last, will you give me a year in the front shop learning how to figure jobs? Teach me the meaning of 'overhead' and how to handle a customer, land his job, and to impress the general public with the dignity of the profession. I will call around after vacation."

More soon,

"RATSY."

RECONSTRUCTION

Editor SANITARY ENGINEER. — If we are to keep pace with the Bull about reconstruction let us take stock of our own trade first. How much junk must we carry to carry on a repair business simply because things are not standard? How often have supply pipes to come out when bath or basin cocks are to be changed? How many ball cocks fit old supplies? How many different threads on copper floats? I know you will say I use all one make. Oh! do you, well if you only expect to keep your own jobs in shape then you will not expand and other men whose jobs you must repair use other makes. Is it any satisfaction to the customer, the journeyman or to yourself to find that everything is of different size and thread. How about the Dominion Association taking this up? During the war in Britain everything was supposed to be made standard. You can see at a glance what this would mean to a master, journeyman and last, but not least, the consumer, who, to say the least, is the one that we all make a living out of. Oh! don't say or think the public be damned, for in this period we shall find that we cannot get along without them. Now just think this over and put the thing up to the Dominion Association and let us see what they can do with it.

"RATSY."

New Goods Department

KLOSET KLEAN

Kloset Klean, manufactured by the Chamberlain Desolvo Co., Ltd., of Toronto, is made, it is stated, for cleaning closet bowls only, and, it is claimed, it will keep them clean and sanitary. It is also claimed that it will not in any way injure the bowl or affect the pipes or plumbing connections. It is claimed that it will work quickly and thoroughly and that it leaves no fumes, no odor and no dirt.

In Chicago there is a bureau devoted to finding employment for men 45 years and over. It is estimated that over 20,000 men have thus found employment. In practically every case the concerns who hired the men came back for more, which proves you are not by any means a dead one at 45 and over.

THREE GUESSES—WHAT IS HE?

One does not need to take three guesses to determine the line of business this Texas merchant follows. There is a suggestion here which some member of the Canadian trade may wish to follow. The above is a photograph showing G. D. Harris' bathtub auto standing in front of his plumbing establishment at 1704 Commerce Street, Dallas, Texas.—Courtesy The Plumbers' Trade Journal, New York.

PROTECTION OF SEPTIC TANK FROM FROST

The Editor, SANITARY ENGINEER. — I am installing a septic tank in this town, which will not be put into use until the middle or end of September, as the owner of the house is visiting in the East, and will not return till about that time. As that will be rather late in the season I feel that some protection will have to be given the tank to keep it from freezing during the first winter. Will you kindly tell me what protection will be necessary, also how late in the season it would be safe to start a septic tank?

Will the disposal field need any protection (say, a covering of straw or manure?) Is lye in any form injurious to germ-life in the septic tank? A septic tank which I installed 18 months ago is working well, but the scum does not form on top of the water in the settling chamber. My customer has been using home-made soap containing pound of lye to five pounds of grease for laundry purposes, and I wondered if this would prevent the scum forming.—Yours, Western Reader.

Answer.—The warmth of sewage is as a rule sufficient to keep the ground of the disposal field from freezing, and as the proper treatment of the effluent depends so much on a free aeration of the soil it is better to leave the ground uncovered. Of course, the type of the tank used and the class of waste treated have a bearing on the quality of the effluent and this in turn has some effect on the freezing temperature of the liquid.

Now, while there is little, if any, danger of the normal septic tank system becoming ineffective because of frost, the unusual conditions surrounding the particular plant in question may make necessary some protection over the disposal field. If you find the ground around the field tiles freezing you had better cover it with a layer of straw. Do not use manure. The substance treated in the last stages of such a plant are ammonia and the carbonaceous residues. If manure should be used in covering the field you would likely find the ground so soaked with ammonia in the spring that complete oxidation of the effluent would not take place until well on in the following July.

Lye in any form is injurious to the germ life in the septic tank. If more than a normal quantity of lye, or washing compounds, is used a separate disposal plant should be arranged for treatment of such. The small amount of lye used in the ordinary household has no appreciable effect in preventing the proper working of a septic tank system. In some septic tanks no scum ever forms, but its absence does not seem to affect the work of the system. The scum, however, serves the purpose of protecting the sewage from temperature changes, and also prevents the agitation of the liquid, which interferes with sedimentation and anaerobic action. In other tanks so much scum gathers that it contracts the free area of the tank and it is then necessary to break it up by top-flooding. Very little septic action takes place in the scum and while some scum is desirable, its absence does not by any means indicate that septic action is not taking place.

If the ground around the field tiles is kept from freezing until 24 hours after the septic tank is first used, the system may be started at any time.

The tank should not be larger than required for 12 to 24 hours' supply of sewage.

Storm water should not be run into the septic tank.

Editor, SANITARY ENGINEER.—What size would you recommend for a septic tank for an average family? How close to the house; how would you dispose of the sewage after it leaves the septic tank where the house is built on a town lot and you have to confine the filtration to the lot the house is biult on?

SUBSCRIBER.

Answer.—In answering the questions asked we are taking the opportunity of placing before our readers some of the fundamental principles of purification of sewage by the septic tank system.

With an understanding of the principles involved it will become a matter of detail to arrange a purification plant suitable to any peculiar circumstances surrounding the conditions of installation. If sewage is placed in any air and light proof vessel and allowed to remain for a time "septic" action will take place. When the sewage enters the septic tank its flow is retarded with the result that the solid matters settle to the bottom of the tank, where they are changed into iquid and gas by anaerobic bacteria. This act of fermentation will cause some of the deposited material to rise to the surface of the water, when, together with the material that is lighter than the water, they will form a scum or mat. This mat assists in excluding air and light from the sewage and in this way benefits the life of the anaerobic bacteria in the sewage. Litte or no bacterial action takes place in the scum and therefore an excessive thickness of the mat is undesirable. If the mat should grow so fast that it chokes the flow of sewage through the tank it may be necessary at times to break it up by flooding sewage over it.

From two weeks to several months is required for the development of the complete septic action in the sludge. It takes that time for the necessary bacteria to multiply. Some of this matter in the sludge will resist decomposition for months, and although the volume of sludge will remain after a time nearly constant it is necessary to remove some of the sludge at intervals. The length of intervals varies from six months to six years. About one-third of the necessary purification of the sewage takes place in the tank and it is necessary to treat it further before it can be considered as harmless.

The sewage should not stay too long in the septic tank. For fresh sewage 12 hours is a good limit of time. Stale sewage should not remain longer than six hours.

The volume of sewage from the average residence can be estimated as being from 25 to 40 gallons per head per day.

After the fluid leaves the septic tank it must be purified by aeration. The purification here is due to the action of aerobic bacteria and it is therefore necessary at this stage of the process to provide an area where air may come in contact with the effluent.

When the ground is of a porous nature aeration can be obtained by discharging the effluent through 3-inch drain tiles set at from 12 in. to 24 in. below the surface of the ground. It is necessary that this discharge be not continuous, as otherwise the anaerobic-charged effluent will soon kill all of the aerobic bacteria in the ground and in a short time the field will become putrid. When the dosing of the tiles occurs at intervals the aerobic bacteria have time to rest and multiply.

There should be an allowance of one foot of field tile for every gallon of water and at least five square feet of ground area for each foot of tile.

The field tiles should not have a greater fall than 2 inches in 100 feet and they should branch from the main drain at an angle of 45°. The joints should be covered on the top to prevent earth falling in to the pipes from above.

When heavy clay land is encountered it is necessary to sub-drain the field, and also, at times, strip the soil from where the field is stunted and mix a certain proportion of sod with the soil before setting the tiles in place. Where the sub-drains are fairly close to the surface, say 2 ft. 6 in., it will only be necessary to treat the field to a depth of 6 inches below the sub-surface tiles.

If snow falls before a severe frost comes, the protection given by the snow will generally be enough to prevent freezing of the sewage in the disposal field. If deep furrows are run between the tiles there will be little danger from frost. A disposal field of a residence for a family of 8 to 10 persons would cover an area of about 2,000 square feet.

The first chamber in the septic tank should be large enough to contain about 280 gallons; the closing chamber 165 to 180 gallons.

Where the house is set on a large plot of ground the disposal plot is usually set at about 80 to 100 feet from the house; but a septic tank if well built and maintained can be placed quite close (about five feet) to the house without danger. It is, however, well to run the field tile in a direction away from the house, so that no liquid escaping from the disposal bed may find its way back to the foundation walls.

Where the area of the ground is not large enough to allow for the sub-surface system of aeration, it is necessary to build a septic tank along the lines already described, but making the volume of the tank equal to about 350 gallons and dividing the tank into two compartments by a wall reaching to within 20 inches of the floor. The depth of sewage in this tank is to be about 3 ft. 2 in. In the secondary compartment of the tank there is set a 6 in. fine sod filter resting on a bed of pebbles and a grillage of laths. The effluent passes from the first chamber of the tank through this sand filter and thence by overflow to a third chamber containing an aeration field of half gravel, with an area of 14 sq. ft. and a depth of about 3 ft. This aeration chamber is to be well vented and the gravel bed is to be drained by means of 6 lines of 4-in. tiles. The tiles are to be vented at their ends by uprights running through the gravel bed, and opening into the chamber above the water line. The liquid escaping from the drain at the end should be clear of odor. If there is no drain where this water may be run off it will be necessary to provide some kind of a storage tank, where it may be pumped on the land.

If the aeration filter should become clogged or rendered inoperative through any other cause, it will then be necessary to treat the effluent in the storage tank with chloride of lime or some other disinfectant.

DOMESTIC HOT WATER IN CIRCULATING SYSTEM

Sanitary Engineer, Toronto:

Dear Sirs,—Enclosed please find sketch of a contemplated job, viz., two 30-gallon boilers in basement connected to jack heater, to heat water for five basins, laundry tubs, sinks, baths, etc.

The risers for the hot water will go up the partitions separate to each fixture in ½-inch pipe; putting an ½ ft. x ½ inch x ⅜ inch tee below, where the hot water supply runs out to a fixture, and then dropping the ⅜ inch pipe to basement return connection.

Will these drops, viz., ⅜ inch into ½ inch pipe running to boiler returns, and having a fall all of the way back, form a circulating system, so that we will be able to draw hot water from a fixture as soon as the taps are opened?

Will it be necessary to put a ½ inch swinging check in the return at point where pipe enters return at boiler?

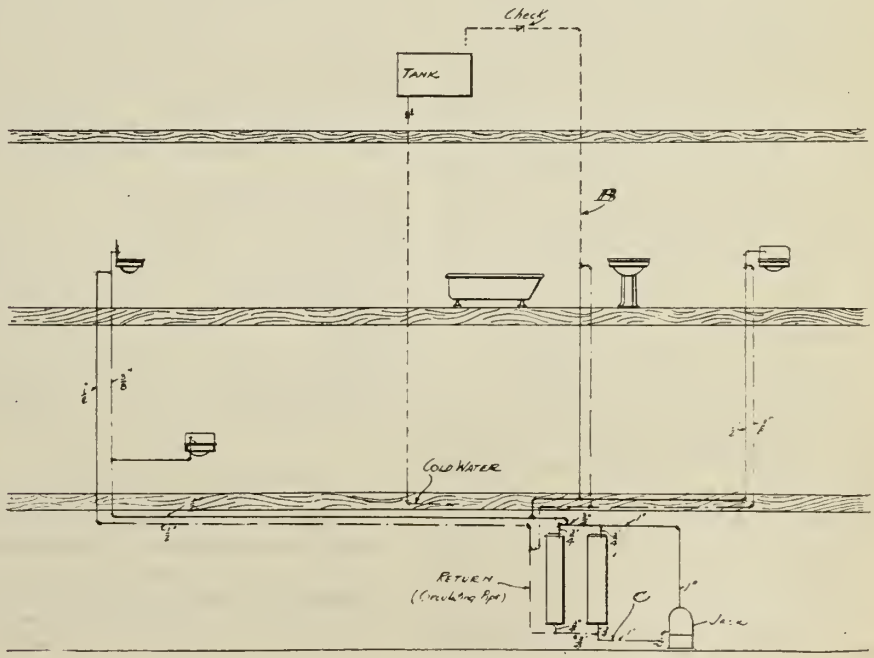
Would you advise an exhaust pipe from the hot water, pipe to go over top of tank, so as to relieve system in case of water getting too hot, or will the circulation of water be enough to cool and avoid this?—Apprentice.

Answer.—In making the accompanying drawing we have not shown the cold water connection to the boilers, so that all piping indicated, with the exception of the main feed from the tank, shows the hot water circulating system only. You will notice that the details of pipe connections between boilers and jack are not the same as shown on your sketch, and that there is also an expansion, or relief, pipe (B) shown on this drawing.

With regard to the jack and boiler feed and return connection the pipes should run a full one inch to the connections close to the boilers and then reduced by means of 1 inch x ¾ inch x ¾ inch tees, as shown, so that the current of water flowing to and from the jack will be divided equally for each boiler.

The return pipe (C) should be kept low enough down to form a trap between the boilers and jack, and then no swing check in the return pipe will be required. An exhaust pipe should be run from the highest fixture branch to a point well above the supply tank. The purpose of this exhaust is not entirely that of a relief for expansion, but mainly as an escape for accumulated air and steam. If the exhaust pipe is not installed, air will gather at the top of every loop in the system and prevent circulation. The height of the exhaust pipe will control the boiling temperature of the water; the higher the pipe, the hotter the water becomes before reaching a steaming temperature. The exhaust pipe also acts as a balancing force in equalizing circulation. Branches to fixture should be taken from the top of loops and not from the sides.

The system if installed as described will give the results required, but if there is room in the attic for an overhead dis-



tributing loop, it would be an advantage to instal the system as an overhead feed, thus doing away with the double set of risers. The plant would then be installed in this way: A pipe could be run right up from the top of the storage boilers to the attic, where it would run out to the drop risers. The drop risers would be connected to a return in the basement, and this return would connect to the boilers and to the jack in a manner similar to that shown on the drawing. The highest point of the overhead loop should be vented, and then should be placed in that vent a light swing check valve set to prevent air entering the system when the hot water tap is opened.

All branches to return piping in basement should have the tees set with their openings looking to the side and not out of the top. This refers to either the double riser or overhead system of circulation.

Rodney, Ont.

Editor SANITARY ENGINEER.—Would you kindly advise me if a 2½-inch pipe would work satisfactory on a pump, the cylinder being fitted for 2-inch pipe?

Yours truly,
D. MISTELE.

Answer.—The 2½-inch connection may be used, but it will reduce the efficiency of the pump by about 40 per cent. If the pump is installed for a lift of about 30 feet you will find that with this connection that the limit of the lift will be 12 feet.

MARKET TENDENCIES

Continued from page 38

sheets and tin plates may be expected within the next few days."

There seems to be a difference of opinion in the market regarding the plate situation. Advices from very reliable sources continue to refer to plate as the weak spot in the steel situation, while others point to the fact that operations are gradually approaching some 70 per cent. capacity at many of the mills. One dealer to-day was willing to stake his reputation on the fact that a higher schedule for plate would be announced inside of a month. This hardly seems likely, as there is a very large plate capacity in the steel centres now, and it can take on a lot more business before coming to the point where capacity will be in sight. Quotations here range as follows:

14 gauge	4 85	5 10
16 gauge	4 96	5 20
18-20 gauge	5 80	....
22-24 gauge	5 85	....
26 gauge	5 90	....
28 gauge	6 00	....
3-16 inch plate	4 90	6 26
¼-inch boiler plate	4 60	5 80

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS.

10¾ oz.	$7 80	$8 10
U.S. 28	7 40	7 70
U.S. 26	7 10	7 40
22 and 24	6 95	7 25
18 and 20	6 80	7 10
16	6 66	6 96
12 and 14	6 50	6 80

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Higher Prices Named on Solder

LEAD AND ZINC PRODUCTS.—Higher prices are again in evidence on solder this week, this being the second change since last issue, with quotations ranging from ½c to 3c per lb. above last week's figures. The prices now in effect are for the guaranteed, 35½c to 38c per lb.; strictly, 34½c to 37c; commercial, 32½c to 35c; wiping, 31½c to 34c; wire, 35½c to 41c. The strength of the tin market is largely responsible for this move upward.

A firm undertone prevails in manufactured lead products with business active. Prices remain unchanged at figures shown herewith:

Lead pipe, list, per lb.		$0 12½
Lead waste pipe, list, per lb.		0 13½
Do., over 8 inches, list, per lb.		0 14½
Above subject to discount of 10%.		
Lead traps and bends		15%
Lead wool, lb.	0 11	0 12½
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 12	0 13
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 35½	$0 38
Solder, strictly, lb.	0 34½	0 37
Solder, commercial, lb.	0 32½	0 35
Solder, wiping, lb.	0 31½	0 34
Solder, wire, lb.	0 35½	0 41
Zinc sheets, per lb.		0 17

Scrap Market Shows Easing Away

OLD MATERIALS.—The scrap metal market continues strong, though a marked falling away in business is reported, due to unsettled labor situation. It is still marked by a real and acute scarcity in some lines, particularly heavy melting steel. There does not seem to be much of this material to dispose of, and there is also a scarcity of machinery scrap, the demand for this latter being brisk, with the offerings correspondingly poor. There is some speculation as to whether much of these wanted metals is being held back for still greater increases. It would appear that there should be more of this material in the country. It may be that labor is not available to bring it out, or that the price is not tempting enough, but the fact is that it is not making its appearance. Prices show no change from figures herewith:

Dealers' Buying Prices—		
Tea lead		0 03½
Heavy lead pipe		0 05¼
Pipe scrap		6 00
Stove plate, per ton		13 00
No. 2 busheling		11 00
Yellow brass		0 09
Red Brass		0 16¾
Light brass		0 07
Scrap zinc		0 06
Heavy copper		0 18
Wrought iron, No. 1, per gr. ton		14 00
No. 1 machinery cast		18 00
Heavy melting steel		13 50

Tin Higher; Copper Moves Up Also

INGOT METALS.—In a market where advances are quite rapid there very often develops quite a wide range of quotations. This is shown this week in prices quoted on spelter, lead and antimony. Tin is up 5c to 6c per lb., and copper has advanced another cent.

COPPER.—The market is somewhat quieter but there is a strong undertone and higher prices have been named locally, to-day's figures being 27c per lb. There is a very nice volume of business being done.

TIN.—A sharp advance of from 5 to 6 cents per lb. is shown in this metal this week in new price of 61c to 62c per lb. which has been established. Greater activity is shown in sales.

SPELTER.—Quotations show quite a wide range of from 10c to 10½c per lb. A fair volume of business is offering.

LEAD. — Little change in prices is shown this week though the range has widened towards a higher level. Buying is quite brisk with quotations ranging from 7c to 8c per lb.

ANTIMONY. — A somewhat stiffer feeling is apparent in this metal. Prices are named at from 10c to 11c per lb., which represents a 1c advance in some quarters. There is a good amount of business being handled.

ALUMINUM.—New developments are lacking, though somewhat greater activity in sales is noted. The price remains unchanged at 35c per lb.

CANADIAN NATIONAL EXHIBITION NOTES

In order to accommodate the Canadian War Memorial paintings at the Canadian National Exhibition, an extension of 130 by 30 feet to the fine arts gallery is necessitated. Some of the paintings are over 20 feet long.

The "Hell of Death" that faced the Canadians at the second battle of Ypres, when they were sent against the first German gas attack, is vividly portrayed in the War Memorials paintings to be shown at the Canadian National Exhibition this year.

One whole building will be devoted to Canadian war trophies at the Canadian National Exhibition, while the big guns, aeroplanes and other large relics will be distributed around the grounds, giving the big fair a truly victory atmosphere.

H.R.H. the Prince of Wales will spend three days in Toronto during the big fair. He will open the Exhibition on Monday, August 25th, in the open air, where many thousands may see him, and will remain in the city until Wednesday, spending all or part of three days at the Exhibition grounds.

Seventeen American flyers have already entered for the New York to Toronto aeroplane race to be started from the Canadian National Exhibition by the Prince of Wales on August 25, the opening day of the big fair.

Over ten thousand dollars in cash prizes and trophies will be awarded the successful flyers in the Canadian National Exhibition aeroplane race from Toronto to New York and return.

Cols. Barker and Bishop, the world's greatest aces, will have charge of the flying circus at the Canadian National Exhibition this year. They will fly surrendered German Fokkers and types of British, French and Italian machines.

Heating and Ventilating

HOT WATER HEATING SYSTEMS

Tenth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the tenth of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on "Hot Water Heating Systems" a most illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the design for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The eleventh article of the series will appear in the next issue.

WHEN the tired engineer is called to listen to the voice of an irate customer complaining that the hot water system (installed by the said engineer) is no good, the chances are that the engineer will be secure in his confidence that the fault lies more with the attendant than with the system.

So many hot water heating plants have been installed in private residences that most journeymen fitters are quite familiar with the details of this work.

The master fitter sends his employees out on work of this kind with a serenity that at times is exasperating to the advocate of other types of apparatus.

About ten years ago the author of these articles had the experience of listening to a happy individual claiming that in five years' time there would be no more hot water heating systems installed. He had a system that had hot water systems faded away to a shadow, and he could see the finish of the hot water advocates. He could not see his own finish—a finish that was to be more dramatic and sudden than the finish of the subjects of his derision.

But do not think that we mean to say that there are no merits in other systems. Far from that, we believe that there are circumstances existing where the installation of a hot water heating system is neither wise nor profitable. And when conditions of that kind arise there are systems of steam and vapor heating which may be installed to the advantage of the engineer and the satisfaction of his client.

It is, however, with hot water systems, both of gravity and forced circulation, that we are now interested, and therefore for the time being must drop anything resembling a comparative criticism of systems.

When the engineer makes a survey of a house to be heated he can, if he is a man of some experience, make a fairly close estimate of the size of apparatus required, basing his figures alone on judgment. But to make the estimate exact, he must go over room by room, measuring the cubic contents to be heated, together with the exposed walls and glass surfaces, and all of the other contributing causes of heat loss.

He may use a rule of thumb in calculating his radiating surfaces, or he may figure back to the theoretical heat loss and proportion the radiator and boiler to that.

One rule that is frequently used in Toronto is that where the cubic contents are divided by 100; the wall by 10, and the glass by 1, the resulting figures of these divisions are added together and the result is considered to be the amount of radiating surface required for each room. A safety factor of from 10 to 20 per cent. of the estimated radiation is added for rooms on the north side of the building, and also for halls. About 20 per cent. of the estimated radiation is deducted from bedrooms.

If he is basing his figures on the heat loss he considers that the efficiency of hot water radiation for gravity circulation is 150 B.t.u. per sq. ft. per hr.

When he comes to the point where he makes a choice of locations for his radiation, he may find that the window stools are so low that it is impossible to set the radiators, of the size required, in these preferred positions; so he makes the next best choice and places the radiators as close to the greatest exposures as circumstances may permit.

After indicating on his plan the sizes of the radiators and their locations, he is ready to lay out the design of the piping. And when he comes to this stage of his work he perhaps decides to use the tappings of the radiators as a basis for the pipe sizes. He finds, upon referring to the catalogues of radiator companies, that hot water radiators are tapped thus—for single or twin connections

Up to 48 sq. ft., 1 in.
Up to 100 sq. ft., 1¼ in.
Over 100 sq. ft., 1½ in.

He may decide to run separate mains to the ground floor radiators, so that the rapid flow of water to and from the higher radiators will not interfere with the flow of water to those set at the lower levels. The main, or mains, leading to the ground floor radiators are taken, as a rule, out of the top of the centre openings of the header on the boiler. The mains leading to the upper floor radiators are generally taken out of openings set farther away from the centre of the header than those feeding the ground floor rods. However, if there is an upper floor radiator set at a very great distance from the boiler, he may decide to give the pipe leading to that radiator a position in the header that will favor a rapid circulation in that direction.

He is always careful to keep his mains pitched up from the boiler in the direction of the flow to the radiators, and to vent every dead end, such as that at the highest point of each radiator.

With a boiler of ample capacity con-

nected to a proper flue, and with radiators properly proportioned to the rooms, the engineer may be confident that the heating plant installed in this way will not be subject to the crankiness of certain other systems.

There is no danger of getting the pipe sizes too small for the work required when the engineer designs the plant with pipe sizes based on radiator tappings. The fault is likely to be pipe sizes greatly in excess of the actual requirements. On a job of less than ten or twelve radiators the excess is hardly worth considering, but when a great many tappings are used it is well for the engineer to base the pipe sizes on the amount of radiation served, and specifying that the radiators be tapped according to a schedule governed by the conditions of the installation. When hot water pipes are too large the flow of water becomes so slow that a very uneven circulation is obtained throughout the system, and as a result some of the radiators on the pipe lines will not get hot unless a hard fire is kept burning in the boiler. Local circulation in pipe lines indicates simply wasted energy, which means wasted heat.

If the rate of flow through the pipes become too high there is a loss of efficiency through friction. The friction may be great enough to counterbalance the temperature head necessary to drive the water to radiators at a distance from the boiler. But friction is not often the cause of poor circulation. The cause is oftener the poor arrangement of the piping. The main feeding a number of radiators must have at least an area equivalent to all of the radiator tappings with which it connects. If you have two radiators with 1 in. tappings the pipe feeding these two tappings must have an area of 1.57 inches. This means that a 1½ in. pipe should be used. It would be better practice to cut down on the size of the tappings, say, to ¾ in. and use even a 1 in. feed, than to cut the feed down to 1¼ and use the two 1 in. tappings.

There are times when it is advisable to run a main or mains to feed both ground and upper floor radiators. In a case of this kind the radiators to upper floors that are fed from near the boiler should have their branches taken at an angle of 45 degrees out of the bottom of the mains. All radiators close to the boiler should have their branches taken out of the sides of the main. Radiators set at a distance from the boiler should have their branches taken out of the top of main. Generally it is advisable to take the branches to upper floor radiators out of the side of mains, with that exception already noted with regard to the radiators close to the boiler.

In the system just described, reductions in the sizes of mains must only be made where branches come out of the tops, otherwise an eccentric coupling must be used and turned in such a way that no pocket is formed in the line where air may gather.

The last radiator on the line must always be one set either on the ground floor or at the basement ceiling.

When a hot water radiator is set below or at the boiler level it is necessary to feed it by way of an overhead loop. This loop should run up to a height at least exceeding twice the distance of the difference between the lower part of the radiator and the top of the boiler. The loop should be vented at its highest point and the radiator should be fed from the pipe on the drop side of the loop. The higher the loop is run the faster the circulation will be through the rad.

The systems described so far in this article are all two pipe. That is, the flow and return pipes are uniform in size and generally in direction. There are some systems when one large pipe is used both as a return and as a feed. The branches leading from the pipe to the feed of each radiator are taken out of the top of the main supply pipe and the return branches are connected to the are some systems where one large pipe as the circumstances may require. This system of piping is used to a greater extent in forced systems than in those where the temperature head is the motive power used in creating a circulation.

Air gathering in the piping or in the radiators is an obstructon to circulation. There is a certain amount of free air that enters a heating plant with every fresh supply of water. Most of this air will escape from the system through the expansion tank vent, but if the water in the system is rapidly heated after it is first admitted there will be some accumulation of air in the higher parts of the radiators. Thus the constant overheating of water in the system with the resulting loss due to over-expansion, and the following refilling of part of the system with fresh water is the genesis of a great deal of the annoyances caused by the necessity of frequently opening the air vents on the radiators.

The law governing the temperature conditions of water with regard to the pressure to which it is subjected is often used to good effect in hot water systems in this way. Between the expansion tank and the system there is set a weight that will hold the water down in the system until a certain temperature is obtained. This weight is usually graded to 10 lbs. pressure, and as a result the water may be heated to a temperature of about 237 degrees Fahr. before any steam is generated. The expansive force tied up in the system causes the water to circulate very rapidly in its effort to equalize the pressure. The weights used must be such that they will never stick, otherwise a violent explosion may occur.

Where two boilers are connected and valved separately, the expansion pipe must be placed on the inside of the valves. It is well in a case of this kind to have two separate expansion tanks. Several serious explosions have taken place here in Toronto because of the omission of such reliefs for the systems.

When the engineer is called upon to design a forced hot water heating system, he is likely to make some pretty glaring errors if he is not well versed in the laws of hydrostatics. It is true enough that men have installed a good many forced water systems, not knowing what the term even meant, but had they known more about this matter when they were first called in to do the work, they would not have been guilty of running pipe lines too large or too small for the work, nor would they have so carefully arranged details that could only be a detriment to the circulation.

In estimating the surfaces of radiation required in a forced system of circulation, a much higher heat transmitting power may be assumed for these surfaces than is the case with gravity systems. Gravity systems are figured for a radiator efficiency of 150 B.t.u. per hr. The efficiency of a square foot of cast iron radiation under the average condition of a forced system is 190 B.t.u. Pipe coils have an efficiency with this type of system of 250 B.t.u. These figures are based on an initial water temperature of about 200 degrees, with a temperature drop of 35 degrees in the main return.

In figuring the pipe sizes required, it is necessary to allow 1.6 gals. of water per minute for every 250 B.t.u. per hour transmitted by way of the radiators.

The quantity of water carried by the mains to and from the radiators is governed by the velocity of the water therein traveling and the diameter of the mains.

The velocities may be taken as 260 ft. per minute in a 3 in. pipe; 320 in a 4 in. pipe; 375 in a 5 in. pipe; 410 in a 6 in. pipe; 450 in a 7 in. pipe, and 510 in an 8 in. pipe.

Feed and return riser pipes are from ¾ in. or a 48 ft. load to 2½ in. on a 600 foot load.

The pump must be just large enough to overcome the friction head, and it should be of the centrifugal type. The careful study of any work on hydraulics will give the data necessary to allow for the friction head due to the velocities and the quantity of water carried in the pipes. Space here does not permit at present the giving of this data, but later on we hope to place before our readers certain principles of the science of hydrostatics that they may find of value in designing work of this kind.

Just as in gravity system, so in forced systems care must be used in preventing the short-circuiting of hot water. Sometimes this is done by reducing the area of the feed or return pipes serving radiators or the parts of the system that are working too fast.

The boiler used in this kind of work must be so built that the circulation within it will be properly equalized. It is a common thing to find only 50 per cent. of the heating surface in a boiler used in an effective way with these systems. When steam boilers are used it is necessary to have some kind of a reheater or generator installed where the water for the system may be heated.

Ventilating the Modern School

Ninth Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

ALREADY there has appeared in this series an article with regard to the importance of locating the ventilating flues in position suitable to the construction and architectural arrangement of the buildings wherein the flues are to be erected.

The responsibility for the location of the flues is not often, as it should be, placed with the engineer designing the ventilating plant. Too frequently the exigencies of the architectural design prohibit the proper arrangement of flues for the heating and ventilating system requested. and it is then necessary for the engineer to design a ventilating system differing in its details with that of the system the school board and the architect first had in their minds.

While it is important that the ventilating engineer's design should not in any way mar the appearance or effect of any other work on the building, it is of greater importance, in at least so far as the ventilating equipment is concerned, that he should choose locations for the fresh air inlets and foul air outlets that will result in a uniform air circulation in the room to be ventilated.

It is, then, with regard to the loction of these openings that our interest at present lies.

First, we will take up the location of the opening or openings whereby fresh air enters the class-room, and in doing this we may consider, for illustration, that the first of our examples is a fresh air face set at a height of eight feet from the floor line of a standard class-room. The fresh air flues are located along one of the interior walls, and the air is driven through the flue, either by a fan or by gravity pressure.

Up to the point when the air enters the class-room fairly constant conditions of pressure and of temperatures exist, but just as soon as the air escapes from the flue it becomes subject to the variations of the temperature and pressure of the atmosphere within the room. It is these varying conditions of pressure and temperature that makes it necessary to frequently provide more than one fresh or foul air opening for each class-room.

The provision of an opening for a fresh air inlet and also the placing of one for a foul air outlet will not always result in an ideal circulation of air. This can be understood by a reference to air movements in a class-room due to temperature conditions alone. For example: The fresh air, as we have already stated, enters the class-room through a face set on an interior wall. In the winter this fresh air is slightly warmer than the air in the room, and therefore it naturally ascends to the ceiling. It is a characteristic of air that it clings to surfaces, so this warm fresh air travels across the room close to the ceiling until it encounters the cooling surfaces of the outer walls, and then becoming chilled it drops toward the floor line. At the floor it drifts across to the foul air outlet, when it escapes to the vent stack. Of course, the heat of the radiators, located under the windows, has some effect in creating an upward current of air along the coldest location of the room, and this results in a direct disturbance of the air currents here; but this disturbance is not in itself sufficient to greatly offset the general air circulation, and therefore need not be taken into account. The movement of air in a room during the winter months is, therefore, generally downward on the exterior walls.

But now the hot summer comes along, and the outer walls are heated from the direct rays of the sun. The fresh air driven into the rooms is likely to be cooler than the air in the room, and therefore it naturally drops to the floor line. If the vent face is placed at the floor the fresh air will not circulate in the room, but will pass directly through that face, and to the vent stack. If a vent face is placed close to the ceiling, the cold fresh air will pass across the floor and upward on the warm outside walls to the ceiling, where it will drift across to the vent and escape.

The circulation of air has been described here as taking direct paths, and while it is true that the general circulation is along these lines, the point must not be forgotten that the chemical and physical properties of the air are constantly undergoing changes that tend to split the currents up in such a way that an equable circulation of air is obtained practically throughout the volume of the room.

The direction of air currents may be discovered by making use of toy balloons filled with hydrogen gas and counterweighted to make them stable. These balloons may be set in the fresh air openings, from whence they will be carried by the air current through the paths described. Or an ammonium-chloride test may be made in this way: Two bottles are obtained, one containing hydrochloric-acid and the other ammonium-hydroxide. Tubes are to be placed through the corks of the bottles and an atomizer bulb and nozzle arranged in such a way that the compression of the bulb will force air through the two bottles at the same time and unite the fumes at the nozzle; the result will be a small puff of smoke that will not settle out of the air. The smoke from black powder discharged in the fresh air flues will not give a very accurate indication of the air movement; although it is a test frequently resorted to by many architects and engineers.

The arrangement of fresh air flues and faces, so far described here, is that where dilution of the foul air is the principle on which the ventilating system is based. In many public buildings a direct displacement of foul air is desired, and it is then necessary to arrange all of the fresh air inlets and the foul air outlets as far apart as possible.

In direct displacement systems the fresh air is often introduced through one side of the room and the foul air driven out of the other side. Or this air may come in at the floor line and be exhausted at the ceiling, or the vice versa. With the direct displacement the action of positive flushing takes place. However with such a system there is a danger of pockets of dead air being formed in the corners of the room, unless an adequate number of inlets and outlets are provided.

More heat must be supplied to the room where the direct displacement action occurs than where a dilution system is installed; but, as the direct displacement system requires that the air openings be well distributed throughout the area of the room, a less volume of fresh air is required than in the dilution system.

One method of providing a direct displacement system is to introduce the fresh air on the exposed side of the room of exhausting the foul air from the other through faces set in the vent flues on the inside walls. A more expensive, but a better, system is to drive the fresh air through channels under the floor, connecting these channels to mushroom diffusing heads set under each seat. The area of these mushroom heads may be adjusted to equalize the circulation through the room. The foul air is exhausted through openings in the ceilings, connected to channels similar to those under the floors. In some systems the fresh air comes into the rooms at the ceilings and the foul air escapes to the vent flues through the mushroom heads at the floor.

Mushroom systems of ventilation are used to a great extent in theatres and churches, and but rarely—at least in this country—in public schools. Their omission from public schools is not, in our opinion, due to any inherent defect of the system, but rather on account of the expense necessary to the installation.

SELLING GOODS AT THE MARKET

Is a merchant always justified in marking up his stock to keep pace with wholesale market quotations?

"It is simply rank profiteering," a farmer told George F. Sharp, a general merchant at Gull Lake, Sask.

"Listen," Mr. Sharp said to him. "Suppose you purchased a horse for $200, and on account of the world shortage the price of horses went up to $300 within the next six months, would you be such a rank profiteer as to ask $300 for your horse, or would you take what you consider a fair price of $225? If you did you would lose $75, because in buying another horse you would have to pay the full market value."

"I begin to see the light of day," said the farmer.

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

AN advance is to be made immediately in pipe fittings. Manufacturers have withdrawn all quotations and new ones are being worked out. It is stated that the new figures may show an increase as high as fifteen per cent. in many cases.

New and higher figures are also in effect on soil pipe and the approximate advance is ten per cent.

Shortage of goods is causing some anxiety in many quarters. This situation is increased by slow deliveries. One jobber stated to SANITARY ENGINEER that he had been unable to get the shipments of bath tubs he required because no legs for them were obtainable. Others are complaining about shortages of soil pipe and so on. One firm has more than 800 residences to supply and is finding some difficulty in getting the goods.

Business in general has been excellent and from inquiries that are coming in it will increase. In addition to a large number of dwelling houses being built, plans are being prepared for many more and in addition to this work many large projects are under way which will mean the expenditure of large sums in the spring and at different times next summer.

The settlement of a number of labor difficulties is enabling manufacturers to increase much needed production and they are hoping that from now on this situation will steadily improve and that they will be able to take full advantage of the splendid trade that is developing.

During the week some substantial orders have been placed for marine goods. This will greatly stimulate a branch of the trade that had been a little quiet.

Ingot metals are showing more steadiness than for some time, although conditions are being affected by labor troubles. Lead is strong. Copper, after advancing steadily, has steadied and no changes have been recorded recently. Prices of tin advanced five cents, but the upward movement has stopped. Business has been active in most lines of ingot metals.

Toronto, August 13. — Shortage of goods is apparent in many lines in the plumbing and heating trades, and is delaying work. Orders have been coming in so briskly that many manufacturers are getting behind with their deliveries and the situation is aggravated by difficulty in obtaining help. The building business is especially active and promises to remain so as many large projects are getting under way and others are planned. It is estimated that more than $5,000,000 worth of new dwellings will be under construction shortly in Toronto alone, for the housing commissions. There has been renewed activity in orders for marine goods and manufacturers have enough work on hand to keep them going now for some time. Many of the workers who have been on strike in various metal trades are now back at work and there is urgent need for greater production.

Enamelware Prices Are Holding Firmly

ENAMELWARE.—Slow deliveries of goods are causing some annoyance and with business coming in as it has been the manufacturers state that this condition is likely to be worse rather than improve. The building permits continue to increase steadily and great activity in construction work is apparent, especially in projects calling for various lines of enamelware. Prices are holding firm, the quotations on some of the well known lines being as follows:

Bath tubs, rill rim, 4, 4½, 5 feet, 24 to 30 in. wide		$35 30
Bath tubs, 5½ ft.		39 25
Basins, flat back, 14 x 15 in.		6 80
Do., corner, 15 in.		7 50
Sinks, roll rim, 18 x 30 in.		15 80
Sinks, flat rim, 20 x 30	$6 75	6.65
Do., 18 x 30	5 80	5 90
Do., 18 x 24	5 37	5 25

Do., 14 x 20	4 45	....
Closets, oak tank and seat	....	25 50
Do., enamel iron or white vitro tank	....	27 50

No Changes Shown in Range Boilers

RANGE BOILERS.——There has been a good demand for range boilers. Prices show no changes and manufacturers are not looking for any to take place in the near future they state. With a large number of dwellings being constructed and plans for more getting under way continually the outlook for business is good. Quotations are as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Soil Pipe Higher, Fittings to Advance

SOIL PIPE, FITINGS.—New quotations, which are 10 per cent. above former figures, are now in effect on soil pipe. Business has been very active and manufacturers are having difficulty in keeping pace with orders.

Prices have been withdrawn on fittings and new ones will be named shortly. These are expected to show an advance which may run as high as fifteen per cent. The old quotations were as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	10%
Medium and extra heavy soil pipe, 4 in..	15%
Medium and extra heavy soil pipe fittings, 2 in. to 6 in.	25%
8 in. extra heavy pipe and fittings	5%

PIPE FITTINGS

Boiler Tubes Reveal Strong Tone

BOILER TUBES. — Seamless tubes seem about due for an increase, although the new prices are not announced yet, but it is understood the warehouses are calling in quotations that were made some days ago, and which have not been closed with. The increase will probably be about 2½ per cent., and the only good reason for it seems to be that there is a great demand for tubes just at this time, and many of the mills are booked well into the future. Quotations range as follows:

BOILER TUBES—	Seamless	Lapweld
1¼ inch	$27 00	$.....
1½ inch	28 00	.....
1¾ inch	30 00	26 00

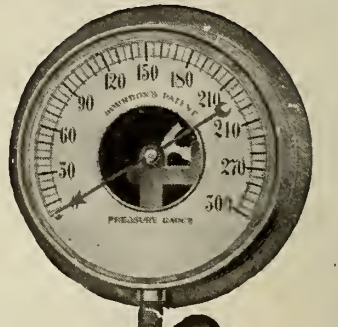
UNITED BRASSFOUNDERS AND ENGINEERS, LIMITED

EMPRESS FOUNDRY, CORNBROOK, MANCHESTER, ENG.

DURING THE WAR our plants were exclusively engaged on work of supreme national importance.

At the commencement of the new era we are pleased to announce that we intend to again direct our energies to the intensive production of:—

GUNMETAL and BRASS VALVES and COCKS.
STEAM, WATER and COMPRESSED AIR FITTINGS GENERALLY.
CAST IRON STOP and SLUICE VALVES.
SEMI-ROTARY PUMPS.
EXTRUDED BRASS and BRONZE BARS.
BRASS BOLTS and NUTS, STUDS and GENERAL TURNED WORK FROM THE BAR.
CAST AND MALLEABLE IRON COCKS and PIPE FITTINGS.
PRESSURE and VACUUM GAUGES.
INJECTORS and GENERAL JET APPLIANCES.
ENGINE GOVERNORS (Pickering, Proell, and Other Types).
SPRAYING MACHINES, for Insecticides and Lime-washing.
COPPERSMITHS' WORK.
"STELLA" BRAND ALLOYS: MANGANESE COPPER, SILICON COPPER, FERRO ZINC, PHOSPHOR COPPER and TIN, etc.



"UBEL" POST-WAR SERVICE

If you are interested in any or all of the lines mentioned, and are in a position to take a hand in the energetic distribution of the same, please communicate with us NOW to our Head Office, at above address.

"Morrison" Gauges

Include Recording Pressure and Temperature Gauges, Blast Pressure Gauges, Standard Test Gauges, Hydraulic, Altitude and Sprinkler Alarm Gauges, Combination Water Works Gauges, Steam, Vacuum, Locomotive and Duplex Gauges, Pyrometer Gauges, Engineers' Clocks and Revolution Counters, Pressure Gauge Testers, Pyrometers for Bakers' Ovens, Thermometers for Heating Installations, Feed Water, Flue, Gas, etc.

"J.M.T." is seen on most all Canadian Working Drawings and Specifications. You may expect frequent calls for Morrison goods.

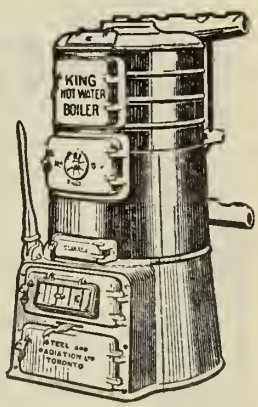
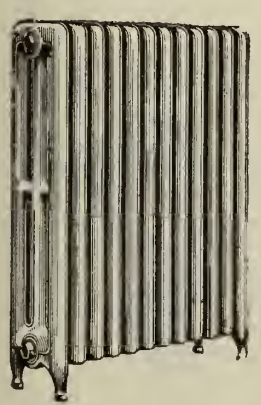
KING HOT WATER BOILERS AND IMPERIAL RADIATORS





Heating Systems that Ensure Satisfied Customers

Don't gamble with your reputation by installing ordinary heating systems. Even if you make a little more money on such a system, you absolutely can't afford to take the risk. King Hot Water Boilers and Imperial Radiators are mechanically perfect and form an unbeatable heating combination.

The exceptionally low fuel consumption of the King Boiler makes it a general favorite wherever it is used. The "thin waterway" construction of King Boilers ensures an even distribution of heat. If it's satisfied customers you want, recommend and install "The system that gives satisfaction"—King Boilers and Imperial Radiators.

Over 60,000 Daisy Hot Water Boilers Now in Use. Are *You* Selling Your Share?

Daisy Hot Water Boilers are easiest to sell because they have an established reputation for exactly meeting the requirements of the modern home.

Every Daisy you instal will help build bigger business by bringing repeat orders for installation in neighboring homes later.

WARDEN KING, Limited, Montreal

BRANCH OFFICE. 136 SIMCOE ST., TORONTO

Quaturn Ball Cock

Did you ever sell a **whistling, noisy Ball Cock?** It didn't advertise you very well, did it? And very likely your customer was not much pleased either.

Next time use Quaturn.

Because, under moderate pressure, they operate quickly, positively and noiselessly.

Because the working parts may be renewed when worn, without taking off the body, and they are interchangeable with all other Quaturn fixtures.

Because they close with the pressure and therefore tend always to close tighter, eliminating leaks.

Because a satisfied customer means more business for you.

Mark of Proof Is Proof of Quality

There's proved and certified strength in every

WILLIAMS' IMPROVED "VULCAN" CHAIN PIPE WRENCH

Each and every Flat Link Chain is "proof-tested" to two-thirds of its listed catalog strength in a standard tension machine. To each chain so tested is attached the Gray Leaden Seal, illustrated above, and every Flat Link Chain leaving our works *must* bear this seal—the Proof of Quality—as evidence that it has passed our standardized "proof-tests."

Look for this Mark of Proof for it is Proof of Quality—it guarantees uninterrupted, severe service as well as safety to the operator. Williams' "Vulcan" Chain Pipe Wrenches are the *only* Wrenches which offer this certified assurance.

May we send you a copy of our descriptive booklet?

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

R. MACDOUGALL CO., LTD.

GALT., CANADA

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

Inquiries from Importers and Dealers Solicited. Send for Catalogue No. 55.

X Laboratories 45

There's Something about an Original that Can Never be Imitated!

IF you've ever heard Harry Lauder sing his Scotch songs you could tell an imitation with your eyes shut.

You've seen Charlie Chaplin do his stunts—do you think an imitator could fool the people?

Whether it's real diamonds or paste —whether it's pure gold or brass—an imitation is simply an imitation—**and nothing else.**

That's why the thoughtful steamfitter isn't going to fall for anybody's talk about something "just as good" as "X" Boiler Liquid. He knows that for positive results it is safer to stick to the original. An imitation of the genuine "X" may look like it — but that's all. Patents are allowed on the "X" Liquid process. Its quality **can't** be imitated. Imitations of the genuine "X" Liquid cause foaming. **"X" will prevent foaming.**

No fitter can afford to experiment with his profits. When you get a leaky or cracked boiler job you want to know that you can send any man to that job —have him finish it quickly—otherwise there's the kicking, the arguing and the time-wasting that is utterly useless from a money-making standpoint.

Over 25,000 steamfitters now know that "X" Liquid is the **only** scientific process for repairing leaky and cracked boilers—and for making them LEAKPROOF—RUSTPROOF — AND SCALEPROOF. They know that with "X" they make three times the profit that they could by dismantling and welding.

And they wouldn't risk their reputations experimenting with an imitation.

"X" LABORATORIES

636 Washington St. Boston, Mass., U.S.A.

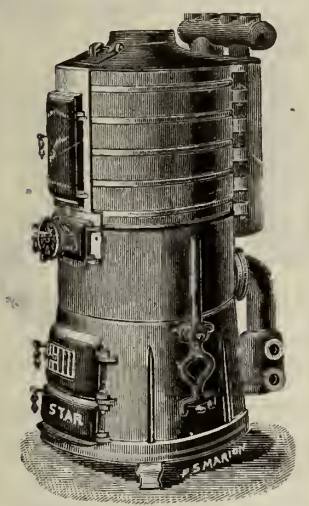
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.

The principal feature of the Star Boiler is that **no other round hot water boiler has any coal-saving improvement not embodied in the "Star."**

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

O. BELANGER, REG'D.

MONTREAL

You Sell in the Dark

when you're guessing at costs. To know your costs, eliminate loss, reduce overhead expense and know where you stand—you should be enjoying "Allpriser." Why sell a fitting for 10c that costs 12c? Be up with the times; know your cost the "Allpriser" way.

Without "Allpriser"

you're struggling in a maze of "almost," "somewhere-near," "just-about" and general guesswork. Can any man compete in modern business that runs on dead reckoning? Exact navigation is needed to avoid the rocks and shoals of business to-day.

"Allpriser" is a flexible leather-bound book. 7 x 9, of 150 pages (loose leaf). It's a trade cost book especially for plumbing and heating. It includes a list with net prices of all staples. It provides a service for $25 a year that keeps price sheats revised to the latest change.

Write for subscription blank or further information.

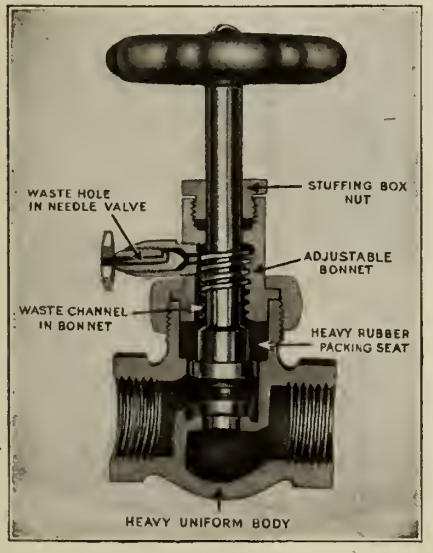
The New "Emco" A 332
Stop and Waste Cock

A "Two in one Fitting."

With five points of Superiority—

—five selling points in addition to the prestige that goes with the word "Emco," the trademark of its makers.



Cross Section
"Emco" A332 Stop and Waste Cock

As a straight Stop-Cock or a Stop and Waste Cock it is equally adaptable.

Study the marked points in the cross sections. Pay particular attention to the arrangements for waste water:

First—the adjustable bonnet which allows the needle waste valve to be placed in proper position for catching waste water.

Second—the needle valve which may be shut off independently to prevent a rush of water out the waste tube, when turning water on and off.

Every "Emco" is thoroughly tested before leaving our factory.

Write for our catalogues.

Order direct.

GUARANTEE

A Little "Straight Talk" to the Canadian Plumbing Trade

Just what does this word mean TO YOU? At one time it was a sacred word, intended to convey to the suspecting public the manufacturer's "OATH," so to speak, that he had used his best endeavours to construct the article offered, strictly in accordance with his claims made in advertising it to the people, and further, the word was an assurance to the buying public of the willingness on the part of the maker to protect the purchaser from loss, if by any chance the article sold did not show the merits claimed in the advertisement.

What does the word stand for to-day? You know as well as we do, it is a camouflage, used extensively by concerns marketing inferior goods, and it is regrettable to note that where quality is least to be found, you will get in its place a whirlwind campaign featuring the guarantee, and about the time the article is spread over the territory, the specialized feature, "ITS GUARANTEE," has passed away, like many of its predecessors, or it may linger long enough to absorb some of your time and postage in a vain effort to prove that the "trouble was up to the factory." Again, it may live long enough to enter its final resting place—"undoubtedly" the courts. A lawyer (if he be honest) will admit that no word in the English language has ever been the cause of so much litigation as the much abused slogan "FULLY GUARANTEED."

It is a suggestion that the sanitary engineer fight shy of product earmarked in this way, but demand the manufacturer's "TRADE MARK" on everything he uses. This mark, to have value, must prove its worth. Therefore, if the maker is willing to stamp his approval on the product, and to stand or fall by this act, you can with safety consider the "TRADE MARK" as your insurance policy. With this in mind, we give below our respective marks of Quality, Efficiency and Service.

"Dual" Mixer

A valve that really mixes Hot and Cold Water, and maintains a uniform mixture.

For ease of operation, simple construction and easy installation, it has set a new standard of efficiency.

Cold Water must be turned on first, no possibility of scalding.

Made in several forms for Showers, Sprays, Operating Rooms, etc.

At the well-known works of Messrs. Brunner, Mond & Co. these valves provide baths for 2,500 employees.

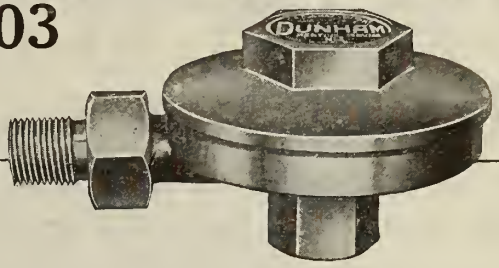
Same in principle today as in 1903



INVESTIGATE the trap question and you find two truths: that in the last fifteen years the carbon post type and the float type trap have been supplanted by the thermostatic disc type trap—and that the Dunham Radiator Trap, the **first** thermostatic disc trap, is essentially the same in principle to-day as when it was first marketed.

The Dunham Radiator Trap was designed to relieve the radiator of the entrained air and water under conditions varying from 10 pounds pressure to 15 inches of vacuum, without adjustment. It did this in 1903—it does it to-day.

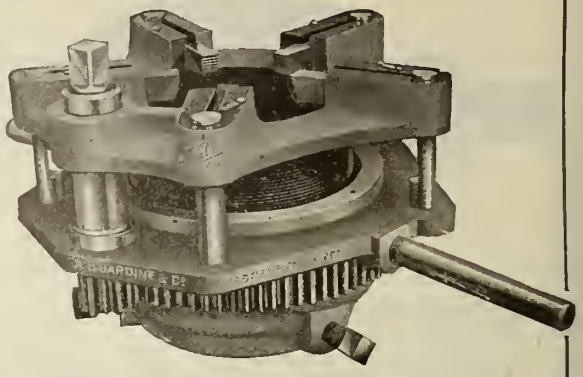
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity 2½ to 6 in. inclusive. Weight, 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

SECRETARY-TREASURER
Garrett F. Frankland, Toronto

WHO AM I?

I am—

I am the one thing necessary to the success of any line of business.

I am the means of bringing together men who have much in common and I create harmony among them.

I am what makes fellowship among competitors.

I am that which stands for united effort—which means attainment of all desires.

I am the one and only thing which every business needs, no matter how small, to make it grow large.

I am the "Exchange" for Ideas—the reason for nine heads over a business instead of one.

I am the connection that brings the strong to the weak—to help, not crush.

I am known down through the ages, and walk arm in arm with progress.

I am working day and night, and my efforts are beneficial to all business men, even to those who reject me.

I am building business, and building public confidence in business.

I am honest, straightforward, and legitimate, first, last and always.

I am—"ASSOCIATION!"

ARE YOU WITH ME?

If so, forward your name and address to the secretary.

Every Sanitary and Heating Engineer throughout the Dominion is urgently requested to answer the above call, and remember our motto—

ALL FOR ONE
and
ONE FOR ALL.

Yours for co-operation,
FRANK R. MAXWELL, President.

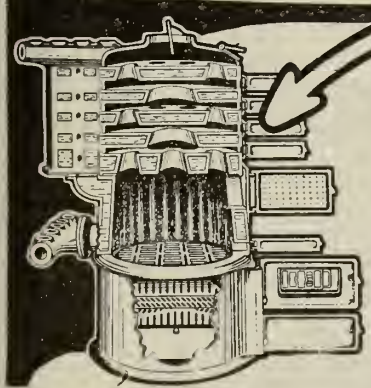
WHY "THE SOVEREIGN" HAS INDIVIDUAL CLEAN-OUT DOORS



Efficiency detail in "Sovereign" Hot Water Boiler

"Individual Clean-Out Doors" is one of the minor features of improvement in the "Sovereign" Hot Water Boiler. It shows how finely the idea of conserving heat has been worked out. Opening only one door at a time, while removing soot or ashes from between the boiler sections, prevents unnecessarily chilling the heating medium.

The principals of the Taylor-Forbes Company introduced the screw-nipple wall radiator in Canada, and are the original designers of the **largest first section** in Hot Water Boilers, a feature which is now widely copied or imitated.

Follow the line of least resistance—"Sovereign" Boilers and Radiators make sales easy.

The Plumber as a Salesman

"Wanted—A Salesman For Plumbing Supplies"—read the advertisement, and among the answers received were some from Master Plumbers, some of them very fine fellows, fairly well educated and who knew the Trade thoroughly.

They wanted, to use their own words, to better themselves and they thought the position as a Salesman offered a greater opportunity for advancement.

But is such really the case. Let us assume that the applicant obtains a position with a first-class plumbing supply house or manufacturer. He is no longer a free agent, he must conform with the rules of his house and to the established customs of the great fraternity of salesmen. He is expected to show initiative in promoting new business and great energy in developing the business which should naturally result from direct inquiries. He interviews everyone who does or is likely to require plumbing material and in the hardest kind of competition secures his orders.

Does his work cease when he turns his orders in to the house? Not so. He will find a hundred and one little matters that require to be adjusted and many of them have no connections with the sale as neither he nor his house have any control over the goods after they are delivered.

Suppose he remains as he is—a Master Plumber. He has the same ability and opportunity as a salesman. If he is progressive he knows all the work that is going on or can obtain the information from the same source as either the jobber or manufacturer. He has the same number of illustrations, the same literature and he has the same initiative, but he develops it on his own account.

He has the advantage of being able to sell direct to the consumer, personally interviews his prospect, visualizes the installation, and in his most interesting way describes the modern bathroom, the complete kitchen or convenient laundry equipment, and eventually closes the contract or makes the sale.

His interest, however, does not cease at this point. He is complete master of the situation, buys the material he specifies, has it installed under his supervision by clean and careful workmen, with the result that he is able to guarantee an absolutely perfect job which will be satisfactory to his customer and a future reference for himself.

Such a man is a salesman in every sense of the word. In addition to selling the goods, he sells service and in that line there is very little competition and price is not a factor in the transaction.

Our company's interest is, of course, in having its products properly installed. Plumbers tell us that they like our fixtures, that they have a nice clear color, are easy to clean, properly packed and convenient to install; but we know that no matter how good our ware is it is more attractive and becomes a better advertisement when it is properly installed by a good mechanic under the careful supervision of a Master Plumber who takes an interest in his work.

Just think what it would mean if every Master Plumber in Canada, and there are about twenty-five hundred, was a well-trained salesman and directed his energy and ability to sell plumbing material under the conditions we have set forth. The volume of business would increase and the conditions under which the work was done would be more profitable to the plumber and more satisfactory to the manufacturer and the consumer.

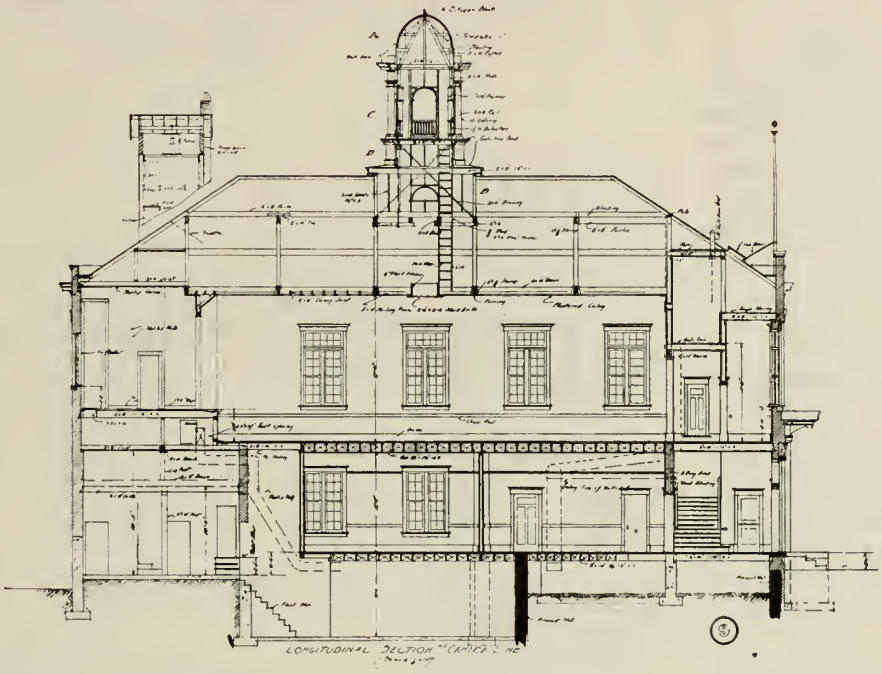
Sanitary Plant of a Memorial Hall

Details Showing Work Entailed in Installing Modern Plumbing in Town Where No Waterworks Exist—Lakefield, Ont., Tackles Job



Incorporated in the Design is a System of Sewage Disposal and a System Supplying Fresh Water—Plans Reproduced Show Details

THE village of Lakefield, Ont., where the hall is being erected, has no public sewers nor a domestic water supply, and therefore it became necessary when specifying a modern plumbing system for the building to incorporate in the design a system of sewage disposal and a system supplying fresh water.

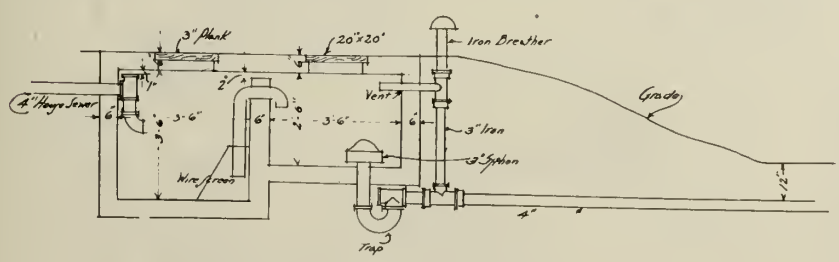
The site of the building is the corner of a park; the ground falling to the north with a gradient sufficient to allow for the installation of a septic tank, but not quite enough for the provision of a sludge removing chamber. The ground is a sandy loam and is of a nature that allows for almost ideal working conditions for the system of sewage disposal specified.

Will Drive a Well

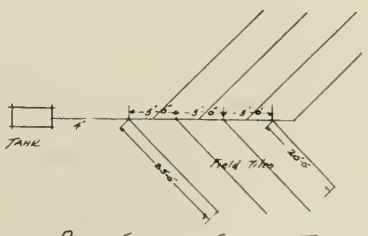
A well fifteen feet deep is to be driven close to the building—at a higher level than the sewage disposal field. Water will be drawn from the well by a 500-gallon per hour pump operated by a ¾ H.P. self-starting electric motor. The pump is to be connected to a 520-gallon storage tank and the tank is to be connected to the fixtures by means of a supply pipe run just as with a city service pressure.

The rain water pipes are not connected with the sewage system. They drain to a dry well set just below the frost level.

Referring to the plan it may seem to the reader that the septic tank is rather small for



CROSS SECTION OF SEPTIC TANK



PLAN SHOWING SEPTIC TANK & FIELD

Note: This does not indicate location

the number of fixtures shown, but the consideration of how often these fixtures will be used should show why a tank of the ordinary residence size was specified. If the tank is too large, the sewage remains in it longer than required for the best working of the bacterial action.

The septic tank will have overall dimensions of 9 ft. x 4 ft. 6 in. It will be constructed of concrete with 6 in. walls as shown in the section.

Empties Into Tank

The house sewer empties into the tank as shown and it will be noted that there is a tree with an open end placed at this junction, where the air driven ahead of the sewage may escape above the mat lying on the surface of the water in the tank.

Would Need a Box

If this vent was omitted it would be necessary to place a 12 in. box around the house sewer outlet to prevent the rush of sewage breaking up the mat. A wire screen is placed around the mouth of the overflow pipe to prevent solids from the sludge bed finding their way into the closing chamber.

After the effluent has passed into the closing chamber it is syphoned into the aeration field at intervals governed by the time taken to fill the closing chamber to a point necessary for the action of syphonage. The depth of the trap or the syphon is not drawn to scale.

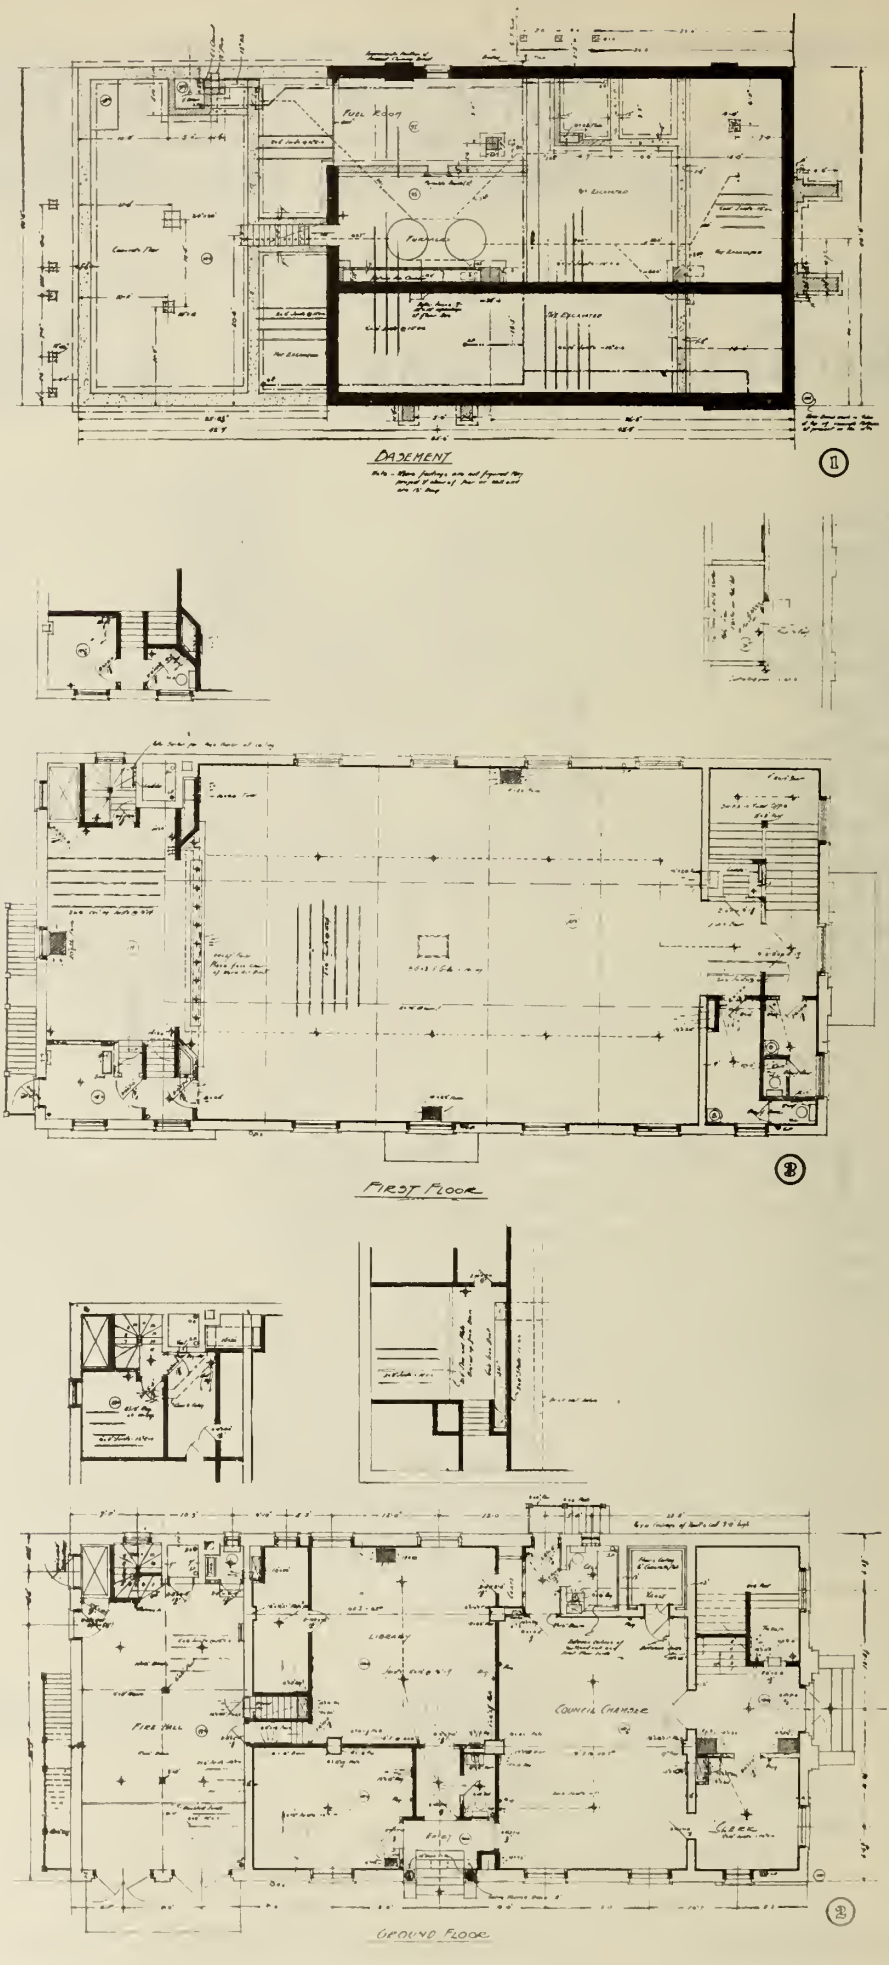
There are 4 in. medium cast iron soil pipes shown in the drawings with all of the necessary brass screw cap cleanouts where bends occur in pipes.

All fixtures will be vented to 3 in. main vent stacks run beside the main soil pipes.

The wash basins will be supplied with compression bubbling faucets so that they may be used as drinking fountains.

The W.C. seats are to be fitted with ball weights, so that the seats will always be thrown back of the bowls, except when they are in use. All seats will have open fronts.

Every closet in the building will have outside light and air.



Plumbers Wrestle With New By-Laws

Committee Has Had Many Sessions to Consider New Laws to be Adopted by Montreal City—Care Necessary That Best Working Measures May be Adopted

THE committee of Montreal Master Plumbers who has had under advisement the proposed plumbing by-laws of the city, has been working hard of late to perform the task. It will be recalled that the Administrative Commission of the city recently requested the co-operation of the craft in this respect. This is a tribute to the importance of the functions performed by the Master Plumbers, and the efforts being carried out under the chairmanship of P. C. Ogilvie will doubtless greatly add to the effectiveness of the measures proposed. True, it means a lot of work for these men, but it is in the interests of the craft and in that of the public that the committee is laboring.

General Meeting Held

Of course, the committee has been working for some time at this task. The time was thought opportune to acquaint the masters, generally, of the progress made, and of the characer of the proposals. In accordance with this, a meeting was called and held in the Montreal Builders' Exchange on the evening of the 21st inst. This was well attended, and while the discussion did not bring the desired results, interest in the new by-laws has been stimulated.

There were nearly forty members and non-members present at this meeting and David K. Trotter, secretary of the Builders' Exchange, briefly outlined the object for which the meeting had been called and suggested the appointment of a French-Canadian and an English-speaking chairman. This was approved and Telesphore Latourelle, Montreal, president of the Association of Master Plumbers, was selected to address the meeting in French, while D. A. Bethune was the English-speaking appointee.

Committee Reports

The committee is comprised of P. C. Ogilvie, Walter Ryan and Alex. Charette. As chairman, Mr. Ogilvie reported progress, indicating that the committee had considered, clause by clause, about one hundred of the proposed sections, this being, approximately, half of them.

Appreciation of the tedious effort required to minutely and carefully consider by-laws which are to be the guide of hundreds of plumbers is not always given. As an indication of what this means Mr. Ogilvie stated that eight meetings have already been held and these were of from two to three hours' duration each. He also stated that in their considerations they had remembered the duty which is owed the public generally. These laws must be so framed as to conserve and guard the public health. With this in view, the type of master plumbers should be high and this could be secured, in part at least, through the adoption of, and adherence to, a rigid examination test to be embodied in the requirements of the city by-laws. Examinations to be passed should be more exacting. Fees, perhaps, should be greater than they now are.

Some discussion arose as to the consideration of the various clauses. If this were continued, it would take a long time and it was finally decided to postpone the further consideration of the clauses for a week.

Awakening Interest

After interesting and more or less extended observations by the joint chairmen as to the qualifications of master plumbers, and what these qualifications should be, the meeting took a decidedly different, though an interesting turn. The fact that many of those present were not members of the local association was introduced, and the advantages of belonging, officially, to such a body were voiced by J. E. Walsh. Mr. Walsh referred to the particularly good and interested material that had been secured within the past year or two. President Latourelle and Mr. George Delaney were two of the youngest members, in point of actual contact with association affairs in Montreal, and yet they were among the most enthusiastic. It was, Mr. Walsh thought, one of the best arguments anyone could advance as to the advantages of belonging to the Master Plumbers' Association.

Interest was quite manifest and it will not be surprising if the Montreal section is twice as large, ere long, as it is at present. The extent of development which any association can look for will depend, largely, upon the zeal with which members tackle their work. New blood will be welcomed in the Montreal Association, and the membership fee of $5 will debar none, surely.

Further discussion will be taken up on these matters, and also regarding wage and labor conditions, on August 28th.

Montreal May Spend $3,000,000 on Homes for Workingmen

Houses to Cost $3,000 Each Are Planned and if Arrangements Are Carried Out Construction Work Will Commence in the Spring

HOUSES for the working man, which would cost about $3,000 and rent for 10 per cent. of that cost, per year, is the tentative proposal of Dr. Emile Nadeau, housing director for the Province of Quebec, outlined at a representative gathering of the members of the Builders' Exchange, in Montreal. Dr Nadeau outlined briefly a plan for the erection of 100 houses in the city of Montreal, the details, at a rough estimate being $300 for the lot, $300 for local improvements, and $2,400 for the building, or $3,000 in all. The life of such a class of buildings as Dr. Nadeau had in mind, would, he said, be 60 years.

Spend $3,000,000

Montreal, Dr. Nadeau, pointed out, would have about $3,000,000 to expend in housing, under the federal grant for that purpose, and it was his idea, that three building societies ought to be formed, which would handle $1,000,000 each of that fund, such organizations to be operated on purely philanthropic lines, as the returns were not to be more than six per cent. Plans, specifications, supervision and all the overhead would be undertaken by the society at an additional cost of two and half per cent., said Dr. Nadeau, and this, he explained, could be done for such a comparatively low figure by reason of the fact that the plans would be uniform for the entire Province, and that expert advice would be easily available from members of the organization.

Become Shareholders

Persons desiring to take advantage of this proposition would be obliged to become shareholders in the society to the extent of at least one share, thus every tenant would be a shareholder, and would eventually become the owner of his property. If, after 10 years, he desired to vacate the property, he could only dispose of it to the society, and would not be permitted to make an individual profit on his transaction.

Mr. William Rutherford inquired when the plans would be ready and Dr. Nadeau said that they would not be completed until the fall, that during the winter, if the project was to be carried out, preliminary town planning work would be done, and by May next the entire proposition would be in shape for building operations. Dr. Nadeau stated that a number of influential men in Quebec, Hull and Sherbrooke were ready to take hold of the idea.

Working a Winning Combination

Hardware, Plumbing and Electrical Fixtures Bring Steady Business and Good Profits to Davison & McInnis of Woodstock, Ont., the Year Round — Splendid Results Obtained From Window Displays and Advertising

Based on an interview by C. E. PARSONS, of Sanitary Engineer, with G. A. Davison and A. L. McInnis, of Davison & McInnis, of Woodstock, Ont.

"WE were forced into the business. People came in asking for things and we had to get the stock. Now we have got more business at times than we can handle."

This was the statement made by A. L. McInnis, of Davison & McInnis, of Woodstock, Ont., to SANITARY ENGINEER in reference to the firm's trade in electrical fixtures and supplies.

"Business has been better than ever," he said, "since we are allowed to do wiring again. We soon found when we went into the electrical business that we had to carry the stock in order to get the results we wanted and make money. Our constant aim in all our business is to stock good goods and back them up by good service."

Are Kept Busy

Within a radius of ten miles around Woodstock are a number of milk factories. From these as well as from the homes of the prosperous farmers all over that section Davison & McInnis get a lot of work. "We keep six men going ten hours a day the year round," said Mr. McInnis. "We never have any slack time. Last fall things got so busy that for six weeks we closed our order book and refused to take on any more work."

The firm has two good-sized display windows and these are devoted to showing seasonable lines. They are changed each week.

Have Got Results

"I cannot speak too highly of the results we get from our window displays," said Mr. McInnis. "A single instance that occurred recently is typical. We had planned a special sale and fixed up a window display and put in cards announcing the special. We intended to advertise it, but we never got a chance. The stuff was no sooner in the window than it commenced to move and we cleaned out every piece in a short time. As far as our advertising is concerned, however, we do quite a lot and have always had splendid results. We find it a very effective way to reach the buying public, not only in the city, but in the homes all through the countryside.

Keep Them Displayed

Davison & McInnis keep their store and their windows in spotless condition. The electrical fixtures are placed right up in the front of the store and on one side, just behind the show window, is a display of globes and other supplies. On the same side and right near the front stands a handsome silent salesman filled with electric flashlights. Mr. McInnis says it has sold a lot of goods and that his sales in this line are growing steadily. The left side of the store at the front is devoted to a display of enamelware which makes a fine showing on specially arranged shelves.

Keep Them Displayed

Out on the floor seasonable lines are kept on display, including such goods as electric stoves, electric washers, etc.

"We have been handling electric ranges for two years," said Mr. McInnis, "and in that time we have sold seventeen. This business grows automatically once it gets started. One satisfied customer sends another. We find that this business is developing itself nicely and prospects are good for a steady trade."

The firm some time ago commenced the repair of electrical goods of all kinds and its business in this department has grown to such an extent that now one man is kept doing nothing else.

Out on the Floor

It has been found that handling one line of goods helps the sale of another. For instance perhaps a man who is build-

Interior view of the Davison & McInnis store at Woodstock, Ont. This firm believes in getting goods out where the people can see them, as they find this a material aid in getting "turnover," the goal of good merchandising.

ing a new house comes in to see about the plumbing and selects the bathroom equipment, the heating and other equipment. While he is in the store he can see a fine display of electrical fixtures and every effort is made to interest him in this line, not only for the lighting for the bathroom, but for the whole house. If his wife is along there are electric irons, electric washers and other lines in which she is interested and many sales are made in this way.

Sell Many Ranges

Gas ranges are a big seller with Davison & McInnis.

"We have sold over 200 in two years," said Mr. McInnis.

He stated that in the farm homes around Woodstock there is a noticeable tendency towards improvement and that the farmers are good buyers and want the best and are willing to pay for it.

In connection with the plumbing end of the business the firm works along the line of replacing parts that are giving trouble with new goods instead of trying to repair the old.

"We have found," said Mr. McInnis, "that in most cases it is bad business to try and fix up something that is not worth fixing. It only gives trouble again, perhaps the next day and then the owner is dissatisfied. I generally advise owners to put in a new part and find that they are willing to do this when it is explained to them why it should be done and that better results will be obtained."

Should Be Remedied

Mr. McInnis brought up a point in connection with the manufacturers that is causing a good deal of discussion among various firms.

"If a manufacturers sells us an article that is supposed to be tested and guaranteed and it proves defective," he said, "why should we have to stand the expense? Take thirty-gallon range boilers, for instance. I have taken out more than twenty. All were supposed to have been thoroughly tested. Each defective boiler cost me over $3 to change. I think that there ought to be some protection for the dealer and that the trade ought to take this matter up. Some action should be taken to protect firms like ourselves."

In Close Touch

In its hardware, plumbing and electrical business the firm keeps in very close touch with the contractors. In this way contracts are very often obtained which practically cover a house or new factory in all lines which Davison & McInnis are prepared to figure on. By getting large orders of this kind for builders' hardware, electrical fixtures, paints, plumbing and heating and other goods they reduce their selling costs to a minimum and increase their profits automatically. This is one of the advantages to be derived from carrying on a general business of this kind, as all profits on each line are secured by the one firm. As far as Davison & McInnis are concerned they are very, very well satisfied with the merchandising end of their business and with the results that have been obtained from the combination of hardware, plumbing and electrical goods.

The store front of the Davison & McInnis store in Woodstock, Ont. Good use is made of the windows, and a very good showing of electrical fixtures is seen suspended from the ceiling of the window to the left.

Retailers Strongly Supporting Move to Eliminate Unfair Advertising

Merchants Are Much More Alert Than Manufacturers and Jobbers, Says Bulletin Issued by the Associated Advertising Clubs of the World

SOME manufacturers who so often complain that the retailer is behind times in movements for the improvement of business methods may be greatly surprised, says a bulletin from the Associated Advertising Clubs of the World, to learn that retailers are, on the average, very much more alert than manufacturers and jobbers in their interest in the elimination of unfair advertising and other unfair practices in selling, such as are dealt with by the National Vigilance Committee of the Associated Advertising Clubs, and by the local Vigilance Committees of advertising clubs affiliated with the A.A.C. of W.

Support the Movement

"Perhaps there could be no better indication of the interest of local advertisers," says a bulletin from the Associated Advertising Clubs, "than the way the retailers contribute toward the support of the truth in advertising movement. Some local stores contribute $1,000 or more a year toward local better business bureau work, and a large number are paying more than $250 a year. One store pays $1,300, and says it is getting its money's worth.

"When the Better Business Commission of Toledo was recently organized," continues the bulletin, "there were eleven subscriptions of $300 each from local business men, while the local Chamber of Commerce signed up at $1,000 a year. In Cleveland, Indianapolis, Detroit, and in numerous other cities, payments of $250 a year and more are not unusual.

"These figures are cited," says the bulletin, "to show that the local retailer is very much interested in better advertising, and that he proposes to see the movement go forward. In the meantime, some of these stores which are investing considerable sums in local vigilance work are paying considerable sums toward the general work of the Associated Advertising Clubs of the World. One store which pays more than $1,000 locally is paying $200 a year as a member of the general movement, another which pays $300 locally pays $100 to the general cause, etc.

"While the retailers may be slow in some things, they have not been slow at all in their support of the movement for truthful advertising and for the elimination of unfair selling competition."

THREE-DAY OUTING

A three day picnic that took the form of an auto trip from Port Arthur and Fort William to Duluth and back, was enjoyed by several of the plumbers of Port Arthur and Fort William and their wives. Those who took in the trip were: Mr. and Mrs. L. A. Greene, Mr. and Mrs. W. B. Sime, Mr. and Mrs. H. R. Sime, Mr. and Mrs. S. Oakley, Mr. and Mrs. F. J. Green, Mr. and Mrs. R. A. Shaw, Miss Mae Hubman, Miss Gibson and Mrs. J. Montgomery.

Says Go After Business Aggressively and You Will Get It

Donald Sinclair, Paris, Ont., Sanitary Engineer, Sees Splendid Opportunities in the Activity Now Going On All Over Canada For Selling More and Better Goods— He Keeps in Close Touch With the Farmers

DONALD SINCLAIR, of Paris, Ont., has been doing a steady business in the installation of pneumatic water systems, heating systems, bathroom equipment, and other plumbing lines. Now that construction work is being resumed on a normal scale and a lot of much needed home building is going forward, he looks for business to expand steadily. Each year also sees more and more farmers putting modern improvements in their homes. Mr. Sinclair in a salesman and neglects no opportunity when out on a job to size up all the needs of the customer, and then gets busy with practical suggestions which often leads to sales.

Helps Get Business

There is a great deal to be done in this way, he says, and a lot of business to be rounded up that can be reached in no other way. He finds that people appreciate his suggestions as service from a man who knows his business and is advising them, not because he has something he wants to sell them, but because he has goods which will make their homes better, and more comfortable, and will pay many times over in service the money expended.

Seizes Opportunity

Making the most of opportunities by taking advantage of them quickly has helped Mr. Sinclair to keep pace with the demands of the people throughout the countryside. There are many prosperous farmers in the district and many of them have been adopting modern improvements. Mr. Sinclair soon let them know that they could get electric fixtures at his store, and also that he handled bathroom fixtures, electric lamps and electric washers.

Gradual Development

While there has been no big rush in these lines, but rather a gradual development, as one satisfied party told another of the benefits of the new lines, it has been a steady growth that has meant a lot of nice business for Mr. Sinclair. He has had to meet mail order competition in these goods and others, but he says he can do it every time and without any trouble. In selling electric washers he nearly always works on the plan of letting any woman who shows that she is really interested take a machine home and try it.

"Once the women get them home," said Mr. Sinclair, "and see just how much time and drudgery a machine will save them, they don't want to part with the machine, and it is rarely that one ever comes back."

Favors Cash Trade

While Mr. Sinclair favors doing business on a cash basis, he says it is not always possible to do this under conditions as they exist in this vicinity. He has strong sentiments regarding the matter, however.

"In my opinion," he said, "credit business is a curse of the country. Everybody knows you and tries to take advantage of you because they know you. I think the Government ought to enact legislation which will prohibit the credit business. There are endless small accounts and these eat themselves up in no time in efforts to collect them."

Lets People Know

Mr. Sinclair has found that it pays and pays well to have display windows, to keep his goods out in the shop where people can see them and to advertise regularly

"Don't be afraid to let people see your stock," said Mr. Sinclair. "Goods that are kept hidden away under the counters, in drawers or down the cellar will not turn over nearly as fast as those that are displayed in your store so everyone that comes in will see them"

Do Good Work

Another foundation principle is that all work that is done must be of the best. Mr. Sinclair wants no dissatisfied customers either from his hardware store or his plumbing department. With an eye to building for the future, he has always worked along this line, and he says it is the only plan to follow. He has found from experience that no merchant can have a better advertisement than satisfied customers. No matter what they buy from you, if they are satisfied they will talk about your store and your goods and your service to your friends. Mr. Sinclair can trace a lot of business to good words spoken about him by those whom he has pleased. Not only that, he says, but they always come back when they want anything else.

Don't Forget Your Overhead

Impossible to Get Best Results Unless Business is Conducted on A Business-Like Plan—Too Many Firms in the Past Have Been Neglecting to Take All Items Into Account When Figuring

IN ALL lines of business efficiency in management as a result of general conditions is becoming more vital to success than ever before. Those who have been studying how they can get the best results have had it unmistakably borne in upon then that the whole problem centres around overhead. The time is coming, and very rapidly, when the dealer who has not a sound knowledge of overhead is going to be so handicapped by following old methods that he will be forced to adopt business methods or quit.

It is not always realized that the smaller shops doing a general business have a great influence on prices, and as overhead is one of the great factors in determining price, it may be readily seen that the greatest good to the greatest number may be accomplished when a comprehensive knowledge of overhead becomes established in the minds of those in the trade. Once a plumber gets it into his head why and how his prices have been too low, and how to arrive at the correct price it is inevitable that betterment will follow.

For the great mass of shops it would be an impossibility to maintain a department for dividing overhead into its integral parts. This, however, is unnecessary. Each man may arrive at the percentage it costs him to carry on business for himself. The great trouble seems to be that many of those in the trade do not always include all the items that should be included, and as a result are making the public a present of whatever charges are left out by figuring too low. Overhead means the expense of carrying on business, and includes the money paid for rent, insurance (fire, liability, accident, compensation, etc.), taxes (water, city, country), advertising, printing, stationery and postage, telephone and telegraph, trade and daily papers, mercantile reports, legal expense (attorney fees, etc.), collections, dues to trade organizations, etc., charities and donations, shop supplies for which no charge is made, lost time of workmen (time paid for but not chargeable to any job), bad debts allowance (reduction made to get settlement of account), depreciation (on tools and equipment), freight (where not added to cost of material), car fare (when not charged to job), light (gas, electricity, etc.), power (gas, electricity, etc.), (steam), heat (gas, coal, etc.), hauling (where wagon or truck is owned by establishment this would include all cost of operation, such as drivers' wages, feed, repairs, etc.), salaries (money paid to those for whose services no charge is made, viz., bookkeepers, errand boys; where the latter do not work on jobs, money they receive should go in this item).

Saving Fuel in Heating a House

By L. P. BRECKENRIDGE and S. B. FLAGG

The total output of coal in the world during the calendar year 1913, according to a Government report,* was 1,443,393,052 short tons, and of this enormous amount 39.5 per cent., or 570,048,125 tons, was mined in the United States. Probably 10 to 15 per cent. of the coal produced in this country went to purchasers who used it largely for heating dwellings. The Federal Government uses a large quantity of coal for heating the many small buildings occupied by its various departments and bureaus, and is therefore directly interested not only in selecting proper fuels, but in obtaining the best possible results from their consumption. Because of this interest on its own account and the widespread interest of householders the Government some years ago conducted tests to determine the relative value, for use in residence-heating boilers, of several typical fuels.†

The value a householder gets from the fuel he burns depends largely on the character of the heating apparatus, the conditions under which it is installed, and the manner in which the fire is handled. The authors, from experience in firing residence-heating apparatus and from observing the methods employed by many who attend to such apparatus, keenly appreciate the importance of proper firing methods, and have written this paper in the belief that some general remarks on the selection, care and operation of residence-heating apparatus may prove of value to many who are interested in burning fuel in the most economical manner.

This is the second instalment of the fourth of the series of Engineering Bulletins issued by the United States Fuel Administration in collaboration with the Bureau of Mines, Department of the Interior. This series is receiving very favorable comment. In the concluding instalment on "Saving Fuel in Heating a House," "General Suggestions on the Firing of Coal, etc., will be dealt with. This fourth article covers the saving of fuel in house heating thoroughly and should appeal to every heating engineer. There will be three instalments. Keep them all for reference.—EDITOR'S NOTE.

Factors Governing Consumption of Fuel and Convenience of Operation

Climate

Some factors that greatly affect the total consumption of fuel are not at all related to fuel economy; one of these is climate. It is obvious that in northern Maine much more coal or wood will be needed to heat a house of a certain size to a certain temperature on a January day than will be needed in southern Georgia. In this instance the difference of outdoor temperature is great, but a smaller difference will have an effect. Variable weather always makes difficult the economical use of fuel; high winds likewise are unfavorable because of the volume of cold air that enters a house. Convenience of operation will also be affected by climatic conditions, being favored by even but not too low temperatures and by lack of high winds.

Size and Type of Dwelling

Other things being equal, fuel consumption will, of course, vary with the size of the house and the number of rooms heated. Nevertheless many people do not give this point due consideration when comparing coal bills for a year, and do not take into account differing requirements of temperature and duration of heating.

In addition, satisfactory heating and the quantity of fuel required will depend largely on the construction of the house. As a rule, a stone or brick house will be more easily and economically heated than a frame house, although substantial and thorough construction are of greater importance than the building material. Ill-fitting doors and window frames or sashes, especially in a house exposed to high winds, may make economical heating impossible with any boiler or furnace. Double or storm windows and weather strips will materially lessen the quantity of fuel consumed and the amount of attention required by the heating apparatus.

Even the distribution of radiators affects the cost of heating, for where they are not well distributed it is necessary to maintain them at too high a temperature in order to warm the cool corners of a room.

Location of Dwelling

The location of a house with reference to exposure to winds is a large factor in determining the difficulty of warming it. Between a 10-room house standing alone on a bare hill and a house of like size and excellence of construction, but the middle one of a closely-built row standing in a hollow, there will be a marked difference in heating cost.

Heating and Ventilating System Used

Convenience of operation of any house-heating apparatus is largely dependent on the system of heating and ventilation employed. The cost of heating will also depend, but to a less degree, on the type of equipment. Fuel economy and convenience are against a separate fire in each room unless the house is small or only part of it is to be warmed, except in those localities where natural gas is available at low rates or the duration of cold weather is brief.

In most houses there is no positive system of ventilation; in fact, except in sleeping rooms during the night, little or no provision is made for the admission of fresh air. Nearly all houses warmed by hot-air furnaces have ducts to take from outdoors the air to be heated and delivered to the different rooms. In dwellings heated by an indirect system, whether steam or hot water, the heating coils are in ducts through which the outside air enters. In comparatively few homes is any special provision made for removing the foul air, leakage from windows and doors being the usual reliance, particularly in a house heated by a hot-air furnace. If an indirect steam or hot-water system is installed, means of removing foul air are more frequently provided, either by vent stacks leading into the attic or through the roof, with register openings in different rooms, or by open grates, the flues for which can be equipped with dampers to regulate the removal of foul air. The system sometimes fails to work satisfactorily if provision is not made for the escape of foul air from a room, as the fresh warm air will not continue to flow in unless an equal amount escapes.

As already stated, the first cost of heating by the hot-

air furnace is less than that of either the steam or the hot-water system, but to maintain equal temperature conditions may require the burning of more fuel, whether the furnace heats air taken from outdoors or reheats air already in the house. Evidently, reheating air will require less fuel, and consequently less attention to the furnace, than heating fresh air, but the ventilation will not be good.

Some furnaces have the cold-air duct so arranged that some of the air may be taken from outdoors and the rest from inside the house, the proportion of fresh air being regulated by dampers in the two branches of the cold-air duct. In homes heated by steam or hot water, the method of heating, whether direct or indirect, and the provision, if any, for removing foul air will affect the consumption of fuel, which will vary with the percentage of the total radiation that is indirect and with the amount of warm air removed through vent stacks or grates. Owners of houses heated by different methods sometimes compare results and draw conclusions as to relative advantages of each system. If the houses are similarly situated and constructed and like conditions are maintained, these comparisons are of value, but such similarity is rare. The important bearing of ventilation on the fuel consumption may be illustrated by computations of the heat required for a two-storey brick and frame house. These computations show that if the air in the rooms is to be changed once an hour the amount of "radiation," or the quantity of heat to be delivered into the rooms, must be 25 to 30 per cent. more and if the air is to be changed twice an hour the "radiation" must be 50 to 55 per cent. more than without ventilation. When many persons are in a room it costs more, as a rule, to heat the air needed for ventilation than to supply the heat radiated from the building.

Life of Heating Apparatus

Another point to be considered in a discussion of the relative merits of systems of heating, although not one affecting so directly the fuel consumption or the convenience of operation, is the life of the apparatus or equipment. Ordinarily, but not always, a steam or hot-water boiler may be expected to be in serviceable condition after two hot-air furnaces have served their day and been replaced. To install a steam-heating system in a house of average size will cost, roughly, twice as much as to put in a hot-air system and somewhat less than to install a hot-water system, but the higher first cost of a steam or a hot-water system will in a measure be offset by low outlay for repairs or renewals

Convenience of Operation

As regards convenient and satisfactory operation, although much depends on factors other than the system of heating, yet each system has certain inherent advantages and disadvantages, some of which have been pointed out. With either a steam or a hot-water system of heating, radiators may be placed at any desired point in a room, although there is a prevailing belief that the radiators must be put in front of the windows to warm the cold air that descends from the glass cooling surface or enters about the sash or window frame. With a hot-air furnace there is a possibility, especially after the furnace has been in use for some time, of smoke and gases from the fire leaking into the air passages and being carried to the rooms, whereas with a steam or hot-water system there is ordinarily no chance for such leakage. If the house is not tight, the distribution of heat from a hot air furnace to the several rooms is easily disturbed by the wind and is less positive than with either a steam or a hot-water system and at times there may be trouble in heating the windward side of the house. Also, a furnace-heating system maintains a less even temperature because less heat is stored in it. In this respect, hot-water heating has a distinct advantage over both steam and hot air because the large quantity of water in the boiler, pipes, and radiators can maintain the temperature throughout the house for a considerable time after the fire dies down. In addition, the maintenance of an even temperature in mild weather is easier with the hot-water system because the temperature of the water in the radiators, hence the amount of heat given off, can be controlled within wide limits.

Size of Boiler and Furnace Size of Fire Pot

The type and size of the boiler or furnace selected is also an important but not generally recognized factor in determining fuel consumption and convenience of operation. Until the last five years both makers and buyers of house-heating boilers and furnaces gave little thought to the fuel to be burned. This neglect was a natural consequence of anthracite coal being generally used both in the east, where much of the heating apparatus was made, and in many places farther west ,and tests to determine the boiler or furnace capacity required to heat dwellings of various sizes were conducted with this fuel. In fact, the ratings published to-day for much heating equipment are based on the use of one of the larger sizes of anthracite. The sizes ordinarily used for domestic service weigh approximately 55 pounds to the cubic foot, whereas bituminous coals weigh from 47 to 52 pounds and coke from 30 to 40 pounds to the cubic foot.

To warm the air in a house and to supply the heat lost from the windows and walls a certain quantity of fuel must be burned in the heater, this quantity depending on the heat value of the fuel, the efficiency with which it is utilized, and on other factors. If to supply the necessary heat requires the consumption of 20 pounds of fuel per hour and the boiler or furnace is to keep this up for eight hours without attention, it is evident that the fire pot must be large enough to hold 160 pounds of fuel, and in addition the quantity necessary to rekindle a fresh charge, this quantity being ordinarily assumed to be 20 per cent. of the quantity of fuel in the fire pot after the firing, or in this case 40 pounds. Hence the fire pot must hold 200 pounds of fuel and still leave space for combustion.

If anthracite coal, bituminous coal, and coke are available and each has such heating value that 20 pounds of it will be required per hour to supply heat, the fire pot space occupied by an 8-hour charge of such fuel may be figured by dividing 200 by the weight per cubic foot of each fuel, the space thus calculated being approximately 3.6 cubic feet for anthracite, 4.0 cubic feet for bituminous coal, and 5.7 cubic feet for coke. Therefore if the fire pot were designed for anthracite, it would hold coke enough for a firing period of approximately five hours instead of eight.

Depth of Fire Pot

Not only is the capacity of the fire pot important, but its depth should receive consideration. If the full rated load is to be carried without attention to the fire for a minimum period of eight hours, the depth of the fuel bed be at least 12 inches. A heater that is to burn coke should be designed for a greater depth—probably 24 inches—on account of the bulkiness of the fuel and the different combustion conditions required for burning it satisfactorily. In fact, one of the largest manufacturers of boilers for heating houses by steam or hot water now designs such equipment for a fuel bed 18 inches deep when anthracite is to be used. As regards necessary size of fire pot, another detail that affects both economy and convenience of operation is the combustion space above the fuel bed.

Any unburned combustible gases that leave the fire pot are rapidly cooled in passing over the heat-absorbing surfaces between the fire pot and the smoke pipe, and their temperature is quickly brought below that necessary for ignition. If either anthracite coal or coke is to be burned, a relatively small combustion space above the fuel bed will be required because combustion takes place in or close

to the fuel bed. If bituminous coal is to be used, however, more space should be provided for burning the combustible gases rising from the fuel bed, or a considerable part of these gases will escape unburned, the flue surfaces will become coated with soot, and the heat losses will be large.

Passages From Fire Pot to Smoke Pipe

Another important detail, if bituminous coal is to be used, is the cross section for the gas passages between the fire pot and the smoke pipe. If the passages are not large enough the draft may be cut down by the accumulation of soot in the flues possibly to such an extent that the fire will go out. Also, if bituminous coal is to be used the flues should be of such size and so arranged as to invite frequent and easy cleaning.

General Considerations

The effect of the size of the boiler or furnace on convenience of operation can probably be more readily seen than the effect on fuel consumption. Obviously if the heater be smaller than the proper size, firing at shorter intervals will be necessary, drafts will have to be kept open, and the temperature of the escaping gases will be higher than if a heater of proper size is installed—between 375° and 475° F. in ordinary winter weather. The inconvenience resulting from too large a boiler or furnace is less than from one undersize, but careful handling will be necessary to control the fire satisfactorily in mild weather.

As regards the increased fuel consumption resulting from a heater being too large or too small, each hot-air furnace, steam boiler, or hot-water boiler has certain limits of capacity or rates of working within which it will do its work most economically. Below or above these limits a smaller proportion of the available heat in the fuel will be utilized in heating; in other words, the efficiency of the heater will be lower. Each heater has a particular capacity at which its efficiency is highest, but if the heater be properly designed, within a certain range of capacity the efficiency will be practically equal to the maximum. Obviously the equipment selected should be one that during most of the heating season will be operated within these limits, but will take care of maximum demands for a short time. In some European countries where fuel is relatively much more expensive than with us, some of the larger residences have two or more heaters and as many of these are used as the weather makes necessary, so that each is kept working within the most economical limits.

Kind of Fuel Used

Another factor determining fuel consumption and convenience of operation of heating apparatus is the kind of fuel to be used. As a rule, fuels are like other commodities in that the most desirable are the most expensive.

As previously pointed out, the ideal method of heating so far as convenience of operation is concerned is by the use of electricity, but the cost is ordinarily prohibitive. The situation in regard to the use of gas in house-heating boilers or furnaces is much the same except in those localities where natural gas is available at low rates.

Anthracite

Because of the desirable features of anthracite as a house-heating fuel, the consequent demand for it, and the increasing cost of production, the prices of the larger sizes have gradually increased. Many people who formerly burned nothing else in house-heating apparatus have come to feel that the convenience resulting from its use costs too much, and have changed to bituminous coal. Just what premium a householder will pay for this convenience can not be told, for it will depend on the locality and other factors. In some instances the higher cost of a more desirable fuel may be partly offset by a smaller cost of attendance, but usually such a saving will be negligible.

It may be possible, however, to burn some of the smaller sizes of anthracite with the furnace or egg size and thus effect a saving. The price per ton of these smaller sizes is less in proportion to their calorific value because they are in less demand and they can be used to advantage in banking the fire over night or in carrying a slow fire in moderate weather. Pea coal is probably the best size for such use, but unfortunately it and the smaller sizes are obtained with difficulty in many of the markets where the larger, or domestic, sizes are sold. The quality of anthracite sold by different dealers may differ decidedly, not so much from differences in the character of the coal in different mines as from differences in the carefulness of preparation at different mines, and of breakage in handling. Such differences will manifestly affect both the consumption of fuel and the attention needed by the fire.

Bituminous Coal

Among the various kinds and grades of bituminous coal the differences in fuel value and in their physical characteristics are much greater than among anthracites, and for that reason should receive especial attention. In every locality a number of coals will be available and the most satisfactory one in any particular case will usually have to be determined by trial, unless the characteristics of each and the effects of these are known.

Uniformity of size is a desirable characteristic, as it permits easier control of the fire. This is particularly true of anthracite, a mixture of sizes often accounting for poor results from a certain lot of coal. Sized or screened bituminous coal may be bought for its greater convenience, even though its cost may exceed that of lump coal or run-of-mine. In some localities slack coal has been burned successfully by some people, although it is believed that this would not ordinarily be possible because of the strong draft required.

Care of Furnace

Unquestionably with any fuel the prime factor determining fuel consumption and freedom from operating troubles ,although it may generally not be so recognized, is method of operation. Inasmuch as the proper methods of firing different fuels are discussed under another head, the authors will consider here only some general aspects of the subject.

The person most likely to be interested in proper methods of operation is the one who pays the fuel bills, and as a rule therefore it is to be expected that better results will be obtained if the firing is done by the householder than if some one is hired to tend the fires. However, something more than an interest in keeping down the coal bills is necessary; some knowledge of the characteristics of the fuel and of the functions of the different parts of the heater is required to save fuel and trouble.

Regulation of Draft

Many furnaces or boilers are operated in a haphazard way—drafts are opened or coal is put on when the house becomes cool, and then the fire is allowed to burn rapidly until either the rooms are too warm or the fuel bed is burned down too far to kindle properly a new charge of coal.

Such firing is always wasteful. The heater should receive regular attention, and if the demands for heat

Continued on page 34

EDITORIAL COMMENT

OUR readers, and particularly those personally acquainted with Col. J. B. Maclean, President of the Maclean Publishing Co., will learn with deep regret and heartfelt sympathy of the sudden death on August 17, of his son and only child Hector, aged sixteen years.

Hector was on a camping trip with Upper Canada College boys and was taken suddenly ill with acute indigestion. He was rushed in to Temiskaming, where medical attention was secured, but they were unable to save his life.

PLUMBERS ARE TOO MODEST

THERE is a whole lot of truth in what a manufacturer said to SANITARY ENGINEER recently, that the average man in the plumbing trade is far too modest. While the master plumbers and others who look after installations appreciate fully the value and the importance of the work they are doing, they are so close to it that they hardly ever think of impressing these things on the general public. It is said that one never appreciates good health until he is ill. If something happened suddenly and all the plumbers in the country ceased their work, it would only be a question of a very short time before the public would realize, and realize in no uncertain manner, that they are very necessary. The first places to be affected would of course be the large and populous cities. Without the sanitary arrangements which are made possible alone by the work of the sanitary engineers there would soon be outbreaks of disease that would menace many lives and cause endless illness and inconvenience. Without the heating engineers thousands and thousands of homes would have to go back to conditions as they existed in the days before modern equipment and methods made modern comfort possible. Imagine homes without plumbing, without hot and cold water, without bathroom equipment, sanitary equipment, and with old-time methods of heating and yet people one hundred years ago had to get along without these things. These are only a few of the things the work of the sanitary and heating engineer takes care of. He goes along about his business from day to day, works long hours and very often is called upon to attend to work that few people would undertake. He does it and does it thoroughly, but because he makes no noise about it and takes no pains to let the world know about it he is, comparatively speaking, unappreciated. In his hands is one of the most important matters of the whole nation, the national health. In his hands, to a great extent, rests the physical and material comfort of millions of people. Very few of these millions of people ever realize how dependent they are upon the plumber. There is such a thing as being too modest and it often looks as if the plumber were guilty of this and suffers accordingly in prestige because he hides his light under a bushel.

CULTIVATE SALESMANSHIP

MANY of the most aggressive plumbing and heating contractors are realizing as never before the possibilities that lie ahead for those who cultivate salesmanship. By comparing their own returns before they commenced to develop the merchandising side of the business with the increased turnover that has followed systematic efforts they can readily see that there is an opportunity that spells Profits. The best thing about the development of salesmanship is that it does not in any way detract from a man's ability as a plumber or heating contractor. It simply makes him a keener business man, more alive to the interests of his own shop and quicker to see opportunities to be of service to the public. This is really the great principle that underlies all successful business and the greatest merchants are those who have realized this and followed it out closely. The plumbing and heating contractor who is a good salesman will find no off days. He will be kept too busy and will have the satisfaction of seeing his trade steadily expanding and his profits accumulating. Men in the trade who have been developing the salesmanship idea, state to SANITARY ENGINEER, that it is easier to get results by going after business systematically than it is by the old haphazard methods. Looking back on the old plan they followed they see where they were not making the money they should and not getting the general results that they wanted to get year in and year out in a steadily growing trade. Men in other trades right alongside of them waxed more and more prosperous until finally the plumbing and heating men began to in-

vestigate and try to find out why they did not get along too. They found out that getting results in business means doing business in a businesslike way. The principles are not hard to learn, and if followed out produce certain, definite returns. Salesmanship and business go hand in hand and may be developed. No matter how good a worker a man is or how much he knows about his trade, unless he develops salesmanship and business system he will be handicapped in the race.

BUSINESS MEN SHOULD HELP

BUSINESS men, if they will, can lend most valuable help in the making of better laws. Their efforts can be exerted not only locally but in bettering provincial and federal legislation. Men who by their sheer ability to grapple with and master business problems have won success possess qualities which fit them for dealing with civic and general public problems. One of the worst things that is frequently said about the Government at Ottawa and the smaller but important governments in scores of Canadian municipalities is their utter failure to conduct business in a business-like way. The merchant who governs his own business successfully is eminently fitted for taking his share in helping solve community difficulties. His advice and counsel based on long experience would be invaluable. Probably at no time in the history of the Dominion are men of this kind needed to direct public affairs so badly as at present. Canada is at an important stage of its development and if left to the devices of the professional politicians the country may be set back for many years. Business men have had good reason to know just how little aggressive or constructive leadership there is at Ottawa when commercial interests are at stake. With this in mind, and the future of Canadian business depending upon the action that is taken, or not taken now, business men owe it to themselves to take an interest in the law making that is to be done.

COAL FAMINE FEARED

FROM time to time notice has been directed by SANITARY ENGINEER to the coal situation and the fears of a shortage during the coming winter. Conditions according to the latest information available are growing steadily worse from a production standpoint. Canada looks to the United States for sixty per cent. of its requirements and at the present time production in the American mines is twenty per cent. below actual requirements. A few winters ago many merchants had it vividly impressed upon them what a coal shortage means in severe weather and what effects it has on business. The situation now presenting itself has a most important aspect for heating men. There will undoubtedly be a big demand for heating equipment. Wood in many sections of the country is almost as expensive and as scarce as coal. Electricity and oil are the two substitutes that have been steadily increasing in popularity. In many districts, of course, electricity is not available. There is every indication that the calls for oil-burning equipment this fall and winter will break all records.

NEW BOARD ON JOB

THE new Board of Commerce has a big task ahead of it. In plumbing trade circles in Canada, as in other trades, rumors have been going the rounds for many years of alleged combines, associations and other influences that are supposed to curtail production and boost prices, and in other ways stifle competitive effort. If illegal practices exist they should be wiped out, and the new Board, it is expected and hoped, will either kill or cure the evils, if they are found to exist. Present indications are that the Board will get down to business at an early date.

ARMISTICE DAY AND NOW

DURING the last months of the war there was a very widespread uneasiness in regard to what the cessation of hostilities might mean to prices. There was a fairly general feeling that the bottom might drop out of things with calamitous results to the merchant and others.

SANITARY ENGINEER could not see matters in this light, and persistently stated that prices would not decline appreciably for many months after the war, perhaps even for years. At that time we spoke of world markets bare of goods, and of depleted reserve stocks, and announced our belief that under these conditions declines were not within the realms of possibility.

The passing months have vindicated this contention. Not only have there been no sharp declines, but as a matter of fact in perhaps the majority of instances the trend of prices has been in an upward direction since the signing of the armistice.

Now "Peace Day" has come and gone, after nine months of armistice conditions, and the world is settling down to the knowledge, that conditions that took years to produce cannot change in a moment. There is no fear of slumping prices—SANITARY ENGINEER said this nine months ago, and it says so again to-day. There will be downward revision, but the fear of tobogganing prices was a nightmare that had no sound basis in fact. The part of reasonable caution is always the part of wisdom, but the man who waits for a landslide in prices is facing a very considerable wait.

Rules for Computing Required Radiation

"Domestic Engineering" Gives the Following Abstract of the Rules Submitted to the National District Heating Association by the Rules and Regulations' Committee

IT has been the desire of a great many members of the association for the past few years to have the National District Heating Association adopt a standard rule for figuring required steam and hot water radiation. There have been several papers on this subject presented before the association in the past and as there was such a great number of rules used by the various member companies, some of which did not check within 50 to 75 per cent. of each other, the adoption of a standard rule has been carried over from year to year by the association with no action taken.

Two years ago when the educational committee decided to get up an association handbook, it was suggested that they adopt a standard rule for figuring radiation, which would be known as the National District Heating Association rule, and make it a part of the handbook.

The Educational Committee was so busy that year with other matters that very little work was done on the radiation formula, and when the new committee on rules and regulations was appointed last year, the formulating of a standard rule for figuring radiation was turned over to them.

There have been numerous drafts of a proposed rule submitted to the committee members in the past three months, and as there are fourteen members on the committee, there has been a great deal of criticism and discussion on same, which resulted in a great many changes and additions to the original draft. Some of the members were of the opinion that the scientific method was too complicated, and that we should adopt a rule similar to rules Nos. 2 and 3. Other members were of the opinion that further additions should be made to the rule. As a result the rules which the committee is now submitting to the association for its approval and adoption do not meet with the individual ideas of each member, but the committee is agreed as a whole that if the proposed rules are adopted by the association as their standard, there is sufficient data in same so that the various members of the association can compile simplified formulas to fit their local conditions if they do not care to adopt rule No. 1 for general use.

Table No. 4 of rule No. 1, which gives the coefficients of heat transmission from the various types of radiation and pipe coils, is the latest addition to the proposed rules, and while they will probably not be used for general use, they are included for use by engineers who wish to go into complete detail in the design of heating systems.

Suggested rules Nos. 2 and 3 are samples of simplified rules which can be computed from the data in rule No. 1 to fit and fixed local conditions. It is the desire of the members of the Rules and Regulations Committee in publishing the proposed rules in the bulletin to have all members of the Rules and Regulations Committee in before the convention in June, at which time the formal adoption will be requested.

Rules for Determining Square Feet of Radiation Required to Heat a Building

The following rule No. 1 is what is known as the B.t.u. rule for figuring radiation and can be applied to any condition of temperature differences or any type of heating system, either steam or hot water. It is recommended for use to member companies, heating engineers, architects and heating contractors.

Rules Nos. 2 and 3 are examples of rules which are known as simplified or short-cut methods for computing required radiation. They are made up from the factors in rule No. 1 and fit a certain type of building construction and temperature difference. When circumstances make it advisable, in the case of any particular heating company, to have in use a simplified formula, a rule similar to rules Nos. 2 and 3 can be made up from the factors in rule No. 1 to fit local conditions, with an average type of building construction.

Any room or space having an opening which may communicate with the rooms or space to be heated, whether radiation be installed or not in such rooms or space must be considered in the measurements for space heated in either of the following ways, depending on the existing conditions:

1. If the unheated space is an active room and has a door or other opening which opens into the adjoining heated space and such doors or openings are left open the majority of the time, the entire space should be included in the measurements and sufficient radiation installed in the heated rooms.

2. If the unheated space is an active room and the doors or other openings are left open the majority of the time, the space and exposures of the unheated room should not be included in the measurements, but the walls adjoining the unheated and heated space should be taken as exposed surface in the measurements for the heated room. Basements and attics, which are used for storage purposes only, should not be considered as space to be heated.

Following are the three rules referred to above.

Rule No. 1

Since the radiation in any room must emit sufficient heat to compensate for all heat losses from that room and since heat is transmitted by different building materials at different rates, it follows that:

Radiation required = B.t.u. lost per hr. from room ÷ B.t.u. emitted per sq. ft. of radiation per hr. = H ÷ B.t.u. per hr. from radiation.

R = H ÷ X (temperature difference between contents of radiator and room temperature).

The value of X in the following computations is taken as 1.7 B.t.u., which is the coefficient of heat transmission from the type of radiation most generally used. See table No. 4 for coefficients for various types of radiation and pipe coils.

Gravity straight steam systems having from 1 to 3 lbs. pressure:

$$R = \frac{H}{1.7(220-70)} \text{ per season 3-lb. gauges} = \frac{H}{255}. \text{ Safe Value} = \frac{H}{250}$$

Vapor systems with individual traps on the return end of each radiation:

$$R = \frac{H}{1.7(212-70)} \text{ for steam at atmospheric pressure} = \frac{H}{241}$$

$$\text{Safe value} = \frac{H}{240}.$$

Atmospheric systems with open trap return and excess radiation for cooling surface:

$$R = \frac{H}{1.7\ (212-70) \div 120} = \frac{H}{200}$$

Hot water systems having an average of 170 degrees water:

$$R = \frac{H}{1.7(170-70)} \quad \frac{H}{170} \quad \frac{H}{165}$$

Theoretically, one B.t.u. will heat 55 cu. ft. of air one degree F., allowing for safety and simplicity in figuring. Fifty cu. ft. are used, which makes the constant for one change .02 B.t.u. per degree difference in temperature.

In computing required radiation for well-constructed residences and office buildings, good practice allows one change of air per hour; well-constructed store buildings two air changes per hour. For buildings of loose construction and those employing some method of forced ventilation, more air changes per hour will be considered, depending upon the existing conditions of buildings and ventilating system.

Table No. 1 shows the B.t.u. required to heat one cubic foot of space at various temperatures and air changes.

Table No. 2 shows the B.t.u. losses per hour through one square foot of various building materials with varying temperature differences.

Table No. 3 shows the percentage by

TABLE NO. 2.

	B.T.U. Difference K	Difference in Temperature Between Room and Outside. 50°	60°	70°	80°	85°	90°

Single ¾-inch floor, plaster beneath	.26	13	16	18	21	22	23

Percentage of Increased Radiation Due to High Ceilings.

Room 12 to 14½ ft. from floor to ceiling	3%
Rooms 14½ to 18 ft. from floor to ceiling	6%
Rooms 18 ft. and above from floor to ceiling	10%

which the B.t.u. loss obtained from table No. 2 will be increased when the exposure is other than southern.

To compute the radiation required in any room:

First—Compute the B.t.u. required to heat the air in the room by multiplying the cubical contents by the proper factor.

Second—Compute the B. t. u. lost through the doors and windows by multiplying their area by the proper factor.

Third—Compute the B.t.u. lost through the walls, floor and ceilings in the same manner.

For steam radiation (one to three lbs. pressure)—Divide the sum of these results by 250 and the quotient is the number of square feet of straight steam radiation required.

For vapor radiation (with radiator traps)—Divide the sum of these results by 240 and the quotient is the number of square feet of vapor radiation required.

For atmospheric radiation (with extra cooling surface)—Divide the sum of these results by 200 and the quotient is the number of square feet of atmospheric radiation required.

For hot water radiation (water at 170 degrees F.)—Divide the sum of these results by 165 and the quotient is the number of square feet of hot water radiation required.

Percentage by which the heat losses given in table No. 2 are increased if the exposure is other than southern:

TABLE NO. 3

Rule No. 2

Rule No. 2 is to be used for computing the required steam radiation for a building assuming a temperature of 70 degrees inside with an outdoor temperature at zero, with 13-inch brick walls or average frame construction. Windows, single glass, set tight, and assuming one and one-half changes of air per hour in the building.

R=.008C+.08W+.35G.

R=Required steam radiation with system using steam at 1 to 3 lbs. pressure.

C=Cubic feet of space to be heated.

W=Square feet of exposed wall surface.

G=Square feet of exposed glass surface.

Note—No allowance made for extreme exposures.

Rule No. 3

Rule No. 3 can be used for computing required hot water radiation for a building, assuming a temperature of 70 degrees inside with an outdoor temperature at zero, with 13-inch brick walls or average frame construction. Windows, single glass, set tight, and assuming one and one-half changes of air per hour in the building.

R=.013C+.12W+.53G.

R=Required hot water radiation with average temperature of water in system of 170 degrees F.

C=Cubic feet of space to be heated.

W=Square feet of exposed wall surface.

G=Square feet of exposed glass surface.

Note—No allowance made for extreme exposures.

A simple device for improving the shearing strength of bolted joints in wooden structures has been brought out by Professor C. Forssell, of Stockholm. It takes the form of a corrugated washer, which is threaded on the bolt between the two pieces to be joined. The bolt is tightened against a pair of plain washers on the outside with sufficient pressure to force the corrugations into the wood. The strength of the joint is thus unaffected by the bolt hole, and depends on the friction between the two surfaces which are proportionate to the size of the washer and the depth of the corrugations. The strength of the joint is increased, according to Ingenioren, about twofold. The washers are known as "Bufo" washers, and made in various sizes, but all 1-16 in. thick, with corrugations about 9-32 in. high. In order to permit sinking into the wood, it is necessary to remove all knots at the joints to a depth of 3-16 inch. to 3-8 inch. The bolt is screwed up with spanners not less than 2 ft. to 2½ ft. long, and it is necessary to repeat the process after the first 48 hours and a further 72 hours.

An American still holds the world's airplane altitude record with 28,900 ft., as recent rereading of the British claimant's instruments showed a revised height of only 27,000 feet.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

BUSINESS CHANGES

Winnipeg.—J. Rychlenski has purchased the plumbing business of Andrew Guest.

NEW FIRMS

Aug. Brunelle, plumber, etc., has been registered at Montreal.

Lapointe & Cote, Limited, plumbers, Quebec have obtained a charter.

OBITUARY

The death occurred at Montreal of Samson Roch.

The funeral took place at Edmonton cemetery, and was very largely attended by members of the trade and the public in general.

The death of J. A. Lockerbie, of Edmonton, Alberta, occurred on August 1 at the family residence, 10309 116th street, after an illness of little over a week. He leaves a widow and two children.

Mr. Lockerbie was a resident of Edmonton since 1899, coming at that time from Owen Sound, Ont. He was engaged in the plumbing business under the firm name of J. A. Lockerbie, Limited, of which he was senior member, president and manager; his brother, Douglas, is also a member of the firm.

After an illness of about three months' duration Mr. George E. Finlay, formerly of Mitchell, Ont., died on August 31 at his residence, 185 Pape avenue, Toronto. Mr. Finlay was born at Mitchell 33 years ago, and after some time spent at Collingwood, went to Toronto about eight years ago. He was engaged in the plumbing business, but recently became connected with the firm of Imont Agnes Company, Limited. The funeral was held at Collingwood, Ont.

QUESTION BOX

Editor,
Sanitary Engineer,
Toronto.

Will you kindly tell me the quantity of B. T. U's. a 2,000 watt electric water heater should be capable of generating per hour, and also the best method of figuring the size of heater required for a given number of B. T. U's. required end the cost of energy required.

Yours truly,
A. T.,
Montreal.

ANSWER: The heating value of one watt hour in B. t. u. is 3.412. Therefore a 2,000 heater should be capable of generating 6824 B. t. u., or in other words enough heat to raise the temperature of 97 lbs. of water 70 degrees Fahr. in one hour.

The cost of the energy required varies with the charges made by the companies supplying electric current. When paying 3 cents per kilowatt hour, the cost of heating may be estimated at 3 cents per 3400 B. t. u.

To make an estimate of the size of heater needed; divide the number of B. t. u. required per hour by 3.412, this will give in watts the capacity of the heater that should be specified.—Ed.

TENDERS

The Board of Education at Carleton Place, Ont., plans the erection of a new four-roomed public school.

WAGES AND HOURS TO BE CONSIDERED BY MONTREAL ASSOCIATION

While it was intended to take up the discussion of wage scale and hours at the meeting of the Montreal Master Plumbers on August 21st, this important matter was not reached. It will probably be taken up at the adjourned conference on August 28th.

It will be recalled that the Master Plumbers, assembled in their recent convention at Montreal, expressed their willingness and their earnest desire to meet their employees on a fair and generous basis of remuneration. The burden of increased wages has been a heavy one and still the members of the craft have realized the necessities of the case and have, in many instances, made advances of considerable extent to the men without request.

From present indications it may be necessary to go farther and meet a flat request for ninety cents per hour to first-class men. This is a big wage and it is one which has never before been equalled. But with a high type of workmanship and a speeded-up service, there is no question as to the amount of work that can be accomplished. Faithful and conscientious work will prompt the paying of bigger wages and will undoubtedly justify it.

There has been some suggestion of a general strike developing among the various sections of the building trades here. Whether this will transpire will be decided next week, it is expected. In the meantime little difficulty has been reported from plumbers of the city.

A CORRECTION

In the last issue of SANITARY ENGINEER, under the Question Box heading, appeared the following question and answer:

Rodney, Ont.

Editor SANITARY ENGINEER.—Would you kindly advise me if a 2½-inch pipe would work satisfactory on a pump, the cylinder being fitted for 2-inch pipe?

Yours truly,
D. MISTELE.

Answer.—The 2½-inch connection may be used, but it will reduce the efficiency of the pump by about 40 per cent. If the pump is installed for a lift of about 30 feet you will find that with this connection that the limit of the lift will be 12 feet.

Where the answer says: "Pump is installed for a lift of about 30 feet," it should have read "20 feet." This would be quite clear were a moment's thought given to figuring same out, the error being a typographical one.

MAY INSTAL PLANT

The city engineer at Hamilton, Ont., has recommended the installation of a sterilizing plant at the beach pumping station. The council has decided to ask the medical health officer and city engineer to submit a full report as to the need of one.

HUGE NEW ROLLING MILLS

According to press reports the new steel rolling mill which is to be erected on the British Forgings site at Ashbridge's Bay by Baldwins, Limited, of Swansea, Wales, is to be known as Baldwins Canadian Steel Corporation, Limited.

A. M. Russell, of Hugh Russell & Sons, Montreal, is to be president of the new company, which is expected to provide employment for 2,300 men within a year.

MOLINE HEAT

Moline Heat, Moline, Illinois, has issued a most attractively printed catalogue in which is described in complete detail the "Univent." A history is given of heating and ventilating and of the evolution of the Univent. The catalogue contains thirty-two pages, 11 by 8½ in., and many of the illustrations are in colors. Readers of SANITARY ENGINEER who are interested may obtain a copy of the catalogue on request. The firm has also issued a booklet in which is described the Liberty draft controller.

LETTERS TO THE EDITOR

These columns are open to contributions upon any topic of interest to the trade, it being understood that the views expressed are those of the contributors, and do not necessarily imply editorial indorsement. Names of contributors will be withheld, if desired, but name of writer must accompany correspondence as an evidence of good faith.

A MEANS FOR THE CONVERSATION OF COAL

Ottawa, Can., Aug. 22, 19.

Editor, Sanitary Engineer—As there are several indisputable reasons why anthracite coal will be scarce and of high price during the winters of the future, I am of the opinion that City Councils or private corporations should follow the example set by the Dominion Government and construct central heating stations for the business districts of their cities.

The Government plant at Ottawa will, when completed, supply heat to seven large buildings besides the Parliament buildings.

Would Conserve Coal

This, to my mind, is the "only solution" for the conservation of our anthracite coal, also a means for reducing the overhead expenses for furnace attendance, and removal of ashes, which are injurious to the merchant's stock. Pedestrians on our business streets would not run the risk of having a shovel of coal around their lower-limbs, as is often the case during coaling-up time. These are not the only advantages that would be gained by the business blocks of cities being heated from central plants. There is the ever-present risk of fire through carelessness with hot ashes, or through explosions caused by inexperienced caretakers, sometimes resulting in loss of life.

An Important Matter

It is as necessary to conserve created wealth as it is to prevent waste of natural resources. We pride ourselves on our up-to-date fire brigade, maintained at a great cost. Should we not give attention to the prevention of these conflagrations that are continually occurring in our cities? As most stores are full of inflammable goods, such places when on fire often have an attraction for neighboring stores, consequently there are for months ugly gaps in the business streets of our cities. Money burned up that can never be replaced.

"Marching Backwards, So to Speak"

Would it not be a blessing to have all our hotels heated by central plant system. There are many reasons why such should be. It has been said that the fire waste of our cities and towns is greater per capita than in any other country in the world, and constitutes an enormous drain upon the resources of the Dominion, no wonder lumber is high in price.

We are a nation of money-makers, but we are told that we are a wasteful people. Should we not use every means to prevent fires rather than be content to pay a high rate of insurance on buildings and stocks, thereby reducing the merchants' overhead expenses and enable him to sell his goods cheaper.

Little Interest Shown

It is surprising that more interest has not been taken in the past in our cities regarding central heating systems. Such plants are in successful working order in the number of between 300 and 400 in the cities of the United States and paying good dividends. One plant in Detroit is furnishing heat for 1,500 customers. In Ottawa, for instance, such a plant could be installed on Albert Street, where the theatre was burned down. It could supply heat to all the business premises on both sides of Sparks Street from the Russell House to Bank Street.

Careful Tests Made

Careful tests have been made on store and such-like heating boiler furnaces which has shown that from 35 to 50% efficiency was all that was being obtained from the coal. Tests made with up-to-date furnaces of a central heating plant show 75 to 80% efficiency from the coal burned. The reason for this is that the combustion of the coal is carried out on scientic lines. Equipment is used that requires the services of a man of more experience in the management of boilers than is found among packers or cellar-men. Take, for instance, the amount of coal, which is principally anthracite, that is consumed each winter in the buildings of our business districts of our cities. If this coal could be saved each winter would it not leave more anthracite for use in private residential heating, and as the demand for this grade of coal would not be so great, would it not cause it to be cheaper.

Difference in Cost

The difference in cost between anthracite and the grade of coal that can be used in furnaces of up-to-date central heating plants is over 100% screening or the run of mine. Nova Scotia coal would answer well, and with proper equipment can be burned without any black smoke issuing from the stock; a light yellow haze, hardly perceptible, is the result.

These are the days for efficiency.

We never miss the water till the well runs dry. This matter should not be deferred till anthracite coal costs $25 per ton. In the days of my apprenticeship it was $4.50 per ton.

Registered on Meter

A supply of steam is brought into a building similar to gas or water, and is registered on a meter. Should a building be heated by hot water, converters are used, in which the water is heated by steam instead of a coal fire. The temperature of the water is more uniform and easier regulated than with coal fire. No alteration of existing piping is necessary. The Eastern Departmental Block, also the new Customs House in this city, are heated by these converters, and have given every satisfaction.

Difficulty Overcome

Central heating systems like electric lighting and many other works when in their infancy gave trouble, owing to lack of knowledge regarding the expansion and contraction of the underground pipes, also for lack of knowledge regarding the conservation of the heat from them, but these matters are a thing of the past, perserverance has been rewarded. Steam can now be conveyed thousands of feet in underground mains if properly insulated.

An Invisible Gas

Some people have an idea that steam is of a nature like smoke; this is not so. Steam is an invisible gas, but when in contact with the atmosphere, condenses to a watery white vapor, and is visible. Obviously the better the pipes are protected the less steam will be condensed in them and the higher the efficiency of the plant and larger dividends.

In cities where waterfalls are not available as motor power for electric light plants, great economy in coal would result by having central heating systems in connection with them, as the exhaust steam from the dynamo engines could be turned into street mains for heating buildings.

A Long Season

Of all the peoples of the world we in this part of Canada depend on artificial heat for our very existence for a good half of each year. Should we not see to it that every means that is possible for the conservation of our coal is applied. Very much could be written on this subject. I may, however, point out that with up-to-date furnaces of central heating plants the very poorest or smallest grade of coal can be used, even if as fine as gunpowder. So also can lignite or even peat.

Since writing the above I hear that our City Council is contemplating the installation of a central heating plant for their municipal buildings. This is certainly a step in the right direction, which the electors should approve.

RUSTLERS

I served my time under an old "stiff-necked Glassco beggar," a Scotchman who was perfect master of the trade, who could line a tank such as I have not seen the superior in all my experience. He took one and a half days at the job, but it was finished perfectly and you could see that a mechanic had been at it. One day a Jour blew in and wanted a job, which was quite an event in our village. The old man hired him as he had three or four soft water jobs, and started the lad lining tanks. The lad dug in and how he did rustle and had two tanks lined in the day. They were fair jobs—I have seen hundreds not so good since then—and they did not leak. Imagine my surprise when the old man started in to him like a bull at a gate and told him that such ——— fools as him spoiled the trade, paid him up and let him go. For years that stuck in my crop, and I never could get the old man's glasses to look his way, and I thought he was going in his dotage till a few years ago. Then I saw a rustler come to town (we have grown since), and we hired him, for, though his work was a little rough he could get through a pile of it, and he just seemed to live to work. How he seemed to enjoy it, and what a money-maker he was for us! How we touted him, nursed him and told everyone what a good man he was! A year ago he started opposition to us and now we do not think he is so nice. We have rust in our joints, and are not as young as we used to be, and we have to sit up nights planning how we can work fast enough to keep up to his competition. Who was the wisest, the old man or us?

More to come,

"RATSY."

PRACTICAL SHEET METAL WORK

Continued from page 35

2, and transfer the measurements from quarter pattern E, Fig. 1, to Fig. 2, as shown, beginning at 1 to 6 and 6 to 1. This will only give pattern for one-half of the design, which means that four pieces like Fig. 2 are required to make a cone.

The quarter pattern shown at E in Fig. 1, is simply a round flat flange which forms the lower half of piece C. No seam allowance is needed for this pipe, as it should be fitted to the underside of C, and C should be made large to enable it to be placed over piece E. Fig. 1 is almost self-explanatory and requires no further description.

The erection of 300 modern houses in Kitchener, Ont., is being considered by the Dominion Rubber System, which operates four industries in the city.

Heating and Ventilating

HEAT

Eleventh Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the eleventh of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on "Heat" a complete and most illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the design for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The twelfth article of the series will appear in the next issue.

MOST people consider that they have a clear understanding of what heat is; but when they are asked to define it, their answers are likely to be: "Why, it is the opposite of cold."

Very well then. What is cold?

Now we are struck for awhile, and then we say: "Cold is low temperature."

"What is temperature?"

We might keep on with such questions forever and not come to any clearer conception of the nature of heat than if we were discussing the thickness of the hide of a rhinoceros.

The answer to the question is that heat is a form of movement.

All substances are made up of small bodies that can exist separately. Some of these bodies have a greater physical or chemical attraction for certain kinds of different bodies than they have for others.

Some physicists claim that these small bodies are constantly in motion; no matter how dense the material may be that they form. And just as the stars swing around the sun in this solar system, so these small bodies—molecules—are in motion around the centre of their particular attraction. To these men a piece of ice is not a dead thing. The density of its apparent quiescent state is due not to an absolute cessation of the movement of the molecules, but to a slowness of movement that we, in our limited power of perception, are not allowed to define.

A piece of wood also contains molecules that may be so disorganized that their movements becoming rapid cause a separation. When molecules reach a certain state of vibration, they can no longer exist with other molecules of a different nature and then an action takes place that sometimes results in what we term "combustion."

The molecules in the block of wood may be set into a high vibration by transference of a vibration from a fire or they may be set into this action by the energy expended by friction.

With the increased liveliness of the molecule there comes what we term a higher temperature.

Temperature is a relative term that we used in rating the vibration of the molecules. When two substances are placed close together, the vibrations of each tend to become uniform, thus:

A block of ice formed from a pound of water is dropped into a vessel containing 2 lbs. of water at 160 degrees above zero Fah. The higher vibration of the 180 degree-water are transferred to, and set up a corresponding movement, in a block of ice. After a short time the ice is dissolved, and when we use a thermometer to test the temperature, or vibration of the water we find that the thermometer gives a lower reading than the original 180 degrees. Thus we see that the slowness of molecular movement in the ice was transferred to the water at the same time that the faster molecular vibrations of the water entered the body of ice. So we come to understand that it is the rate of the molecular movement that indicates temperature and that causes heat or cold to move from one body to another.

Matter cannot be destroyed. It can only be changed in form. When we burn a piece of coal we only succeed in separating the elements that formed that substance. Some of these elements have passed off in gases that perhaps ultimately may combine with other elements to form coal again. Thus there is a constant cycle of molecular energy throughout the varying stages of being.

To understand the transference of heat we must believe, without expectation of other proof, that there is a fluid so fine that it is contained in every substance; that is in all space away beyond the atmosphere of the earth; that cannot be exhausted from any vessel, in a word that it persists forever. (This fluid is known as ether.) This fluid can be caused to vibrate as water may vibrate when a stone is thrown in it. The discharge of an electric spark causes the ether to vibrate in waves corresponding in length to the length of the spark and in radius to the intensity of the discharge.

Waves of light and waves of heat are carried from the sun to the earth by the medium of this fluid. The radiant heat from a direct radiator is carried in the same way.

The ether does not conduct heat as a bar of iron conducts it. The iron becomes warm because of the increasing molecular vibration; but the ether does not become warm. A few thousand feet above the earth the cold is intense because there is no palpable substance where the heat waves caused by the sun may be arrested and stored.

Now, although the surface of the earth is closer to the sun than is the centre, we know that the deeper we go into the earth the warmer it becomes. The inner heat is supposed to be due to the still un-

quenched fires of creation and is known as terrestrial heat.

Heat may be caused by compression; by friction; and by chemical combinations.

The principle governing the propagation of heat is the principle aiso governing the making of ice.

In heating systems the object is to get the heat out of the combustible and into the room to be heated. In refrigerating systems the object is to get the heat out of the substance to be frozen.

Where a steam heating system is used the steam becomes hot because of the taking of heat from out of the fuel. In a refrigerating system the water becomes frozen because the heat has been taken from it to vaporize some liquid with a lower vapour point than that of wataer.

In the first article of this series the unit used in the measurement of the effect of heat was taken up in detail. The Engineer must have just as clear an understanding of what the heat unit means as he has of the existence of water. It is utterly impossible to do any very fine figuring or to design anything original without that understanding; and so the wise man considers no time wasted that is spent in seeking for information that may assist in visualizing in his mind the properties of heat.

When water is soaked up in a sponge, a temperature change takes place due to capillary heat.

Heat because it is a form of energy may be changed into work and thus a heat unit may be also considered as a measurement of work.

The unit of work is the mechanical horse power, i. e., the work required to lift 33,000 lbs. 1 foot in a minute. When using the mechanical horse power as a basis for figuring equivalent heat, a person is likely to lose track of their figures in transposing dynamite effect to heat. A heating horse power may be considered as being 42.4 B.t.. in a minute or 2,545 B.t.u. an hour.

In electricity the work unit is the joule per second— 1 watt. There are 746 watts in one horse power, therefore one watt is equivalent to 3.41 B. t. u.

In the close figuring of surfaces for heating or for ventilation, it is often the custom of engineers to consider that heat is radiated from the bodies in a room in proportions approximating the following figures:

Gas light, split burners, 300 B.t.u. per hour.
Coal oil lamp, 160 B.t.u. per hour.
Electric light, per watt, 3.4 B.t.u. per hour.
Small child, 240 B.t.u. per hour.
Adult, 400 B.t.u. per hour.

When we understand how one pound of distilled water at 63 degrees Fah. is the basis of our standards it becomes easy to allow for other substances when we are in possession of the specific heat and weight of such. Some of the articles following this will be composed entirely of tables giving specific weights and heat values.

Ventilating the Modern School

Tenth Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

IN heating systems where direct radiators are used, much discomfort is, at times, experienced by the children sitting close to where the radiators are installed. This is especially the case on cold windy days when the heating effect of the ventilating system is not great enough to permit the checking of the radiators. Children sitting close to such surfaces are exposed to a condition that should not be allowed. An endeavor to mitigate the evil effects of direct radiation has resulted in the design of screens that may be placed between the radiators and the seats. These screens are made of tin on the side exposed to the radiator and backed with asbestos board and stiffeners. They are attached to the radiators by means of bolts, and to the floors by standards, in such a manner that there is a free air passage of a depth of at least an inch and a half between the screen and the heating surfaces. They may be made by any tinsmith and the cost of the installation is not sufficient to warrant the refusal of a School board in having the work done. Here is an opportunity for aggressive action on the part of those men who are interested in the health of the School population. There are schools where children suffer because of the lack of screens similar to these described, and if this hint should result in the general adoption of the protecting screens where direct radiators are used, we are satisfied that an improved mental activity will follow with those scholars that perhaps in the past have been accused unjustly of stupidity. The installation of the screen will not result in the reduction of the heating efficiency of the radiator.

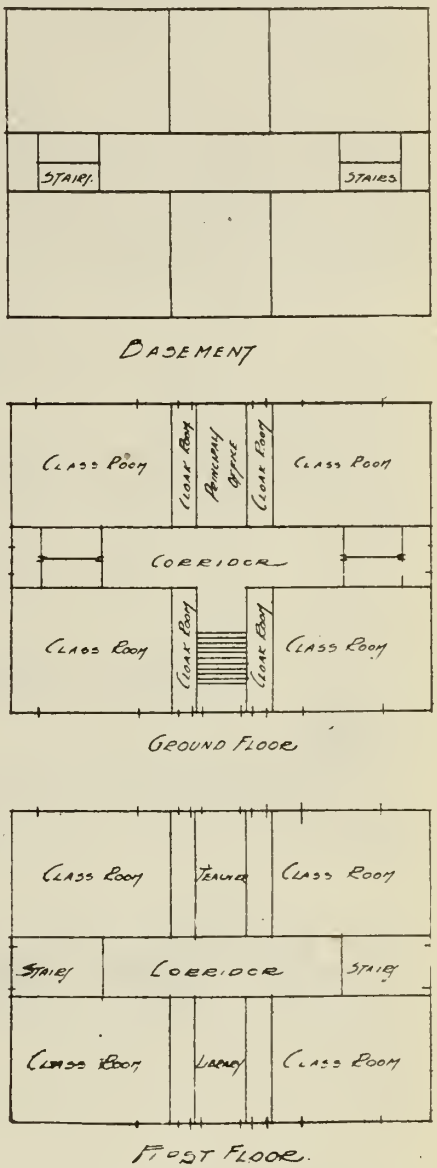
In the fourth article of this series, appearing in the June 1 issue of the SANITARY ENGINEER, a description of a gravity ventilating system for an eight-roomed school building was given. In the system then described the ventilating equipment was distinct from that of the heating. It is now our intention to use the same building in an example of how a ventilating plant may be installed to act also as the heating apparatus.

The storey heights from floor to ceilings are thus:

Basement	10 ft. 6 in.
Ground Floor	12 ft. 6 in.
First Floor	12 ft. 6 in.

All class rooms are 32 feet long and 25 feet wide. The windows are massed along one side of each class room and have an area of about 160 square feet of glass. Each class room is to have a seating capacity for 40 pupils.

In the gravity system of ventilation the flues were to be proportioned so as to deliver 30 cubic feet of fresh air a minute to each occupant of the room. The fresh air was to be delivered to each class room at a temperature never exceeding 72 degrees above zero.



The class rooms were to be warmed by direct radiation placed under the windows and in other exposed locations throughout the building.

The fresh air and foul air flues were to be located in one of the inside walls; just as in systems of fan ventilation with direct radiation heating.

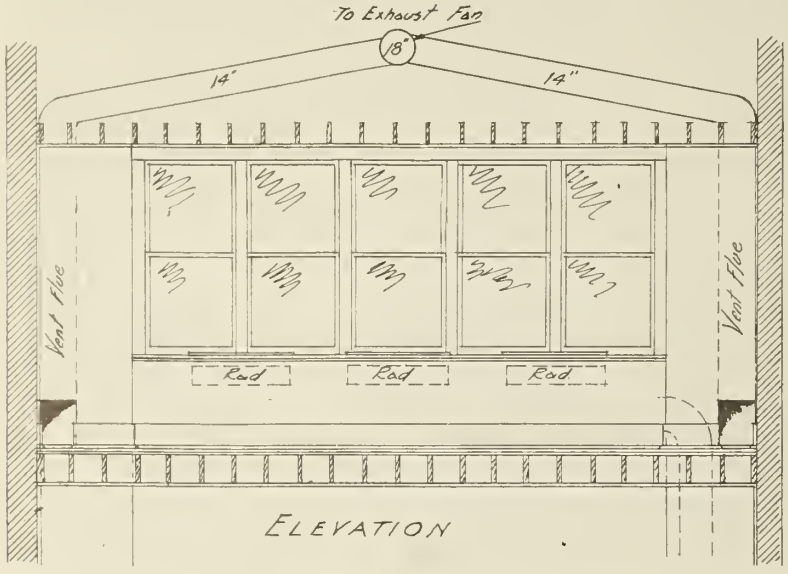
The system that is to be described in this article is an adaptation of the hot blast system and is one that is frequently used in the heating and ventilating of the assembly halls or auditoriums of large school buildings. Although having many merits that should justify its use to a greater extent in class rooms, few

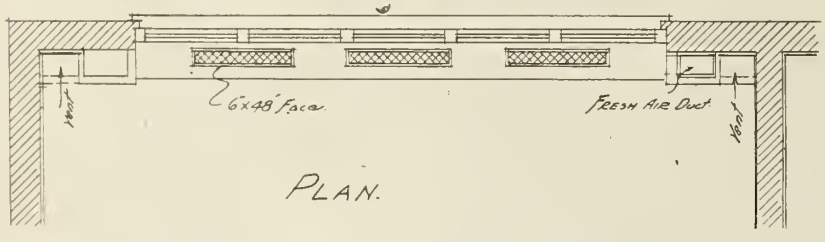
engineers or architects seem to have realized its advantages.

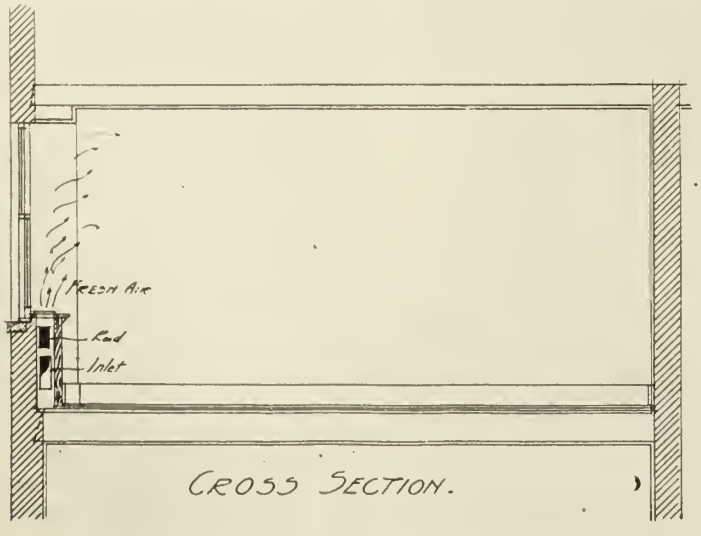
This system of heating and ventilating may have defects that have escaped the author's observation, and it is his earnest desire that some of the fruits of this article may be enough dissenting criticisms to at least clear the atmosphere of biased opinions which the result of a clearer conception of the fundamental laws governing the installation of ventilating systems.

In describing the functions of the system and the application of the details, a great deal of what has already appeared in this series of articles must be repeated. The repetition is necessary because it is our intention to start with the elementary principles of the subject and detail step by step the problems of the design, together with the resulting solutions.

In former articles of this series attention has been directed to certain uncontrollable conditions of nature that at times will nullify the most determined efforts of ventilating engineers to instal systems that should invariably maintain a uniform condition of the air passing through, or contained within, the building. Particular attention is directed to the effects of conflicting air currents, and in the system now described it is to be noted that the fresh air inlet faces are placed in a stragetic position and are not as subject to outer air disturbances as are those of the systems where the pressure of the supply fan is practically exhausted at a considerable distance from and rendered ineffectual by the pressure of the outer atmosphere.







In designing a system of hot blast heating and ventilating for this school we will make use of direct radiators for the heating of all small rooms, corridors, ect. The radiation for the corridors will be proportioned for the usual heat loss, and as no ventilating service for such need be provided we will, in his example, confine our attention to the combined systems that are to be installed in the class rooms.

Now the volume of air required in our former examples was controlled entirely by the standard of air purity desired; but in this example the quantity of air is in ratio to its capacity as a heat carrier.

We must figure the heat loss, and then provide air in the quantities and the temperatures required, not only for ventilation, but also to effect the heat loss occasioned by the cooling surfaces of the rooms and by leakage.

We are to assume that the building is located in a climate where 10 degrees below zero is the coldest winter weather.

We may figure our heat losses thus:

First for leakages: One change of air in an hour is considered a good average standard; but rooms on the north and west of the building will be likely subject to a leakage of slightly more than this, while rooms on the south may be something less. But as one change of air per hour is a fair average we may take that as a basis for our estimate.

The cube of a class room is 10,000 cubic feet. The average temperature of the air within a class room is 68 degrees above zero. We must then provide heat for 10,000 cubic feet of air an hour at a temperature range of the difference between 68 degrees above and 10 degrees below zero.

We divide 10,000 cubic feet of air by the factor 55 to find the equivalent glass surface and we find that we have 180 square feet E. G. S. This 180 multiplied by the temperature range of 78 gives us an answer of 14040 B. t. u. an hour; required for heat loss occasioned by leakage.

Next we estimate the heat loss due to the cooling surface of the exterior walls: There are two walls with a total area of 712½ sq. ft. Deducting the window surface of 160 square feet from this we have an area of 552½ sq. ft. of wall to consider as a cooling surface. For convenience in figuring we will assume that these figures are 553.

As a rule we allow 4 square feet of wall surface as being equivalent to 1 sq. ft. of glass; but in this example we will refer back to the chart given in the SANITARY ENGINEER of July 1 and find that the 16 in. brick wall, as we have it here—is equivalent to 27 per cent. of a like area of glass. But the brick wall in the school has an air space of one inch and a lining of lath and plaster; so we must allow for this heat insulation value when estimating the heat loss resulting here. We may consider that the insulation value of 1 in. of lath and plaster on

wall furring will be enough to allow the discounting of at least 30 per cent. from the heat loss through the plain brick wall; so we consider that the 16 in. brick wall, furred and plastered as specified, is equivalent to 19% of a like area of glass.

Therefore the 553 ft. of wall is now to be considered as 105 square feet of glass. The heat loss through this is found by multiplying the 105 square feet of glass by the temperature range of 78 degrees, which gives us a heat loss of 8190 B. T. U. an hour.

The heat loss through the window is found by multiplying the glass area by the temperature range, thus: 160 x 78 = 13,400 B. t. u. n an hour.

The total heat loss found so far is:

Leakage	14,040 B. t. u.
Wall surface	8,190 B. t. u.
Glass	13,400 B. t. u.
	35,630 B. t. u. an hour

There should be added to this heat loss, already found, the loss due to ventilation. The method of figuring for this was given in the article appearing in the SANITARY ENGINEER of June 1, and it was here indicated that 113,520 B. t. u. were required an hour to heat the quantity of air for the ventilation of the room. Remember that these figures for ventilation are based on the number of occupants of the room, and not in the ratio to the size of the room.

It will be noted that there is a great deal more heat required to ventilate than to keep the rooms warm; and when we come to figure the air required to carry the heat to the room, we may find that the air required by ventilation is something in excess of, or less than, the air required for carrying the heat to the room.

The volume of air required as a heat carrier is governed by the differences of temperature of the incoming and outgoing air. The difference is known as the "temperature drop."

Where the air is driven into the rooms at some distance from the cooling surface of the windows, etc., the initial temperature of the air must be higher than that when the air is driven directly in front of these surfaces as in the example here given.

If the warm air is driven into the room on the inside walls, the temperature of the incoming air must be at times as high as 120 degrees above zero, whereas when the heat is blown directly up in front of the windows, a temperature of more than 90 degrees above zero will never be required, and, as a rule, a temperature of 80 degrees will be quite enough for the most rigorous weather conditions.

We will consider that the entering temperature of the air is to be 85 degrees and that it is to drop to 60 degrees at the vent outlets. Air dropping thus gives off about .452 of a B. t. u. in an hour per cubic foot, and as the heat loss, without regard to the ventilation, is 35630 B. t. u. we find that we require (when we divide the heat loss in neat units by the quantity of heat given off by the air) an air supply of about 78827 cubic feet per hour.

The quantity of air required for heating is thus a little more than the air required for ventilation. By raising the temperature of the incoming air we could reduce the quantity of air required as a heat carrier.

Our next step is to arrange the heating surfaces etc., for heating the air. We might place all of the heating surfaces in one stack in the basement and then heat the incoming air to the temperatures required, then driving it through a series of ducts to the fresh air openings in the rooms. But in doing so we would not have the flexible temperature control that is one of the merits of the system illustrated in this article.

The fresh air that is drawn in from out of doors is to be heated to a temperature of 50 degrees in the basement, and to be there humidified and otherwise prepared for the auxillary heaters placed within the fresh air ducts at their class room openings.

Eight class rooms are indicated on the drawings and as each class room requires 78827 cubic feet of air per hour we muct specify a supply fan capable of delivering 10510 cubic feet of air per minute.

It is the intention to first heat the air, at the primary heaters in the basement, to a temperature of 40 degrees; then passing it through an air washer where it is saturated with water vapour. The air will then pass through the secondary heater where it will be heated to a temperature of 60 degrees above zero. From the secondary heaters the air travels through galvanized iron ducts, or ducts of other materials, to the heaters at the class rooms. The air will be finally heated to the temperature required to keep the room at the uniform temperature of 68 degrees above zero.

If the wind is blowing coldly from the north-east, the radiators on that side of the building will be working full blast to take care of the additional heat required there, while those in the warmer parts of the building will be automatically checked because of the little heat required at that delivery. The variation of the heating demands will in no way affect the constant even flow of air through the rooms. The air temperature is set at 60 degrees above zero, and if because of contrary winds, a part of he air travelling in certain channels becomes low in temperature it will be heated before it enters the room.

The direction taken by the fresh air in passing from inlet to outlet registers in class rooms is the same during warm weather as during cold. This can be understood by the reference to the illustration.

As the arrangement of fans, heaters, air washers, re-heaters, etc., is practically the same as that of the ordinary plenum system of ventilating we will not now attempt to describe this part of the apparatus, but will take up our problem at the point where the air is travelling through the ducts in the basement at a temperature ranging from 50 to 60 degrees above zero, and at a velocity of 1,000 feet a minute.

We must decide on the area required in the final heaters, and we go about it in this way:

The temperature of the air when it reaches the final heaters is somewhere between 50 and 60 degrees above zero. We will say 55 degrees, and as it is to be raised to a temperature of 85 degrees, the mean temperature is 70 degrees. One B. t. u. will raise the temperature of 55 cubic feet of air 1 degree at this temperature, so we divide 78827 cubic feet of air by 55, multiplying the result by the 30 degrees difference required and find that we should provide heating surface equal to supplying 42990 B. t. u.

"But hold on!" some one says: "How about the heating surface required for the loss due to ventilation?" So we must go back for a while over some of our figures to show how this has been provided.

You will remember that the loss of heat in the ventilation was figured at 113,520 B. t. u.

Well, we now have an air supply of 78,827 cubic feet an hour raised from 10 degrees below zero to 60 degrees above. In raising the temperature of the air to this point 116,050 B. t. u. were added to the air. This is a good deal in excess of the quantity required to offset the heat loss of ventilation.

The area of radiating surfaces required in the final heaters will be governed by the condition of setting. Pipe coils might be used in place of the cast iron sections shown, but for convenience we are to consider the heaters here made up of extended surface cast iron radiators of the same type as those used in the primary and secondary heating chambers.

The current of air to which the final heaters are exposed moves at a speed of about 600 feet a minute, and as the mean temperature of that air is about 70° each square foot of radiation should give up approximately 1107 B. t. u. in one hour. Thus we require about 40 square feet of heating surface here. We will therefore use three sections of 50 in. Veno radiators totalling 40½ square feet of radiation.

The fresh air outlets are to be proportioned so that the speed of the escaping air may be kept down to 300 linear feet a minute. This low velocity is not dedetermined because of the danger of draughts; but rather as an aid in establishing a uniform rate of air flow around the radiators that set immediately below these faces. The area of the faces required is that found by dividing 300 (the air velocity) by 1314 (the air volume)—4.3 square feet. As only about 2/3 of the face area can be considered as

a free air-way we should consider that the faces required must have an area of 6 square feet.

When we start to design the foul air outlets we must remember that these must be proportioned so that there will be no draughts caused by having these outlets too small. The outlets are at the floor line, and as there must be sufficient area to carry 1230 cubic feet of foul air away every minute, and as these outlets must not be proportioned for a velocity of more than 200 feet per minute we find that the vent opening should have an area of at least 6 square feet. We will provide two openings as shown on the plan and make the area of each opening 3 square feet. There is no reason for faces on these openings so we will leave the openings uncovered. The back of the vent flues are to be plastered and the flooring and base boards returned around the re-entering angles by the carpenter.

The foul air flues must not be unduly small in proportion to their inlets as otherwise the high velocity of the air passing through the flue will result only in the upper part of the inlets being used as exhausts. The velocity in these flues is to be figured at 400 feet a minute.

An exhaust fan should be used in a system of this kind, as the exposure of the backs of the vent flues to the outer walls will have the effect of preventing any upward air travel due to temperature head. Of course the backs of these flues may be insulated from the cold, by the building in of dead air pipes, etc., but the extra cost of construction will go a long way in paying for an exhaust fan.

The pipe to the exhaust fan may be figured for a velocity of 800 feet a minute.

This system cannot be considered as complete without automatic temperature control.

Needless to say that it is necessary to provide doors for easy access to all parts of the ventilating system so that it may always be kept clean.

It will be necessary to set equalizing dampers to regulate the flow of air in different directions. These are details not shown; but details that can easily be designed by anyone having the data given in this and in previous articles of the series.

The drawing of the cross section indicates how the cold air leaking through and around the windows becomes mixed with the warmer air and does not pour in a cold stream down on the heads of the pupils.

A system like this could hardly be used without the fans. The location of the radiators would work against any considerable air circulation by the effect of gravity alone.

It would be an easy matter to connect the vent flues to a common gathering chamber from whence the air could be returned to the fan and to the heater in the basement, thus providing for the rotation of air during the time that the building was unoccupied. A cheaper, but less effective, way of providing for this rotation would be to have an opening left in the centre of the corridor. This opening being connected to the fan room. When a room is unoccupied the dampers in the vent flues are closed and the door of the class room is left open, thus the air will travel from the class room through the corridors, to the large opening, and from thence to the heater chamber in the basement.

SAVING FUEL IN HEATING A HOUSE

Continued from page 23

are intelligently anticipated, as they ordinarily can be, the house can be warmed with minimum trouble and fuel. When the rooms become too warm the fire should be checked by stopping the admission of air under the grate and decreasing the draft by opening the "check damper." If, as often is done, the ash-pit damper or the ash-pit door be allowed to remain open and the draft reduced by opening the fire door, the combustion of the fuel continues, although at a slower rate, but the cold air entering the fire door chills the heater so that little heat is realized from the coal.

Sometimes the draft is so strong that the difficulty of controlling the fire is increased, especially when the demand for heat is small or the fire is to be banked. To facilitate control under such conditions it is usually advisable to have, besides the check damper, a plain damper in the smoke pipe. This damper should fit the smoke pipe loosely and must never be entirely closed; during most of the heating season it can be kept partly closed, but during severe weather, when more heat is required, it can be opened wide. Sometimes the draft may be insufficient to burn the necessary quantity of the particular fuel used. If such a condition is always noticed in severe weather, the heater may be too small, the smoke pipe may be choked or be poorly fitted to the heater or to the chimney, or the chimney may be too small or be obstructed by soot or debris. As to the size of smoke pipe and chimney, one authority says that the cross-sectional area of the smoke pipe should be one-eighth of the grate area, that the diameter of a round chimney should be 2 inches more than that of the smoke pipe, and that if the chimney be square the inside length of the side should be 1½ inches more than the diameter of the smoke pipe.

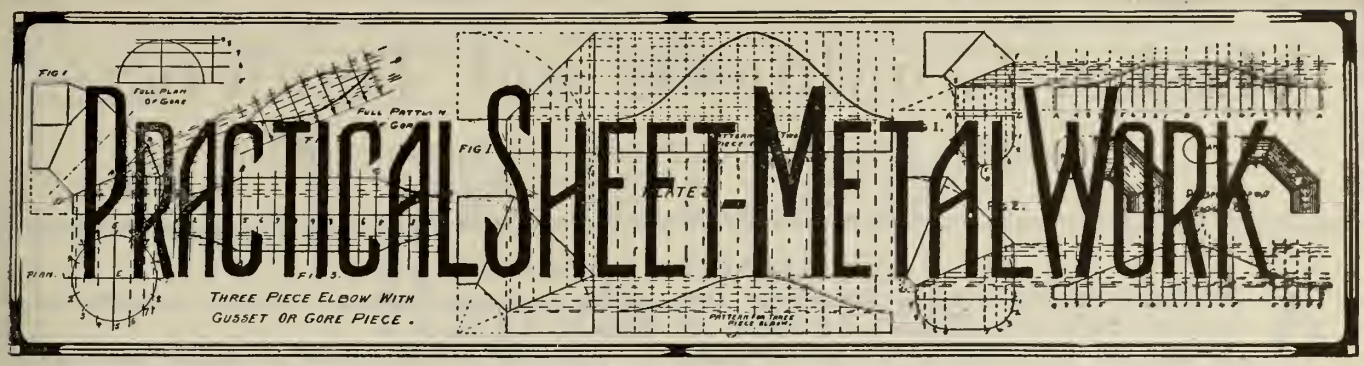
If the draft trouble proves to be due to leaky connections or to obstructions it can readily be corrected. If the heater or the chimney be too small the difficulties may be lessened either by firing more frequently and keeping the fuel bed thinner, or by using larger coal, of fairly uniform size, in order that the air may more easily flow through the fuel bed. Conversely, if the draft is very strong a smaller size of coal may possibly be used to good advantage.

To burn a pound of coal requires much more than a pound of air, and the volume of a pound of air at atmospheric pressure is far greater than that of a pound of coal. To burn more coal requires more air, and this air must be forced into the ash pit and up through the fuel bed by the difference between the pressure of the hot air and gases over the fire pot and that of the air entering the ash pit—in other words, by the "draft." This difference in pressure may be affected by various causes, some of which have been mentioned, but depends largely on the height of the chimney, which in turn is determined in a measure by the general design of the house. Under no circumstances should the top of the chimney be lower than the highest part of the roof, or a current of air may be forced down the chimney and the basement be filled with smoke when the wind blows in certain directions. Similar trouble may be experienced if the chimney is not as high as an adjoining building.

Removal of Ashes

Usually the most disagreeable feature of tending house-heating apparatus is the removal of the ashes, and the possibility of facilitating the handling of ashes should receive attention when a heater is installed. If the bottom of the ash pit is on a level with the floor or only a short distance below the grates, as is ordinarily the case, ashes can not be allowed to accumulate under the grates for more than two days, or possibly more than one day, except in moderate weather, and must either be carried from the basement then or stored there and removed later. In any case the ashes must be shoveled at least once with the consequent scattering of dust. Some heaters are now set with a recess under the base, this recess holding a can into which the ashes drop directly. The recess must be so constructed as to permit easy removal of the can and to prevent leakage of air through the base and the fuel bed when the fire is to be banked or checked.

(To be continued)



By THOMAS STANFIELD

THIS is the season of the year when hardwaremen with tinsmithing and heating departments should begin to look forward to the fall trade. Evidence of this is already to hand by an inquiry as to the way to make a ventilator for chimney top. The method of making a ventilator has previously been described in SANITARY ENGINEER, but for the benefit of those who may be interested again the process is again described.

The accompanying illustration, Fig. 1, describes a type of ventilator which appears at first glance to be a common one. Many sheet metal workers simply make this top with pieces A, C and D, but such tops are little better than ornaments, except that piece A serves as a cover to the pipe D.

The top described in Fig. 1 is known as an improved Emerson ventilator, the old and original Emerson top was fitted with a flat top, which took the place of the solid cone A, B. It will be noted that the two slanted surfaces B, C will deflect the wind from whatever direction it blows, so as to form a horizontal current of air over the top of the open end of pipe D and not only will this top give satisfaction as a ventilator, but also as a chimney top, too.

The first step to take when developing pattern for such a piece of work is to draw the elevation Fig. 1. The size of cone A, B and flared piece C should be about two-thirds the diameter of the pipe and the cone should have a depth from upper and lower point of about one-quarter its own diameter. Piece C should be flared at a little over twice that of the cone. The perspective view, Fig. 4, shows a fairly well balanced design, which is not only effective, but looks well proportioned.

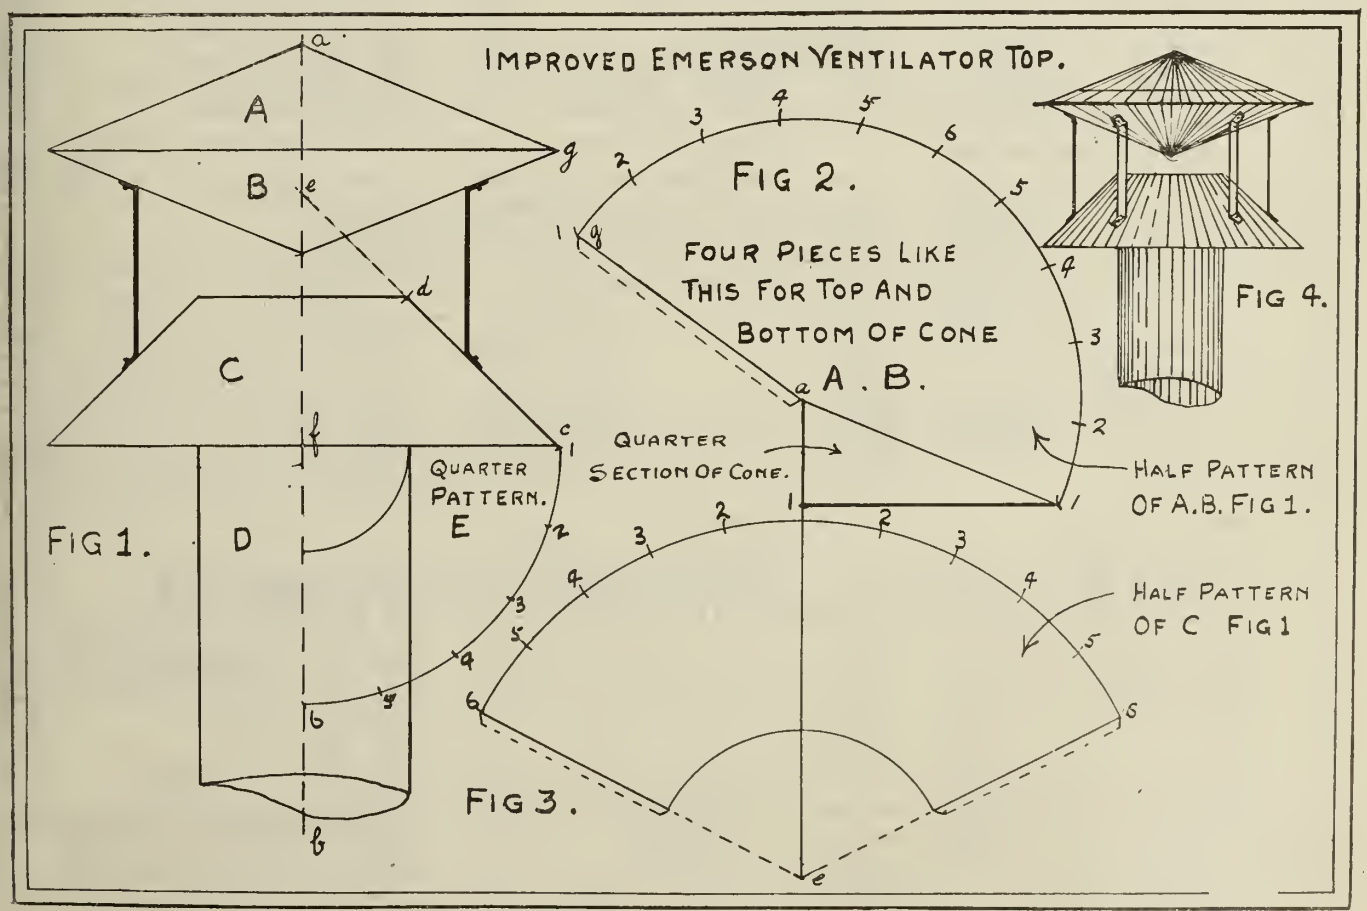
Having drawn the elevation on the centre line a, b extend the slant line c, d to e on a, b as shown at d, e and with e as centre draw a circle, Fig. 3, which is the half pattern of piece C.

Next place the compass as f and draw two arcs from c to dotted line a, b and divide this arc into five equal parts, 1, 2, 3, 4, 5, 6, and transfer same to arc in Fig. 3, and repeat, beginning with 6 to 1, and 1 to 6. Then by using e on Fig. 1 as centre and d as radius, the half pattern of C is completed except that allowance for locks and seams must be made.

To develop the cone requires two full pattern pieces, one should be at least one-quarter of an inch larger all round to allow for seam.

Place point of compass at a, and with g as radius draw an arc as shown in Fig.

Continued on page 29



Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

A NUMBER of important changes in the markets have been made. As stated in the last issue of SANITARY ENGINEER, pipe fittings are higher, the new quotations being ten per cent. above former figures. An advance of five per cent. has been made on all lines of enamelware. Malleable fittings are quoted at approximately 12 per cent. above former prices.

New prices on brass goods show an advance of approximately fifteen per cent. Prices on some lines are not yet worked out, but it is stated that the new prices will be about the figure stated.

The cheaper grade of oakum has advanced slightly. No change has been made in prices of waste.

In the ingot metals the only change is in tin which is slightly easier. Copper remains very firm.

The shortage of goods which has been mentioned in previous issues of SANITARY ENGINEER is even more acute in many lines and the delay in obtaining much needed equipment is creating complaints which affect and annoy everyone in the trade. Many plumbers are being held up because they are unable to get soil pipe, fittings or other necessaries.

There is every indication that the general activity which has developed in building will continue throughout the season and that there will be a steady and excellent demand for goods. While the labor troubles are not all settled, the outlook is much more satisfactory than it was a short time ago. The effects, however, will be felt for some little time as depleted stocks cannot be replaced at a moment's notice.

TORONTO, August 29.—"Business is good," is the general opinion expressed by those in the trade. Most of them add that their principal trouble is to get enough goods to keep up with the orders that are coming in. It is an impossibility to get anything like sufficient supplies in many lines and as a result a great deal of work is being delayed. Manufacturers are looking for continued activity in building. Many of them have enough orders on hand now to keep them working steadily all the rest of the season, and inquiries which are coming indicate that there will be a lot of work get under way in the spring. While a large number of dwellings have been erected, the scarcity of housing accommodation seems to be practically as acute as ever, especially in the larger centres. From the country districts come reports of splendid prosperity, and inquiries from many farmers who are planning to put modern improvements in their homes, instal water systems and so on. Taken altogether the outlook for good business is bright.

Enamelware Prices Advance 5 Per Cent.

ENAMELWARE.—A five per cent. advance on all lines of enamelware has gone into effect. Slow deliveries of goods continue to cause inconvenience to those in the trade. Business has been good and prospects are that it will continue so throughout the year. Building permits continue to show a substantial growth and as there is a large percentage of residences of a good class being built there is a steady call for enamelware goods. Quotations on some of the well-known lines are as follows:

Bath tubs, rill rim, 4, 4½, 5 feet, 24 to 30 in. wide	$37 07
Bath tubs, 5½ ft.	41 27
Lavatories—	
17x10" Apron F139 or P4045	11 00
18x24" Apron F154 or P3845 or P3847	17 00
18x21" Apron F169 or P4205	12 70
18x21" Roll rim F197, F199 or P4655-6	11 10
17x19" Roll rim F241 or P4345	9.05
Sinks, roll rim, 18 x 30 in.	16 60
Sinks, flat rim, 20 x 30	6.77-6.65
Do., 18 x 30	6.07-6.19
Do., 16 x 24	5.29-5.45
Closets, oak tank and seat	26 50
Do., enamel iron or white vitro tank	30 00

Range Boiler Prices Remain Unchanged

RANGE BOILERS.—Prices of range boilers show no changes. Business has been good and with continued activity in building there is every prospect that it will remain so. Quotations are as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Soil Pipe Scarce; Fittings Are Higher

SOIL PIPE, FITTINGS.—Deliveries of soil pipe have been very slow and as a result there is a good deal of complaining. Many firms have been unable to obtain anything like the amount they require, and the best they can get is promises.

New prices are out on both pipe fittings and malleable fittings, and show advances of approximately ten to twelve per cent. The new figures are shown below:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	10%
Medium and extra heavy soil pipe, 4 in..	15%
Medium and extra heavy soil pipe fittings, 2 in. to 6 in.	25%
8 in. extra heavy pipe and fittings	5%

PIPE FITTINGS

Cast iron fittings	10%
Plugs	22%
Bushings	25%
Unions, ¼" to 2½"	40%
Do., ⅛", 3" and larger	35%
Dart unions, ¼-inch to 2-inch	25%
Do., 2½-inch and larger	15%
Nipples, up to 4-inch	80%
Do., 4½-inch and larger	70%
Do., running thread 4-in. and under	50%
Couplings, 4-in. and under	40%
Do., 4½-in. and larger	20%

MALLEABLE FITTINGS

	Black	Galv'd
Malleable Fittings, Class A, lb.	$0 57	$0 72
Do., Class B, lb. net	0 25	0 35
Do., Class C, lb. net	0 19	0 25

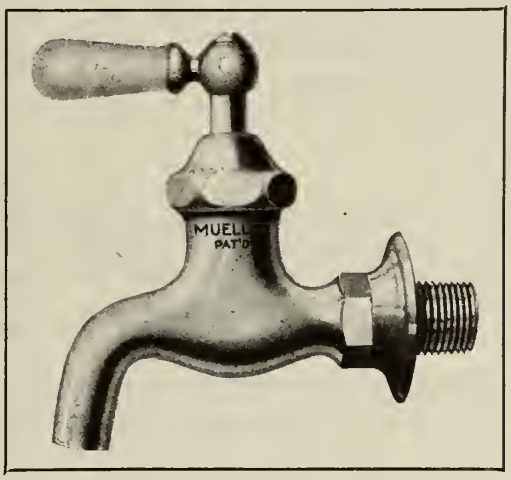
Many Advances Shown In Price of Brass Goods

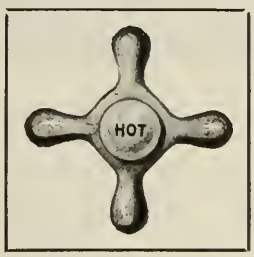
BRASS STEAM GOODS.—A number of price changes, all to higher levels, have been made. Business has been good and as stocks of many lines have been steadily going down with little replacement owing to labor troubles, deliveries are often somewhat slow. There is fair activity in marine goods. Quotations are as follows:

Compression work, standard	35
Fuller work, standard	40
Bath cocks, compression	37
Bath cocks, Fuller	40
Flatway stop and waste cocks, standard	38
Roundway stop and waste cocks, standard	38
Brass steam cocks, standard	Net List
Globe, angle and check valves, standard.	5-23%
Do., removable disc	10-22%
Radiator valves, standard	15%
Do., removable disc	Net List
Basin Cocks—	
No. 0 and 1, Fuller pattern	40
Compression	30
Quick opening	40
Globe, angle and check valves, standard, medium pressure	5-23%
Radiator valves, standard med. pressure	31%
Radiator valves, removable seat, medium pressure	25

MADE IN CANADA

MUELLER
Rapidac Bibbs





**A 2231, Plain Spout
With Hexagon, Solid Flange Outside
Thread**

The **MUELLER** Rapidac Bibb A 2231 pictured above is but one design out of a complete line embodying many new and exclusive features.

The anti-spreading feature, contained in this and other **MUELLER** bibbs, is cast as an integral part of the bibb. This device breaks up the whirling motion of the water and delivers it from the spout in a smooth, solid stream.

Built in every **MUELLER** Bibb is the superior mechanical construction perfected in sixty years' brass foundry experience.

H. MUELLER MFG. CO., LTD.

SARNIA CANADA

Send for our new Canadian Catalog "A"

MADE IN CANADA

Oakum is Higher; Waste Unchanged

WASTE, OAKUM.—An advance is shown in the cheaper grades of oakum and quotations on plumber's spun now range from $9.50 to $10.00 per hundred pounds. The other grades remain steady. No change is shown in the prices of waste. Quotations are as follows:

	Per 100 lbs.	
Best American	$21 00	$22 00
Clipper, spun	.....	21 00
Do., unspun	.....	10 50
Plumbers' spun	9 50	10 00

Firm Market Prevails On Wrought Pipe

WROUGHT PIPE.—Strength is prominent in the feeling on wrought pipe. Higher prices are being talked of and seem due to come almost any time. Difficulty in getting sufficient skelp to meet needs of production is being experienced and with trade good, it is indicated that it is not easy to take care of business offering.

Boiler Tubes Hold Firm; Unchanged

BOILER TUBES.—Boiler tubes rule with a firm undertone, but show no actual change from prices given below:

BOILER TUBES—	Seamless	Lapweld
1¼ inch	$27 00	$.....
1½ inch	28 00	.....
1¾ inch	30 00	26 00
2 inch	30 00	26 00
2¼ inch	33 00	28 00
2½ inch	40 00	32 00
3 inch	46 00	38 00
3¼ inch	.....	45 00
3½ inch	56 00	42 00
4 inch	70 00	54 00

Galvanized Sheets Register Advance

SHEETS, PLATES.—An advance of 20c per 100 pounds is reported in some quarters on galvanized sheets, and the tendency of the market all through seems upward. Warehouses are buying quite heavily in some cases, although in others they have not cleared out the large war stock that was being carried. One of the dealers stated this morning: "We are buying heavily now, because we confidently expect that prices are going up to a higher level than they are at present. There are labor troubles of several kinds on the horizon in the steel mill district, and these, along with other tendencies, are going to keep prices up. We regard it as a good policy on our part to buy enough now to put us in good shape for some weeks and months to come.

Business locally is coming along quite freely and warehouse shipments are going forward in good shape. Range of prices to-day follows:

14 gauge	4 85	5 10
16 gauge	4 95	5 20
18-20 gauge	5 80	....
22-24 gauge	5 85	....
26 gauge	5 90	....
28 gauge	6 00	....
3-16 inch plate	4 90	6 25
¼-inch boiler plate	4 50	5 80

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS.

10¾ oz.	$7 80	$8 00	$8 10
U.S. 28	7 40	7 60	7 70
U.S. 26	7 10	7 30	7 40
22 and 24	6 95	7 15	7 25
18 and 20	6 80	7 00	7 10
16	6 65	6 85	6 95
12 and 14	6 50	6 70	6 80

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Better Movement of Lead Products Noted

LEAD AND ZINC PRODUCTS.—A distinct improvement in amount of business being handled is reported, and outlook seems to be for a continuation of this condition. Prices are well maintained, and without change at following levels:

Doubt Shows Up In Scrap Metal Circles

OLD MATERIALS.—A feeling of doubt exists in the minds of some of the large dealers in scrap metals as to what the next move is going to be. There seems to be an impression that there is some manipulation going on in the larger consuming and buying centres, and until this is dispelled it is likely that there will be a tendency on the part of some of the larger dealers in Canada to sit tight. It may be that there will be a slight dip in values, but it is hard to see where it can last for any length of time. It is claimed by several that though coppers and steel have reached their peak for some time at least, and that they are not due for much higher figures. However, there is no feeling that they will travel far in the opposite direction. Some of the smaller sellers feel that right now is a good time to sell their material, and they are still letting it go, particularly as the buyers here and in Montreal are standing behind the prices that have been ruling for some weeks past, and it hardly seems likely, unless something unforeseen happens, that there will be any reduction in buying values.

Little Change Made In Ingot Metals

INGOT METALS.—An easier price has been made on tin in some quarters, but apart from that, little change has been made. Business generally is very fair.

COPPER.—The market is holding its own, and seems somewhat stronger, although no actual price change has occurred here. The price rules at 27c per pound.

TIN.—A decline has been recorded in some quarters on tin, making quotations read from 58c to 61c per pound. Stocks are very fair and demand satisfactory.

SPELTER.—A somewhat better demand is reported in this metal, which has had a tendency to strengthen the market. No actual change is reported, however, the price ranging around 10c per pound.

LEAD.—Sales are very good, and the market seems quite steady, with firmness showing. Prices here range about 7c per pound, an unchanged figure.

ANTIMONY.—Trade is along fairly well regulated lines with sales considered satisfactory, and prices firm at about 10c to 10¼c per pound.

ALUMINUM.—There is nothing startling in this metal, which is moving out in somewhat better volume at around 35c per pound, an unchanged figure.

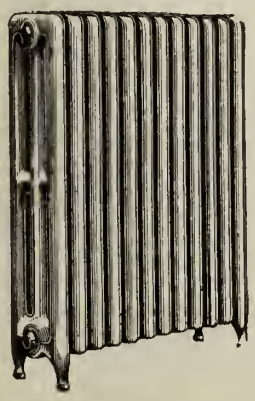
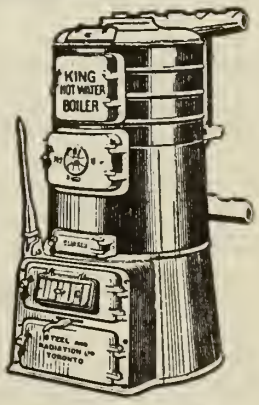
KING HOT WATER BOILERS AND IMPERIAL RADIATORS



The Perfect Heating System



By all the tests to which a heating system can be subjected, the King Hot Water System makes a record of almost one hundred per cent. The scientific construction of the water channels; the arrangement of the fire chamber and flues; the quickness with which heat is taken up by the water, lessening the amount of fuel required; the airtight joints, preventing waste of fuel by ungovernable drafts; the strength of the materials; the convenience of all parts; the ease of shaking and ash disposal; the dust-tight ash pan, and other points are reasons why you should install King Hot Water Systems.

Quaturn Ball Cock

Did you ever sell a **whistling, noisy Ball Cock?** It didn't advertise you very well, did it? And very likely your customer was not much pleased either.

Next time use Quaturn.

Because, under moderate pressure, they operate quickly, positively and noiselessly.

Because the working parts may be renewed when worn, without taking off the body, and they are interchangeable with all other Quaturn fixtures.

Because they close with the pressure and therefore tend always to close tighter, eliminating leaks.

Because a satisfied customer means more business for you.

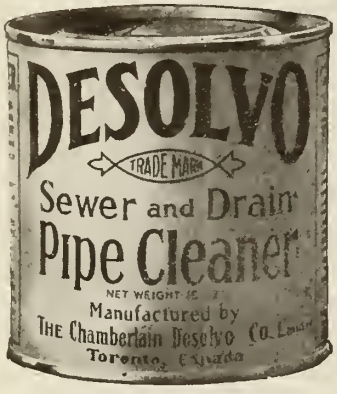
Saves You Money

Allpriser Service

Why stand losses, unnecessary overhead and confusion of cost data? Allpriser Service is a direct saving of money and pays for itself—pays you a profit on itself, in fact. Did you never sell an article costing 12c for 10c?
Allpriser Service consists of a flexible leather bound book 7 x 9, of 150 loose-leaf pages. The service includes a list of net prices of all staple articles and a regular service of new sheets revised to the latest changes. Allpriser Service is only $25.00 annually.

KENNETH B. ALLISON, 668 Yonge St., Toronto



Clears Pipes and Drains

Desolvo has an appeal that makes sales and repeat orders. You can readily see that the housewife will purchase an article that means clearing pipes without tearing up the house, and lawn.
K.K. cleans stains from closets and makes a job easy that was repulsive before.

Order from your jobber.

IMPERIAL CITY HEATERS, LIMITED

SARNIA, CAN.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Why Jenkins Bros'. Valves Are Superior

Fig. 106

They are the original renewable Disc Valves. They have more imitators than all other makes of valves combined. They have kept pace with increasing steam pressures and severe working conditions. They are of the simplest design, and can be easily repaired by any man of ordinary intelligence. They are made interchangeable in every part, and any part can be duplicated promptly and inexpensively by the dealer. In the majority of cases they can be repaired by merely changing the disc without the laborious task of regrinding.

Fig. 108

They are recognized as the Standard Steam Valves in all parts of the World, and wherever there are supply houses—Jenkins Bros'. Valves will be found. The Standard of quality never changes except to improve, and while to-day there are hundreds of imitators, the sales of genuine Jenkins Bros'. Valves are constantly increasing.

JOHN H. HALL & SONS, LIMITED
BRANTFORD, CANADA

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it; through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

R. MACDOUGALL CO., LTD.
GALT., CANADA

WORTH WHILE PUBLICITY

The general tendency in Canada is towards selling high-grade goods. There never was a time, in the history of the country, when all branches of the Canadian trade were more interested in securing all possible information regarding products they can recommend and guarantee to their customers. Advertisers in SANITARY ENGINEER reach the cream of the trade in all parts of the Dominion.

They Are Wanted "Beaver"

Square End Pipe Cutters

They meet the exact requirements for a pipe cutter.
Don't be bothered with the expense and trouble of hack saw blades—$20 to $30 a year, and the burrs and reduced pipe area resulting from their use. Beaver Square End Pipe Cutters leave a clean-cut square end—no reaming or filing required. The knives feed automatically—set ready to cut when placed on the pipe.
They work easily and give satisfaction. In use on conduits by electrical contractors everywhere.

SAW AND FINE EDGE CUTTERS

You should investigate these lines. Besides those shown here there is a host of others. For instance, see our Washers and Pipe Cutter assortments, and the way they are packed in convenient, partitioned, strong, dovetailed shelf boxes with sliding lids.

The merchant should figure on the direct money value of the reduced selling cost, due to better display and ease of handling.

Have you seen Wolverine Kantleak Floats? They are made absolutely without solder, of heavy copper. Spuds of red brass are swedged on the inside to withstand acid or alkaline water. Wolverine Coil Furnaces are fitted with safety valve and bulb, and with air pump. Wolverine Waste Tank and Spud Washers are made of the finest quality of rubber obtainable.

These are but a few of the many lines that are omitted here. We cannot, for obvious reasons, make a catalog of an advertising page.

William and James

A Little "Straight Talk" to the Canadian Plumbing Trade

WILLIAM began business five years ago in a small shop on Front Street. He cleaned the windows; a bright sign appeared announcing William Smith, Plumber. There was a modest but attractive display of shining fixtures. The floor was swept, the store was clean and neat. In the workshop the absolute rule was neatness and order, no waste. When an assistant was brought in this rule was insisted upon. Now each one of the ten assistants agrees when engaged to maintain this rule.

JAMES started up some five years back in a place on Main Street. He told some of his friends about it and with a marking brush wrote a cardboard sign which told that JAMES JONES, PLUMBER, had located here. On arrival of supplies he gave orders to "stick 'em in there any place." In the workshop there is a splendid example of what is meant by "CHAOS." The two assistants now engaged help to make matters worse.

WILLIAM bought a small and simple set of books and a card index for prospects. This has grown into a modern up-to-the-minute system and the office boasts a typewriter and an adding machine. A bookkeeper and a stenographer look after the details and are able to courteously receive customers when William is absent, take notes as to requirements and lay foundations for future business.

JAMES never could be bothered with that bookkeeping stuff. He kept his records in a scribbling book, on bits of paper and backs of envelopes, He has now added a daybook and ledger but "never has time" to get them up to date and a young shop helper has to lend a hand occasionally.

WILLIAM has a reputation for "QUALITY" goods, for sharp attention to business, for courtesy to his clients, for consideration of their needs. He has a good rating at the bank. An automobile and a motor truck add greatly to the service and efficiency of his business.

JAMES is known as "the cheap man." He puts in a job which will "do well enough." That's the way he gets the business he has procured. He neglects to pay his bills, drafts on him are continually returned unaccepted because he "has no time to attend to them." A horse and wagon still do duty for deliveries and trucking.

These two men began with equal opportunities. The examples are multiplied in almost every town and city.
Why not cultivate the lines of William's progress?
QUALITY, EFFICIENCY and SERVICE.

PNEUMATIC WATER SUPPLY SYSTEM FEATURE OF STANDARD SANITARY DISPLAY

AN exhibit of more than passing interest at the Canadian National Exhibition this year was that of the Standard Sanitary Mfg. Co., Toronto. This included a display of pneumatic water supply systems, sanitary bathroom and kitchen equipment which should bring splendid results to those sanitary engineers who follow closely on the trail of those of their customers who witnessed same.

Each and every day and all of each day a big crowd was gathered about the exhibit asking questions and securing information from the courteous salesmen of the company. The favorable impression left in the minds of the visitors is one which can be capitalized by the sanitary engineer in his own town.

One feature of particular interest in the exhibit was that which showed equipment for the farm home, including pneumatic water systems. The value of this display was quite evident, demonstrating as it did, that the farmer though one hundred miles from the city, can equip his home with the same conveniences in every respect as those citizens served by a city or town water supply.

There is no time better then the present for the sanitary engineer to advertise himself as able to instal the class of Standard Sanitary equipment seen at the Exhibition. Now is the opportune moment to secure contracts for installation of pneumatic water systems, bathrooms and kitchen equipment which will keep your men busy. Lay out your plans and book up your customers now while they are in the mood to be approached on the subject of using this class of material.

The display which is reproduced above speaks for itself. There is no more attractive line of merchandise than Standard Sanitary enamelware. This class of goods lends itself particularly well to display and at all times the sanitary engineer should keep his wares out where they will be seen.

The advertising done by this progressive firm to bring their goods to the attention of your customers should not be lost on you. Follow it up and cash in on greater sales of Standard Sanitary equipment. Your opportunity is here—take advantage of it.

Williams' Improved "Vulcan" Drop-Forged Chain Pipe Wrench

FEW tools are called upon to stand greater strain and harder wear than the pipe wrench. Because Williams' "Vulcan" Chain Pipe Wrenches have withstood every test during years of hard, continuous service under all conditions, they have earned a well-deserved reputation for dependability, and are favorably known the world over. They embody every good feature for which Williams' *Superior* quality stands.

Made in 8 sizes for ⅛ to 18 inch pipe. All Flat Link Chains are "proof-tested" on a standard tension machine and "certified." Every wrench is unconditionally guaranteed.

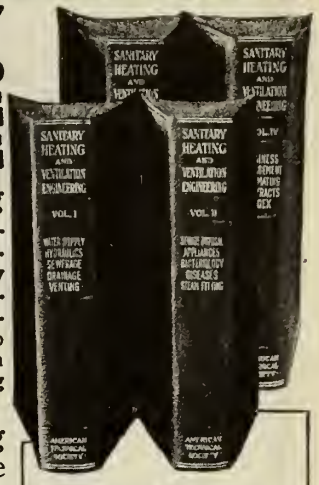
GET IN THE BIG MONEY CLASS NOW

SANITARY HEATING AND VENTILATING ENGINEERING



SANITARY Heating and Ventilating Engineering offers wonderful opportunities for advancement and money making right now. Modern methods and appliances are fast replacing the old ones, and the men who are up-to-date — the trained men — the men who know — are going to reap the benefit.

Get your share of the big money now. Here is the first thing for you to do — tear the coupon off this page and mail it to us today. It won't obligate you in any way and you don't have to send a penny, but it will bring you these four big volumes — just off the press — packed full of the very things you need to train yourself — all worked out for you in clear, understandable English by eighteen of the most successful men in these professions today.

No matter what your job is or how much you earn, you need these books — and you need them now. If you are in business for yourself, they will make your business bigger and better — the volume on business management, estimating and contracts and specifications alone will do it.

4 big volumes, size 5½ x 8¼ ins., bound in flexible American Morocco and trimmed in gold: 1454 pages: over 1100 pictures, diagrams and plates.

Here's what the Books Contain Thousands of problems under the following headlines are all worked out and made as simple as A-B-C.

Sanitary Science and Materials.
Water Supply. Hydraulics.
Sewers and Drains.
Drainage and Venting.
Sanitary Appliances.
Sewage Disposal.
Bacteriology and Sanitation.
Infectious Diseases.
Steam and Hot Water Fitting.
Domestic Hot Water Supply.
Heating and Ventilating Engineering.
Sheet Metal Work.
Business Management.
Estimating.
Contracts. Specifications.
Mechanical Drawing.
General Index and Review Questions and Index to Each Volume.

Free Consulting Service With these books goes free a year's consulting service in the American Technical Society, worth $12.00. This enables you to consult our engineers and experts for one year without charge. Ask as many questions within the scope of the book as you want for one year.

SHIPPED FREE

Examine the books and see for yourself just how valuable they are, but don't send us any money. The little coupon is all you need. Fill out all three lines and mail it NOW. It will bring you the whole set of books by express collect, and you can keep them seven days to use as you please—study them at home—take them to your shop—try to find some problem they won't answer, and ship them back at our expense if you think you can get along without them. If you want to keep the books after seven days' use, send us only $2.00. The balance can be sent in monthly payments of $2.00 each until the special introductory price of $13.80 is paid.

It will take years of hit-or-miss experience to gain what these books will give you in a short time; so don't pass up this opportunity—ACT NOW. We may never be able to offer this low price and these special terms again—only 7c a day. Tear off coupon before you lay this down and mail *today*.

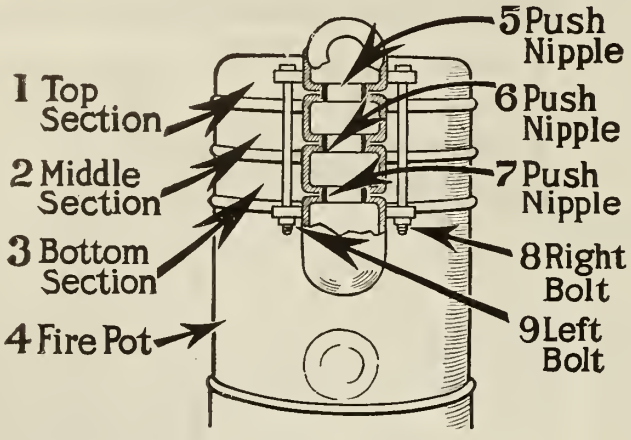
THE MOGUL BOILER

Has Only Nine Main Parts Above the Base



DON'T buy a boiler with a lot of parts. The more parts, the more chances of it getting out of order; the more repairs to pay for.

The MOGUL boiler has NINE (count them in the sketch) main parts above the base. Ordinary boilers have nineteen main parts. Thus other boilers have 111% more parts, and are that much more likely to get out of order. On the MOGUL there is not even a rubber gasket to wear out. If it had rubber gaskets, they would have to be replaced every year or two. And if the rubber gaskets were not replaced accurately (and this is most difficult to do) the circulation of the water would be impeded, and more coal consumed to propel the same amount of heat to the rooms. But the absence of rubber gaskets and the few parts in the MOGUL boiler ensure a wonderfully rapid circulation of water through it. And this rapid circulation of water is one of the causes of the MOGUL'S economy of fuel, fully one-third less coal being required.

The Mogul Boiler and Safford Radiator Systems

are in every way superior to ordinary heating systems. The Safford, you see, is a *specialized* hot water system—the product of an organization with 30 years' experience.

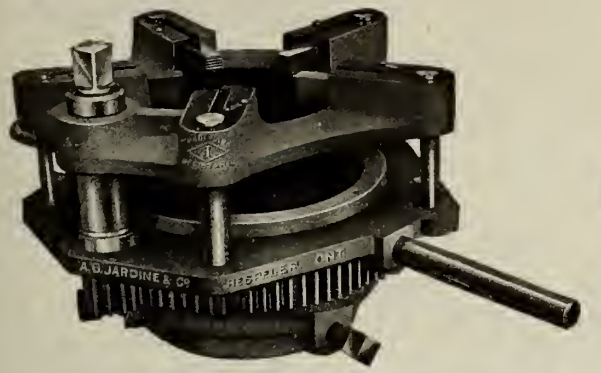
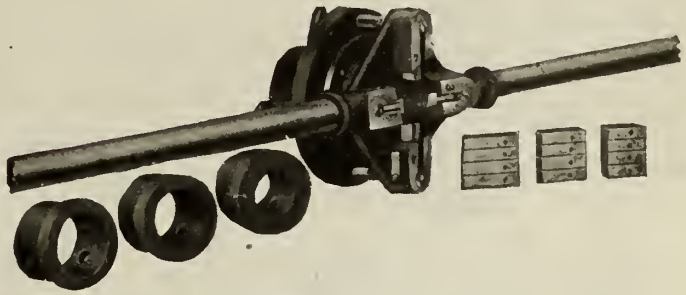
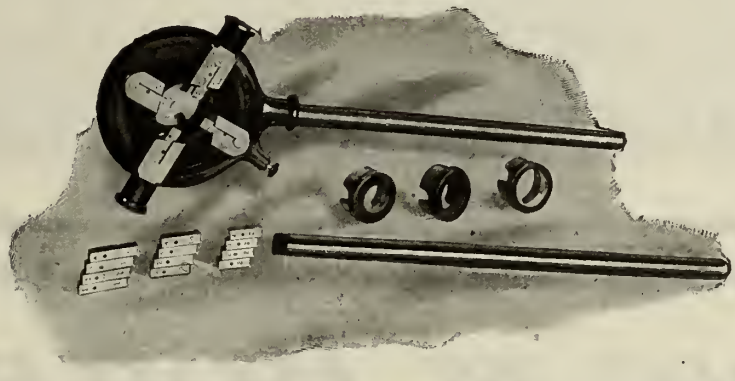
Perfect Threads



"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity, 2½ to 6 in. inclusive. Weight, 120 lbs.



"Toledo" Adjustable Threading Tool No. 1. Capacity, 1 to 2 in., inclusive.



"Toledo" Adjustable Ratchet Threading Tool No. 1A. Capacity, 1 to 2 in., inclusive.

"Toledo" and "Jardine" Pipe-Threading Tools Cut Labor Cost in Half

With these efficient tools one man can do the work of two.

All the power applied to the dies is used to cut the perfect thread; no waste in friction on the pipe. As the tool advances on the pipe the cutters open out, putting the proper taper on the thread. The back of the cutters merely follow in the thread, serving to steady the whole.

Jardine and Toledo Tools are of simple design for strength and service—no "gadgets" and "jimcracks" to get out of order, wrongly assembled or lost.

A ratchet fits these tools for use in any odd corner. The pipe may be threaded in place at an obvious saving—in many cases equal to the cost of the tool.

A NEW ONE FOR "EX" VISITORS

THIS year a new face appeared at the "Ex." or rather a new exhibitor. At the right hand side of the main entrance of Machinery Hall, visitors were greeted with the exhibit and attendants of the Hoyt Metal Co., Toronto.

Most hardware dealers and manufacturers have for the past few years associated the Hoyt people with the manufacture of Babbitts, solders, leads, etc., but few realized that their line consisted of the wide range of products which their display disclosed.

One of the main features of the Hoyt Metal Co.'s exhibit was "United" Lined Products—lead-lined, tin-lined, brass and copper-lined pipe and fittings, acid valves, centrifugal acid pumps, lead-lined chemical apparatus. This is a comparatively new line for Canada, but one which is in demand in the local market. Many were the interested visitors who stopped to inquire into the "United Process" of lining pipes, fittings and chemical equipment.

Another note-worthy line exhibited here was "Ulco" hard metal, a hard bearing metal of comparatively high tensile strength, with relative immunity to corrosion. It may be used in place of high-grade alloys such as those made of nickel, copper, bronze and tin, etc., and costs considerably less. "Ulco" hard metal can displace brass for many purposes where high tensile strength of bras is not an important factor. Beside these lines Frost King and other grades of Babbitts, solders, etc., were shown in a most complete range. The Exhibit was attractively gotten up and the attendants gave courteous attention to all enquires and distributed literature and catalogs bearing on the various lines on display.

There is no doubt the work done here will impress users of the above mentioned lines and result in good future business for the company. The best jobbers in all parts of Canada carry full stocks of Hoyt Metals and will be able to supply hardware dealers with all information regarding "Ulco" hard metal. Information re any of the above lines will be gladly sent direct or indirect.

The Plumber as a Salesman

"Wanted—A Salesman For Plumbing Supplies"—read the advertisement, and among the answers received were some from Master Plumbers, some of them very fine fellows, fairly well educated and who knew the Trade thoroughly.

They wanted, to use their own words, to better themselves and they thought the position as a Salesman offered a greater opportunity for advancement.

But is such really the case? Let us assume that the applicant obtains a position with a first-class plumbing supply house or manufacturer. He is no longer a free agent, he must conform with the rules of his house and to the established customs of the great fraternity of salesmen. He is expected to show initiative in promoting new business and great energy in developing the business which should naturally result from direct inquiries. He interviews everyone who does or is likely to require plumbing material and in the hardest kind of competition secures his orders.

Does his work cease when he turns his orders in to the house? Not so. He will find a hundred and one little matters that require to be adjusted and many of them have no connections with the sale as neither he nor his house have any control over the goods after they are delivered.

Suppose he remains as he is—a Master Plumber. He has the same ability and opportunity as a salesman. If he is progressive he knows all the work that is going on or can obtain the information from the same source as either the jobber or manufacturer. He has the same number of illustrations, the same literature and he has the same initiative, but he develops it on his own account.

He has the advantage of being able to sell direct to the consumer, personally interviews his prospect, visualizes the installation, and in his most interesting way describes the modern bathroom, the complete kitchen or convenient laundry equipment, and eventually closes the contract or makes the sale.

His interest, however, does not cease at this point. He is complete master of the situation, buys the material he specifies, has it installed under his supervision by clean and careful workmen, with the result that he is able to guarantee an absolutely perfect job which will be satisfactory to his customer and a future reference for himself.

Such a man is a salesman in every sense of the word. In addition to selling the goods, he sells service and in that line there is very little competition and price is not a factor in the transaction.

Our company's interest is, of course, in having its products properly installed. Plumbers tell us that they like our fixtures, that they have a nice clear color, are easy to clean, properly packed and convenient to install; but we know that no matter how good our ware is it is more attractive and becomes a better advertisement when it is properly installed by a good mechanic under the careful supervision of a Master Plumber who takes an interest in his work.

Just think what it would mean if every Master Plumber in Canada, and there are about twenty-five hundred, was a well-trained salesman and directed his energy and ability to sell plumbing material under the conditions we have set forth. The volume of business would increase and the conditions under which the work was done would be more profitable to the plumber and more satisfactory to the manufacturer and the consumer.

Fifty-Three Years In The One Stand

David Hall, Practical Plumber, Kingston, Ont., Now Owns Business and Premises Where He Started in to Learn His Trade—The Early Days and the Steps of Progress Which Have Followed

IT WAS fifty-three years ago when David Hall, then a boy of 13, first started in to learn the plumbing and heating trades in the stand where he now conducts his own splendid business in the city of Kingston, Ont. Yes, it is now his own business, and has been for a matter of over twenty years, his life work proving a successful one which has placed him in an independent position to-day.

Tells of Early Days

On the cards which Mr. Hall uses to-day, are the words: "Practical Plumber," and indeed he is just that. Mr. Hall, in a reminiscent mood, spoke of the early days when the plumber made his own traps and bends, when they handled brass work, making such lines as stop-cocks, copper pipe, etc., right in the shop. In fact Mr. Hall showed the writer a trap which he had made over thirty-five years ago, and a fine piece of workmanship it was. Mr. Hall also spoke of stop-cocks made in the shop over fifty years ago, which he knew were in service to-day. He told also of the time when he wiped 7 joints with four pounds of metal.

These were all interesting points brought out dealing with the early days but Mr. Hall does not live in the past. He is fully cognizant of the changes which have taken place and speaks as enthusiastically of the improvements which have been made to bring the trade up to to-day's high plane as he does of the days of his apprenticeship.

Lives in the Present

It requires a man with vision and initiative, too, to keep up with the van of progress. So many men who have been in business for half a century sour on their trade and always believe the past was best. Not so, however, with Mr. Hall. He realizes that progress has been made, and whereas he feels that perhaps the class of workmen to-day may not be as expert in many lines as those with whom he learned his trade, he is satisfied with the world as it is to-day in this speed age.

View of the display room of David Hall, practical plumber, Kingston, Ont. It was fifty-three years ago in this same stand where Mr. Hall started in to learn his trade. To-day he owns the business and the premises.

Son and Daughter There

Associated with Mr. Hall are his son, Charles H. Hall, and daughter, Helen Hall. Miss Hall looks after the books, does the buying, keeps the prices up to date, and is a big factor in the successful conduct of the business to-day. It can be seen from the list of her duties that they are vital, and to her keen judgment Mr. Hall attributes much of their ability to buy right and sell their goods and time at a profit. Miss Hall looks after the display room to quite an extent and handles much of the selling on the bathroom fittings, gas fixtures and other lines which they merchandise.

Mr. Hall's Story

Asked as to what he attributed his success to, Mr. Hall stated "service." "It may be an old term to use, but it is the foundation on which any business to attain success and continue along profit-making lines must build," stated Mr. Hall. "One may wonder why we don't go out and figure on many big contracts. Our plan is to get the business before it reaches a competitive stage. We sell our material and work on a 'satisfaction guaranteed or money back' basis, and you cannot get away from selling when you stand back of the work you do. We have customers who have been with us for years, and their continued satisfaction is the best advertising we can have."

They Came Back

Mr. Hall told some amusing experiences they had had with many of their customers. "There are any number who have left us—stated we charged them too much or some other excuse," Mr. Hall said, "but they have come back, and the reason they have come back is that we give satisfaction. The work we do has to be up to a standard, not down to a price. When you do business that way you get the class of trade that is profitable. When you do a cheap job it soon advertises the fact and you are given a black eye, with goodness knows how many people who might otherwise have been customers. The fact that the customer may have got all that he paid for has no bearing on the question—he only looks at the results, and when they are not right the man who handled the job is the one to blame."

Worthy of Best Efforts

And there is just a point there which might be given some consideration, too. Isn't the sanitary and heating profession worthy the best efforts of the men engaged therein. Why undertake work which is a "cheap John" job—it is no satisfaction to the man doing the work if he has any pride in his profession, and most certainly the customer will not be satisfied.

Carries Gas Fixtures

In addition to the sanitary and heating business which Mr. Hall does, he carries on an extensive trade in gas fixtures and fittings. In the early days Kingston was very largely dependent on gas for lighting, and a very large proportion of the houses are piped for its use. Those handling gas fixtures are growing fewer owing to the rapid strides of electricity, but Mr. Hall finds his trade keeping up splendidly. He is one of the very few able to supply fixtures and take care of the necessary work, and draws a big share of the business offering to-day.

Good Display Room

Mr. Hall has a splendid display room, as will be seen from the accompanying photograph. The various types of bathroom equipment are shown in addition to the gas fixtures and accessories. Bathroom fittings are displayed under glass in a nice wall case and make a splendid appearance.

Altogether David Hall, practical plumber, is a good type of business man to emulate. He understands his trade, he takes pride in his profession, he does a class of work which he labels "satisfaction guaranteed," and he charges prices in keeping with the class of work this motto entails. In spite of his years he is still a young man, and now enjoys watching his son and daughter handling the reins, although he still keeps an eye over things.

Regina Water Supply Comes in for Criticism

THE water supply of Regina, Sask., which for years has been recognized as inadequate to the needs of a growing city, has come in for criticism at the hands of the Regina "Leader," which says in a recent issue editorially:

"The problem of securing an adequate supply of good water has for many years agitated the minds of the people of Moose Jaw, and at the present time that city is face to face with the serious question of either obtaining such a supply or having the growth and prosperity of the city checked and even the health of its people endangered.

"To a lesser extent, Regina is confronted with the same problem. Unlike Moose Jaw, this city's present supply of water is all that could be desired from the standpoint of quality and purity as a drinking beverage, although it leaves something to be desired for industrial and other domestic purposes, being too hard and injurious in its effects on boilers. But Regina's supply is not what it should be from the standpoint of quantity, and if this city is to continue to forge ahead an energetic policy must be adopted and followed, having in view a very large increase in the amount of water available for daily consumption by its citizens and the industries which Regina ought to secure, and only can secure if a sufficieny of good water is guaranteed.

"It is probably quite true that there is available at the present source of Regina's supply sufficient water to meet the ordinary requirements of householders, and that it is possible to further increase that supply from time to time to meet householders' needs for some time to come. But Regina's City Council and citizens might just as well open their eyes wide to the fact that the present source of supply will not meet all the requirements of the city, industrially as well as for purely household purposes, if there is to be any substantial increase in our population and in the number of our industrial undertakings.

"At the present time Regina citizens are suffering from inability to get water for hours, if not days at a time, higher than the second floor in homes and business blocks, while the pressure even on the ground floor is reduced to such an extent at times that a mere dribble comes from the taps. The unusually dry season of 1919 may partly account for this. In addition we have the open confession of the city council that during the past few years it had neglected to give proper attention to the wells, with the result that there is not the flow of water there should be and that some of the wells are now in such a condition that it is open to question whether it would not be cheaper to abandon them and sink new ones rather than attempt repairs and the necessary cleaning of the old wells.

"But after making due allowance for these things, the fact must be recognized that during the war Regina secured, among her business enterprises, the great plant of the Imperial Oil Co., which is probably the largest consumer of water in the city, and which, coupled with the increasing quantities required by the three railways having terminals or divisional headquarters here, accounts for many hundreds of thousands of gallons a day. These requirements must be met, and met in an ever increasing amount, if Regina is to continue to grow and prosper.

"Even assuming that Regina can substantially increase the supply from present sources, and thus make good present requirements—which are not now being fully met—it would be folly to imagine that from the present springs we can secure sufficient water to adequately supply a Regina of 75,000 or 100,000 people, enjoying, as such a city would, scores of industrial concerns whose water consumption would necessarily be very large.

"Moose Jaw is right up against the water problem now. Regina is not far removed from it. It is high time, therefore, that these cities, working in conjunction with the Provincial Government, should quit speculating and talking and set themselves to the task of finding some practical permanent solution of the problem which confronts them."

Central Station Heating in Detroit

The Author in a Paper Read Before the American Society of Mechanical Engineers in Detroit Describes a Successful Central Station Heating Installation in Detroit

By J. H. WALKER

ONE of the natural results of the grouping together of human beings in civilized communities is the existence, in our cities, of central plants for the generation and distribution of heat to surrounding buildings. The advantages of central heating service to the user, over the alternative of operating a heating plant in his own building, are comparable to those accompanying any other public service. To the community also a properly operated central heating plant is a distinct asset, commercially and economically.

The Utilization of Exhaust Heat

The heat carried away by the condensing water in the central electric stations of the United States, equivalent to about 60 per cent. of the total fuel burned by them, is one of the more obvious, although not by any means the greatest waste, of the country's resources. Like many other similar losses this one exists, not because its reduction is theoretically impossible, but because it is seldom commercially practicable. But although commercial considerations have always dictated certain practices in the utilization of fuel and will continue to do so in the future, the increasing cost of coal and the present impulse towards its conservation now direct attention to some of the fundamental problems involved.

This great quantity of heat, rejected at low temperature from the generating units, may be considered as a by-product of electricity supply and as such its rate of production will depend upon the rate of production of electricity, the primary product. The complete utilization of any by-product becomes possible only when an outlet for it exists or can be created. Moreover, since neither electrical energy nor heat can be stored to any great extent, it is necessary for the complete recovery of this by-product that the demand for it be equivalent, hour by hour, and day by day, to the rate of electricity supply. The warming of the interior of buildings is, of course, a natural means of utilizing this heat, but the great diversity in the rate of use of the two commodities renders impossible even an approximately complete realization of the theoretical economy.

The possibility of establishing a better relation between the rates of use is rather slight. The rate of heat supply is largely fixed by unalterable climatic conditions. The use of electricity for lighting is also governed by natural elements. The demand for electricity for industrial use, which now constitutes a major fraction of the output of most central stations, is not governed by these factors and is the only kind of load whose characteristics could conceivably be adjusted to suit the requirements for exhaust heat, and even this could probably not be done to any practicable extent.

Another important obstacle to the full use of this by-product heat through the warming of buildings is due to the great development of the central electric stations which in many industrial centres in the United States have so increased in size that the amount of exhaust heat which would be available as a by-product

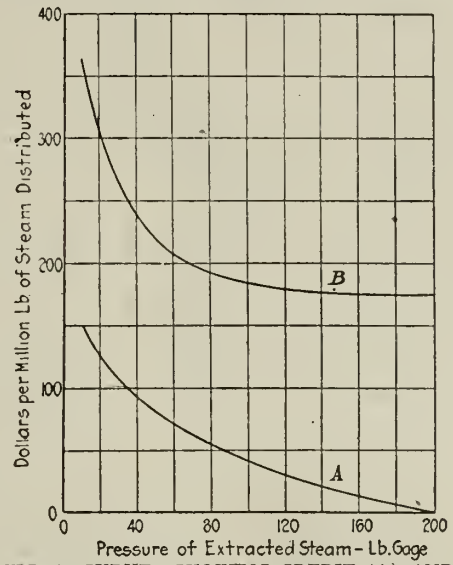

FIG. 1—CURVES SHOWING CREDIT (A) AND DEBIT (B) TO BLEEDER TURBINE PLANT FOR VARIOUS EXTRACTED STEAM PRESSURES.

is greatly in excess of that which it would be commercially feasible to distribute for the heating of buildings.

Systems of Central Heating

Assuming that a central heating load exists and is to be supplied by the electric company, there are in general three methods by which this can be done:

(a) The heating load can be served from a condensing generating station so designed that steam is available for heating at pressures above atmospheric after partial expansion in the electric generating units, the remainder of the steam used for current generation being fully expanded and condensed at high vacuum.

(b) Separate heating plants may be built in locations near the heating load and equipped with non-condensing generating units which will generate current only to the extent of the requirements for exhaust steam for heating, the remainder of the electricity being produced in a condensing station.

(c) The heating system may be supplied entirely with live steam from boiler plants located near the centre of the heating load.

It may so happen that the natural location for the main generating station serving a city is near the heating load, and if this is the case, the first method is preferable. In such a plant the use of bleeder turbines, designed so that steam can be extracted from the intermediate stages after partial expansion, offers great advantages. This arrangement has been successfully carried out in some instances and is probably the nearest possible approach to ideal conditions, since the duplication of equipment is reduced to a minimum.

Often, however, a consideration of land values or of railroad connections requires that the main condensing station be located at such a distance from the heating load as to preclude the possibility of transmitting steam from it. The Delray plant and the Connors Creek plant, the two main generating stations operated by The Detroit Edison Company, are respectively 3½ and 4½ miles from the heating district. A condensing plant, located on high-priced land near the heating district and with inconvenient railroad connections, or none, would be necessary if this first method were to be used. To such a plant, built for electricity supply and consequently, for reasons previously stated, burning more coal than a plant built solely for heating, this matter of proper railroad facilities is particularly important. Here again enters the matter of the transmission of steam, for seldom could the bleeder-turbine plant be located as favorably with reference to the heating load as could live steam plants, and the additional investment in transmission lines must therefore be charged against this plan.

The size of the pipes required to transmit a given quantity of steam over a given distance decreases as the density of the steam and the amount of pressure drop along the pipe increase. The most economical method from the standpoint of investment costs would be to extract steam from the high-pressure stages of the turbine; but the amount of electricity which could be generated per pound of steam would then be reduced. The relative values of these factors for an assumed river-front bleeder-turbine plant in Detroit are illustrated by the curves in Fig. 1. Curve A shows the total credit for the saving in coal and boiler capacity which could be allowed such a bleeder-turbine plant located on the river front and serving the existing Detroit heating system. Curve B shows the total

of the additional investment charges due to the higher-priced land on which the plant would be built, plus the investment charges and line losses involved in transmitting the steam from this river-front plant to the centres of the heating load. Even at higher extraction pressures the bleeder plant would not be justified under Detroit conditions because of its unfavorable location with respect to the heating load.

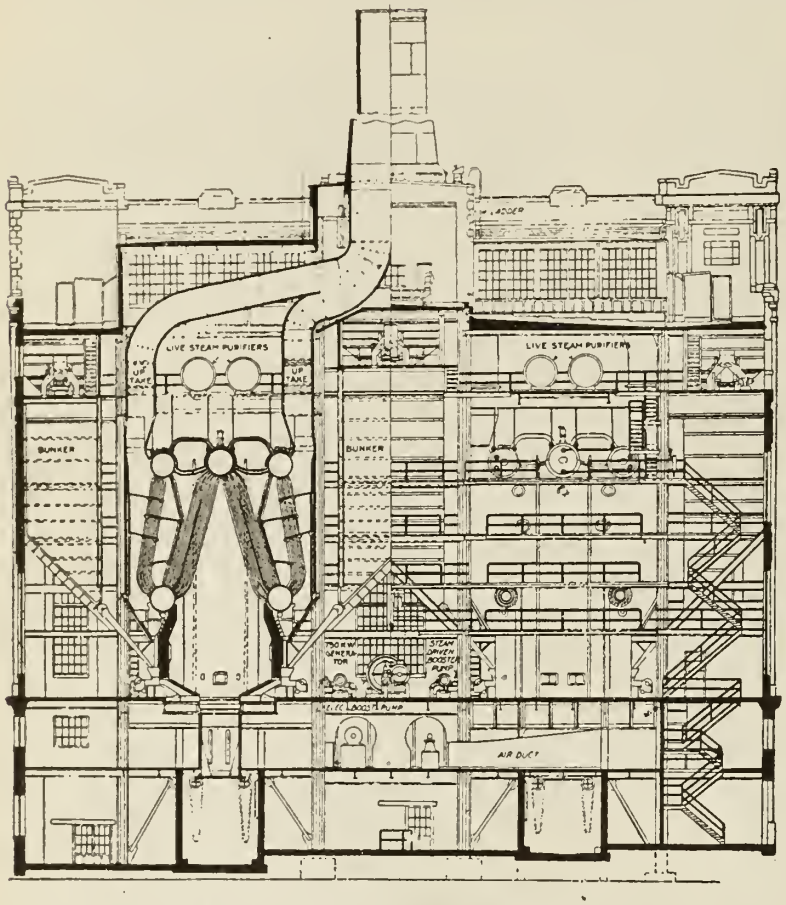

FIG. 2—CROSS-SECTION OF THE CONGRESS STREET PLANT.

The second plan above mentioned, namely, the building of plants located near the heating load and generating current only to the extent of the exhaust-steam requirements, involves somewhat different factors. In this case the capacity of the generating units will be determined by the heating requirements and the electricity generated by them will be the by-product. An essential requirement for the success of this plan is that the relation of these generating units to the electrical system as a whole be such as to allow their loads to be adjusted without restriction according to the momentary requirements for exhaust steam.

The value of such current as the heating plant will produce will be determined largely by the cost of producing an equal amount in the condensing stations. If the condensing stations do not produce current at an extremely low cost and, if other conditions are not unfavorable, this plan may prove very attractive and is in fact the mostly widely used method of combining the electrical and steam-heating plant. But unfavorable conditions surrounding the production of this relatively small amount of current may render its cost unattractive. The size of such generating units as might be installed in the heating plant may be so insignificant compared to the large size of the units in the condensing plant that the investment in the main station is not measurably reduced and the smaller units are therefore additional investment. The investment in steam-distribution mains is also much greater than when steam at higher pressures is used.

Development of Central Heating in Detroit

The immediate motive which, in 1903, led to the establishment of the central heating industry in Detroit was the possibility of obtaining a high thermal efficiency in the generation of electricity through the utilization of the exhaust steam. The generating plant from which steam was first supplied for heating had previously discharged its exhaust to the atmosphere. Owing to the building, at this time, by the Detroit Edison Company, of a large condensing plant, the smaller plant, with several others, would have been shut down, but the possibility of selling the exhaust steam made it appear desirable to continue the generation of current there to the extent of the exhaust steam requirements. Also, since the plant was located in a district served with direct current, the loss involved in converting an equivalent amount of alternating current received from the main plant to direct current would be saved for such current as might be generated there. The plant was in a high-class residence district and the heating service proved very popular, but the actual overall economy of the plant was not as great as had been anticipated.

A year later the construction of a central heating plant was begun in the business district of the city. This second project was undertaken, not as a means of disposing of exhaust steam, but for the express purpose of supplying the demand for central heating service among the owners of downtown buildings, who were considering shutting down their plants and purchasing electric service. The downtown plant was built primarily as a heating plant, and though provision was made for electric generating units they were never installed and the heating mains were supplied with steam from the boilers through reducing valves.

With the development of the large condensing generating stations the generation of current in the heating plants grew less and less attractive and when a third heating plant became necessary, because of increasing demand for steam heat, no provision was made for electric generators. The same practice was followed when, in 1916, the original exhaust-steam plant was rebuilt; and when the steam-distribution system of another company which had been engaged in the generation of electricity and the distribution of exhaust steam in the business district was purchased by the Detroit Edison Company, the new plant which was built to supply this district was also designed as a heating plant only. The entire combined distribution system is now being supplied with live steam from the boilers through reducing valves.

Since there are no generating units exhausting into the heating system the pressure carried on it is not limited by considerations of back pressure. On those sections of the system formerly supplied with exhaust steam at from 2 to 5 lb. pressure, the pressure now maintained ranges from 5 to 15 lb. and is being increased from year to year, toward the upper limit permitted by the strength

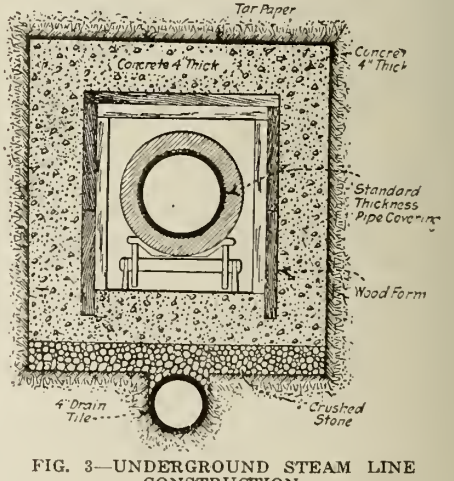

FIG. 3—UNDERGROUND STEAM LINE CONSTRUCTION.

of the pipes. The pressure on the section originally designed as a live-steam system is about 30 lb. Because of the increased capacity of the distribution system at higher pressures, due to the greater density of the steam and the greater allowable pressure drop, these higher distribution pressures are desirable.

The steam is delivered to the network of mains through connections made at the plants and also through feeders, from the plants which deliver steam to certain feeding points in the distribution network, the method being similar to the feeder and main method employed in electric-distribution systems.

Reasons For Using Live Steam

The supplying of live steam to the heating system and the abandonment of the generation of current in the heating plants is commercially justifiable, even though such current would be generated at a high thermal efficiency. The underlying reason for this is that there exist certain unfavorable conditions which outweigh the thermal advantage and make the total cost of such current higher than the generating cost at the large and efficient main generating stations.

The method of live-steam operation was adopted in Detroit before the recent great advance in the price of coal. The present high price of coal makes exhaust-steam operation appear somewhat more favorable and it is, of course, conceivable that at some future date a very high coal price may compel a change of policy. But with the cost of underground lines also increasing, the saving in distribution investment will probably continue to be sufficient to justify a continuation of the present methods.

Distribution System

The popularity of the heating service in Detroit has led to its development on an extensive scale. The present distribution system covers an area about 2 miles long and half a mile wide which includes the entire central shopping, business, and financial districts and a small portion of the residence district. About 2,700,000 sq. ft. of radiation, besides numerous water heaters and cooking fixtures, are served. The distribution system contains about 20 miles of tunnels. The four boiler plants which supply steam to the system contain 17,470 rated boiler horsepower, and they delivered in 1918 nearly two billion pounds of steam to the system. Over 1,700 consumers are served.

Though originally built in three distinct sections, the system is now a practically continuous network, and the plants are so much interconnected that the load can readily be shifted from one to another. In the spring and early autumn two of the four plants were the entire area.

The four boiler plants in Detroit which supply steam to the heating system are equipped with water-tube boilers and underfeed stokers and are of modern design throughout. Their location in the central district of the city necessarily restricts the amount of land which they may occupy and demands a suitable type of architecture, absolutely smokeless operation, and extreme cleanliness in the handling of coal and ashes.

A cross-section of the Congress street plant, the newest of the four, is shown in Fig. 2. It is designed to eventually contain four 1,300-h.p. boilers and two 2,600-h.p. boilers of the "W" type. In the effort to reduce the amount of attendance labor at this plant the auxiliaries are located, for the most part, on the boiler-room floor so as to be within convenient reach of the few men constituting the operating crew. Coal is hauled from bunkers at the railroad sidings to the plant in drop-bottom buckets of 5 tons capacity, which are lifted by a crane and emptied into overhead hoppers from which the coal is distributed by belt conveyers to the boiler bunkers. Ash-handling equipment is practically nil, the boilers being set at a sufficient elevation to allow wagons to be driven beneath the hoppers.

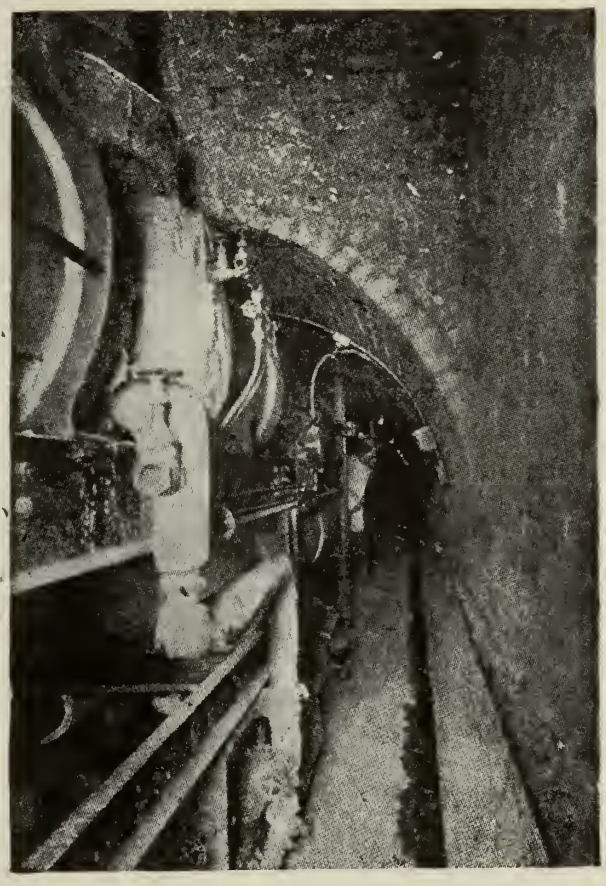

FIG. 4—TUNNEL CONSTRUCTION FOR STEAM LINES.

Because of the fact that only a relatively small amount of condensation is returned to the plants, careful treatment of the raw water is necessary. The feedwater flows through live-steam purifiers, operating at boiler pressure, in which the scale-forming materials are precipitated. In addition, sodium carbonate is fed in automatically graduated amounts to reduce the slight amount of hard scale-forming material which finds its way into the boiler. Although Detroit water is not a bad boiler water, these precautions are necessary because of the large percentage of make-up water and the rather high rates of steaming at which the boilers are sometimes driven.

The auxiliaries are almost entirely motor driven. The current is supplied by a 750-kw. turbo-generator unit exhausting into an open feedwater heater. The load carried on this generator is adjusted according to the requirements for exhaust steam for heating the feedwater and any excess current generated is delivered to the outside electric-distribution system. Conversely, if the electricity requirements of the plant exceed the output of the generator, current is drawn from the outside supply. Exhaust steam is thus made available for heating the feedwater and the advantages of motor-driven auxiliaries are also secured. Moreover the turbo-generator constitutes a source of electricity supply for the plant in case of local interruption of the outside service.

Steam is generated at a pressure of 130 lb. gauge. This pressure is chosen in order to provide for considerable pressure drops in the outgoing feeders as calculated for present conditions. It may be raised to 160 lb. at some future date. The outgoing steam lines leave the plant through a tunnel shaft.

Feeders

Because of the great increase in connected load the transmission capacity of the distribution network, most of which was installed several years ago, is now quite inadequate. To have raised the pressure throughout the system would have increased its capacity; but the system pressure was permanently limited by the fact that most of the underground fittings are of a low-pressure pattern, and temporarily by the fact that in those sections of the system formerly supplied with exhaust steam the customers' installations are not provided with reducing valves Instead of attempting to change these conditions, which would have involved the reconstruction of much of the distribution network, the less expensive plan was adopted of running feeders from the plants to various centres of distribution. In selecting the pipe sizes for feeders, advantage is taken of the difference between boiler pressure and distribution pressure, and the size of the pipe is so chosen that at times of maximum load much or even all of this pressure drop will take place in the pipe itself. The diameter and the cost of the pipe line are thus materially reduced. In operation, the pressure of the steam de-

livered to the feeder is raised or lowered as required by the adjustment of a reducing valve at the plant, in order to maintain a constant pressure at the centre of distribution which the feeder supplies. The pressure existing at this centre of distribution is recorded at the plant by a long-distance gauge, electrically operated.

The velocity of the steam flow in the feeders at times of heavy load is very high. Velocities as great as 75,000 ft. per min. have been measured. This high velocity does not appear to be at all objectionable, however, there being no apparent erosion of the pipe and no hammer, or objectionable vibration. The fact that the steam is in a superheated state because of the pressure drop is an advantage in these respects. Feeders are constructed with long radius bends and where the connection is made to the distribution mains the diameter of the pipe is gradually increased by special taper fittings so as to reconvert a portion of the velocity head to static pressure.

A considerable pressure gradient is also allowed to take place in the distribution mains as well as in the feeders; but this is relatively small, since the upper limit is fixed by the allowable working pressure of the older mains. The more recently laid mains are capable of withstanding a working pressure of 125 lb. and the gradient in the mains can therefore be increased at some future date. From a standpoint of safety, however, the desirability of carrying pressures in excess of about 50 lb. on the service connections to buildings is questionable until further development in pressure-reducing apparatus is made.

This method of steam distribution is obviously an adaptation to previously existing conditions and would doubtless be modified if an entirely new system were being laid out.

Underground Construction

The distribution mains range in size from 20 in. near the stations to 4 in. at the outskirts of the system. The original underground pipes were laid in a segimental wood casing bound with wire. This construction has been fairly successful under favorable soil conditions, but the concrete conduit shown in Fig. 3 has been found to be superior in many respects and has been used exclusively for several years in all new construction. In this construction the pipe is insulated with a standard thickness of pipe covering and surrounded with an envelope of concrete poured over a wooden form, leaving an air space around the pipe. Proper underdrainage is of course essential.

The longitudinal expansion and contraction of the pipe, due to changes in its temperature, are absorbed, in the earlier construction, by means of expansion fittings of the copper-diaphragm type. In recent construction a slip joint, consisting of a brass sleeve, sliding in a packed gland, has been used. The use of slip joints decreases somewhat the cost of the pipe line as they will absorb more travel and can be placed at wider intervals than the diaphragm fitting.

The underground mains have not been laid sufficiently long to permit of an accurate estimate of their life. The oldest lines laid in wood casing have now been in service 15 years and, while the casing in many places has deteriorated considerably, in other places it is in fairly good condition. The concrete construction, dating back 10 years. seems to have deteriorated very little. The only repairs or replacements which have been made to date have been made necessary by external corrosion or pipe arising from some outside and local cause such as a water-pipe leak. An average life of 20 years for the wood log construction and 30 years for the concrete construction would seem to be a very conservative estimate. Soil conditions in that part of the city where the heating mains are laid are particularly favorable, the soil being very well drained. Manholes are located at intervals of about one city block (300 to 400 ft.), to house the slip joints, valves and bleeder traps.

In the heart of the business district the pipes are in tunnels, of which there are about 2 miles, lying from 25 to 40 ft. below the street level. In cross-section they are similar to a horseshoe and are built of brick, with concrete floors. (Fig. 4). For the most part they are about 6 ft. in heiht and 6 ft. wide. The tunnels are ventilated by suction fans which draw a small amount of air through them continuously and much larger amounts when it becomes necessary for men to work in them. Their temperature ranges between 90 and 130 deg. Fahr. When two or more pipes are to be laid under a street in a congested district it has proved desirable to build a tunnel to avoid the inconvenience to the public attendant upon tearing up the street, either for the original construction work or for subsequent changes. The tunnel permits of ready access to the pipes at any time, and since it is far below any other structures, no obstructions are met with. Tunnel construction is exceptionally simple in Detroit where the subsoil is a blue clay nearly impervious to water and well adapted to tunneling operations. The cost of tunnel construction is high, but the advantages gained are compensatory.

Distribution Losses

Distribution losses from various sources are considerable. Heat losses from the mains are the principal item. This loss can be controlled within limits in designing the system of the application of the proper amount of insulation, so as to produce the most economical relation between heat loss and investment costs. Besides the condensation losses in the mains and service connections, there are losses due to the leakage of steam from consumers' piping and air valves, and loss due to the escape of unmetered condensation, and the slip of meters. About 80 per cent. of the steam delivered by the plants is metered as condensation in the consumers' buildings. This figure compares favorably, considering the nature of the business, with the efficiency of electrical distribution. In 1918, for example, the ratio between the electrical plant output and the consumers' meter readings for the Detroit district was 83 per cent., the large items of loss being transmission, transformation and conversion.

The condensation from the buildings

What Others in the Trade Are Doing

How Plumbers All Over the Dominion Are Keeping Their Names Before the Public —There May be Many Hints in Some of These Advertisements Which You Can Use With Good Results When You Are Arranging Your Own Copy

A. E. LAW, **Leamington, Ont.**, in a single column advertisement, illustrated at the top by an illustration of a gas water heater, says: "Hot water in summer is essential to good health, comfort and sanitary cleanliness. It's easy to have, costs little, and takes but a few minutes if you have one of our gas heaters. They consume but a small amount of gas, are clean, economical and in every way satisfactory. ASK US FOR PRICES.

P. Atkinson, **Preston, Ont.**, in a single column ad three inches deep, says: "Plumbing, steam and hot water heating. First-class workmanship guaranteed. Estimates given. Jobbing promptly attended to. Phone 19."

D. J. Shea, **Fredericton, N.B.**, in a double column ad. 2½ inches deep shows an illustration of a heater and in display type says: "A wickless kerosene heater, just the same in its heating principle as the gas water heaters, except that the gas is generated from kerosene. Steady, even, powerful blue flame, no wick, no odor, no dirt. Call and examine them."

Adam Clark, Halifax, N.S., in his advertisement, says: "Now is the proper time to have inspection and contemplate alterations made to your HEATING AND PLUMBING. Do not leave it until the fall when the rush is on. Heating, plumbing, ventilation, sprinkler systems."

Victoria Plumbing Co., Ltd., Victoria, B.C., in a neat two-column ad. with a border all round, says in display type: "WE DO NOT CHARGE FOR ESTIMATING. Try us on your next job. Materials and workmanship guaranteed. Phones: 3402, night, 1450L."

Theal Bros. & Moxley, Grimsby, Ont., in a single column advertisement, all in display type, announce that: "POOR PLUMBING MEANS WASTED MONEY, WASTED TIME, WASTED HEALTH. WE SAVE YOU THESE. PHONE 21."

Weldon Carter, Summerland, B.C., in a two-column announcement two and a half inches deep, says: "Weldon Carter, plumber and heating engineer, with a larger stock of supplies and material and more help, I am now in a much better position than ever before to attend to your orders for plumbing, heating, etc."

I. N. Watson, **Creemore, Ont.**, in a single column ad. 2½ inches deep says in display type: "Plumbing, tinsmithing and repairing. Pipe fitting of all kinds done. Furnace work a specialty. Give us a call. Phone 92."

Mainer & Bartindale, Orillia, Ont., in an advertisement five inches square illustrated with a bath into which the water is seen pouring through open faucets, and under the heading in large type "PLUMBING" says: "We supply quality goods and instal them in the best manner, and our prices are right. Get our prices on WIRING. We have a first-class electrician to look after your needs. Remember, we sell fixtures, lamps, bulbs, etc. FURNACES—Look to us to clean and repair your furnace now. It ruins your furnace to leave it in a dirty state all summer and rots and rusts it out. We also look after the repairing of your roofs, eavetroughs, etc. Call us at Phone 124."

Pitt Bros., Regina, Saskatchewan, in an ad. five inches deep and six inches wide show an illustration of a hot water boiler with pipes, etc. Under the heading, in display type, "MR. BUILDER, MR. FARMER," they say: "If you are intending to instal a hot water or steam plant, also plumbing in your building, in the city or country, call, phone or write and we will gladly submit you an estimate free of charge. A few of the numerous plants installed in the country (here follows a list of fourteen names and addresses). Plumbing installed in the country under Government supervision. ALL WORK GUARANTEED. Phone 5012."

Simmons Bros., Kingston, Ont., under the heading in display type, "TO INSURE GOOD PLUMBING" in a double-column advertisement, three inches deep show an illustration of a workman installing a bath and say: "To insure good plumbing get a good plumber. If you procure fine fixtures, then have them installed by slipshod plumbers, you are only half right. All plumbers are not good mechanics even though they claim to be. But if you come to us we assure you good fixtures, good workmen and the right price."

Adair, The Plumber, Kincardine, Ont., in a two-column announcement five inches deep says: "Adair, the plumber, is now settled in his new and up-to-date quarters in E. Miller's old stand, south of the Morgan House, and invites the public to call and inspect the well-assorted stock of plumbing supplies he has in stock. NO ONE CAN AFFORD TO FUMBLE WITH PLUMBERS. That's logical. That's why we are always on the lookout to protect our customers' interests in the way of acquiring good workmanship and materials. We aspire to give our customers the two greatest factors above mentioned, coupled with our always ready, six-days-a-week service. We aim to please. Are you going to rod your barn or house, Mr. Farmer? If so let us demonstrate to you the superior qualities of ——— lightning rods. Repairing of all kinds solicited. ESTIMATES FURNISHED on plumbing, heating, eavetroughing and everything in the tinsmithing line."

Union Plumbing and Heating, Estevan, Saskatchewan, in a double-column ad. five inches deep says in display: "Plumbing, heating, tinsmithing. Specialty in repair work. We are in a position to quote to the farmers and trade, the lowest prices on plumbing and tinsmithing. Estimates free. District agents for ——— furnaces."

Selkirk Bros., Montreal, make the following announcement: "PLUMBING—prompt and economic service; stoves repaired quickly, furnaces inspected. Contract work solicited. Phone St. Louis 350."

Frank & Shuett, Guelph, Ont., in a double-column advertisement 1½ inches deep say: "EXPERT PLUMBING AND TIN SHOP. When requiring plumbing, heating and tinsmithing, furnaces cleaned, repaired and installed; repairs to stoves, pipes, and all classes of tinware: felt, gravel and iron roofing; eavetroughing and metallic roofing—call in or phone 362."

A. J. Wise Heating and Plumbing Co., Toronto, say in their advertisement: "BEWARE. Don't wait for cold weather to have your heating system overhauled. Consult our experts. Just call H610. No job too distant. No service too great."

A. L. McKay, Semans, Saskatchewan, in a double-column advertisement with black border all around says: "SANITARY PLUMBING, STEAM AND HOT WATER HEATING. We are always pleased to advise you or give you an estimation on the cost of any system you are thinking of installing. For information see J. Dutton, or phone or write A. L. McKay, Plumbing and Heating Engineer."

EDITORIAL COMMENT

THE GET-TOGETHER SPIRIT

EVIDENCES of a better relationship between employer and employee are not lacking in spite of the many strikes which have been called and that threaten. This is shown in welfare schemes and insurance plans being instituted by many firms for the benefit of their employees. But it is not solely for the benefit of employees, as these employers have realized. They appreciate that a satisfied employee is an asset and are taking steps which will encourage an employee to stay with them and develop their abilities in the interests of the employer. This means the development of experienced help by which production can be increased. Greater production is the crying need of the day to bring about a readjustment from the present high scale of living. The growth of these get-together schemes is an omen for good; let us lend them every encouragement.

THE HIGH COST OF STRIKING

JUST how many strikes are on and are threatened throughout the world to-day it is impossible to say, but it is certain that at no time in history have strikes been so common or so widespread. It is impossible to pick up a daily paper now without finding the word "strike" figuring prominently in the headlines. One of the chief causes of the walkouts is usually given as the high cost of living. Not very much is said though about the high cost of striking. Every time a man strikes and every man who strikes increases the cost of living. He may get a few dollars a week more in wages, but this simply means that the cost of whatever product he is making advances and his fellow workers have to pay it. Then they strike and get more wages, and the man who first went out has to pay more for the commodities his fellow men are making. This sort of thing has been going on so continuously that everyone is affected by the high costs. This has been added to not only by higher wages, but by shorter hours and limited production. Prices cannot come down until there is a surplus of goods. What is needed is more production, not less. If by some miracle production could be brought up to the point where the world's needs could be supplied prices would quickly readjust themselves. One of the regrettable things about most of the strikes is that they never would have happened if both sides had got together and talked things over and understood the other's difficulties and tried to allow for them. Figures which are available for the recent strike of the miners in Yorkshire, England, show that in damages to the mines, coal lost to industry and losses to other industries, the total was $37,500,000. The miners' strike fund, which amounted to $1,400,000, and had taken them 25 years to accumulate, was completely exhausted. And all because there was a misunderstanding over a few clauses in an agreement and neither side would get together and talk things over. It is obvious that this sort of thing is ruinous in its results and is bad for trade, bad for the people directly concerned and bad for the nation.

WE CAN'T AFFORD THIS

CANADA'S fire waste in spite of our enormous resources is suicidal, and if continued means only one thing, an enormous and unnecessary drain upon every man, woman and child in the country. Because it does not appeal to them personally, the great majority of people fail to realize that they suffer every time there is a fire loss. The whole country is just that much poorer every time property is destroyed. It can never be replaced. The insurance companies may pay for it but they cannot bring it back and the great mass of people provide the insurance companies with the money. Every merchant who carries insurance provides for it in his overhead and the consumer pays. Last year Canada's fire losses were almost $34,000,000. This year it is not expected they will be quite so large. One of the reasons for the reduction is the attention that is now being given to the problem of checking fires. Every hardware man in the country can do his share in this good work and it is to his interests to do it. There are many ways of helping and as soon as everyone realizes what a criminal waste is taking place and does his share in stopping it, just so soon will Canada's fire loss cease to be the largest per capita fire loss in the world.

EDITORIAL BRIEFS

BETWEEN 1901 and 1919, Canadian workers lost over 14,000,000 days through strikes. Even at $3.00 per day this represents over $42,000,000 in wages, not to count the loss in production, interest on capital involved, etc. Strikes are, therefore, a factor in the high cost of living which should not be overlooked.

Saving Fuel in Heating a House

By L. P. BRECKENRIDGE and S. B. FLAGG

THE total output of coal in the world during the calendar year 1913, according to a Government report, was 1,443,393,052 short tons and of this enormous amount 39.5 per cent., or 570,048,125 tons, was mined in the United States. Probably 10 to 15 per cent. of the coal produced in this country went to purchasers who used it largely for heating dwellings. The Federal Government uses a large quantity of coal for heating the many small buildings occupied by its various departments and bureaus, and is therefore directly interested not only in selecting proper fuels, but in obtaining the best possible results from their consumption. Because of this interest on its own account and the widespread interest of householders the Government some years ago conducted tests to determine the relative value, for use in residence-heating boilers, of several typical fuels.†

The value a householder gets from the fuel he burns depends largely on the character of the heating apparatus, the conditions under which it is installed, and the manner in which the fire is handled. The authors, from experience in firing residence-heating apparatus and from observing the methods employed by many who attend to such apparatus, keenly appreciate the importance of proper firing methods, and have written this paper in the belief that some general remarks on the selection, care and operation of residence-heating apparatus may prove of value to many who are interested in burning fuel in the most economical manner.

This is the third instalment of the fourth of the series of Engineering Bulletins issued by the United States Fuel Administration in collaboration with the Bureau of Mines, Department of the Interior. This series is receiving very favorable comment. In this concluding instalment on "Saving Fuel in Heating a House," "General Suggestions on the Firing of Coal, etc., are dealt with. This fourth article covers the saving of fuel in house heating thoroughly and should appeal to every heating engineer. This is the last instalment. Keep them all for reference.—EDITOR'S NOTE.

General Suggestions on the Firing of Different Fuels

FUNDAMENTALLY, the process of combustion is the same for all fuels. Whether the fuel be wood, coal, or oil, heat is produced by the carbon or other combustible elements combining with the oxygen of the air. The oxygen and these combustible elements unite in certain proportions at certain temperatures and a definite quantity of heat is evolved in each case. Some of the heat is absorbed by other parts of the fuel, heating them to ignition temperature, and some of the heat is absorbed by the nitrogen in the air supplied—ordinary air contains about 80 per cent. nitrogen—and by the gaseous products of combustion, raising them to a high temperature. Part of the heat radiated from the glowing fuel or conveyed by the hot gases passes over the heating surfaces of the boiler or furnace, is taken up by the water or air heated, and is distributed to the rooms of the house.

The admission of more air through the fuel bed or fire door than is required to furnish the oxygen necessary for complete combustion tends to cool the fuel bed and the gases that rise from it. As oxygen unites with combustible elements in definite proportions, the theoretical amount of oxygen and hence of air needed for the complete combustion of a given weight of coal can be computed. However, in burning any kind of fuel on a grate, considerable heat is lost in unburned material if only the quantity of air theoretically required be admitted, because it is practically impossible to get all of the particles of combustible matter in the fuel to unite with all the particles of oxygen in the air theoretically required. An excess of air must always be supplied, but this excess should be neither more nor less than is necessary to insure complete combustion.

The importance of providing an inlet for the air that must enter the furnace room is frequently overlooked, especially in small, tightly-closed furnace rooms. Roughly, 150 to 300 cubic feet of air are required for each pound of coal burned, and, to prevent trouble from insufficient draft, some means for admitting this air to the furnace room must be provided. Usually enough air leaks into the furnace room through cracks and poorly fitting windows, but the tighter the construction of the room the greater the need of an air inlet.

The suggestions following have to do especially with preventing incomplete combustion and the admission of a large excess of air into the furnace, and the minimizing of the attention necessary to maintain the proper temperature in the rooms heated.

Regulation of Draft

Whatever fuel may be selected, convenience will be promoted by having the heater large enough to maintain for at least eight hours, without attention, proper room temperatures under any weather conditions, except the most severe. If a heater will not do this, it is too small or the draft is insufficient. Satisfactory regulation of the fire will be facilitated by a proper equipment of dampers, including (1) a hand damper in the smoke pipe; (2) a check damper, also in the smoke pipe, and (3) a damper (preferably a lift damper) in the ash pit. The ash-pit damper and ash door as well as the pit itself should be so made that the supply of air under the grates can be entirely cut off by closing the door and damper, otherwise proper control of the fire will be difficult if not impossible. This is a point often neglected. If bituminous coal is to be burned a lift damper in the firing door is advisable. Slight explosions of combustible gas sometimes occur in the furnace after fuel has been put on and unless the firing door is provided with a lift damper which can open and relieve the pressure, the door itself may be blown open.

Whether the fuel be hard or soft coal, coke, or wood, the stack damper should be kept partly closed at all times except in severe weather, unless the conditions as to size of boiler and draft are such that all the available draft is regularly needed. In most cases, with the stack damper partly closed, the proper regulation can be obtained by varying the positions of the check damper and the ash-pit damper. The fire door should not be used to check the fire except in emergencies, for the reason that the cold air admitted through the open door cools the fire pot at the same time that it checks the fire.

Firing and Cleaning Furnace

Other suggestions that apply regardless of the fuel used are: Attend to the fire regularly, do not wait until it has burned low and heat is needed throughout the house. Often the need can be anticipated and by attention at the proper time trouble can be avoided. In addition, economy of fuel is more likely to be obtained by fairly uniform rates of burning than by attempting to supply a large amount of heat in a short period and then suddenly checking the fire.

Let the size of the coal fired be as nearly uniform as possible. Using coal of uneven size prevents an even flow of air through the fuel bed and increases the tendency of the fire to burn through in spots.

Try to keep the fuel bed free from air holes, as they cause waste of fuel and may prevent the heater from maintaining the desired temperature.

Avoid excessive shaking of the grates and thus reduce the amount of coal lost by falling into the ash pit. Ordinarily, the shaking of the grates should be stopped as soon as bright particles begin to drop through or, under some conditions, as soon as light from the fuel bed begins to show in the ash pit.

When the demand for heat is urgent or the fire must be built up quickly, keep the fuel bed uniformly thick, but not too thick, using the coarser part of the coal and all the draft available. Air will then flow freely through the entire fuel bed and burn the coal at a maximum rate. Under such conditions the firings should be made at frequent intervals and small charges used, so that the fresh fuel will only for a short time chill the temperature of the fire pot. When heavy firings are made the fresh fuel not only increases the resistance to flow of air through the fuel bed, so that the rate of combustion is lowered, but it acts as a cold blanket to screen the heating surfaces from the radiant heat of the fuel bed.

In mild weather it is well to leave on the grates a layer of ashes under the active fuel bed. This layer will increase the resistance to the flow of air through the fuel bed and facilitate the maintenance of the low rate of combustion required in such weather; also, it will cut off some of the grate surface.

Clinkers should be kept worked out of the fuel bed, for they obstruct the flow of air through it, clog the grates, and may break the parts of shaking grates.

Keep heating surfaces, or flues as they are sometimes called if the heater be a boiler, swept clean so that they will readily absorb heat. Soot cuts down the heat-absorbing power of any heating surface very rapidly, and therefore should not be allowed to accumulate. Do not allow ashes to pile up under the grates in the ash pit, for they will seal off the air from part of the grate surface and may cause the grate bars to be burned and warped.

Ash in Different Coals

Purchase coal as free from slate and ash as possible. The inert, or non-combustible, matter not only has to be removed from the ash pit or the fire pot of the heater, but prevents to a certain degree the getting of proper results from the combustible matter burned. In a delivery of coal containing much non-combustible matter the purchaser will usually be able to detect pieces of slate or lumps of bony coal, which contain alternate bands of slate and coal. If the delivery contains an excessive amount of incombustible matter in small particles mixed with the fine coal, the evidence will be the large amount of refuse taken from the heater and the difficulty of maintaining desired temperatures in cold weather. Coals mined in different fields differ widely in the proportion of ash they contain and in the care with which they are prepared for market. Hence it is impossible to say, without a knowledge of the coal, what the proportion of refuse should be. For some typical coals, however, figures are given below to show the proportion of ash and the average and the maximum proportion of refuse to be expected.

Noncombustible matter in anthracite and bituminous coal.

Coal	Average proportion of ash in dry coal.	Refuse	
		Average	Should not exceed—
Pennsylvania anthracite—			
Egg	10	13	15
Stove	12	15	17
Chestnut	14	16	18
Pea	16	18	20
No. 1 and No. 2 buckwheat	18	21	23
Yard pea	15	17	19
Bituminous—			
Eastern	8 to 14	10 to 17	12 to 19
Indiana and Illinois	8 to 16	10 to 19	12 to 21
Southern Kansas	10 to 13	12 to 16	14 to 18

Conclusion

Ascertain by experiment what operating conditions produce the best results in your particular heater and adhere to them. It is impossible to give exact and detailed instructions for firing all heaters. Certain general principles have been pointed out, but the best method of applying these principles in a particular case can be determined only by experiment.

Insufficient draft is often responsible for failures of heating systems to meet requirements. The chimney or smoke pipe may be too small, or may be obstructed, or there may be leaky joints in the pipe.

Firing Anthracite

To get the best results in firing anthracite the following recommendations are made:

Keep the fuel bed thick so that it will not burn through in spots and admit a large excess of air.

If there is a bright bed of coals over the entire grate, as there should be before a heavy charge is fired, some of the burning coal should be pushed to one side or end of the grate—the part nearest the opening where the gases leave the fire pot—and the bed of live coals made thicker there. Then fire the fresh charge so as to make the bed of approximately uniform thickness and yet leave visible a bright spot of live coal to ignite the combustible gases coming off the freshly-fired fuel. In this way combustible gases from the coal will be burned gradually and will not accumulate in the fire pot and burn with an explosion.

If the fire is low, take care not to put it out by throwing on too much fresh fuel. Fire lightly, and allow each firing to become ignited before fresh coal is thrown on.

Relative Advantages of the Different Sizes

Use small sizes of coal if they are available and the draft is strong enough. There may now be less advantage than formerly in burning chestnut size coal instead of stove or egg size because the demand for chestnut has raised the price to practically that of stove or furnace coal. However, in many furnaces a less amount of the small sizes appears to give the same heating effect.

Fuel bills may be reduced by burning pea size, or, better, No. 1 buckwheat, if conditions permit. If the draft is not strong enough, or if the heater is so small that the coal must be burned rapidly, the small sizes may give clinker trouble or may not give heat enough. Under such conditions it may be necessary to burn the larger sizes of coal exclusively, or at least during the most severe weather.

Householders living where the small sizes of anthracite are used for steaming purposes and are generally available can profit most by burning them. In other localities, however, there will usually be a small supply of the fine coal resulting from the breakage of the larger sizes in handling. Some dealers screen out the dust and sell the best of this fine coal under the designation of "yard pea." The price at which it can be obtained will depend, of course, on the demand, but "yard pea" will always cost the householder less than stove, egg, or furnace size. A householder who buys anthracite that has been handled many times may find that the stove or egg size he ordered contains fine coal enough to increase the re-

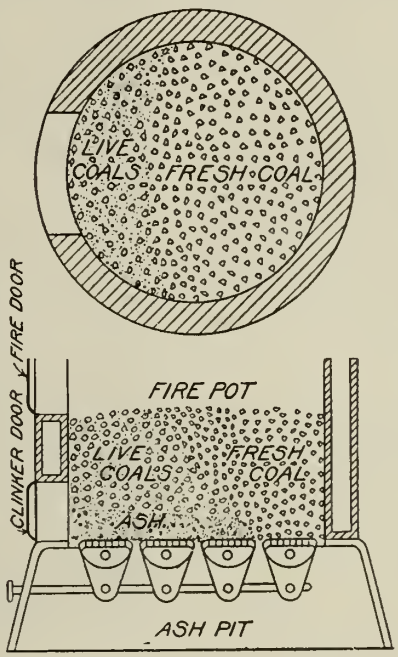
sistance of the fuel bed so much that the coal can not be burned fast enough to heat the house in severe weather. In such a case, it may be advisable to screen the coal with a rake or coal fork and reserve the fine coal for use in mild weather or for banking the fire.

Firing Bituminous Coal

The wide differences among bituminous coals make it impossible to give more than general suggestions for firing them. However, certain points of difference between the methods of firing these coals and anthracite may be pointed out.

Do not spread fresh fuel over the entire surface of the fire. Bituminous coal requires more air immediately after firing than does anthracite coal or coke, and covering the entire fire not only decreases the flow of air through the fuel bed, but also lowers the temperature in the fire pot enough to cause incomplete combustion of the volatile matter distilled from the coal, and consequently, a loss of heat up the chimney.

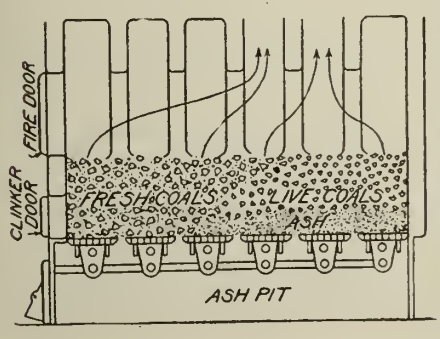
Use some coking method of firing; that is, work the partly burned coal, from which the gas has been driven, to one part of the fire and throw the fresh coal on the remaining portion. The fresh fuel then ignites slowly, the combustible gas is driven off gradually, and the live coals that are exposed on one part of the fire heat this gas and the air coming through the fuel bed so that more of the gas is burned before it leaves the fire pot. If, on the other hand, fresh coal is spread uniformly over the entire surface of the fire, much of the gas driven off is not ignited and escapes unburned. Figure 1 shows how this coking method may be used in firing a heater having a round fire pot, and figure 2 how it may be used for a rectangular fire pot.



Keep the flue surfaces clean and the cleaning doors tightly closed. The cleaning of the flues should be given regular and frequent attention or it is apt to be overlooked entirely.

Banking the Fire

When preparing the fire to last overnight, or for a similar length of time, push some of the burning coal aside and fire the fresh charge so as to leave a bright spot visible to ignite the distilled gases. The drafts should then be allowed to stand open for a short period, possibly half an hour, before they are closed for the night, so that part of the volatile matter or gases in the coal can be driven off before the air supply is greatly reduced. In adjusting the air supply for the night use the ash-pit damper or slide and the check damper in the smoke pipe.



If the ash pit is tight the firing door can and should be kept closed, or part of the heat of the fuel will be wasted in heating the cold air entering above the fire. The quantity of fuel that will be required, and the proper adjustment of the draft will vary, of course, with weather conditions, and will have to be learned by experience.

Firing Coke

Coke can not be burned in the same way as anthracite or as bituminous coal, but with proper handling can generally be used with satisfaction where anthracite can be. In order to have a coke fire last as long and develop as much heat, approximately as many pounds of coke must be fired as of anthracite. The volume of coke, however, will be much greater than that of anthracite, and usually the fire pot will have to be filled completely to hold the fire a considerable period. Coke makes a very porous fuel bed; hence the control of drafts is important. Ordinarily some ashes can be left on the grate and they will make draft control easier.

The proper regulation of draft must be learned by experience in any case, but some general instructions may be given. Before firing a fresh charge be sure that there is a fair bed of fuel remaining from the last firing and that it is thoroughly aglow. If necessary fire a small quantity and let it become well ignited before putting in the main charge. Let drafts stay on for a short time after the new charge is fired, then they may be checked. Coke of uniform size is desirable, and for small fire pots the coke should be about nut size, whereas for larger fire pots coke of stove or egg size may be satisfactorily used.

Firing Wood

Unfortunately most of the equipment for burning wood is poorly developed. The principal difficulty in successfully heating a house with wood is controlling the supply of air to the fire. A wood fire may be kept for a number of hours without attention if the air can be cut off, but the fire will last only a few hours at most unless the air supply is cut off effectively. The fuel bed of a wood fire offers much less resistance to the flow of air than that of a coal fire, so that a very slight difference in air pressure, or "draft," between the furnace room and the fire pot will force through the fuel bed enough air to keep up a good rate of combustion. Even with all draft doors and slides closed, it is difficult to keep a wood fire "banked" unless the coals are covered with ashes.

Owing to lack of space the "Tests and General Deductions" from the foregoing have had to be held over until the next, the October, issue.

Out of the war shortage of tin has come a new and successful substitute for babbitt as a bearing metal. It is composed almost wholly of lead, hardened by an electrical process. Its high manufacturing cost is more than compensated for by the low market price of lead compared with tin. The new metal shows a tensile strength of 13,000 lbs., the figure for genuine babbitt being 11,000; and an elastic limit of 11,525 lbs. as against 10,000 for babbitt. Its friction factor is very low. With a shaft running at 400 r.p.m. and a load of 1,000 lbs. per sq. in., 150° was the highest temperature reached by the bearing.

The Eiffel Tower, the tallest structure in the world, was erected by Alexander Eiffel, a French engineer, for the exposition of 1889 at Paris. It stands in the Champ de Mars, and is 984 feet high (429 feet higher than the Washington Monument). The base is a square of 112 yards, from each corner of which rise the four curving supports of interlaced iron-work. At a height of 590 feet these merge into a single shaft. There are three platforms at various heights, to which the ascent is made by elevators or staircases—1,927 steps in all. The total cost was over $1,000,000, of which the State contributed $300,000. In 1909 the Tower became the property of the City of Paris.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

Trade Notes

The proposal for installing water meters in the city of Lethbridge was defeated at the recent election. According to the Lethbridge "Herald": "The result is not surprising, as the proposal for installing meters, with its expenditure of $35,000, was not placed in that business-like fashion before the electors which such a business proposition demanded."

Contracts have been let for the erection of a comfort station in Moose Jaw, Sask. The contract for plumbing, amounting to $3,493, was awarded to the Moose Jaw Heating and Plumbing Co.

Specifications are to be drawn up and tenders called for immediately for the proposed lavatory on Danforth Ave., Toronto. The building is of brick, a single storey, and has a basement equipped with a boiler-room and coal bin. Six water closets are provided in each end, and twelve urinals have been installed in the western end. Hand basins and drinking fountains will be provided in each section.

General Hughes, after an inspection of Stoney Mountain penitentiary, near Winnipeg, stated that it was the poorest institution of its kind in the Dominion. It lacked modern equipment from the sanitary viewpoint and also from the viewpoint of cells. Work to correct these weaknesses had been commenced before the war, but had been discontinued by the Government during the war because of the large expense incurred. No sanitary conveniences were provided except a bucket, and lamps were used for lighting purposes.

The National Safety Council, with headquarters in Chicago, Ill., are planning a monster program for their eighth annual safety congress, which takes places in Cleveland, O., at the Statler Hotel, from October 1 to 4. This is a congress of men and women interested in accident prevention and the improvement of industrial relations.

Personals

W. H. Cunningham of Kasement Skrene Dore Co., Toronto, who has been spending a few weeks in England and Scotland, on business, returned last week on the Tunisian. Mr. Cunningham reports great difficulty in securing return passage. Many of his fellow passengers have been weeks trying to book.

Dr. M. M. Seymour, commissioner of public health for Saskatchewan, has been unanimously elected an honorary member of the Sanitary Inspectors' Association of Western Canada. Dr. Seymour has taken great interest in the work of the association since its inception and was an invited guest at the recent annual convention in Saskatoon. His work in connection with the promotion of better sanitary conditions in the province is well known and his appointment as an honorary member is a tribute to the members of the association to this.

Theo. J. Lafreniere, sanitary engineer, Montreal, is one of the three members of the commission named by the plan of the governor-in-council at Quebec to serve on the Government housing scheme. Mr. Lafreniere is sanitary engineer of the superior board of health for Quebec province, and professor of sanitary engineering at Ecole Polytechnique, Montreal. He also served as an expert for the International Joint Commission.

ELECTED PRESIDENT CAN. GAS ASSOCIATION

V. S. McIntyre, superintendent of the Light Commission, Kitchener, Ont., was elected president of the Canadian Gas Association, which met in Niagara Falls recently.

The other officers are C. S. Bagg of the Montreal Light and Power Company, vice-president; George Wallar, of the Consumers Gas Co., Toronto, secretary.

The association decided to urge the Dominion Government to look into the matter of having the railway companies use less of the best gas coal in order to conserve the supply of the latter. It is claimed that the coal, while inferior for gas making purposes, is fully as satisfactory for generating steam in locomotives.

Among the matters which featured the meetings was an address by Arthur V White, of the Dominion Commission of Conservation. He spoke on the fuel problem of the future, pointing out that the time would ultimately come when the coal supply on the continent would become exhausted. The use of lignite was one of the means of conservation and alternatives mentioned.

WOLVERINE LTD., NOW IN TORONTO

The Canadian Wolverine Co., Ltd., whose headquartes have been in Chatham, Ont., have been succeeded by Wolverine Ltd., and the place of business of the new company has been moved to 12 Mercer Street, Toronto.

H. G. Waterman as president and E. T. Needham as vice-president and manager, will have direct charge of the interests of the company in its present form. The line handled by the company will be the same as that manufactured under the regular Wolverine interests, and it is stated every effort to take care of the requirements of the trade will be exerted. Mr. Needham recognizes his responsibilities to the trade whom he would serve, and states that they hope by fair dealing and prices to secure a constantly-growing following of regular customers.

SWISS TRADE MISSION TO VISIT MONTREAL

A number of the members of the Swiss mission now in the United States will visit Montreal in the near future, according to information secured this morning through the office of Consul General for Switzerland, Iseli. The Swiss consul is now in New York greeting his fellow countrymen and making arrangements for their coming to Canada. He is expected to return to the city in the next day or so.

This mission, numbering 217 members, arrived in New York early this week. A banquet was tendered them by the state and civic officials of that city. They are visiting this continent for the purpose of arranging for closer trade relations and investigating commercial conditions in this country.

The Canadian Government has issued an invitation to the mission to visit this country, but it is understood that owing to the brief time at their disposal they will be unable to come to Canada in a body. In view of this fact, however, a number of the most prominent members of the mission will come to Canada. They will visit Montreal some time in the month of October, but the exact date, though fixed, has not yet been announced.

The mission is composed of some of the most outstanding business men in Switzerland, economists and professional men. They will investigate American and Canadian life in all its phases and commercial and social conditions. It

is the consensus of opinion that this exchange of ideas and the grafting of the methods of the Western world into the life of a country such as Switzerland will bring about very satisfactory results. The details of the program of entertainment of the members of the mission when they arrive in Montreal have not yet been completed.

MARITIME BOARD OF TRADE TO MEET

To Hold Twenty-first Annual Meeting at Moncton, N.B.

The Maritime Board of Trade will hold its twenty-first annual meeting in Moncton, N.B., on September 17th and 18th. There will be some matters of vital importance to the Maritime Provinces as well as to other sections of Canada that will be brought up for discussion. The sessions will be held in the Moncton City Hall and will open at 9.30 a.m., September 17.

Among the list of subjects to be discussed will be the following:

1. Maritime Union:—By Amherst and Bathurst Boards.

2. Better transportation facilities:—By North Sydney Board.

3. Re-organization of the Military Forces of Canada:—By Charlottetown, P.E.I., Board.

4. Unit system of management of Canadian National Railways, with headquarters for Eastern unit in the Maritime Provinces:—By Moncton Board.

5. Closer relations between employer and employed:—By Amherst Board.

6. Development of national ports on the Atlantic Coast:—By Saint John and Saint Stephen Boards.

7.—Revision of railway freight rates that discriminate against the Lower Provinces:—By Bathurst Board.

8. Development of water powers in the Maritime Provinces:—By Saint Stephen Board.

9. Inquiry as to proportion of work of Geological Survey of Canada in the Maritime Provinces compared with the other provinces of the Dominion:—By Moncton Board.

10. Transportation—(a) Standardization throughout, of the P.E.I. division of the Canadian National Railways at the earliest possible moment, (b) The securing of a car ferry steamer to supplement the present car ferry between Borden and Tormentine; (c) The placing of S.S. Northumberland, now idle in Charlottetown, on the Charlottetown-Pictou route; (d) Improvement of the passenger service between P.E.I. and mainland points:—By Charlottetown Board.

11. The advantage of a uniform system of weights, measures and money:—By Saint John, N.B., Board.

12. War memorials:—By Saint Stephen Board.

13. The decreasing representation of the Maritime Provinces in the Dominion House of Commons:—By Moncton, N.B., Board.

City of Chatham Considering Water Supply and Sewage Disposal Question

INVESTIGATION of the water supply and the question of sewage disposal is engaging the attention of the Water Commissioners of Chatham, Ont. The question of using the Sny River as the source of Chatham's municipal water, according to Chairman Harry Westman of the Water Commissioners, looks very much as though the scheme would be feasible.

It is impossible to state anything definite, he says, but the commissioners are very hopeful of presenting a proposition to the ratepayers which will convince them that it would be advisable to get water from the Sny.

"There is a very important feature to the proposition," stated Mr. Westman, "which has not been given much publicity, and which to my mind is a very great argument in favor of using Sny water, providing it will not cost to much to pipe it to Chatham.

For some time the health authorities have been after Chatham to construct a sewage disposal plant. They believe that it is not a proper thing to have the sewage dumped into the river, when the city's supply of water is secured from the Thames.

"This matter has been up several times, and those who have been studying city's problems are firmly of the opinion that it will only be a few short years before Chatham will be compelled to erect a sewage disposal plant at a cost of about a quarter of a million dollars. If the civic water supply is secured from the Sny, however, it will not be necessary to think of sewage disposal. This will mean a big saving of money for the city.

"This to my mind is one of the strongest reasons why we should get water from the Sny if anything like an attractive propostion can be figured out. This is the reason why we have instructed engineers to drop everything else for the time being and work on the Sny scheme. Until we know what it will cost we are not in a position to say anything definite. I have a very strong opinion, however, as a result of my own investigations, that the Sny scheme will be found to be the cheapest and best in the long run.

ASKING $50,000 DAMAGES

MacKay and Mahon of Woodstock, have issued a writ on behalf of Harley Barton, school teacher, against the Ingersoll Gas Company for the sum of $50,000 to cover injuries and disfigurements received by Barton through the alleged carelessness of the company. Barton was spending his holidays near his home in Ingersoll, in January, 1918, and while visiting the Ingersoll Gas Works, an explosion took place, killing the superintendent and severely injuring the plaintiff.

EXCHANGE NO FACTOR IN BASIS OF TARIFF

Ottawa.—The Customs Department has had many requests from importers that, in view of the fact that the British pound sterling has heavily declined, this should be taken into consideration when Canadian importers pay customs duties on imports from Great Britain. The practice is that they pay on the par value of $4.86. They believe that they should be given the benefit of current exchange.

The Customs Department points out that the practice is fixed. The matter of exchange is not taken into consideration as the value of the pound sterling is fixed by the Currency Act of Canada as compared with the dollar. Officials claim there is no injustice to the importer, as the goods he imports are worth at the rate of $4.86 2-3 in Great Britain, and under the customs law goods are valued at the time and place whence they are shipped direct to Canada. The importer gets sufficient advantage in the favorable rate of exchange.

The matter has been up for consideration several times. The practice is the same in the United States, the valuation for customs purposes there being $4.86 2-3, as here. The department has refused to entertain all requests to accept payment at the exchange rate.—T. M. F.

CATALOGUES and BOOKLETS

HOYT METAL CO.

A very interesting booklet has been issued by the Hoyt Metal Co., Toronto, covering one of their products. This is attractively gotten up, printed in two colors on coated stock and is pocket size, which makes booklet convenient to carry A full description of the product, its uses and the results of tests in actual use are given.

NEW COUNTER SIGN

The Wilt Twist Drill Company of Canada, Limited, Walkerville, Ont., have issued a very attractive counter sign. This sign, which is intended for distribution to the trade, can be used either as an easel or hung on the wall. Those who are selling Wilt products will find this a very attractive means of keeping the Wilt name before the buying public.

Heating and Ventilating

THE HEATING OF THEATRES

Twelfth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the twelfth of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on "The Heating of Theatres" a most illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the design for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The thirteenth article of the series will appear in the next issue.

THE problem of successfully heating a theatre is a direct problem of ventilation, and when an engineer attempts to design or instal a system of heating, without paying some attention to the requirements of ventilation, he is but inviting failure as a reward for his misguided efforts.

The proofs coming for experience is that no large assembly hall can be properly heated unless there is a constant movement of air throughout the entire volume of the room; and that the heating effect of the circulation of air is, beyond the shadow of a doubt, superior in every way to that where direct radiating surfaces are used alone. Now, this being the case, it is only reasonable that the engineer should look into every contributing cause of advantage, or disadvantage, in using particular types of ventilating apparatus for the installation projected.

Before the engineer can decide on the system that should be used, he must ascertain the class of entertainment for which the building is intended; whether it is to be used only as an auditorium for concert purposes, or as a picture play house, a vaudeville theatre or one where the drama is presented at intervals. This is necessary because each of these buildings have requirements peculiar to its type. For instance, the ventilating of a moving picture house is of an importance that takes precedence to the heating. The reason for this will be given further on in this article. On the other hand, the requirements of the concert hall and legitimate theatre are such that, whilst the installation of the ventilating system is an important item, the provision of a very flexible system of heating is necessary on account of the varying circumstances common in a building that is only used at intervals. This will also be dealt with further on in this article.

First, we will take up the problems especially belonging to the systems for moving picture houses; and before going very far into this we must make a survey of the class of buildings used for this purpose.

Moving picture houses range from the transformed store, where a few hundred dollars represent the investment, to the sumptuous auditoriums that have cost nearly half a million dollars to erect; but the problem of heating is of the same kind for every stage of development, and differs only in a degree for difficulty of solution.

Those who seek entertainment in the transformed store theatre require that they be supplied with pure air just as much as those who go to the larger and more expensive palaces. They require just as comfortable a temperature as if they were sitting in a building where the grand pipe organ adds interest to the screen. Fortunately the transformed store is usually of such a limited seating capacity that systems of heating and ventilating for such may be obtained at a comparatively low price, so that there is hardly an excuse, in the plea of poverty, for the omission of an adequate heating and ventilating plant from this kind of a building, however small it may be.

The transformed store is generally a rectangular room, with the box office and entry crossing the entire front. There is usually an intercepting wall placed at the rear of the entry so that a direct draft traveling through the opened doors and down the aisle will not cause discomfort to the patron who might be in the path of this current of air. In some buildings of this class the greater proportion of the radiation required for the heating of the building is set in the passage between the intercepting wall and the entries. The excess heat developed at this location is carried in the air that is drawn through the theatre by the suction of an exhaust fan at the end of the room farthest from the entry. There have been cases where the radiation installed in the usual way, along the side walls, has not been sufficient to heat the building and when afterwards the same area of surfaces were placed in the entry, as described, no further complaints were registered regarding lack of heat. However, a system of heating and ventilation of this make-shift arrangement is likely to be subject to noticeable drafts. Mention has been made of it here only to illustrate how the effectiveness of seemingly insufficient radiating surfaces may be increased by the provision of a fan, even when there must be added to the usual heat loss the loss that comes from the higher standard of ventilation obtained by the use of the fan.

Moving picture showhouses are, as a rule, occupied by spectators from the early part of the afternoon until well on to midnight, and the heating effect of the occupants of such a building is often great enough to raise the temperature of the building away beyond the point of comfort. Therefore, it would seem that the provision of an exhaust fan is of greater importance than that of a heating system, or of the installation of any air warming apparatus. Now, if the building were filled with spectators

through every hour of the day and night, we might get along very well—at least in the climate of Toronto—with no heating system at all; but when we pause to consider that the people coming into the theatre during the opening hours are not enough in numbers to appreciably affect the temperature of the building, we understand why we must provide a system that will heat the building in the absence of a filled house. Then there is another thing to consider, and that is the matter of providing air to take the place of the air exhausted from the building by way of the ventilating system. If we allow air to enter the room through accidental leakage, we may find that an open door or window is allowing more air to come in at one location than may be desirable. The people sitting close to that opening will find out before very long that the building is ventilated in a way that does not seem to be quite right. So we must provide enough openings to allow fresh air to enter the building without causing drafts. It will not do to have that air entering at a temperature out of proportion to the temperature requirements of the room; the incoming air must be conditioned by the raising of its temperature in the cold weather and by the cooling of its temperature during the summer.

The greatest problem of the ventilating of the moving picture house is that of keeping it cool enough during the summer when the seats are filled. This difficulty may be overcome by the installation of an air cooling system, and when so met, the cold fresh air, in our opinion, must not be driven into the auditorium under the seats. There is a reason for this that should be obvious to those who have even a slight knowledge of physiology. Of course, this only applies to conditions where the air is driven in at a temperature of from fifteen to twenty degrees lower than the surrounding atmosphere. In such a case it would be well where the "mushroom system" is used to make arrangements for the exhaust of air through these heads, and to provide some other way of admitting the air to the room. The mushroom system of air distribution is of so much value in providing an equable distribution of air that ordinarily, where it is used, with an adequate fresh dry air supply, and powerful exhausts in the ceiling, the installation of a cooling system is not required.

From what we have already written, it should be evident to the reader that upward extraction of foul air is desirable in moving picture theatres where no air cooling apparatus is installed; and a downward system of foul air extraction where air cooling apparatus is a part of the equipment.

The intervals of time when a moving picture theatre is unoccupied by spectators are, as a rule, so short in their duration that it is not advisable to allow the building to be without heat at these times. The best way to provide heat for such a circumstance is by means of direct radiators, set where most convenient and effective. When the building is occupied these radiators, unless fitted with thermostatic regulating valves, should be fed from a main, fitted with a valve that may be used for cutting off the heat supply of these radiators when the building is filled with spectators.

It will also be necessary to provide direct radiators for all offices, cloak rooms, passages, and such other rooms as lavatories, etc. There should be a generous supply of radiating surfaces at the entrances; in fact, many small theatres, as we have already stated, are almost entirely heated by the radiators set in these very exposed locations.

Care must be used in seeing that every cloak room is provided with an individual exhaust fan of a suitable size, or that its vent is connected to the main exhaust fan in a manner that will assure the proper ventilation of these rooms at all times. This note seems to be quite necessary in view of the fact that scores of theatres are notorious for their stuffy dressing rooms. The ventilating system of the lavatories should not be connected in any way with that of the balance of building; and each should have their individual exhaust fan.

The machine booth should have a separate exhaust fan, that may be turned on or off at will of the operator of the machine. There should also be a fresh air inlet for this room connecting to the outer air; otherwise the suction of the exhaust fan may cause enough air to enter the booth by way of the opening in front of the machine to fog the lens of the projector.

There is one other part of the building that must be ventilated, and that is the loft between the ceiling and the roof. This space must not be ventilated by any part of the system for ventilating the auditorium. The openings that are in the ceiling of the auditorium must be connected to the exhaust fan by independent ducts and under no circumstance must air from the auditorium be allowed to escape into the loft. The reason for this is that the air in the auditorium is heavily charged with moisture and when it comes in contact with the cold roof this moisture condenses and drops down on the ceiling below, where it may loosen the plaster. The loft should be ventilated by the provision of air inlets just above the ceiling joists and air exhausts placed at intervals in the roof. These will not only prevent moisture gathering on the underside of the roof during the winter, but will also assist in keeping the building cool in the summer.

The detail of providing ventilation for the roof space is one that the heating engineer might think should be included in the duties of the architect. It might be so, but, nevertheless, the heating engineer should look to it that this detail is to be attended to by someone, because there is the possibility of the architect neglecting it.

The subject of fresh air intakes from out of doors has already been covered in some of the articles on school ventilating systems appearing in the SANITARY ENGINEER, so we will not go over this ground again, other than to repeat that the intake should be set high enough above the grade line to escape the danger of allowing dust from the roadway to enter the fan room. The intake should be set remote from smoke stocks, etc., and it should be provided with a heavy wire screen and throttling dampers.

Where there is danger of dust entering the intake an air washer should be provided. Large cheesecloth screens are, at times, substituted for the air washer. They are made in this way: Cheesecloth is stretched on small sash backed with chicken netting, to prevent bagging of the cloth, and the sash are set in a rabeted frame. Sufficient area must be provided to allow air to pass through the screens at a velocity of not more than one hundred feet a minute. The writer has not found these screens satisfactory because of the difficulty in having them properly cleaned, at the intervals required, by the person operating the ventilating system.

We will now turn to a consideration of systems for public assembly halls other than the moving picture house.

Our example will be a play-house that caters to the lovers of the spoken drama, and where the house is occupied by an audience for only about four hours of the day. Now, no one likes to see coal wasted in keeping a building warm when no one is enjoying the heat. If we should instal direct radiation in such an auditorium and allow our building to grow cold during the day, we might find that we could not get it warm again in time for the evening's entertainment. Some men will insist that no coal is saved by allowing a building to get cold during the winter, and that the heat should be kept on all of the time. Perhaps they are right, but there is no question but that the man buying the coal thinks always that they are wrong. So here is the problem: To provide a heating system that will respond to the sudden demand for heat, and that will also provide a flexibility of control that permits a properly graduated lowering of the temperature when the building becomes too warm as the evening advances. We believe that this problem is best answered in the installation of a properly designed and operated forced blast heating and ventilating system. What is a blast system? The name might lead one into the thinking that it was a system where the air came in at a blast similar to that of a typhoon or of a blizzard. But this is not so. The fresh air from a properly designed blast system enters the room so slowly and escapes, when visited, so silently after properly performing its duties that the

Ventilating the Modern School

Eleventh Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

BEFORE a man long practises a trade, a business, or a profession, he will find that a lack of business sense will prevent his advancement much more than any lack of knowledge regarding the details of the commodities which he sells. Lacking knowledge of the details his business sense will prompt him to study details, but lacking business sense his knowledge of details will not prompt him to study business.

It is the purpose of this article to draw the reader's attention to the necessity of carefully examining the plans and specifications that may be presented to him when a School Board asks for tenders for the heating and ventilating system for one of their buildings. He should carefully examine the specifications to see how the guarantee clause reads, so that he will not be called upon to stand the brunt of the error of someone else.

These guarantee clauses are put in specifications assumedly for the purpose of protecting the School Board from the actions of incompetent or dishonest persons. We say assumedly for the reason that the phrasing of many of these guarantees is often that the men responsible for the designs wish to throw the responsibility on to the shoulders of the fitter.

There are a great many men in the world who consider it the finest kind of business to get service for nothing from some source and sell it at a higher figure to someone else. These men are often employed as experts in the rendering of advice to School Boards, and, frequently, they are kept so busy in running after work of that kind that little of their time can be spent in study. "Huh!" they grunt, "what's the use of studying? You can buy brains." Because they never study they are not in a position to value the merits of any professional man's advice; so they look around for advice where they think it may be got for nothing. "Now," they say, "we don't want nothing in them specifications that's agonto cause us trouble, so you had better put in the guarantee clause, making the steamfitter do the work according to our directions, but on his own responsibility." If such a man had to guarantee the efficiency of the plant himself he would soon be out of business. The Province of Ontario has its fair share of these men. They do not even understand the terms of the heating specifications, but, nevertheless, get paid by many School Boards for the service rendered by an engineer employed by the company whose goods are mentioned in a "closed" specification.

The engineers employed by such firms are, as a rule, quite competent, but their hands are tied by the condition of making the specification fit one class of materials only. Personally, I believe that the employment of such engineering service is quite justified when the men supplying that service assume the direct responsibility of the guarantee, and whose representatives inspect the work without the interference of, and the payment to some third person whose only qualification for the work is a list of schools where he was paid for the same ornamental appearance.

When specialty systems are desired by the owners of a building, the men supplying these specialties should be the men making a guarantee for their efficiency. But it does not seem fair that these men should also be called upon to guarantee the boiler unless they specify it. The piping system should be guaranteed by the man who designs it. When the fitter gets a guarantee from the people supplying the boiler, that the boiler will do all the work that is specified for it, and a guarantee from every manufacturer of the materials specified; and a guarantee from the engineer who is responsible for his design, he may then, and not until then, with safety assume the responsibility of the general guarantee.

When getting a guarantee from any firm that is not well established or that is not willing to furnish a bond to back up their guarantees, it is well to look for "jokers" in their wordy epistles.

Some of the catch phrases in such a so-called guarantee would never allow their maker to escape censure in a court of law, but the presence of such phrases in a guarantee makes their writer, in his ignorant confidence, believe that he is safe in any lying promise that he may deem convenient.

Guarantees are often called for by men who are not quite satisfied that the system they specify will do the work demanded, and when some shrewd fitter suggests that it is impossible to guarantee the work as laid out, these men allow the fitter to substitute other work or materials than that on which the tenders for the work were based.

One time an architect employed a man who had spent a number of years in a heating contractor's office. This young fellow had spent his time with the tools and was a qualified mechanic, as well as being a degree man of a technical school. Specifications were drawn up for the heating of an office building, and the guarantee clause read something like this: "The contractor is to check over the plans and specifications, and before commencing work is to notify the architect of any discrepancy that may appear. He is to guarantee that his work and material will be of the quality specified, and under no consideration is he to do work differing from that shown or specified without consulting the architect and securing his written consent for such changes." The owner of the building did not employ the architect to inspect the work, but decided to attempt this himself. The contract for the installation of a steam heating system was let to two careful and conscientious men, who, not being blessed with much capital, had recently acquired a partner with a few thousand dollars and no sense. This lippy individual ran over the specifications and noticed the side heading of the guarantee clause. Immediately he jumped to the conclusion that the fitter was called upon to guarantee the work, so, without consulting anyone, made just such changes as he believed would save a few dollars. When the time came for the receipt of final payment, the owner of the building refused to accept the plant without a guarantee covering its efficiency. On going through the original specifications the heating contractors discovered that they were not required by the terms of that contract document to provide such a guarantee. They were advised that if they had followed the plans they could not be compelled to give a guarantee regarding the plant's efficiency, but, as they had taken the responsibility of deviating from the plans they could not expect to receive final payment from the owner of the building until they furnished the guarantee.

In another case a contractor from a large city undertook the work of installing a heating plant in a country school. The plant specified was guaranteed by the manufacturers of the specialties specified and the agreement between the board and the manufacturers was to supply the inspection necessary for the proper installation of their system of heating. The manufacturers neglected to send a competent man to inspect the work during the time of installation. When the work was practically complete the engineer responsible for the design paid a belated visit to the premises and then discovered that the foreman steamfitter, with wonderous zeal and egotism, had decided that it was part of his duties to revise the manufacturer's plans. This is another case of where misplaced zeal took dollars out of the profits—dollars that had to be spent in changing the work before the manufacturers would give the School Board a guarantee.

Perhaps, in both of the cases mentioned, the men who were responsible for making the changes were quite competent to lay out and to do the work, but they certainly possessed little business sense or they might have understood the difficulties they were inviting.

When heating and ventilating plants are designed by competent men, there is not, as often now as in the past, a clause in the specification demanding that the contractor guarantee more than work or material. When a board employs an inspector to pass on the work and material as it is being installed, and furn-

ishes the contractor with specifications that describe methods of doing the work, the contractor should not be asked to furnish a guarantee for the efficiency of the plant. Only when the contractor is responsible for the plans and specifications should he be called upon to make a guarantee. If the board employs an architect or a consulting engineer to lay out the heating system, it should secure a guarantee from the persons responsible for the design and not expect the contractor to check the figures of a man whose fees are generally as great as the net profits of the contractor.

Before entering into the contract to instal any kind of a heating or ventilating system, the contractor should come to a thorough understanding with the School Board regarding guarantee and payments, as otherwise a good deal of misunderstanding is sure to occur before a final settlement is made.

THE HEATING OF THEATRES

Continued from page 33

occupants of the room take no thought of the temperature of the building either when they enter to see the play or when they are leaving.

With a blast system the walls of the auditorium may be still cold from the effect of a prolonged absence of heat, but the atmosphere of the room, and the furniture contained therein will be warmed from the heat carried in by the air, so that no one in the room will have grounds for complaint, unless they wish to warm their cheeks on the walls.

In designing a blast system for a theatre building, we must first figure on the heat loss in the usual way and provide enough heating surfaces in the air warming radiators to offset this. Before the building is occupied there need be no exhaust of air from the auditorium and therefore there will be no demand made for an outdoor air supply. So all the air extracting ducts must be so arranged that the air within the auditorium can be returned to the air warming rads in the basement, and there reheated. For the purpose of heating the building the temperature of the air will range from 85 to 120 degrees above zero, depending on the weather and the speed of heating service required. After the building is occupied the damper should be thrown back from the outdoor air supply duct, and the vent to outdoors should be opened. The air then entering the auditorium will, of course, drop some in temperature, but in any case it should not be allowed to exceed a temperature of 80 degrees above zero while the building is occupied. If the proper amount of air for ventilation is supplied it is not likely to require a higher temperature than 65 to 75 degrees above zero. Automatic heat regulation must be supplied with a system of this kind.

The air washer should not be used during the time that the temperature of the auditorium is below 58 degrees above zero.

Direct radiation should be placed in the entry, in the dressing rooms, the offices, etc.

The stage of the ordinary theatre requires a great deal more radiating surfaces than can be calculated by any rule. So after figuring the heat loss due to the great wall area at the rear of the stage, and after placing enough radiation, high up on that wall and in the fly galleries, to protect the baldheaded men in the front row from catching cold, there should be an equal amount of direct radiation placed down close to the stage floors. The stage of a theatre is a very draughty place, and as the dressing rooms are usually so small that they are too warm, it is necessary to fairly load the stage with heating surfaces to prevent the actors from becoming "chilled to their bones."

If direct radiation is relied upon alone to heat any auditorium, be it church or theatre, and if that auditorium is to be heated only at intervals, we must provide at least 30 per cent. more radiating surface than might be ordinarily used. The boiler and the rest of the system must be in a like proportion.

In auditoriums of this class a boiler should be provided that will permit the getting up of considerable steam pressure quickly by hard firing, and it must contain a sufficient body of water to allow for a great deal of sudden evaporation without much lowering of the water line.

It is impossible to ventilate a theatre building by a gravity system. Some theatres are ventilated by the use of an exhaust fan only, whilst others are ventilated only by a pressure fan. Usually it is well to instal both types of fans and run them in combination. If this, for any reason, is impossible, and only one type of fan can be used, the fan selected for a moving picture house should be of the exhaust type; for all other auditoriums the pressure fan should be specified.

In any case the fan specified should have a capacity equivalent to 1,800 cubic feet of air per person per hour. When a pressure fan is used for supplying tempered air, and exhaust fans are used in the extraction of the foul air, these fans must not be so small that they must be run at an excessive speed in performing their functions; nor must they be so large that they must be run so slow that proper conditions of pressure can not be obtained. The danger of getting a fan too large for properly balanced pressure conditions is greater where there is a long run of air-carrying ducts in front of the fan nozzle, than when the fan is blowing air through a short system of these ducts. This is why the fans specified for foul air extractors are figured for a lower static pressure than those used as pressure fans. Generally in theatres seating about 1,200 persons, the supply fan is proportioned for a static pressure of from .75 to 1.0 water gauge with an outlet velocity ranging from 1,800 to 2,000 feet per minute. Exhaust fans are, as a rule, in this class of work proportioned for a static pressure of .37 inches water gauge and an outlet velocity of 1,800 feet per minute. These proportions are based on the assumption of the use of fan with blast wheels of the multi-blade type. When a propeller type of fan is used in the foul air exhaust the proportion should be based on static pressure of .25 inches water gauge and a speed not exceeding 550 revolutions per minute.

In this general description of the heating and ventilating systems of theatres we have directed the reader's attention more to some of the requirements of fans than we have to certain other details that are as essential to a perfect working system. Frequently there is a good deal of misunderstanding in the matter of fans, because some men cannot clear their heads of the idea that volume of air is the same thing as a pressure; they believe that if they require a fan delivering 30,000 cubic feet of air per minute, all they need do is to specify a fan having that capacity, and, with the same incomplete understanding, believe that the fan should be run at a speed not much exceeding that of 175 revolutions per minute. It is quite correct that fans should be run at as low a speed as may be possible under the circumstances surrounding their installation, but the fact must never be lost sight of that the fans must be run fast enough to develop the pressure necessary to properly fill the entire system of ducts, etc., with air, traveling the directions required by the design.

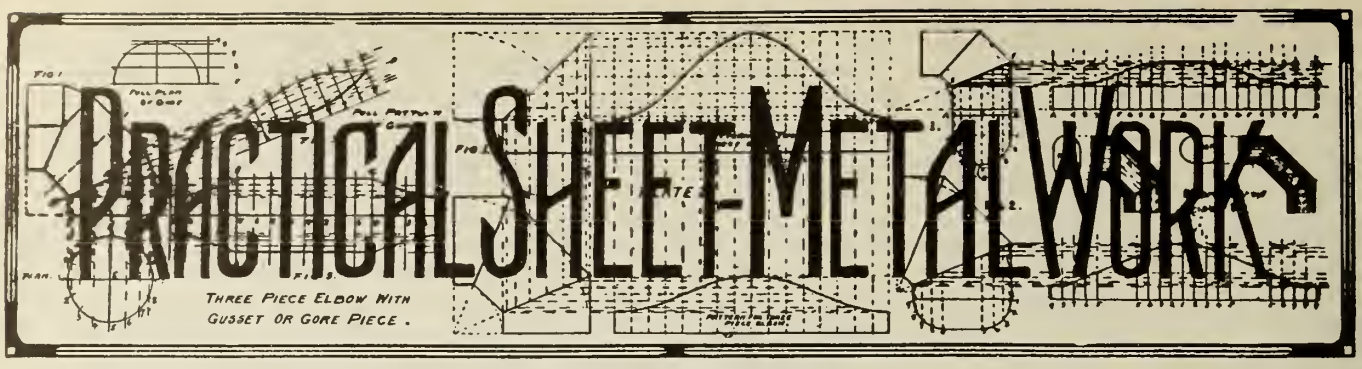
A PECULIAR ACCIDENT

A peculiar accident happened at Parry Sound, Ont., when a small water heater, which had been repaired at the shop of Messrs. Elliott & Guilliat, was being tested for a leak by attaching to the water tap, an explosion occurred. A large piece of the steel sheeting on the heater flew across the room, hitting Mr. Elliott on the arm, cutting it badly, and breaking the arm.

Mr. Guilliatt was examing the heater a few seconds before and had just left it a moment before the accident occurred. The supposition is that, at the time, direct pressure was being put on the mains, causing many pounds additional to come through. The piece which hit Mr. Elliott was about a foot long and six inches wide, and of about an eighth of an inch in thickness.

SEWER RENTAL RAISED

An amendment to the plumbing and drainage bylaw has been passed by the council at Kamloops, B. C., raising the sewer rent to $2.50 per annum. The new bylaw states that all moneys obtained be placed in a separate fund, known as the sewer rental fund, to be used for the maintenance and extension of the sewerage system as the council may see fit.



By THOMAS STANFIELD

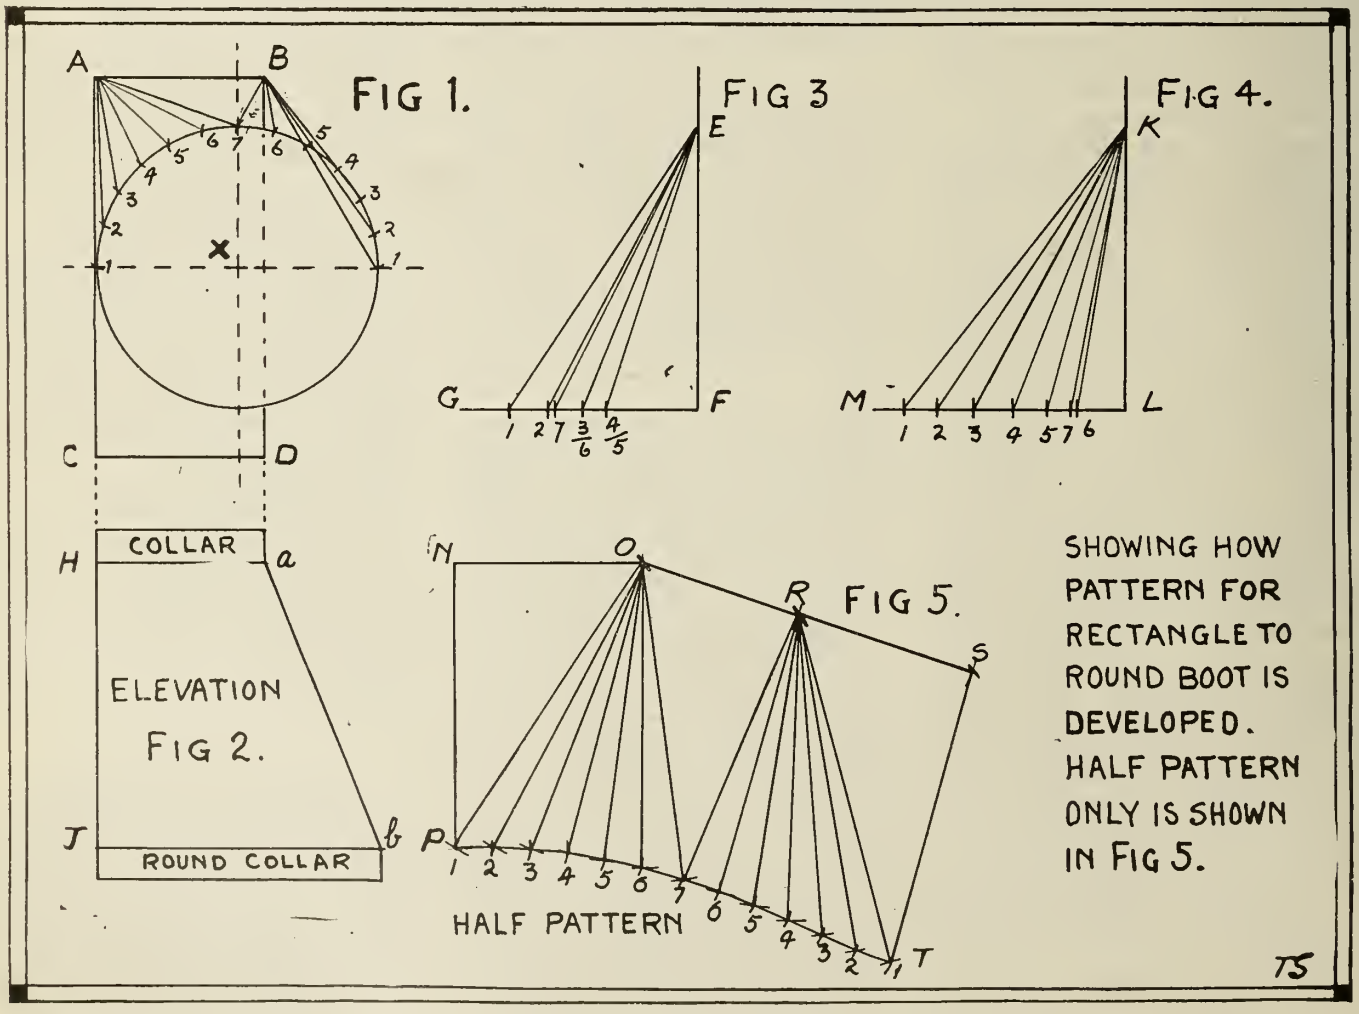
A READER asks how a rectangle to round boot pattern must be developed. Sizes given are: 24 inches high, 24 inches diameter, with rectangle 32 inches by 14.

The first step to take is to draw a plan and side elevation as shown in Figs. 1 and 2, and divide the circle into four parts. Then divide two of these parts into six equal parts each as described by 1, 2, 3, 4, 5, 6 and 7. It will be seen that the rectangle is marked A B C D. From point A draw a number of lines to 2 3 4 5 6 and 7, and from B to 1 2 3 4 5 6 7. It will be seen that points B, 4 and 3 are in direct line with each other, so that the one line will suffice.

Now turn to Fig. 3 and draw a vertical line E F with line G at right angles. Next mark off the height of boot as shown in Fig. 2 at H J on vertical line and the distance will be given between points F and E. Turn again to Fig. 1 and place compass point at B, and open to point 1. Transfer this measurement to line F G in Fig. 3 by drawing an arc as shown at G 1. Again place compass at B in Fig. 1 and open to B 2, transfer this measurement to Fig. 3 on line F G and repeat until all the measurements have been used from B.

Now turn to Fig. 4 and draw lines K L M, repeating in the same order all the previous operations by placing compass at point A and opening same to 1 2 3 4 5 6 7 in turn and transferring each measurement until Fig. 4 is completed. All the details have now been procured that are necessary to commence with the developing of the actual pattern.

First draw a horizontal line as at N O with line N P at right angles to same. Let the distance between points N and O be equal to half the length of the rectangle, which in this case would be 16 inches. The length of the vertical line N P should be 24 inches, being the length corresponding with the height of the boot. See H J in Fig. 1. Turn again to Fig. 3 and draw a number of slant lines from E to 1 2 3, etc., until all the points are formed at E. It will be seen that lines 3 and 4 are the same as 6 and 5. Now, place the compass point at E and open up to 1,



transferring same to Fig. 5 by placing point at O, and drawing a small arc. Next, place the compass point at P and make an arc cutting the one just made, procuring the measurement for this short arc from any of the small measurements shown in half circle at Fig. 1, 1, 2, or 2, 3. It will be seen that by repeating these operations all the measurements described in Fig. 3 to Fig. 5, at the stretchout line will be procured. Now connect all these points from P 1 to 7, with point O.

We will now turn to Fig. 1 and place compass point at A, opening same up to B. Then transferring this measurement by placing compass point at O in Fig. 5 and drawing a small arc as at R.

It is now necessary to turn to Fig. 4 and connect point K with 1, 2, 3, etc., by drawing the slant lines shown, and repeating the operations by transferring all the measurements as has been done from Fig. 3 except that the measurements must be transferred in the order shown following from 7 to 6, 5, 4, etc.

Having cut all the arcs again, connect points 7, 6, 5, 4, 3, 2, 1 to R; next, draw an arc from R to S, the distance being the same as from N to O. To determine the distance between S and T 1, place the compass at A and open to B in Fig. 2, this being the true length of the metal at the slant height of the boot. It will be seen that the distance between O R, Fig. 5, is equal to H, a, Fig. 2, and that R S and N O equals the half of front and back of rectangle portion shown at A C and B D in Fig. 1. The curved line P T in Fig. 5 equals the true length of half the round end.

By turning the half pattern over at N P and allowing for seam at S T the seam will come at front of boot.

CENTRAL STATION HEATING IN DETROIT

Continued from page 24

heated is returned to the plants only to a very limited extent. In the tunnels it is necessary to install a return line to receive the discharge from the traps on the steam lines, and wherever possible the condensation is drained from the adjacent buildings to this line. It is difficult and costly, however, in many cases, to arrange a gravity discharge from the building basements to the tunnel, and the cost of installing and operating pumps to handle the condensation would more than offset the value of the heat and the feedwater which would be salvaged.

In the districts not served from tunnels, all of the condensation is wasted to the sewers. Even with the present high cost of coal, return lines would scarcely be a profitable investment. Furthermore, they are short-lived, and any leakage from them is disastrous to adjacent steam lines. The proper method of salvaging the heat in the condensation is by means of an economizing coil in the consumer's building.

Consumer's Installations

The consumer's equipment includes, besides the usual radiators and piping, a pressure-reducing valve, which reduces the service pressure to the lower pressure required for heating, and a trap whose function is to discharge the water of condensation from the system.

Economizing coils, utilizing the heat in the condensation, are recommended by the company, but not required. They are seldom installed in any but the largest buildings, as few consumers care to make the necessary investment even though a demonstrated saving can be made. In some buildings the condensation is passed through a surface heater which preheats the water used for lavatory purposes, and this seems to be the most satisfactory form of economizer for large buildings.

The regular heating season covers 8 months of the year, though summer service for cooking and water heating is supplied to a few consumers conveniently located. Cool weather in September usually makes necessary the commencement of service before the contract date of October 1. It has, in fact, been started in August. Steam was originally sold to some extent for power purposes, but this service is now practically discontinued.

Meters

The meter first used in Detroit was of the tilting type, consisting of a rectangular pan of two compartments hung on knife-edge or ball bearings, the compartments filling alternately and, when full, tipping the pan so as to bring the opposite compartment to the filling position. In 1907 a revolving meter was devised, consisting of a drum of four compartments which filled and dumped successively, the drum being revolved by the weight of the water. This meter was fairly successful and a few of that design are still in use, but a greatly improved design of revolving meter, operating on the same general principle (Fig. 5), was originated in 1909 by Hans Resert and is being used at present, with slight modifications.

12 and 14	6 50	6 70	6 80

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Steady Trade in Lead Products at Firm Prices

LEAD AND ZINC PRODUCTS.—Manufacturers report business coming along nicely with a decidedly firm undertone to the market on solder, due to advances recorded in the price of tin. No changes have yet occurred, however. Lead products are holding unchanged with a good demand in evidence.

Scrap Markets Still Rather Quiet

OLD MATERIALS.—Business is fairly good in the scrap metal market, and this is about all that can be said for it. The larger dealers are shipping to the United States market, but only on contract, and no new business is being taken on for the present. In some places slight increases have been shown in line with tendencies outlined in these columns last issue.

Copper continues to be fairly strong. There is quite an amount of copper turnings yet in this country, the property of the United States Ordnance Department. A certain part of this has been disposed of, but sales have not been made against the entire holdings. As far as the shell steel scrap is concerned, the market has been cleared out, as all that the United States Government had stored here has been sold or removed, while that of the British Government has in a large measure been shipped back to Britain.

Tin Registers an Advance; Others Holding

INGOT METALS.—Higher prices are again the order of the day in some quarters on tin, with other metals showing an unchanged market, though spelter is weak. The demand for all lines is generally good.

COPPER.—There has been just a little doubt as to the course of copper during the past few days, it being held that it was at its peak and was likely to recede. The trade here is not disturbed, this being quoted at 27c per pound with a somewhat steadier feeling apparent.

TIN.—An upward move is again revealed in some quarters on tin, prices showing a wide range as a result at 62c to 65c per pound. Supplies are ample and the demand considered satisfactory.

SPELTER.—Weakness is showing up in this metal, but no actual change in price is shown here, 10c per pound being the figure generally prevailing.

LEAD.—The demand for lead is considered very good and the market is ruling firm at unchanged levels. Some factors have made a slight advance in quotations, but this has not extended to the local field.

ANTIMONY.—A brisk demand is reported which serves to keep the market firm. Supplies, though ample, are not superfluous. The price ranges from 10c to 11c per pound.

ALUMINUM.—New features are lacking in regard to this metal. Sales are coming along pretty fair and price shows no change at 35c per pound.

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKET AT A GLANCE

REVISIONS have been made in some quarters on galvanized and black steel sheets, resulting in an advance in both of these commodities. Steel plate is just the reverse having shown a slight decline. The market is firm at present levels, which are in the form more of a readjustment than otherwise.

Boiler tubes, seamless, show an advance ranging from 5 to 7½%, with lapweld tubes in some sizes similarly affected. These changes, it is indicated, bring prices more in line with latest prices issued by the manufacturers.

The strength of tin features the ingot metal market. During the past couple of weeks, the position of this metal has strengthened materially and advances ranging from four cents to six cents per pound, are shown in the prices quoted to-day. The other metals show no new feature though spelter is weak but remains unchanged as far as price is concerned.

One remarkable thing experienced is the actual difficulty noted in taking care of the business offering with promptness. Manufacturers and jobbers both express difficulty in supplying the trade with their requirements. Business has come along with an unexpected rush and this added to the curtailed production in many lines owing to strikes is resulting in the present scramble for material.

TORONTO, September 12.—Slightly higher prices on galvanized and black sheets have been recorded in some quarters. Boiler tubes have also moved upward to the extent of about 5 to 7½ per cent. Tin is showing strength and has advanced during the week. Jobbers complain that great difficulty is being experienced in taking care of orders, manufacturers being so rushed that deliveries are slow and uncertain. This condition prevails in enamelware, soil pipe and fittings, brass goods, etc., it is said.

Activity Shown in Sales of Enamelware

ENAMELWARE.—Manufacturers' and jobbers' reports indicate decided activity in the sale of all lines of enamelware, with difficulty being experienced in getting the goods out quickly enough to meet the demand Prices are firmly held, and were it only possible to meet demands promptly, all would be happy.

Bath tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	$37 07

100-gallon	50 00	58 00
120-gallon	60 00	67 00

Difficulty Meeting Demands for Soil Pipe

SOIL PIPE, FITTINGS.—Business has come along with such a rush that manufacturers are being hard pressed to take care of orders for soil pipe and fittings. As a matter of fact, a system of allottisg supplies has had to be adopted to some extent to insure the fairest distribution. Prices are firmly held at following levels:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	10%
Medium and extra heavy soil pipe, 4 in..	15%
Medium and extra heavy soil pipe fittings, 2 in. to 6 in.	25%

Oakum Readjusted; Waste Unchanged

WASTE, OAKUM.—A readjustment has taken place in prices ruling on plumbers' oakum, to-day's quotations being made at from $10 to $10.75 per 100 pounds, which represents an advance. Cotton waste prices are well maintained at unchanged figures. Trade in both waste and oakum is considered very good.

	Per 100 lbs.

Wrought Pipe Becoming Scarce

WROUGHT PIPE. — Wrought pipe maintains an unchanged position as regards prices, those shown in list of quotations below being firmly held. The shortage of skelp reported in these columns two weeks ago has developed to a point where a famine is said to exist in ½ inch galvanized pipe, and some other sizes are very hard to procure. Manufacturers claim it will be two weeks at least before further supplies are released. Prices to-day follow:

3½ inch	60 00	44 00
4 inch	75 00	56 00

Advance Recorded in Sheets; Plates Down

SHEETS, PLATES.—An advance has been recorded in some quarters in both black and galvanized sheets, and the tendency seems to be towards the slightly higher level. The range of prices on galvanized is still the same, with indications that the $8.00 figure for 10¾-oz., 30-inch width, will be general in another week or so. Black sheets, which have been down considerably in some quarters in an effort to reduce stocks to a more workable basis, are de-adjusted to a higher basis of quoting, as shown in figures below. Plate has been revised downward, ¼-inch and heavier being quoted at $4.25 per 100 pounds.

BLACK SHEETS—		
14 gauge	4 75	5 10

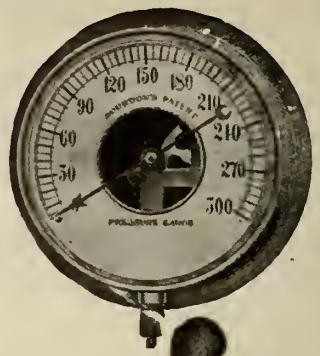
FIVE WORKS---OVER 3,000 EMPLOYEES

UNITED BRASSFOUNDERS AND ENGINEERS, LIMITED

EMPRESS FOUNDRY, CORNBROOK, MANCHESTER, ENG.



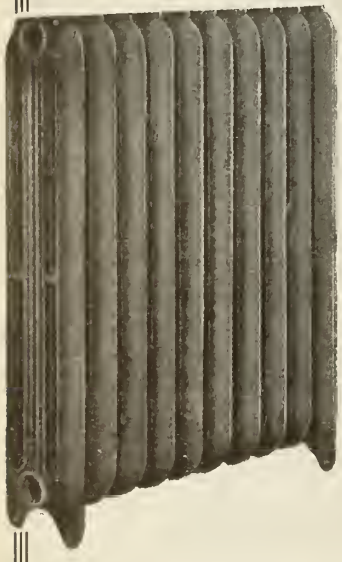
DURING THE WAR our plants were exclusively engaged on work of supreme national importance.

At the commencement of the new era we are pleased to announce that we intend to again direct our energies to the intensive production of:—

GUNMETAL and BRASS VALVES and COCKS.
STEAM, WATER and COMPRESSED AIR FITTINGS GENERALLY.
CAST IRON STOP and SLUICE VALVES.
SEMI-ROTARY PUMPS.
EXTRUDED BRASS and BRONZE BARS.
BRASS BOLTS and NUTS, STUDS and GENERAL TURNED WORK FROM THE BAR.
CAST AND MALLEABLE IRON COCKS and PIPE FITTINGS.
PRESSURE and VACUUM GAUGES.
INJECTORS and GENERAL JET APPLIANCES.
ENGINE GOVERNORS (Pickering, Proell, and Other Types).
SPRAYING MACHINES, for Insecticides and Lime-washing.
COPPERSMITHS' WORK.
"STELLA" BRAND ALLOYS: MANGANESE COPPER, SILICON COPPER, FERRO ZINC, PHOSPHOR COPPER and TIN, etc.

"UBEL" POST-WAR SERVICE

If you are interested in any or all of the lines mentioned, and are in a position to take a hand in the energetic distribution of the same, please communicate with us NOW to our Head Office, at above address.



SOVEREIGN RADIATORS

Facts and Features About Their Superiority

Sovereign Radiators are built for service. They are made in a variety of sizes and attractive designs—conveniently suited to meet the demands of the area to be heated. Sovereign Radiators have absolutely tight and unleakable joints—large smooth connections—ensuring an easy flow and regular distribution of water or steam, and having a large heating surface, they supply the fullest warmth-distributing capacity. That is part evidence that should go far towards convincing you that at all times you should specify and instal Sovereign Radiators (with the Sovereign Boiler) for your own as well as your customers' interests.

We have an abundance of literature for your own information and the use of your prospective customer. Consult us about your particular requirements—we are always ready and willing to help you secure more business.

There's Something about an Original that Can Never be Imitated!

IF you've ever heard Harry Lauder sing his Scotch songs you could tell an imitation with your eyes shut.

You've seen Charlie Chaplin do his stunts—do you think an imitator could fool the people?

Whether it's real diamonds or paste—whether it's pure gold or brass—an imitation is simply an imitation—**and nothing else.**

That's why the thoughtful steamfitter isn't going to fall for anybody's talk about something "just as good" as "X" Boiler Liquid. He knows that for positive results it is safer to stick to the original. An imitation of the genuine "X" may look like it — but that's all. Patents are allowed on the "X" Liquid process. Its quality **can't** be imitated. Imitations of the genuine "X" Liquid cause foaming. **"X" will prevent foaming.**

No fitter can afford to experiment with his profits. When you get a leaky or cracked boiler job you want to know that you can send any man to that job—have him finish it quickly—otherwise there's the kicking, the arguing and the time-wasting that is utterly useless from a money-making standpoint.

Over 25,000 steamfitters now know that "X" Liquid is the **only** scientific process for repairing leaky and cracked boilers—and for making them LEAKPROOF—RUSTPROOF — AND SCALEPROOF. They know that with "X" they make three times the profit that they could by dismantling and welding.

And they wouldn't risk their reputations experimenting with an imitation.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Nut with Nut-Guards

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

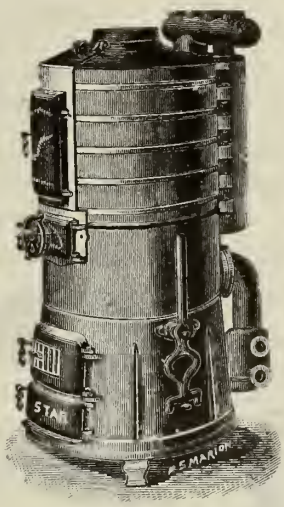
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.

The principal feature of the Star Boiler is **that no other round hot water boiler has any coal-saving improvement not embodied in the "Star."**

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

"Dual" Mixer

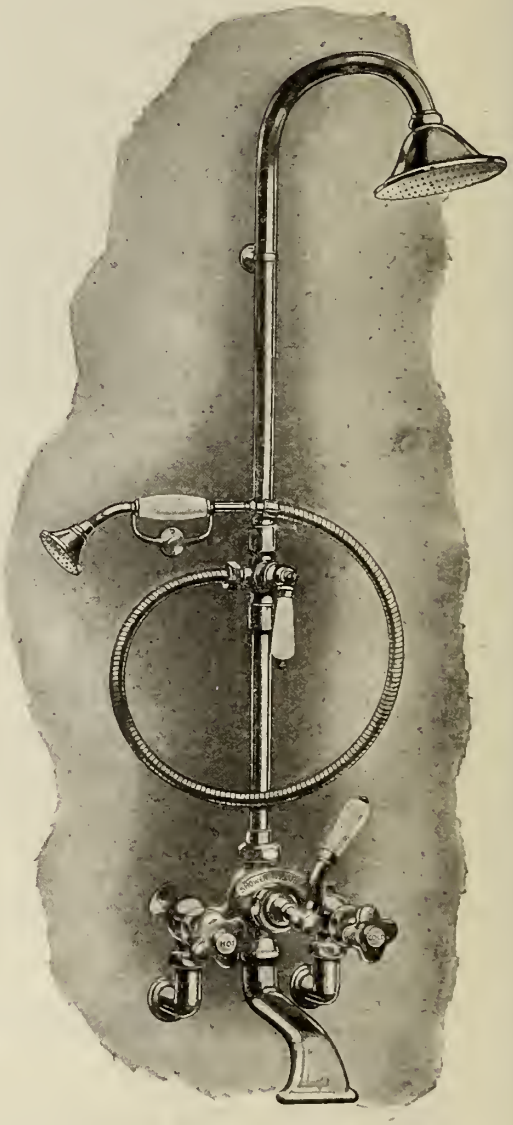
A valve that really mixes Hot and Cold Water, and maintains a uniform mixture.

For ease of operation, simple construction and easy installation, it has set a new standard of efficiency.

Cold Water must be turned on first, no possibility of scalding.

Made in several forms for Showers, Sprays, Operating Rooms, etc.

At the well-known works of Messrs. Brunner, Mond & Co. these valves provide baths for 2,500 employees.



G. & W. G. GUMMER, LIMITED

Manufacturers of every description of

Engineers,' Plumbers' and Sanitary Quality Brassware

The 2-Part Trap

TWO major parts make up this distinctively simple trap: the body, with inlet and outlet connections; the cover, in which the Dunham Thermostatic Disc is securely fastened.

This disc of special phosphor bronze contains a fluid which is extremely sensitive to temperature changes over a wide range—10 pounds of pressure to 15 inches of vacuum.

Temperatures above normal close the trap; temperatures below normal open it for the escape of the troublesome air and water.

Should it ever become necessary to renew a trap, the cost is confined to the top part only. Just screw a new one into place. Judging from some of the original traps (installed 15 years ago) we do not anticipate much demand for new tops.

The complete story of Dunham Heating Service is quite interesting. Write for it.

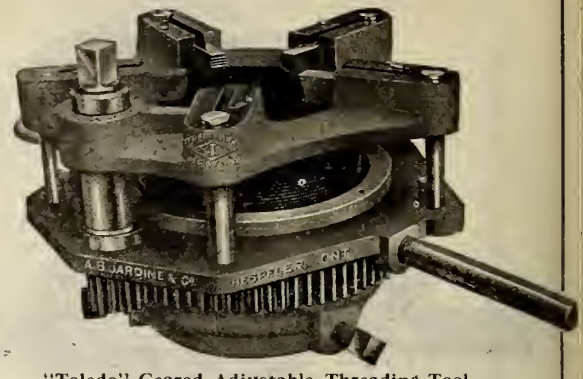
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool
No. 2½. Capacity 2 to 6 in. inclusive.
Weight 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

NATIONAL STEEL TANK AND MFG. CO.

BRADFORD, ILLINOIS, U.S.A.

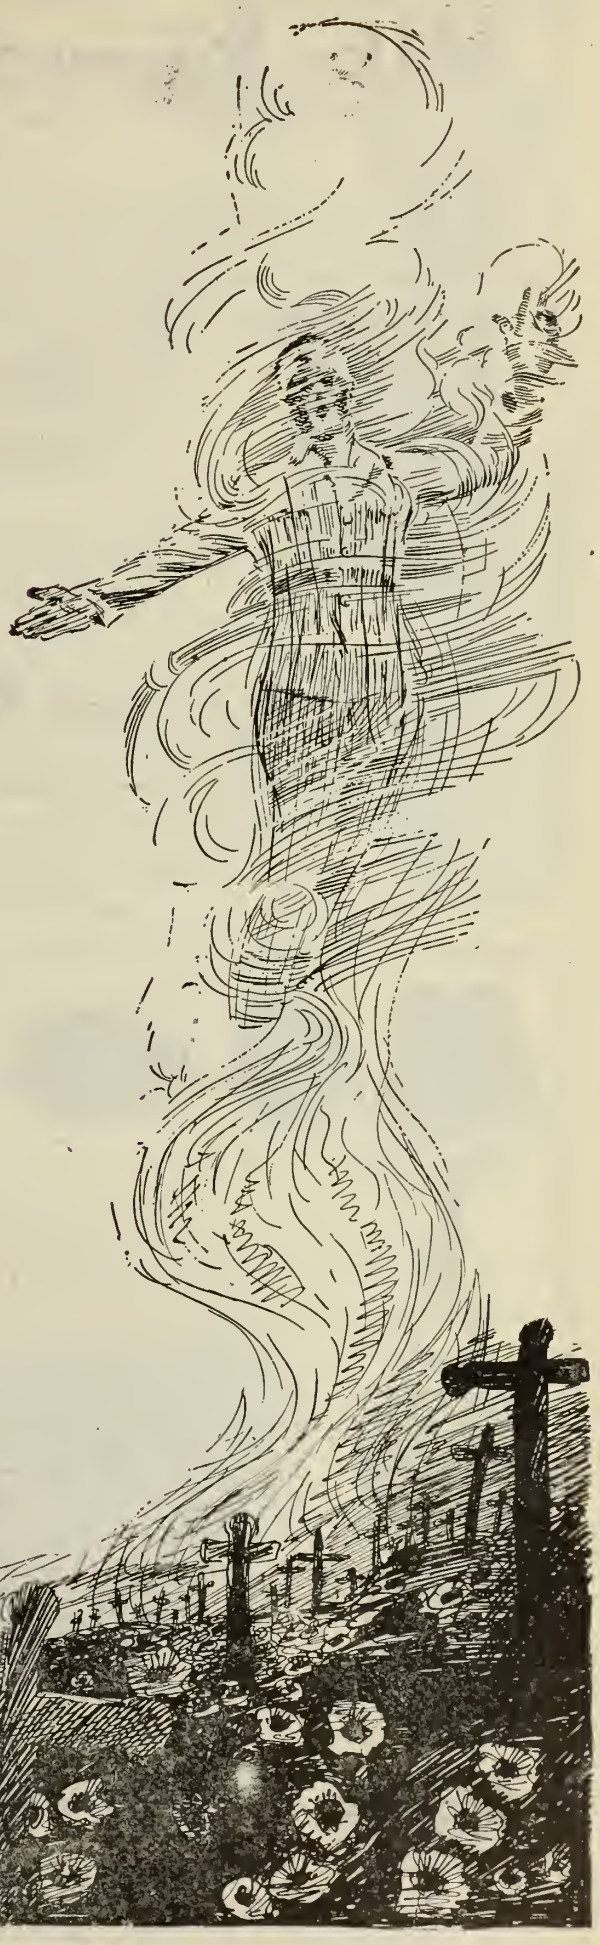
The Soul of a Vision

So then—
My part is ended. Other men,
And women, too, still play their part,
With courage resolute and dauntless heart.

My broken comrade—
Seared by scars that time can not efface,
Is not the jest of fortune; for his aid
A nation's mighty forces doth provide.

And those who live—
To carry on our story down the years,
Face not their "quiet days" in bitter pain;
(Forgotten, now they've stilled the nation's fears)
Dwarfed by the lust of pride and selfish gain.

My Canada—
Thou fair land for whom great love
Inspired my youth to ancient sacrifice;
Grant that our serried ranks in realms above
May witness bear thee, worthy of the Price.



To Pay Debts of Honour

TO the Dead and to the richness of their dying, we must give pause, and in humility confess a debt beyond redemption.

Before the altar of their sacrifice, Canada is consecrated to make its dominion worthy. The Torch that illumines Victory so dearly bought, must burn eternally. Each year of peace must record an added lustre to our heritage.

But to those who have come back in suffering Canada owes a debt which money can, in part, repay.

It is a Debt of Honour. Canada was pledged to the end, that the wounded and the sick be adequately cared for, until they were fairly fitted for the competitive existence of civil life.

For this purpose, our medical services, and our vocational training schools must be maintained until the need for them is no more.

* * * *

These, then, are some of the purposes for which the Victory Loan, 1919, is being raised. Other purposes are told about in other announcements.

As you read them, the conviction will grow upon you of the absolute necessity for the

VICTORY LOAN 1919

Today and Tomorrow

A Little "Straight Talk" to the Canadian Plumbing Trade

TO-DAY is ever present. Its problems are so close to us that they frequently obscure the future. "TO-MORROW can look out for itself; I'll enjoy to-day while it's here," is the life motto of many men, both in business and private life.

TO-MORROW can be made the Golden Day by using TO-DAY at its best; by making the worries of TO-DAY into warnings for TO-MORROW, making TO-DAY'S lessons help us to build greater success in the future.

TO-DAY business may seem to be at its height, buyers frequent, prices soaring, everything running at high pressure. Let us be grateful for these good things, but without pessimism let us build for possible TO-MORROWS when there may be a falling back of the tide of prosperity.

TO-MORROW and its success or failure will be built on how well we have done to-day. The workman who has done his work efficiently will be first in demand when **Service** is required; the business man who has had Quality as his guiding light will be remembered by pleased customers and clients. Confidence will beget new business and greater profits. The care and thought devoted to to-day's work, to the small contract as well as the large one, the class of goods employed, the efficiency of workmen employed will build for the future of the business man individually and the nation as a whole.

TO-DAY anticipates TO-MORROW. The Canadian Plumber has now an opportunity which can be used with the very best effect for himself and his community. Keep always this watchword in view:

"Quality," "Efficiency" and "Service"

THE CANADIAN SOCIETY OF DOMESTIC SANITARY AND HEATING ENGINEERS

President
Frank R. Maxwell, Toronto

Vice-President
Harry Mahoney, Guelph

Secretary-Treasurer
Garrett F. Frankland, Toronto

Are You With Us?

This society aims to improve the standard of Sanitary Plumbing and Heating throughout the Dominion of Canada.

To do this, we require the assistance of every Sanitary and Heating Engineer in the Dominion of Canada.

FIRST—To become a member of this Society, either directly or through his Provincial Society if there is one.

SECOND—To have improved Sanitary Plumbing By-Laws adopted in his own city or town, and also Provincial Plumbing Regulations enacted for his Province.

THIRD—To improve the standard of Heating Installations and have enacted Local By-Laws and Provincial Regulations for the enforcement of such standards and safety measures, that will ensure to the public, satisfaction, protection and economical heating systems in their buildings.

FOURTH—To raise the business ability of those engaged in the Plumbing and Heating Industry to the highest standard of efficiency.

FIFTH—To inaugurate Apprenticeship Regulations throughout the Dominion of Canada, to assure capable, reliable and efficient Plumbers and Steamfitters for our business.

Has your Municipality any Sanitary Plumbing or Heating By-laws?

Kindly notify the Secretary accordingly, forwarding copy, if you have same.

Remember we are ALL FOR ONE and ONE FOR ALL,

Thanking you for your co-operation,

FRANK R. MAXWELL, President

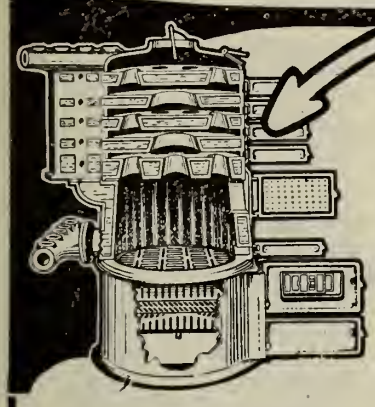
WHY "THE SOVEREIGN" HAS INDIVIDUAL CLEAN-OUT DOORS



Efficiency Detail in "Sovereign" Hot Water Boiler

"Individual Clean-Out Doors" is one of the minor features of improvement in the "Sovereign" Hot Water Boiler. It shows how finely the idea of conserving heat has been worked out. Opening only one door at a time, while removing soot or ashes from between the boiler sections, prevents unnecessarily chilling the heating medium.

The principals of the Taylor-Forbes Company introduced the screw-nipple wall radiator in Canada, and are the original designers of the **largest first section** in Hot Water Boilers, a feature which is now widely copied or imitated.

Follow the line of least resistance —"Sovereign" Boilers and Radiators make sales easy.

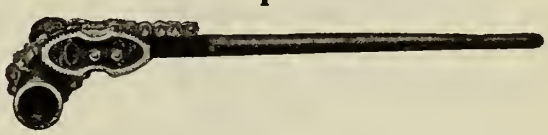
Williams' Improved "Vulcan" Drop-Forged Chain Pipe Wrench



FEW tools are called upon to stand greater strain and harder wear than the pipe wrench. Because Williams' "Vulcan" Chain Pipe Wrenches have withstood every test during years of hard, continuous service under all conditions, they have earned a well-deserved reputation for dependability, and are favorably known the world over. They embody every good feature for which Williams' *Superior* quality stands.

Made in 8 sizes for ⅛ to 18 inch pipe. All Flat Link Chains are "proof-tested" on a standard tension machine and "certified." Every wrench is unconditionally guaranteed.

Big Things for November

YOU'LL find them in MACLEAN'S—page after page of reading material that will grip the attention of hard-to-please readers throughout Canada. You who know authors and their works just examine this list of contents for November MACLEAN'S—then you'll realize it's big selling value.

Order a liberal supply. Tell your customers about these articles in November MACLEAN'S. There are at least seven outstanding features:

"We Must Start Afresh"

By Ralph Connor

An article on the need for Canadians to acquire a new viewpoint on things political, social and religious as a result of the war. The first of a series of three articles by this great Canadian author.

"MY MEMORIES AND MISERIES AS A SCHOOLMASTER"
By Stephen Leacock

A very readable and humorous sketch of a reminiscent nature by Canada's greatest humorist.

"TWO MEN—AND AN IDEA THAT GREW AND GREW AND GREW."
By Charles Christopher Jenkins

An article on two mysterious Western millionaires who own and operate twenty-four business corporations, but about whom practically nothing has been known—J. L. Davidson and John R. Smith. It tells how they built up their remarkable chain of industries.

"A WOMAN ON THE BENCH"
By Mrs. Arthur Murphy (Janey Canuck)

An article on Mrs. Murphy's experiences since she made the experiment of accepting the post of magistrate in the Woman's Court at Edmonton—the first woman in Canada to sit on the bench. It is a forceful, and, in places, a humorous article.

"WHY I REMAIN A CANADIAN"
By Basil King

A short article by this great Canadian author, whose new novel, "The Thread of Flame," starts in December MacLean's. He tells why he remains true to Canadian ideals, despite the necessity of residing and working abroad, and something of his conception of the destiny of this country.

"ARMING FOR THE FRAY"
By J. K. Munro

The usual monthly review of Dominion politics by this shrewd satirist.

"WOMAN'S ACTIVE PART"
By Gertrude Arnold

An extremely readable article on the life in hospitals in the war area by a Canadian nursing sister. It gives information along certain new lines, such as the methods followed to trace missing men through the various hospitals.

FIVE ENTERTAINING STORIES

"MEN AND MONEY"
By Nellie L. McClung.
Illustrated by E. J. Dinsmore.

A story with a mission, one that will be discussed, we believe, very generally throughout the country.

"THE TEST"
By Harry Douglas.
Illustrated by Arthur Heming.

A live story laid on the great Western Prairies.

"THE RAINBOW DEATH"
By Madge Macbeth.
Illustrated by D. G. Summers.

A mystery of intense interest.

"SPANISH DOUBLOONS"
By Camilla Kenyon.
Illustrated by Louis Rogers.

The second instalment of this bright and exciting serial story based on a treasure hunt in the Spanish Main in the present.

"HIS MAJESTY'S WELL-BELOVED"
By Baroness Orczy.
Illustrated by C. F. Peters.

The fifth instalment of this richly entertaining historical novel.

Then there will be the regular departments that are of great interest to Canadians.

Sanitation is Solving Rural Problem

Installation of Modern Conveniences in the Home is Doing More Than Anything Else to Keep the Boys and Girls at Home—Splendid Opportunities For Business in Rural Communities

BECAUSE of the apparent spread of public discontent, some concern for the stability of our institutions has been expressed by students of social science.

One writer states that Cincinnatus will not go back to his plow, or if he does it is only to stand between the handles while he wrangles over his wage. Another writer has succeeded in putting a flippant song in the mouths of the populace whereby they may question how the boys are going to be "kept on the farm after they have seen Par-ree."

The farmer of to-day is not greatly exercised about keeping his boys on the farm; he has found the way.

Found the Answer

The farmer knows that it was not so much the lure of the city as it was the inconveniences of the old farm homes that at one time depleted the rural districts of their population. He knows that more boys were driven from their homes by frost-bitten bedrooms than were drawn to the cities by the bright lights. So to-day he provides his home with the modern conveniences and fosters in his children a desire to remain where their prosperity is reflected more in a growing value of the better things of life than in rampant commercialism.

With the growing ease of travel there has come to the tiller of the field a growing consciousness of the dignity of his calling and a self-respect demanding the things that should be his by right of conquest of the soil. So all over the country there is to-day a vitality of movement in the rural districts pointing to a development of national character founded on the firm base of a disciplined love of home.

Has the Means

The farmer of to-day has the means of providing a home for his family that is more desirable than any home in the city, and he knows that the ability of the home to hold the affections of its children means more for the purity of

There is no better way of getting business than by getting a good stock and letting people know you have it. The attractively arranged display shown in the illustration has meant real money to the Hunt Plumbing Co. of London, Ont., and the combined window and store display has brought many people in who became buyers.

the aspirations in rural life than city dwellers realized.

It was true that in the time of the city-ward drift of the human stream there were conditions of life existing in our rural districts, that, had they persisted, could have only resulted in the sinking of our farm dwellers to their status of a peasant class with outlooks as circumscribed by ignorance as profound as their natural surroundings were glorious.

Only a Memory

Happily those conditions are only one of the dismal memories of the past and now we look with confidence to where the roots of every civilization have been planted—the farm.

No matter what storm of social unrest threatens the fabric of our urban life, we know that there is hope so long as the foundations are not torn from their base, therefore we take encouragement for the future when we consider the wonderful prosperity of our farming communities.

It has been the history of every race of mankind that when the farms were in the hands of the enlightened and prosperous class of men the national life was free from the leprous touch of public immorality and decay of national character.

The roof that shelters generation after generation has a sacredness that cannot be carried into the dark and dirty streets of our cities; and while the city must ever be a partner in the prosperity of the rural abstracts, the city dweller can never experience within the walls of his restless habitations the proud and honorable self-possession of the home of his fathers.

A Pitiful Thing

It is a pitiful thing and full of sorrow for our people when they cannot know the memory for the old family home—a memory that should be the heritage of every man belonging to a native race.

When there is so much in the nature of man that binds their affection to the land that gives them sustenance, it would seem strange that new desire for variety and change should tear them away from their peaceful walks in life to set them struggling amid the dust of city streets.

Are Coming Back

Now that farm homes are being fitted with so many of the modern conveniences of life we find that many young men who could take a leading part in the activities of the city are returning to the farms, knowing that in these days that the farm home has so much to make it desirable as a permanent dwelling place.

The farmer in his growing wealth feels that the desire for higher standards of living conditions demands greater refinements of culture, and it is not long before he realizes that there can be no real culture where pools of stagnant water covered with slimy scum may be seen, or where household debris and garbage become an offense.

Are in the Farm

The roots of civilization are in the farm, but the indications of superior civilization is self-respect. Not vanity, but self-respect, and there is no better token of self-respect than the well-used bathroom.

Of the men that walk in industrial life there is none to whom more is due than to the sanitarian. He has done more to stamp out malignant disease than all of the medical profession that have lived since the days of the father of medicine.

With a quickening civilization there is always a marked activity of the plumbing trades, and this higher type of civilization shown in the growing prosperity of our rural communities gives a promise of an ever-increasing interest in the necessity for sanitary convenience on the farm.

A Fruitful Field

But it is not alone on the farms that the rural sanitary engineer finds a fruitful field for the practice of his art, but also in the towns and villages where the new community spirit, and the use of the automobile, with the consequent better roads is developing a social life that is resulting in the building of superior places of public assembly. These buildings require the best equipment of heating, ventilating, plumbing and lighting fixtures. Here as well as in the domestic field is another demand for the superior services of the high grade sanitary engineer.

Will the New Montreal By-Laws Carry Improvements?

Committee of Master Plumbers Has Worked Conscientiously to Try and Get Good Laws Which Will Not Be a Burden to House Owners

LONG and weary hours have been conscientiously given the consideration of the proposed new plumbing by-laws for the City of Montreal by the committee of Master Plumbers, appointed by the Montreal Master Plumbers' Association. Will the amendments they have proposed be adopted and embodied before the new law goes to the printer?

As head of the committee which has been giving attention to these laws for several weeks past, Chairman P. C. Ogilvie has given a great deal of time from his personal business in an effort to conserve the best in the proposals and to eliminate the unworkable and cumbersome clauses.

Want Fair Laws

"We desire to have a good law but one that will not be a burden to the house owner," said Mr. Ogilvie to SANITARY ENGINEER. "There has been a desire on the part of some to have a lot of clauses in the by-law which will not be of value and which would only mean unnecessary expense for the parties having work done. The plumbers are anxious to have a good law but one that will work as little hardship as possible on anyone."

Knows His Work

Mr. Ogilvie is a past master in work of this kind and has been called in to revise and advise in matters of this kind in Montreal and Westmount for the past twenty years. Naturally he has learned a great deal through this experience, and it is his earnest hope that when the by-laws, with the recommendations attached from the plumbers' committee are sent to the civic authorities, they will adopt them. The point in simplicity is this: That the master plumbers know what are good laws and what poor. They know what rot red tape is and want to see it cut out. It is as much in their interests to see that the new laws are good laws as it is to anyone—of greater interest and moment, in point of fact.

In Effect Shortly

Just what will be done, and when? As far as SANITARY ENGINEER has been able to learn from the officers of the association in Montreal, and from the civic sanitary department, the laws should be in the printers' hands within a month or six weeks. That would mean that they should be available by the end of October or early in November. Good plumbers have followed the consideration of these proposals with interest, meetings have been held and much time spent in careful meditation over them. If the Master Plumbers and Steamfitters and Heating Engineers are given the consideration they merit, and if the best interests of the public at large are fully safeguarded when the final draft is attested, there will be little complaint from the craft here.

BUILDING IS BRISK

Tenders are to be called for by the City Council of St. John, N.B., for the erection of eight new houses, averaging about $3,500 each, under the Government Housing Commission. Plans are under way for the erection of thirty-two other buildings of a similar nature. The whole will represent an outlay of about $150,000. A similar outlay is being made in Moncton under the Housing Board, but the work is more advanced, twelve of the houses now being ready for the plaster and twenty-eight more being in process of building.

Where Would You Draw The Line?

John A. Lillie, of Toronto, Would Allow No Undesirables to Enter the Profession of Sanitary and Heating Engineering in Canada—Suggests a Seven-Year Term For Apprentices

Based on an interview by C. E. PARSONS, of Sanitary Engineer, with John A. Lillie, of Toronto

"I THINK the time has come in the interests of the sanitary and heating profession in Canada to raise the general standard of the trade by drawing the line and excluding certain persons from practising. I do not think any undesirables should be allowed to work at our business. My reason for this is that people from some countries have no conception of our standards of living, especially in regard to sanitary arrangements or general cleanliness, and few of them apparently want to learn."

This is the view of John A. Lillie of 311 Roncesvalles Avenue, Toronto, as given to SANITARY ENGINEER.

Raise the Standard

"Throughout the trade," said Mr. Lillie, "there is an urgent need for the men in it to raise the standard. Few of the sanitary and heating engineers place the proper estimate upon themselves or the importance of their work to the community. Community health and national health is of vital importance. There is nothing that concerns us more, and yet if every man in the trade were to take a holiday for a very short time there would be a complete demoralization. Can you imagine what would happen if every man in the trade laid off for three months? Conditions, especially in the populous centres, would be terrible with disease epidemics and increased death rate everywhere. The sanitary and heating engineers have done more to make the health and comforts of the modern home possible than anyone, and yet is our work appreciated? What is the status in the minds of the average citizen of the plumber? Is he given credit for what he does or for the service he tries to render to the general public? Most emphatically he is not.

What Would Happen?

"If every man in the trade to-morrow morning took down his sign as a plumber and replaced it by hanging in the window his license as a sanitary and heating engineer, the public would begin to take notice. Because the men in the trade have too low an estimate of themselves, the public takes them at their own estimate.

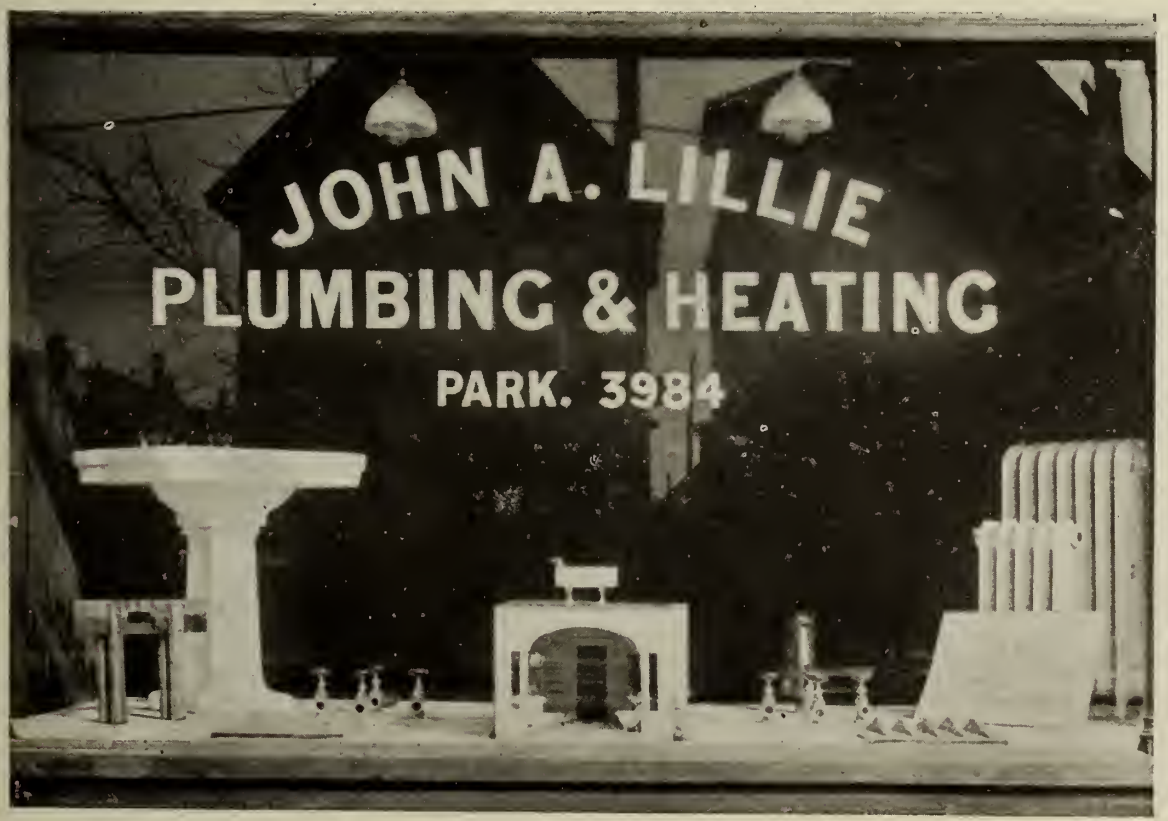
"I think it would be a good idea if every man who is a qualified sanitary and heating engineer wore a uniform so that people would know to what profession they belonged instantly. In my opinion, every qualified man should wear a badge also. It he went out on a job the householder would know as soon as he showed the badge that he was a man who had passed certain examinations and was competent to do certain work. In this way the public would be protected from men who are not properly qualified, but who will take on work about which they know little every time they get the chance."

The Apprentice Problem

Mr. Lillie regards the apprenticeship problem as one of the most important matters that the trade has to solve today.

"I think the term that apprentices serve should be lengthened," he said. "I would make it seven years instead of five as at present. We would then get the boys who wanted to be sanitary and heating engineers into the business. They would come in because of a true love for the work. Sanitary and heating engineering is a real business. There are all kinds of jobs where real skill is required and installations where real pride can be taken in planning and executing the work. Take for instance, such jobs as the heating and plumbing installations in some of the big modern office buildings and hotels.

"To my mind the public needs to revise its attitude in regard to plumbers' apprentices. At the present time, very often, if a boy is sent out with a man,



In his window displays which are changed regularly, John A. Little aims always to keep before the people of his vicinity, goods of the finest quality and educate them to buying this class of goods. He says he gets splendid results from his window displays.

protests are made that it is not necessary to send two men. The public should bear in mind that the boys have to learn and that the only way for them to learn is to get the actual experience by doing the work and seeing how good workmen do it.

Technical Education

In connection with the apprentice problem, Mr. Lillie also believes that more attention should be given to technical education for the boys. A great deal can be done, he believes, to improve matters along this line and provide instruction along the right lines for the boys who are learning the business.

Mr. Lillie believes that every man who is in business should go after business aggressively. Sitting still and waiting for people to come to you is not his idea of getting along. He has two shops and each is located in the heart of two of the best residential districts in Toronto.

"Good goods, good work and good service," said Mr. Lillie, "are my ideas of the foundation of a good business. No man can have a better advertisement for his shop than satisfied customers. They not only come back to him for future work, but they tell their friends and very often bring them.

Don't Mind Expense

"My policy is that no matter whether it is cleaning out a furnace or installing a lot of costly equipment, the job must be done right and the customer satisfied."

Just in connection with this little matter of cleaning furnaces it might be mentioned that Mr. Lillie has worked out a system that is not only fast and efficient, but profitable. He devised a motor equipment which works like a vacuum cleaner. With this apparatus he can go into a man's cellar and in short time thoroughly clean out a furnace and pipes then, if there is any soot or dust on the floor he can, in a few minutes run over it and leave everything spic and span. It takes only a short time to do a thorough job and one which satisfied the customer thoroughly, and for which he is willing to pay a price that leaves Mr. Lillie a good profit.

"I have calls every season from people who have moved away from Toronto," said Mr. Lillie. "One man over at Niagara Falls sends regularly to me to have this work done. He says he knows it will be done right. I told him when he first wrote in that owing to the distance it would be cheaper for him to get somebody at the Falls to do the work, but he said he wanted me to do the work and that the expense did not matter. I have several clients of this kind. It pays to have people think that much of your work."

Good Show Window

Mr. Lillie regards his show window as one of the best advertisements he has for his store. He gives it especial attention and always has a neat and attractive display arranged in it. As will be seen from the accompanying illustration it is not a large window, but it is used to good advantage.

Just how much importance people pay to display windows may be shown by a simple case recently. Early this month Mr. Lillie put in a large display card being the notice: "Get Your Furnace Cleaned Now. We Will be Busy Later." Within a week twelve new customers had called at his shop. Besides this, regular customers had phoned up to tell him not to forget them.

Use The Telephone

In conjunction with the telephone, Mr. Lillie states that 75 per cent. of his business comes in from telephone orders. He uses an advertisement in the telephone directory and says it has produced excellent results. In a district where new homes are constantly being erected and new people moving in Mr. Lillie says the telephone directory keeps his name before them.

"People who have recently moved in or who are not familiar with the firms in this district," said Mr. Lillie, "look in the telephone book just as quickly as there is trouble and they want a plumber. I get a lot of business in that way. They see my ad. in the telephone directory and call at once."

Other Mediums, Too

Mr. Lillie also uses newspaper space and the movies for advertising purposes. Every night his firm name is flashed to the crowds in one of the leading movie theatres in his section of the city.

"If this were only done occasionally," said Mr. Lillie, "it would have little value, but when it is done night after night and all through the year it impresses upon the people the name of John A. Lillie, and also that he is in the plumbing business."

A large street sign is also used by Mr. Lillie to direct people to one of his stores. It is always kept in good shape by being frequently painted and gives directions as to his shop. He gets good results, he says, from this.

Good Store Display

An attractive store display is a big help in business, he says. As will be seen from the illustration of the interior of his shop, he keeps an attractive showing of goods out where everyone who comes in can see it. In this way he sells a lot of goods, especially such lines as gas stoves and bathroom equipment. It takes time to keep this stock looking its best, free from dust and shiny, but Mr. Lillie says it is good business.

This summer he tried out a new stunt in the shape of handling high-priced lawn mowers. It occurred to him that in a district such as he is located in where there are a lot of new homes and well-built homes at that, that there was going to be a demand for lawn mowers. He got in a few of the best he could secure and placed them in a window. Within a short time he had sold a number, and during the season disposed of many more.

At the present time he is seriously considering handling electric fixtures, for which he believes there would be a good demand in his territory.

A Good Collector

Mr. Lillie has learned, he says, that one of the essentials of carrying on business is to be a good collector. It pays, he says to do business in a business-like way.

"Whenever I make a purchase of goods," he said, "I get an invoice the next day. I follow exactly the same plan in my business. As soon as a job is completed an invoice is sent to the customer. He knows then exactly where he stands. Collecting is an important matter. A good deal of tact has to be used. There are cases where, if we did not collect immediately, we would never get our money. There are other cases where the people are perfectly all right, and where, if we made an immediate demand we would lose their business and offend them. We do not take any chances on people that we do not know all about."

What Are the Powers of the Board of Commerce?

This is a Question That is Being Frequently Asked. It is a Question About Which There is Some Doubt. The Actual Powers of the Board and the Authority Under Which It Gets Its Powers Are Here Stated

THERE has been some uncertainty in regard to the powers and jurisdiction of the Board of Commerce. There are some who are inclined to doubt that it has the powers that the commissioners are claiming for it. There can be no real doubt on this score. The scope of its operations and its powers have been very definitely set by two acts recently passed by the Dominion Parliament.

"The Board of Commerce Act" and "The Combines and Fair Prices Act" were passed at the last session of the Dominion Parliament and came in force on July 7, 1919.

The Board of Commerce of Canada is a tribunal created under this act to enforce the terms of the "Combines and Fair Prices Act," which act relates not only to fair prices, but defines the offences relating to combines, mergers, trusts, monopolies, etc., but does not in-

Keep Your Stock Before People

McKelvey & Birch, Ltd., of Kingston, Ont., Have a Splendid Showroom and Get Excellent Results From Their Displays — Newspaper Advertising Has Also Brought in Some Fine Business

THE plumbing department is one of the most important in the whole of the big business of McKelvey & Birch, Ltd., Kingston, Ont. The stock carried is extensive and the business handled of large volume, and altogether this is one department which has developed to a point where it is almost considered in the light of a separate business.

And in a way it is just that. There is no little corner with a sink or a basin to form the display. There is a real showroom which provides an opportunity for customers to make a selection easily and by comparison with the various types of goods available. The accompanying photographs give some idea as to the arrangement of the display.

All Easily Seen

The baths, closets and basins are all arranged where easily seen, and on the wall above will be seen mirrors, medicine chests and bathroom fixtures of many kinds. Attention was also drawn to the arrangement of shelving for carrying bibbs, cocks, and various lines of brass goods. This is not a new method but it is one too seldom employed. Advantages are the constant display of the goods when sampled on the front of the drawers; an arrangement of stock where it is easily and quickly available and the care with which stock can be taken and orders for material running low can be placed.

Daily Check on Stock

The stock of pipe, fittings and various plumbing supplies is arranged on the floor above the main floor and in the cellar below. A daily check is kept so that the amount of goods on hand is always known. The firm employs a card index system by which every item carried in stock is listed. Slips for all the material used on a job are filled out daily and deductions made from the cards. It is possible by this system to determine at all times the amount of goods on hand without leaving the office for a trip to the stock rooms.

Watching the Work

Another point in connection with the sanitary and heating work is the close check kept on the work done by the men. As soon as a certain job has been completed, time cards and list of material used are sent in to the office, and in fifteen minutes the foreman of the work is advised as to whether the firm has made any money on the job or not. If not, there has to be some satisfactory explanation forthcoming—if so, the foreman is told of that, too, and commended when the figures prove to be on the right side of the ledger.

Feel Responsibility

"We are not just looking for a chance to complain and find fault when no money is made," explained Mr. Druce. "We want the men to feel some responsibility in their work and an interest in turning in profit making cards. We are far happier to be able to say to the foreman of the job, 'Well done,' than to have to criticize—not alone because money has been made, but from the fact that we all like to be making a success of the work in hand, no matter what it may be. Incidentally, I might say that we were able last Christmas to share a mighty nice little stake with our employees, so they realize that it is to their interest as well as ours to show a profit on the work they are doing."

Arranging Displays

Displays form an important part of the work done by the advertising man. Not only does he prepare newspaper copy, but he arranges the windows to correspond with the goods advertised in the papers. The floor display is also suited to the advertised lines, and in this consolidation of effort splendid results are obtained.

Windows are Current Events

One rather good idea carried out from time to time in the window displays is linking up the store's merchandise with

Show room of plumbing supplies in the store of McKelvey & Birch, Ltd., Kingston, Ont. It will be seen that the various sizes of tubs, styles of basins, etc., are out where prospective buyers can see and determine upon the types which they consider best adapted to their use. This display is in plain view from the street through a big plate glass front, the immediate foreground in the window being used to display smaller items. Brass goods are stocked in drawers, the drawers being sampled and in this way gain display value.

happenings of the town or pictures running at the local theatres. When the writer was in Kingston, one of the latest pictures of Charlie Chaplin, the popular moving picture comedian, called "Sunnyside," was being shown at one of the theatres. A rake was termed "a fine-tooth-comb," a lawn-mower carried a card about "clippings from the Sunnyside barber shop," and in this way, novelty, which is sometimes found of value, was injected into the showing of these goods.

Changed Regularly

The windows are changed at least once a week and occasionally when a special class of goods is featured for the Saturday specials ads., the windows will undergo another transformation to emphasize in their way the importance of the merchandise being offered.

Issue 32-Page Catalogue

One of the biggest sales developing features which the firm has is the yearly mail-order catalogue they issue. The last issue, just off the press, is a 32-page catalogue, which is sent out to a mailing list of 13,500 people. In the catalogue, particular attention is given to the listing of household supplies such as stoves, tinware, enamelware, dairy supplies, refrigerators, pneumatic water supply systems for country homes, pumps, washing machines, etc.

Splendid Results

"The results obtained are really remarkable," stated Mr. Home. "Not only is this noticeable in the increasing mail-order business which we can call a direct result, but with the greatly-increased use of the automobile. Our stove sales directly to former mail-order customers only have shown a tremendous spurt. People whom we would rarely, if ever, see enter our doors are now consistent visitors. The business we are getting is traceable to the good impression created by the catalogue with the convenience afforded by the automobile, which lessens distance materially."

Farmers Better Buyers

Asked as to the class of goods the farmer is demanding, both Mr. Home and Mr. Druce stated there was a call for merchandise which would minimize farm work in the home. "This is slow in come but it is coming," stated Mr. Druce. "We can see it in the plumbing department, in the call for power washing machines and power churns. We are also selling quite a few electric lighting plants, which is a class of business that opens up great opportunities. In the next few years there will be great development along these lines and the field presents almost unlimited possibilities."

Newspaper Advertising

Speaking of newspaper advertising brings one's attention to this carefully planned part of the sales programme of this aggressive firm.

In commenting on the question of newspaper advertising and its value, Mr. Druce brought out a point which is very often overlooked. That is the buying power of the newspaper as a company and meeting the individual employees' requirements. "We find that we are getting a tremendous amount of business just now from the papers themselves and their employees," Mr. Druce pointed out. "We have been called upon to do a great deal of work around the printing plants, and we know many employees who buy from us through our advertising, and who influence their neighbors to do likewise. If we were getting no more business than that generated from these sources as a result of the space we are using, we would feel well repaid. But of course the effect of our advertising is shown also in the increased business from the city and surrounding country served by these papers."

Ever-Increasing Territory

Very often the merchant takes the attitude that he is getting all the business there is in his district—that the territory is limited and possibilities for expansion nil. It is a mistaken idea which merchants in neighboring towns are cashing in on. Speaking on this question of restricted territory and limited opportunities for trade, Mr. Home said: "We are never satisfied to stand still and rest on the laurels of the past. To-day is here and the possibilities for trade are greater than ever before. Unless we are showing constant increase we feel there must be something wrong and the territory we serve is constantly widening. We do intensive work on the immediate territory which we serve, and it is not difficult to increase the scope of our activities all the time. A territory is never worked out or played out unless the merchant serving the territory is worked out or played out. One cannot sit still in this old world of ours—one goes ahead or goes back. We are in the class with those who want to go ahead and are working toward that end."

Telephone to Customers

Another instance of how aggressive tactics are succeeding for this firm is instanced in the business that is done over the telephone. "We have a regular list of customers served by stage routes whom we call at least once a week on the telephone," Mr. Druce stated to SANITARY ENGINEER. "This work is systematized in such a way that each customer can tell what time we will call and has his list of goods ready to read off to us. They appreciate this attention, too, and the expense of phoning is very small when the business which we secure is taken into consideration, besides the good will engendered."

BOARD OF COMMERCE

Continued from Page 20

clude combinations of workmen or employees.

The board consists of three members, but power is given under the act for a commissioner to sit alone, take evidence and submit same for the consideration of the whole board. It does not follow that because a person is invited or subpoenaed to appear before the board that any charges have or will be made against him, the sole object of the board being to obtain information through these witnesses.

The Fair Prices Act

The Fair Prices Act deals with necessaries of life. The term "necessaries of life" is declared to mean a staple and ordinary article of food (whether fresh, preserved, canned or otherwise treated), clothing and fuel, including the products, material, and ingredients from or of which any thereof are in whole or in part manufactured, composed, derived or made, and such other articles of any description as the board may from time to time by special regulation prescribe. The important and outstanding feature of the act is its creation of new statutory offences for the punishing of hoarding and excessive profits. It is declared that no person shall accumulate or shall withhold beyond an amount thereof reasonably required for the use or consumption of his household or for the ordinary purposes of his business. It is directed that every person who shall at any time hold any necessary of life beyond an amount thereof reasonably required for the use or consumption of his household or for the ordinary purposes of his business and every person who shall hold for the purpose of sale, whether as manufacturer, wholesaler, jobber, retailer or otherwise, any stock-in-trade of any necessary of life shall offer for sale the said excess amount, or the said stock in hand, as the case may be, at prices not higher than are reasonable and just.

Farmers Exempted

The exceptions from this general rule against excessive accumulation are: It does not apply to accumulation by a farmer or gardener of farm or garden products of any land cultivated by him. 2. No manufacturer, wholesaler or jobber is, because of anything in the act, obliged to sell to other than such classes of persons as are accustomed to purchase from manufacturers, wholesalers or jobbers, nor shall any person be under obligation to sell otherwise than in accordance with the ordinary course of business.

What Constitutes An Unfair Profit?

On the subject of unfair profits, the act makes an important definition. An unfair profit shall be deemed to have been made when, pursuant to and after the exercise of its powers by this act conferred, the board shall declare an unfair profit to have been made. The unfair enhancement of cost or price shall be such enhancement as has resulted from the making of an unfair profit.

The board is empowered and directed to enquire into and to restrain and prohibit the making or taking of unfair profits for or upon the holding or disposition of necessaries of life, and to restrain and prohibit all such practices

Saving Fuel in Heating a House

By L. P. BRECKENRIDGE and S. B. FLAGG

THE total output of coal in the world during the calendar year 1913, according to a Government report, was 1,443,393,052 short tons and of this enormous amount 39.5 per cent., or 570,048,125 tons, was mined in the United States. Probably 10 to 15 per cent. of the coal produced in this country went to purchasers who used it largely for heating dwellings. The Federal Government uses a large quantity of coal for heating the many small buildings occupied by its various departments and bureaus, and is therefore directly interested not only in selecting proper fuels, but in obtaining the best possible results from their consumption. Because of this interest on its own account and the widespread interest of householders the Government some years ago conducted tests to determine the relative value, for use in residence-heating boilers, of several typical fuels.†

The value a householder gets from the fuel he burns depends largely on the character of the heating apparatus, the conditions under which it is installed, and the manner in which the fire is handled. The authors, from experience in firing residence-heating apparatus and from observing the methods employed by many who attend to such apparatus, keenly appreciate the importance of proper firing methods, and have written this paper in the belief that some general remarks on the selection, care and operation of residence-heating apparatus may prove of value to many who are interested in burning fuel in the most economical manner.

This is the fourth instalment of the fourth of the series of Engineering Bulletins issued by the United States Fuel Administration in collaboration with the Bureau of Mines, Department of the Interior. This series is receiving very favorable comment. In this concluding instalment on "Saving Fuel in Heating a House," "General Suggestions on the Firing of Coal, etc.," are dealt with. This fourth article covers the saving of fuel in house heating thoroughly and should appeal to every heating engineer. This is the last instalment. Keep them all for reference.—EDITOR'S NOTE.

Tests and General Deductions

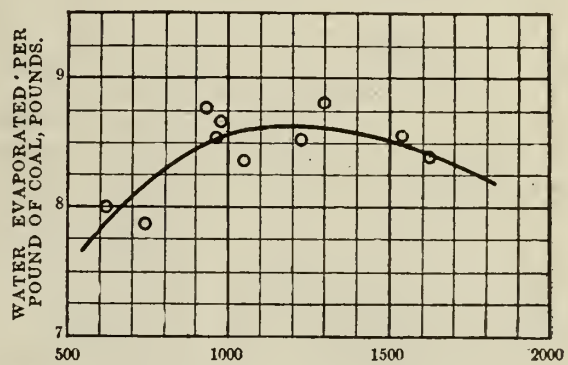
It would be highly desirable to present results of tests that would show a householder how much fuel his own heating equipment, if properly handled, would burn or, if he were considering the installation of such equipment, just what fuel consumption might be expected with any given equipment and fuel. Such information would be appreciated not only by the householder but by architects, heating contractors, and manufacturers of heating equipment.

However, so many variables affect the consumption of fuel in heating equipment that it is impossible to tell closely what quantity of fuel will be needed. A comparison of the amount of fuel burned in heating an equal number of rooms in two houses may be as misleading as a comparison of the ice used by two families, one of which uses much ice for the table and has a refrigerator exposed to excessive heat in a kitchen or on a porch, whereas the other uses little ice on the table and keeps its refrigerator in the cellar.

In fact it would be difficult to construct and equip two houses in such a way that the same quantity of fuel would be required to maintain the same temperature conditions in both, and it would be difficult to buy fuel of such quality that the same quantity would be required for each house if all other conditions were exactly comparable.

Within the last few years some of the leading manufacturers of house-heating boilers have adopted the policy of testing every type of boiler they manufacture and are now publishing, or furnishing on application, the characteristic "economic-performance curves" for each of their boilers when burning different kinds of coal at all probable rates of combustion.

From these performance curves the architect and engineer can plan to better advantage heating equipment for small residences, apartment houses, and office buildings. One of these "economic-performance curves" is shown in figure 3.



Of the published tests of house-heating equipment the greater number were conducted for the purpose of comparing the merits of different fuels for use in such equipment. Tests of this character were made at the Government fuel-testing plant at St. Louis*, at the engineering experiment station of the University of Illinois†, and at the engineering experiment station of the Iowa State College of Agriculture and Mechanical Arts‡, but in none of these tests were residence-heating conditions actually maintained. Therefore the results, although valuable as indicating the behavior of the coals and their probable evaporative power in certain types of boilers at low but fairly uniform rates of combustion, are not of great assistance in determining how much fuel would be needed to heat a certain house.

Data on Fuel Consumption at Residence in New Haven, Conn.

The authors are indebted to Prof. E. H. Lockwood, of the Sheffield Scientific School, Yale University, for the following carefully kept record of the fuel consumed in heating his own residence during the heating season of 1912-13. The record is presented just as received, except for the omission of certain names. It is regrettable that

*Randall, D. T., Tests of coal and briquets as fuel for house-heating boilers: Bull. 27, Bureau of Mines, 44 pp., reprint of U.S. Geol. Survey Bull. 383.

other and equally complete records of fuel consumption for heating small residences are not available:

Memorandum of fuel consumed in heating a small residence.
(Reported by E. H. Lockwood.)

LOCATION AND EXPOSURE

1. Location of house.....New Haven, Conn.
2. Street .....52 Division Street.
3. Exposure .....North and east, sheltered by trees; west, protected by a house 20 feet distant.

DESCRIPTION OF HOUSE

4. Construction .....Frame, clapboard on first floor, shingle on second floor, slate roof.
5. Number of stories.....2, plus attic and cellar.
6. Number of rooms heated by heating system. 10.
7. Windows .....Good condition, single glass windows, with storm windows on north side.

DIMENSION OF ROOMS AND RADIATION INSTALLED

	Floor.	Room.	Floor Space in Feet.	Volume in Cubic Ft.	Amount of Hot Water Radiation Installed, in Feet.
8.	First	Parlor	13 by 14	1,300	52
9.	Do.	Dining	14 by 16	2,030	61
10.	Do.	Living	16 by 20	2,800	150
11.	First and second.	Hall	8 by 10	1,200	65
12.	Second	Bedroom	12 by 14	1,320	31
13.	Do.	do.	13 by 14	1,450	35
14.	Do.	do.	11 by 11	980	22
15.	Do.	do.	9 by 11	700	26
16.	Do.	Bathroom	6 by 8	400	13
17.	Attic	Bedroom	10 by 12	850	26

FURNACE AND HEATING SYSTEM

18. Heating system .....Hot water, direct radiation.
19. Kind of heater.....——, hot water, size ——, No. 2.
20. Diameter of fire pot.....20 inches.
21. Area of grate surface.....2.2 square feet.
22. Kind of radiators.....Cast iron, —— make, some 19 in. high, some 33 in. high.
Total amount of hot-water radiation.....481 feet, actual.
23. a. Exposed double-glass surface.....130 square feet.
b. Exposed single-glass surface.....286 square feet.
c. Exposed wall (plaster and clapboard)...1,750 square feet.
d. Total volume of space heated.....13,000 cubic feet.
24. Supplementary heating system.....2 fireplaces, 1 in dining-room, 1 in living room.
25. Wood burned in fireplaces.....1 cord a year.
26. Kind of wood.....Oak and maple, 2-foot lengths.
27. Use of fireplaces.....Dining-room fireplace used nearly every morning in cold weather for about 1 hour; other fireplace used less, more for cheerfulness than for heating.

FUEL AND METHOD OF FIRING

28. Kind of fuel used.....Yard pea (intermediate in size between washed pea and No. 1 buckwheat).
29. Cost of coal, delivered in bins.....$4.25 per short ton (2,000 pounds).
30. Name of dealer.....———— Coal Co., New Haven, Conn.
31. In charge of furnace.....Owner, aided by family.
32. Firing schedule in cold weather.....Coal fired at 7.30 a.m., 8.30 a.m., 1 p.m., 6.30 p.m. and 10 p.m.
33. Automatic appliances .....Clock to open pipe damper at 5.30 a.m. Used every night.

TIME FURNACE WAS OPERATED—1912-13

34. Furnace fire started in fall.....October 2, 1912.
35. Furnace fire ended in spring (not going continuously after May 1).....May 22, 1913.
36. Number of days furnace was in operation..219.
37. Number of weeks furnace was in operation. 31.3.
38. Number of months furnace was in operation. 7.3.

AMOUNT OF COAL BURNED, AND COST

39. Total weight of coal burned during season..18,780 pounds.
40. Total weight of coal burned during season..9.4 net tons.
41. Average weight of coal burned per day.....86 pounds.
42. Greatest weight of coal burned per day (for 2 days only, Jan. 13 and Feb. 6) .....160 pounds.
43. Smallest weight of coal burned per day....20 pounds.
44. Maximum coal burned per week (Feb 7-13).960 pounds.
45. Minimum coal burned per week (Apr. 23-30).160 pounds.
46. Average weight of coal burned per sq. foot of grate per hour on coldest day.....5 pounds.
47. Cost of coal for furnace for season.....$40.
48. Cost of wood for fireplaces for season.....$8.
49. Total yearly cost of heating house, including furnace and fireplaces.....$48.

TEMPERATURES AND CALCULATED RESULTS

50. Average daily temperature inside for whole season, assumed .....69° F.
51. Average daily temperature inside during coldest week, assumed.....66° F.
52. Average daily temperature outside for 219 days, Oct. 2, 1912, to May 22, 1913, from records of New Haven Weather Bureau..41.5° F.
53. Same for coldest week of winter, February 7-13, 1913 .....20.7° F.
54. Constants used for obtaining heat loss from house:
a. Double glass, per sq. ft. per hour.....0.46 B.t.u.
b. Single glass, per sq. ft. per hour.....1.03 B.t.u.
c. Walls (plaster and clapboard).....0.44 B.t.u.
55. Calorific value of coal was not determined, but from analysis of washed pea sold in New Haven, it was estimated at.....12,500 B.t.u.
56. Heat loss from house, figured from items 23, 50, 51, 52, 53, 54, average from Oct. 2, 1912, to May 22, 1913, per hour.....31,000 B.t.u.
57. Same, average during coldest week from Feb. 7-13 ,1913, per hour.....50,800 B.t.u.
58. Heat theoretically available in fuel, figured from items 41, 44, 55 (assuming 1 cord of wood equal to ½ ton of coal):
a. Average from Oct. 2 to May 22, per hr..47,500 B.t.u.
b. Average during coldest week, Feb. 7-13, 1913, per hour.....75,800 B.t.u.
59. Average furnace efficiency, figured from items 56, 57, 58a, 58b:
a. For 219 days, Oct. 2, 1912, to May 22, 1913 .....65 per cent.
b. For coldest week, Feb. 7-13, 1913.....67 per cent.

MISCELLANEOUS REMARKS

Number of years same furnace has been used with this fuel by present owner....Five years.
Experience of owner.....All rooms can be kept comfortable (70° F.) in coldest weather, except 2 rooms (items 8 and 12). These rooms have insufficient radiation and can not be heated above about 65° F. in coldest weather.
63. Use of rooms.....All rooms in the house have been used continuously and heated during entire winter.
64. Capacity of heater.....Has been ample to supply hot water at all times.
65. Method of weighing coal..... A 25-lb. spring balance was hung from bracket on side of coal bin. Coal was shoveled into ordinary scuttle holding 20 lbs. net, and after weighing was dumped into supply box holding 40 lbs.

The report shows not only a low cost of heating but also an economical use of fuel and illustrates what savings may be effected when the problem is given proper consideration. Yard pea could be used because the heater was large enough to burn the coal, even in the coldest weather, at a low rate of combustion per square foot of grate area. Systematic and regular handling of the fire doubtless had considerable to do with the results obtained. The cost of heating is probably $50 to $100 less than what is expended by a large number of householders who live in the same locality and have about the same heating requirements but use more expensive fuel and give their heating equipment less attention.

Summary

The most important points mentioned in this paper are as follows:

1. The amount of fuel consumed in heating a house depends on many factors. Some of the factors are within the control of the householder; others are not.

2. Both convenience of operation and consumption of fuel depend on the system of heating (and ventilation) installed, and convenience, fuel consumption, and first cost should be considered in making a selection.

3. The heater should be large enough to meet continuously and without attention for periods of eight hours the demands for heat in all weather except the most severe.

4. Heating equipment that burns satisfactorily and economically one kind or size of fuel may not be well adapted to burning another.

5. Ascertain by experiment what fuel and what method

of using it are best suited to your needs. As a rule, the effort to obtain this information will be amply rewarded by the saving that will result.

6. Attend to the fire regularly and try to anticipate the demands for heat.

7. Keep the heat-absorbing surfaces of the heater free from soot and dust by regular cleaning.

8. Heating systems often fail to meet the demand for heat in severe weather because of insufficient draft. To supply additional heat, the heater must be able to burn more coal.

9. The more probable causes of insufficient draft are:

(a) Chimney not high enough, or having its top too near some tall object.

(b) Chimney, smoke pipe, or gas passages of heater clogged with soot or debris, sometimes through the breaking of a partition between two flues in a chimney.

(c) Leaky connection of smoke pipe to heater or to chimney.

(d) Accidental closing of hand damper in smoke pipe.

(e) Clogging of fuel by clinkers.

(f) Too great a length of horizontal smoke pipe between the heater and the chimney.

Col. George Nasmith to Engage in Sanitation Consulting Work

COL. GEORGE G. NASMITH, C. M. G., who has been director of the Toronto civic laboratories since the Health Department was reorganized in 1910, will relinquish his duties in that department at the end of the year, and will engage in consulting work on sanitation matters. He plans to enter upon a commercial career, and has accepted an appointment as consulting scientist with the firm of Gore, Storrie & Nasmith, of Toronto. The announcement came as a surprise to the civic authorities, although it could not be said that it was altogether unexpected in the Health Department.

During his association with the Health Department, Dr. Nasmith successfully inaugurated many improvements for the benefit of the citizens, not the least being the regulations for improving the water supply, which resulted in Toronto having the purest water of any city on the continent. He also brought about reforms in regard to milk supply and the supervision of dairies.

At the outbreak of the war, the services of Dr. Nasmith were requisitioned by General Sir Sam Hughes, then Minister of Militia, and he supervised the installation of the water supply and the sanitation at Valcartier camp. He afterwards proceeded to England with the Canadian forces and did valuable work at Salisbury Plains and other points. His greatest work, however, was in France and Flanders. He was present at the second battle of Ypres, when the Germans made their first gas attack. Dr. Nasmith detected the devilish manoeuvre and promptly found an antidote for it. He also invented a gas mask for the use of the troops when combatting similar attacks later. For this and other most valuable scientific work, Dr. Nasmith was honored by His Majesty King George, who conferred upon him the Order of St. Michael and St. George. Dr. Nasmith is an author of some repute, and has just completed for publication a historical review of the earlier stages of the war, under the caption, "Canada's Sons in Great Britain in the World's War."

Since his return from overseas he has written examinations resulting in his adding to his name, the letters D. P. H. (Diploma Public Health).

Want Wells Exempted From Income Taxes

At the annual meeting of the Canadian Natural Gas and Petroleum Association, held at Hamilton, Ont., President C. E. Steele, Port Colborne, pointed out the need of greater co-operation amongst the producers. This, he said, would not only work to their own benefit, but to the benefit of the consumers as well.

The committee on law and legislation recommended that legislation be sought exempting natural gas wells from income taxes and that amendments to the Act permitting the registration of wells on a different basis, be gone after. An effort will also be made to have the duty on natural gas well tools removed.

The association had a membership of 106, and a cash balance of $455, the treasurer reported.

A. M. McQueen referred to the fact that it was a Hamilton man, J. H. Williams, who drilled the first oil well on the continent, at Oil Springs. He expressed the opinion that there were vast oil deposits in Western Ontario. Addresses were delivered by J. P. Mickle, Toronto, and J. Stoliker, Chatham. At the banquet the principal speaker was D. A. Costie, Niagara Falls, who gave an interesting talk on the history of natural gas development.

Board of Health Wants Wider Powers

New legislation designed to give the health department more control over conditions in Winnipeg, is to be considered shortly by the legislation committee. The authorities intend to deal with several recommendations made by Dr. A. J. Douglas, city health officer, in his annual report and prepare the applications for presentation at the next session of the legislature.

The city probably will ask for authority to pass regulations to prevent excessive noise nuisances, and to secure better control over the ventilation of churches, schools, theatres, motion picture theatres, public buildings, factories and workshops.

It intends also to secure for the department power to approve all mechanical systems of ventilation. It hopes to obtain power to regulate undertakers' establishments, to inspect and regulate barber shops, to order the extermination of rats in buildings and their exclusion by better methods of building construction.

The city will ask for power to license and regulate boarding houses and demand the cleanliness, ventilation and heating of street cars and terminals, according to present plans.

DISCOVERY OF OIL IN ENGLAND

J. E. Ray, Canadian Trade Commissioner in Manchester, England, writes as follows:

"With regard to the discovery of oil in England recently, the well-known geologist, Dr. W. Forbes Leslie, who has just completed a tour of inspection of the East Anglian oil fields, states that it is the greatest discovery since coal. It is calculated that over 2,000,000,000 tons of shale lie in the neighborhood of King's Lynn. Supplies are forthcoming in satisfactory quantities, but boring and laying of plant are not yet completed.

"Dr. Leslie states: 'It is my belief that the supply is well nigh inexhaustible, and it is not damaged by sulphur. The oil is wonderfully pure, and the richness of the deposits extraordinary. For every ton of shale we can average 50 gallons or so of pure crude oil.'"

BOARD OF COMMERCE

Continued from Page 22

with respect to the holding or disposition of necessaries of life, as in the opinion of the board are designed or calculated to unfairly enhance the cost or price of such necessaries of life.

Whenever an offence has been committed against the fair prices part of the act, the board may remit the evidence to the attorney-general for such action as he may be pleased to institute. But the act also provides that the board may itself declare or find as to the guilt of the person concerned, and it may order or prohibit the doing or omission of any act or practice relevant to or connected with the offence and in case of disobedience by such person of such order he shall be liable to a penalty not exceeding one thousand dollars and costs for every day after the expiration of four days during which such person continues to disobey or to omit to perform such order.

RE-TRAINING THE SOLDIERS

CRITICS have said that the Canadian system of vocational training for returned soldiers might be broader and touch a larger proportion of the men. At present some 12,000 veterans are taking the course. It must be remembered that there is no compulsion in this matter. Only those who apply voluntarily receive the advantages.

Great numbers of the returned men are efficient artisans. Others are good office men or experienced in salesmanship. Some belong to the liberal professions. A goodly proportion of the healthy veterans enter civil life by their own exertions and are "making good." There is a proportion of "drifters" also who perhaps do not realize the advantages of the special training courses offered.

Taking all these facts in to consideration, and remembering that many veterans do not apply until they have had a few months' rest, or until the advantages gained by friends may give personal knowledge of the scope and the value of the training, the roster of 12,000 is large.

The best proof of this assertion is found in a comparison with the situation in Great Britain. There about 4,000,000 were enlisted, eight times as many as were in the Canadian Expeditionary Force. If the same proportion of applications were made in England as in Canada, there would be over 90,000 men under training. The actual number of veterans taking the English courses is only 15,000.

Much of the criticism of the work in Canada has been unsoundly based. Generally speaking, the Dominion has a better organized and more efficient plan of re-education than any other nation engaged in the war. It is supported by the proceeds of the Victory Loan. Every Canadian who buys Victory Bonds may be assured, whatever his political opinions, that the work of re-establishment is a pressing need, and that it will be of the utmost advantage in the complete repatriation of returned men.

COURTESY IN BUSINESS

DON'T regard the traveller as an intruder. Modern commercial conditions have made him almost as important a factor in the business world as the retailer. His business is honorable and he has a legitimate claim on your time and is entitled to be received courteously. If you do not have time to talk to him just when he calls tell him so and tell him in such a way that he cannot help seeing that you would gladly talk to him if you could. Make an arrangement to see him later. If he has a new line, listen to him for there may be some good profit in it for you. If he has goods that you do not need you can tell him so courteously.

MAY CLEAR THE AIR

TWO of the greatest strikes in history are now in progress. The walk-out in England involves more than half a million railway workers. That in the United States more than 250,000 workers in the big steel mills. At the present time it is impossible to even forecast what is likely to happen as not enough time has elapsed for developments of a real character in such titanic tests of strength. One thing seems to be fairly certain that no matter which side wins the air will be cleared and an enormous amount of the unrest that has prevailed will be dispelled. This will, of course, mean a step toward normal business conditions, and that is something which every business man has desired earnestly. The effects of the strikes on trade are already

making themselves apparent in slowness of deliveries and a tendency for the markets to stiffen as supplies which are sold out cannot be immediately replaced. Neither do the dealers expect to replace them at former quotations. The general business situation in Canada is regarded as most excellent and the prospects are that it will continue so.

GREAT BUILDING ACTIVITY

EVERY week sees increased activity in the building trades. Many contractors have more work now in hand than they had just before the war and that was the busiest period for many of them in their history. The building projects include all kinds of work, but from the standpoint of the plumber it is particularly gratifying to see so many splendid homes being constructed. Houses of the better class are being erected in great numbers. These call for the best in many lines supplied by the plumbers and a splendid business is being done. In spite of all the work that is now under way a still larger programme of building is developing for next season, and indications are that 1920 will mark new records in construction work in Canada. Many firms are finding themselves so rushed with business that extensions to their plants are required to take care of orders. A large amount of construction work of this kind is developing.

HOUSEHOLDERS AND ELECTRICITY

ON every side the rapid development of electrical utilities is witnessed. Electric washing machines, motors for sewing machines, electric vacuum cleaners—one can go on naming them and one striking thing is the attention paid to the householder, to the lady of the house. Evidence is not lacking that efforts are being put forth to give to the housewife equipment which will make her work easier and better. The shortage of domestic help is one big factor upon which the merchant can depend to enlarge upon his sales of these various appliances. Even when domestic help is available, greater consideration is given towards lightening their labors and the woman of the house is quick to see the advantages in modern electrical equipment. Developing this trade is profitable and makes friends who become permanent customers of the store. Many plumbers to-day are realizing this fact and planning their sales campaigns accordingly.

POOR TELEPHONE SERVICE

POOR telephone service, especially after being promised better service after the rates were raised by the company, is annoying. Business men have been complaining bitterly about long delays in getting calls through, being given wrong numbers repeatedly and similar annoyances. As far as Toronto goes there is apparently some justification for the complaints. It is extremely annoying for anyone who wants a number in a hurry to wait anywhere from three to five minutes before the 'phone is answered, and then to be given a wrong number. When he gets wrong numbers three or four times, with the usual delays in getting an answer at all, the party who is trying to 'phone is exasperated. It is just as annoying after one has given a number and waited some minutes without results to be asked by some sweet-voiced young thing: "Were you wanting a number?" and yet this sort of thing is happening dozens of times every day. If the statements of business men are even anywhere near correct there is ample room for improvement in the telephone service.

HELP THIS GOOD WORK

THE Canadian Government, by proclamation, has designated Thursday, October 9, as "Fire Prevention Day," and people all over the Dominion are being asked to make a close investigation of their premises with a view to discovering and removing all possible causes of fires. Business men are vitally interested in this matter not only personally but from a community standpoint. Many firms realized long ago the dangers that lie in piles of rubbish in cellars and back yards or other places. Their neighbors do not always take the same view and a little personal talk on this question may be the means of saving thousands of dollars from the fire demon. Statistics prove that Canada's enormous fire losses are due not to the fires that originate in the homes but to the destruction of stores and factories. Every time a large store goes up in smoke the loss runs anywhere up to a million dollars. If a home burns the loss seldom exceeds $5,000. The great quantities of goods that are destroyed every time a store or a factory burns means an absolute loss. They cannot be replaced. Due to fires of this kind and to forest fires, Canada's per capita loss has grown to be the largest in the world. The great majority of the costly fires are traceable to carelessness. It is to bring home to people the seriousness of the situation and to impress them with the need of being careful that the Government has instituted "Fire Prevention Day." October 9 was chosen because it was the anniversary of the great fire in Chicago which started when a cow kicked over a lantern in a barn. Every business man can do something to lessen the fire loss in Canada, and it is his duty to do it and lend all the support he can to a movement that will make things better for the entire Dominion. Another matter in which the merchants can help is in seeing that the building by-laws in their community are so altered that fire dangers will be reduced to a minimum. In many towns and cities the building by-laws are obsolete. In others there are good regulations but they are not lived up to. Every effort should be made to see that situations of this kind are corrected.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

PERSONALS

Sometime ago it was announced that Paul Mercier, chief engineer of the city of Montreal, was resigning from the position. It is now learned that he will not be entirely dissociated from the affairs of the city, as he has been retained in the employ of the ratepayers as a consulting engineer. His time, however, will only be partly occupied in this connection, as he will join the staff of the Ecole Polytechnique as an instructor and lecturer.

After serving for four years overseas with infantry battalions and the Engineers, Paul Whitney, of Toronto, has returned and has been appointed manager of the B. Blair Tile Manufacturing Company, Ltd., of Woodstock, Ont. Mr. Whitney was formerly a resident of Prescott, Ont.

NEW FIRMS

A. P. Johnston and J. J. Richardson, hardware and plumbing, have commenced business at Walkerton, Ont., under the firm name of Johnston & Richardson.

TRADE NOTES

H. B. Wilcox, Toronto, plumbing and hardware, has discontinued business.

The Taylor Forbes Co., Ltd., of Guelph, Ont., is erecting an addition to its foundry to cost $9,000.

The Renfrew Electric Products, Ltd., has purchased the Majestic Electric Supplies, Ltd., of Toronto, Ont. The headquarters of the firm will be at 29 Richmond Street W., Toronto.

WANTS PURER WATER

Dr. James Roberts, M. O. H., of Hamilton, Ont., will shortly ask the city to provide additional sanitary equipment for filtering city water. The present equipment, Dr. Roberts states, was doing good work, but when a high east wind is blowing, the city water becomes contaminated, and this is a condition which the health department is trying to overcome.

He is not satisfied with the present conditions, despite the fact that they compare favorably with other large cities. A small expenditure would overcome the polluted condition when east winds are blowing, and he is of the opinion that on no occasion should Hamiltonians have to use water which does not meet with the health requirements. He pointed out that contaminated water used for one day would be sufficient to cause an epidemic, and will recommend that the new apparatus be installed.

Sudden Death of W. Cromwell Gurney

Prominent Toronto Business Man—President and General Manager Gurney Foundry Co., Ltd.

W. Cromwell Gurney, president and general manager of the Gurney Foundry Co., Ltd., collapsed suddenly while visiting the office of his physician for routine treatment. In spite of the efforts of two other physicians present, resuscitation was impossible, and Mr. Gurney passed away from heart failure.

Earlier in the year Mr. Gurney suffered from influenza, from which he had not made a complete recovery. The sudden death of his mother only last week affected him profoundly, and since that tragic event he had been upset and unlike himself. The news of his death came with shocking suddenness, as he

The late W. C. GURNEY

lunched yesterday, apparently in good health, at the National Club in company with business associates.

Mr. Gurney, who was in his 46th year, was the son of the late Edward Gurney, whom he succeeded as president of the firm upon the latter's death a few years ago. He was educated at Upper Canada College, and then entered the Gurney Foundry Co. He was a member of the National Club, Lambton Golf Club, the Canadian Manufacturers' Association, the Board of Trade, and was one of the best-known of Toronto's business men. He was also a member of the Metropolitan Church.

He is survived by his wife and three children, and also one brother, E. H. Gurney, and three sisters, Mrs. Sanford Evans, Ottawa; Mrs. E. B. Ryckman, Toronto, and Miss Gladys Gurney.

Plumbing Inspector Appointed At London

The City Council of London, Ont., after a long delay, has appointed James C. Young of London, as plumbing inspector. The salary is to be $1,500 per annum. It will be his duty to see that all existing bylaws in regard to plumbing are enforced. In future a permit must be taken out by anyone before fixtures relating to plumbing may be installed, and on completion the work must undergo an inspection, for which a charge will be made of $1 for up to five fixtures, and an additional charge of 25 cents for each one above that number.

All the bylaws in regard to buildings must be referred to the plumbing inspector and a report will be made by him to the board of health, relating to the plan for plumbing arrangements.

A journeyman plumber must be in possession of a license from now on.

W. H. CUNNINGHAM BACK

W. H. Cunningham of W. H. Cunningham & Co., Toronto, who has been spending a few weeks in England and Scotland, on business, returned on the "Tunisian." Mr. Cunningham reports great difficulty in securing return passage. Many of his fellow passengers have been weeks trying to book.

Maulson & Buchanan, 40 King St. E., Toronto, have secured the agency for Canada for the line of sanitary clay products and sanitary fixtures manufactured by George Howson & Son, of Hanby, England.

L. J. MUELLER FURNACE CO.

"The Modern Method of Heating Your Home," issued by the L. J. Mueller Furnace Co., of Milwaukee, Wisconsin, contains sixteen pages and deals thoroughly with the Mueller pipeless furnace. The catalogue is printed on glazed paper and is very attractively illustrated. Readers of SANITARY ENGINEER may obtain copies upon request.

Hamilton Master Plumbers Entertained by Standard Sanitary Mfg. Co., Limited

ABOUT eighty of the Master Plumbers of Hamilton, Ont., together with members of the craft from Toronto, Bridgeburg, Niagara Falls, Brantford and Galt, were guests of the Standard Sanitary Mfg. Co., Limited, Toronto, this week, at a banquet held in the King Edward Hotel, and a trip of inspection through the firm's factory.

The outing was arranged by Charles F. Rogers, manager of the company's Hamilton branch, and with the idea of not only bringing the men in the trade together, but of showing them how the goods they are installing are manufactured.

Automobiles were provided and the party got an early start from Hamilton. All went well until the party reached Oakville, where a half an hour was lost while the members made a detour around big "Bill" Whittaker. Soon after this, John Kerr of Hamilton, was stopped by D. W. Rose, of the Gurney Foundry Co., for speeding. Mr. Kerr did not know until he reached Toronto, that a joke was being played on him, and he was much relieved to find that he was not to appear in court on the charge.

Enjoyed Fine Banquet

Soon after arriving in Toronto, the members of the party were taken to the King Edward Hotel for dinner. Following an excellent meal, W. H. Cunningham, of W. H. Cunningham & Co., Toronto, who was toastmaster, proposed the toast to the King. After this had been responded to enthusiastically, the chairman called upon Mr. Hugh Wallace, manager of the Standard Sanitary Mfg. Co., Limited.

Mr. Wallace extended to the visitors a very hearty welcome and declared that it gave him real pleasure, as a former resident of Hamilton, to see so many of his old friends. He regarded it as a real reunion. Gathering together by men in the same line of business was beneficial at all times and brought about a better understanding of one another's problems and promoted general good feeling. Years ago, he said, the men in the trade did not know each other as they should and did not work together. To-day men are working along different lines and organization and friendship is taking the place of the former spirit that kept men apart.

Scores Price Cutting

The old plan, he said, encouraged such evils as price cutting and by working selfishly alone men often found that in the end they had been working without profit. Because one man made a certain price on a job, they felt they had to cut under it, and so it went. This was a wrong plan, and men have discovered that they need to work on a broader basis and have been studying the problems in their own trade and trying to work them out for the good of all.

Mr. Wallace expressed regret that the president of the company, Mr. J. A. Riordan, was ill and unable to attend. On his behalf, he welcomed the visitors not only to Toronto, but to an inspection of the factory.

Kindness Appreciated

W. J. Walsh, on behalf of the members of the Sanitary and Heating Association of Hamilton, expressed the thanks of those present to the company for the outing and entertainment.

"Every time the men in our trade or any other get together at an affair of this kind," he said, "good results. There is a bond established between them and a better feeling exists." A trip through the plant would not only educate the men present, regarding the way in which the goods they were handling are manufactured, but it would bring them into touch with the manufacturer and all those working in the same business have a common interest. Getting together creates a spirit of live and let live and the men should endeavor to get together oftener."

James Saynor of Hamilton, spoke briefly in seconding the vote of thanks proposed by Mr. Walsh.

Co-operation Counts

Charles Marks, of the firm of Marks & Co., Hamilton, spoke of the good relations existing in the trade, and stated that nothing could help cement this spirit like meeting at such gatherings.

"In helping one another," he said, "we help ourselves."

T. H. McLaren, of the Galt Brass Co., urged the men in the trade to get together often and work together for the common good.

Charles F. Rogers, manager of the company's Hamilton branch, was given a rousing reception when he rose to speak. He spoke of the good results of co-operation.

"We are all in the same business," he said, "and we ought to get acquainted and be on friendly terms. There is more in business than a mere dollars and cents' relationship. When you get together and help one another work out your common problems you can get real results. Develop the personal side. You can always learn something from the other fellow, and after you get to know him, you will be glad that you have made his acquaintance.

Stayed For Meeting

K. B. Allison, of the Toronto Society of Domestic Heating and Sanitary Engineers, extended an invitation to the visitors to attend the regular meeting of the Toronto Society in the evening. A number of them did so.

During the afternoon the visitors inspected the factory and saw how the goods were made.

Among those who were guests of the company were: Charles Marks, of Marks & Co., Hamilton; J. F. Birchard, of Ward & King, Toronto; T. H. McLaren, of the Galt Brass Co.; D. W. Rose, of the Gurney Foundry Co., Toronto; W. H. Cunningham, of the W. H. Cunningham & Co., Toronto; C. E. Parsons, of Sanitary Engineer; W. F. Wilkinson, of Fort Erie; E. Cardwell, of W. T. Boyd, of Welland; Sam Hanna, of Niagara Falls; George Taylor, of Brantford; C. Montgomery, of Caledonia; K. B. Allison, of Toronto, and the following from Hamilton: T. Allison, W. T. Boyd, A Beare, A. Bonner, J. F. Birchard, W. Blackalake, J. Berwick, H. Barnes, A. J. Byles, G. Calbeck, O. Clayton, A. Crompton, W. Coffee, E. Cardwell, W. H. Cunningham, Jas. Cummings, A. E. Fletcher, H. Grisch, W. Goodram, F. Goodram, R. Haygarth, S. Hanna, Hinmen, J. Hart, F. Jaschke, J. Kerr, J. Luxon, B. Luxon, P. A. Moore, C. Montgomery, A Mitchell, F. Mullens, A. McKenzie, J. McBeth; J. Matthews, Geo. Pyle, F. Quigley, Ernie Read, F. Shepperd, Geo. Stevenson, F. Sheldrick, Percy Smith, James Saynor, Jas. Sinclair, I. Walsh, D. Wark, W. J. Whitlock, J. F. Whithead, C. F. Rogers, A. E. Hunter, H. A. Rogers, W. A. Paterson, J. Allan, W. Tribe, T. Woods, W. J. Walsh, A. Hoople, N. Clark, T. Arthurs, T. D. Kerr, Chas. Smith, L. Gies, C. Marks, C. P. Marks, Wm. Whittaker, jr., D. W. Rose, D. Robinson, L. H. Horning, F. Chapman.

SHEETS AND WIRE PRODUCTS ACTIVE

The "Iron Trade Review," Cleveland, Ohio, says:

A growing gap between incoming mill specifications and production, despite the latter's steady increase, furnishes wholesome symptoms as to fundamental conditions in iron and steel. The result is an accumulating backlog of live tonnage on mill books in a number of lines, which tends to fortify future operations. Average bookings of the Steel Corporation at present are considerably in excess of hsipments and also of capacity, which means something over 50,000 tons daily. This fact promises to be re-flected in the June unfilled order statement to be issued to-day. The point needs to be stressed that this is an extraordinarily good showing for the whole industry considering the absence of railroad demand.

New orders and specifications in sheets are coming in at the rate of over 20,000 tons daily. In wire products, the mills now are booked practically full for the third quarter and some for a larger period. The rush of demand for oil and gas field pipe has fairly swamped makers and some of the latter are being forced to turn away further business. Tin plate output is up to 90 per cent. The idle Columbus, O., works of the Carnegie Steel Co. is being made ready for early production of sheet bars. A number of steel work blast furnaces are about to blow in.

There is more reference to unskilled labor shortage as a factor in production,

Heating and Ventilating

THE HEATING OF HOSPITALS

Thirteenth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note.—This article is the thirteenth of a series prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simplest terms. Readers will find this article on "The Heating of Hospitals" a most illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the design for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The fourteenth article of the series will appear in the next issue.

THE opportunity for the expression of the true worth of a sanitarian is so great when he is entrusted with the installation of the heating and ventilating or sanitary machinery of a hospital building that unless he is a man of most exacting conscience he should not dare avail himself of the privilege of doing the work.

In a building where the sick and the helpless are to be nursed back to health it is indeed a poor type of a man that cannot hear an insistent call to attend to duties that are often left long in the hands of those who have smothered their every altruistic instinct in mercenary interests.

There is, perhaps, nothing in the nature of the sanitarian's work that has received so much criticism and condemnation than the mechanical equipment to be found in many of our older hospitals.

The crime of these faulty installations is so far-reaching in its evil effects that no engineer who has any regard for his reputation or his character would care to be responsible for such.

Engineer to Blame

Still the blame can hardly be placed elsewhere than with the engineer, for although the question of what standards are required for temperature and air conditions in a hospital properly belong to the physiologist, and although those men were often at fault in their conclusions, the broad fact remains that too often the mechanical equipments were not designed nor installed in a way that would result in even an approximation of the standards set.

In this article we intend to treat the subjects of heating, of ventilating and of the sanitary equipment of the hospital in a broad way, only directing the reader's attention to such details as we believe worthy to rank in first importance.

In an article of this length the reader must not expect to find all of the information that he may require when he undertakes the design of plants described, but he will find enough data to give him a fairly comprehensive idea of the value of the different systems generally used in the modern hospital building.

Interesting History

The hospital, in common with all human institutions that have to do with the public health, has had a varied and intensely interesting history. Some of the most vivid passages in literature deal with the development of the hospital from the days when Sairey Gamp was a first-class example of attendant to these days when the nursing profession is one of the most highly honored by a grateful public.

The standard of sanitary equipment in hospital buildings has not, until recent years, kept pace with the wonderful improvement in the personnel of the attendants, nor in the administration of the hospital as an institution. The slow advance of the sanitarian was in a great measure due to his lack of interest in the study of the requirements for his activities in such a building. Thus, when the constructing sanitary engineer was called upon to install a heating and ventilating or a sanitary plant for a hospital building, he often sought for information from the easiest sources available, and that source was generally the consulting engineers employed by manufacturers of the goods that would be naturally specified.

Not Always as Easy

Technical information was not always as easy to gather as it is to-day, and when the sanitarian of the past made the claim that it was better business to confine his personal attention to work where he had an opportunity of exercising his particular abilities every day than it was where, perhaps, only once in a long life would he have the opportunity of using the information that would cost much time and money in gathering, his plea was then in one way justified. But to-day when the results of laboratory and other experiments are published almost as soon as made, and when tabulated data are so easily obtained, it would seem that only one of a very indifferent mental character could neglect the information so easily acquired.

Specifications Overlapped

It was not that engineers employed by manufacturers were any less capable of doing good work than those in independent practice that caused overlapping of specifications and the excess equipment of certain machinery in public buildings. The reason for the excess, say, of kitchen fixtures often could be found in the engineer's desire to play safe and to provide for nothing less than that required. So he made sure that nothing to be supplied by his firm would be neglected, and thus he specified everything from the "Bain Marie" to the ice cream freezer.

Not Many Specialists

It is only a student of capital affairs and a specialist in such work that can

possibly know much more of what is fit and proper for such an institution than can his brother in the craft. There are not a great many hospital specialists in the heating and ventilating walks of life, so no constructing sanitary engineer need think that he is perfectly safe in neglecting this necessary study because he is being directed in his work by a consulting engineer The consulting engineer may be by no means a hospital specialist, and only as a cunning man of formulae and figures does he design his work. Some of the worst examples of hospital equipment are the fault of engineers that were so full of the ego that they could not ask hospital superintendents for information. Those engineers knew all about such things as B.t.u. calories, ergo, dynes, etc., ad infinitum; but when they relied wholly on that knowledge when designing a plant for a hospital, they were in the same category as the steamfitter or plumber that blindly followed the easy paths of precedent.

Really Only Two

Although there are many different types of hospitals, there are really only two of these types that we need take for example in our description of sanitary heating, ventilating and plumbing systems. We will refer to the general hospital and to those used in the isolation of patients in contagious diseases.

As a rule, the contagious disease hospital is not a very large building, and although its heating and plumbing plants require very special attention, the piping used in these buildings is much less complicated than it is in the larger general hospital. So we will therefore take up first the subject of the general hospital, and then the subject of the contagious disease hospital.

The necessity for ventilation and the problems arising from that necessity will be better comprehended after a reading of the other article appearing in this number of SANITARY ENGINEER and dealing more especially with school house ventilation. There is so much, however, peculiar to hospital systems that we cannot now neglect some mention of the particular requirements of hospital ventilating systems.

The Requirements

In the articles referring to school house ventilation it was stated that 30 cubic feet of air per minute, or 1,800 cubic feet of air per hour, should be the standard quantity of air allowed per pupil. Hospitals require a great deal higher standard than this; ordinarily from 2,100 to 5,000 cubic ft. per hour per patient is the rate.

Many systems have been devised for providing pure fresh air in these quantities. If a dilution system is installed 5,000 cubic feet per hour per bed is not too much air, but if a direct flushing system is installed, much less fresh air will be required.

Some hospital attendants claim that the patients thrive better with the natural ventilation obtained by the opening of windows than they do when weather conditions permits only of ventilation being obtained by the mechanical plant. Certainly there are times when open windows give all of the ventilation required, but so far it has not been proven that window ventilation alone provides a satisfactory solution of the problem of properly ventilating hospital wards, or, in fact, the rooms of any building. However, as there is some merit in window ventilation, it is well that the ventilating engineer should make some provision for the advantageous use of this low cost system of ventilation.

Auxiliary Sash

If it is the purpose to ventilate the building by means of the windows, each window, used as a source of fresh air supply, should be fitted with an auxiliary sash covered with unbleached cotton cloth. This sash should be so made that it can be let into the space left by the raising of the lower sash. The cloth area of the sash should be based on about 3 sq. ft. per bed.

The foul air exhaust fans should be set in a wall almost directly opposite to the opened window, and there should be two faces set in every foul-air flue, one face to be at the floor line, and the other about 6 ft. 6 in. from the floor. The foul air flues must be connected to an exhaust fan, for where no exhaust fan is used with such a system there is never a proper movement of air in the wards on the lee-side of the building. On the windward side the rooms will receive far more air than may be required, while those on the other side of the building will more likely than not be subject to an outward leakage of air, instead of the inward flushing action that the advocates of the so-called "natural system of ventilation" believes they obtain by way of the opened window.

Semi-Direct Radiators

In some of the smaller hospitals ventilation is effected by the passage of fresh outdoor air through the special bases of semi-direct radiators into the rooms where the air is required. The vitiated air is removed by way of vent openings and flues, just as with the system of window cloth ventilation.

Either the window cloth system or the system of semi-direct radiators is, especially if used in conjunction with an exhaust fan, far superior to no system of ventilation at all, but as there has been so far no possible means for controlling the volume of the air leaking into or out of the building where such a system is installed, a great many engineers hesitate to risk their reputations with such systems. Force of circumstance sometimes makes necessary the installation of the lowest first-cost system of ventilation. But as low first-cost systems are necessarily so incomplete in detail, they require a great deal of intermitting attention from so many different people around the building, a successful operation cannot be assured. Yet such a system is far superior to the most expensive mechanical plant if the plant is allowed to stand idle.

Sanitation Is Vital

No matter how small a hospital building may be, it is never so small that too much attention can be paid to its sanitary machinery and its details. And when a person understands how great a proportion of the operating expense of a hospital is connected with the heating and power plant, he at once realizes the importance of giving more than a casual consideration to such subjects.

We may take the largest hospital we know of and then turn to the smaller buildings, where, perhaps, the building is not as large as that housing the power plant for the larger institution. Now, in one we may have an engineering staff of highly paid men, and in the other one general caretaker, whose attention to his engineering work is crowded in between other duties.

The Basic Problem

The basic problem, which is that of supplying the patients with air of the proper temperature and the right degree of purity is exactly the same in both of these buildings; but our method of solution must be different where circumstances differ so much. In the small building we could hardly think of installing a power plant, and it might be that we could get along very well with a gravity system of ventilation. Perhaps, also, it might be advisable to install a hot water system of heating in such a building in preference to that of steam. The solution of these questions is more an exercise of common sense than a matter of the adoption of formula.

Some of the details appearing in this article properly belong only to plants in large buildings; but it is altogether likely that the very necessity for their installation may be such that the detail will suggest some way for the reader to adopt it in principle to some smaller installation.

Power and Heating

For the time being we will drop the subject of ventilation and deal with other parts of the heating and power plants, later on coming back to the details of the ventilating part of the system.

Usually it is the custom of architects to show on the floor plans of the wards, the locations for the beds. And it is a very good thing that they do this, because when the heating engineer gets the plan he finds very little room left for his radiators, and if the beds were not shown on the plans it is altogether likely that the architect would find that after the rads were installed there would be little room left for the beds. Very often in public wards, where the heads of the beds are backed up to the outside walls, the radiators are so close to the

Ventilating the Modern School

Twelfth Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

In the articles so far appearing in this series we have dwelt almost entirely within the field of the mechanical application of systems that serve to maintain the standards of ventilation fixed by the arbitrary rules of the usual practice of the ventilating engineers.

It is now our purpose to present the theories which are at the root of many of these standards, and in doing so we will try to show why physiologists and heating engineers do not always agree in their opinions regarding the subject of what constitutes an adequate ventilating system.

How It Developed

In most of the printed works that deal with ventilating systems, the subject of air analysis is taken up in the first chapter, but we have left it until we present some of the mechanical details of practical work, so that the reader might better understand how a vocation using the data based often on conflicting theories has developed into the engineering practice of to-day.

To one not prepared for a reception of these theories, by an understanding of how, in the actual work of installing ventilating systems, many of the conflicting opinions are reconciled, many of the statements appearing in this article will be contradictory, and because of this it was not considered wise to present the article as the first of the series.

There is a good deal more to say regarding the mechanical details of ventilating systems than has so far been presented in these articles, but as from now on we must constantly refer to the basis of our standards, the reader, if he wishes to follow these articles further, must now pause long enough to gather some information in connection with the theory, and no longer be satisfied with the practical workings of these systems alone.

Basis of Standard

Now the basis of the standard set by one school of thought is found in the treating of the subject of ventilation as a problem in chemistry. This is the oldest school, and as the usual practice of the ventilating engineer of to-day is built upon the theories of that school, we will look into this subject first from their point of view and then afterwards examine the theories of the school claiming that ventilation is purely a physical problem, and that it has little or nothing in common with the study of chemistry.

Composition of Air

For convenience in referring to the data gathered by the first school we will consider the problem of the chemical composition of air; with special reference to carbon-dioxide, oxygen, nitrogen, and organic matter that is due to exhalation and body excretions.

One pound of pure outdoor air, free of moisture, contains:

	Pounds
Oxygen	.2307
Nitrogen	.7687
Carbon dioxide	.0004

Oxygen is the breath of life. It is the supporting element of the breath, without which the blood could not be nourished. Man can live in pure oxygen alone for an hour or more without any great inconvenience. Oxygen is used frequently pure or mixed with other elements for the cure of certain forms of disease. But as vital a thing as this oxygen is, its very value makes it too strong for an exclusive lung diet. When a person breathes pure oxygen for a certain length of time their energies increase, and keep on increasing at such a rapidly accelerated rate that shortly the body becomes feverish and intoxicated.

Drawn Into Lungs

The nitrogen is drawn into the lungs along with the oxygen, and is exhaled without undergoing any change. The oxygen is taken into the blood and carbon-dioxide is thrown off. Thus, when a person breathes he will take in, say, about 50 cubic inches of air with each breath, the air containing volume when taken in about 79 per cent. of nitrogen, 20 per cent. of oxygen and a small quantity of carbon-dioxide. When the air is exhaled, the carbon dioxide is increased to about 4 per cent. of the volume. This reduces the quantity of oxygen to nearly 26 per cent.

A lack of oxygen spells death to all living flesh, or to fire. If a room were tightly closed, life could not long be sustained in it.

The average adult consumes oxygen at about the rate of 20 cubic feet per day, the consumption varying with the activity of the man.

When air is taken into the lung cells, the oxygen comes into contact with the carbonaceous matter in the blood stream and a new combination takes place resulting in carbon dioxide (CO_2). This process is combustion and differs only in degree of intensity from that taking place in a furnace.

Checks Combustion

If air is breathed that contains a large amount of carbon-dioxide, combustion is checked, and the carbon is not thrown off fast enough from the body, thus congestion in the circulation occurs, followed by headaches and other disorders.

The organic impurities exhaled from the lungs are many and varied. They are varied because the eating and other habits of men are varied. No exact data regarding their chemical composition has as yet been determined, but we know that when they are present in the air, even in moderate quantities, that they cause a feeling of oppression, and when they are concentrated they are extremely dangerous. They have a positively poisonous effect when inhaled.

Definite Proportion

The quantity of organic matter exhaled seems to bear a definite proportion to the carbon-dioxide taken into the lungs, and it is for this reason that the quantity of carbon-dioxide in the air is used for gauging the degree of air pollution. The carbon-dioxide can be readily measured by physiologists that the measure of carbon-dioxide could be used as a measure of the pollution of air due to organic impurities.

Outdoor air contains about four parts of CO_2 in 10,000, and it is generally considered a room is well ventilated that contains not more than 6 to 8 parts of CO_2 in 10,000.

The First Problem

The engineer, when he is given the task of providing a mechanical equipment that will maintain a degree of air purity, measured by the amount of CO_2 in the air, must first ascertain how much CO_2 will be added to the air by the exhalations and the body excretions of the occupants within the building. Then, when he has this fixed he is ready to design a plant that will supply enough fresh air to take the place of the air charged with CO_2.

Offsetting Pollution

In some cases he endeavors to offset the pollution by pouring in enough fresh aid to dilute the air within the building to a point of relative purity, and in other cases he designs the ventilating systems so that the foul air is flushed out of the building by the force of incoming fresh air; the flushing action being in some cases assisted by the pulling power of induced draft in the exhausts.

The air allowed per person per cubic feet an hour, when based on this theory, is given in the following table:

Schools	1,800
Theatre	1,200 to 1,800
Hospitals (ordinary)	2,100 to 2,400
Hospitals (epidemic)	4,800

Hard to Convince

Nearly all high-grade ventilating systems have been installed with their designers' eyes fixed on the standards set by what the new school of ventilating engineers term erroneous theories, but nevertheless, after this new school succeeds in coming to a conclusion as to what is really required, they have difficulty in convincing the great mass of people that there is anything justifying any repugnance to taking air into the lungs that has already been breathed over and over again by others.

These fellows claim that all we need in a ventilating system is to keep the air in motion so that it will carry away the animal heat from the bodies of those within a building.

These men claim that there is no scientific fact proving that air once breathed is unfit for further breathing, and all they believe to be desirable is an ap-

paratus for cleaning the air of dust and organic impurities, and also of bodily odors.

Would Effect Saving

Certainly if they ever succeed in proving their theories, some saving in the cost of ventilating a building may be effected.

In a system of ventilation designed on the principles formulated by this body of men, there would be no foul air exhausts. The air would be brought back to an air-treating chamber where it would be washed clear of organic impurities, and its temperature changed to the degree required. There should also be set in this chamber an apparatus for removing odors from the air.

Missed the Essentials

According to the new school, the older physiologists and ventilating engineers have in their consideration of the problem as one of chemistry, missed the real essence of the subject. This school claims that the very thing taken as an indication of the standard of air purity, viz., the CO_2 is the root of what they are pleased to term "Absurd conclusions."

The claim is made that with air kept in movement and at a proper temperature, no inconvenience was experienced or harmful results noted when the air was charged with CO_2 to the extent of 50 parts in 10,000.

But that is not their only claim. They also say that the oxygen content of an occupied room is not lessened, nor the CO_2 content increased sufficiently to enter into the problem of ventilation.

Defend Position

In turn the older school reply to these men that while they admit that the oxygen and CO_2 content of a room, many have taken up too much of their attention in the past; they know that a slight diminution of oxygen occurring in an occupied apartment has a direct effect on the oxidation within the bodies of the occupants. When breathing an excess of CO_2, even when the air is free from organic impurities, there is a marked decrease in the appetite for food with a corresponding fall in weight.

Still the Standard

In the meantime while the battle between the two schools goes merrily on, we may use CO_2 as a standard of value for indicating the quality of fresh air supply and its diffusion.

Perhaps the man who sits down in his prejudice and refuses to go any further on the road to knowledge is not so lively as his brother, who grabs with glee every new theory that comes his way; but it is certain that he is not so exasperating in the desire to throw away all of the knowledge he has already gathered.

Three men walk along every road of life a little way together. There is the "Theorist," the "Practical Man" and the "Faddist," and the fool of the trio is the "Faddist." He is the man who, with one eye half opened, jumped at the conclusion that, because he sees a thing he has seen it first, and that all other men who are not rushing in his direction are poor old fossils, with no vision and no initiative. He cannot comprehend their desire to see things as they are before becoming their champion, and so he goes floundering through a bog of half-baked ideas after some will-of-the-wisp.

Many progressive men have known the day when they might have been numbered with the faddists. There was an excuse for them because they were young and inexperienced, but there is hardly an excuse for the man of years, of what should be discretion, rushing in where others fear to tread, and in rushing in spend the money that belongs to taxpayers.

May Not Work Out

When any new theory is presented, and the results of experiments are given so as to bolster up the truth of that theory, the investigator may find that there is just some little factor present which strikes the key-note of the whole success of the experiment. And that little factor is not one that will be present when the theory is applied to practical work.

We may take for an example the subject of natural or window ventilation that is now receiving so much attention. This system of ventilation is superior to no system at all, but we often wonder if the advocates of such a system give us all the information regarding the type of systems that they have displaced in large schools, or if they have instructed us in how the pupils in some of the schools selected as examples are given special attention regarding the lesson, sleep, and rest periods.

Therefore it seems that the best course to pursue in favor of planning a ventilating system for a school is that wherein we examine carefully every claim of the value of different systems before we decide to adopt any with the idea of its being the best.

THE HEATING OF HOSPITALS

Continued From Page 31

beds that they cause the patients a great deal of discomfort.

Direct Radiators

Direct radiators should be of the hospital type, of perfectly plain pattern with sections spaced 3½ centres. They should be mounted on stork legs, or supported from the walls on heavy cast iron brackets. There should be a space of 3 to 4 inches left between the back of each radiator and the wall. Hospital radiators set thus can be easily kept clean.

Direct radiators should not be set in enclosures unless the enclosures are built so that they can be opened in such a way that every inch of the radiating surfaces and the interior of the enclosures can be kept clean, and even then the concealment of these surfaces provide a temptation for neglect in cleaning the same.

Relative Merits

The relative merits of hot water and steam heating systems for hospitals are continually discussed. And where it is a question of the value of hot water systems and of the old style gravity steam heating apparatus, there is no doubt but that the hot water system, either of a gravity or forced circulation type, is by long odds the best system in so far, at least, as economy and convenience of operation are concerned, but there are defects in the hot water system that are not easily overcome. It is subject to freezing, and it is liable to serious damage in the case of a break in the piping. It is slow to respond to firing or checking. This last objection, however, does not apply to systems of forced circulation.

Where forced circulation systems are used, the superintendent of the heating installation must see that nothing but genuine wrought iron is used in the piping. Ordinary steel piping will not stand up against the attack of the gases liberated in the hot water.

Would Hesitate

Despite the favor of many heating engineers for water heating systems in hospitals, the writer would hesitate in specifying a hot water heating system for anything but the smaller types of hospitals where the expert services of an operating engineer is not always available. There is a certain steadiness of heating with the hot water heating plant that cannot be obtained with any gravity steam system of heating where the fires are left for a long time without attention.

Remember that so far our arguments only have to do with the relative merits of gravity steam and hot water heating systems and that no mention has been made of the faults or the merits of vacuum steam systems.

Many Advantages

There are so many advantages of satisfactory service with a high grade vacuum system that it is not at all surprising to find so many of these systems supplanting all others in popular favor.

Noise must be banished from the sick room, and as the air valve of an ordinary steam radiator is a source of noise, it must be eliminated. No air valves are required on the radiators of vacuum systems; so this is one argument in its favor.

The modulation of radiator temperature can be approximated in a vacuum system just as well as with the water system. The cost of installing the very best vacuum system will not be as great as the cost of installing a forced hot water system. The vacuum system is not as complicated as that of forced hot water.

Are Worthless

Do not look around for cheap graduating and thermostatic valves for vacuum work. Such valves are worthless and have done a great deal to bring the high grade vacuum system into disrepute.

The valves must be heavy in every part, as they are subject to considerable strain. The valve should be constructed

so that its interior may be removed without disconnecting it from the radiator or from the piping. There should be stop valves set so that any radiator may be repaired without affecting any other part of the system.

More Satisfactory

Thermostatic return valves are generally more satisfactory than float valves, because they are not so likely to be noisy. This is not saying that the best float valve is defective. Many of them are giving perfect satisfaction, but under certain conditions become noisy. The movement in the return valve should be at least one-quarter of an inch from the seat when open; anything less than this will hold water in the radiator.

The style of boiler to be used depends upon the size of the hospital. In most hospitals there is a demand made for steam at 40 and 60 lbs. pressure required for sterilizing and laundry purposes. Some small hospitals use low pressure heating boilers for heating, and a high pressure boiler for providing the steam for sterilizing, etc. This arrangement is made in the belief that the janitor can operate both boilers. It would seem to be better economy to employ a high-grade fireman, who, in looking after one fire for most of the year, would save more in the cost of fuel than the amount of his wages.

Water Tube Boilers

In plants where 1,000 boiler h.p. is required it is advisable to use water tube boilers.

Automatic stokers should be used so as to eliminate smoke when soft coal is used for fuel. They also save labor where the plant is as large as 1,000 boiler h.p. or over.

Steam pumps should be of the single cylinder pattern, because, while they cost more than those of the duplex type, they are more economical in the consumption of steam.

All hospitals should have automatic temperature regulation, as such a system prevents overheating and this affects economy in fuel. The thermostats should be of the intermediate acting type, set in such a way that a graduating movement is exercised on the radiator valves, as well as on the air supply dampers. When a gravity steam system is used, the thermostats must be of the direct acting pattern.

Piping Arrangements

The piping of a large hospital may be described as follows:

First: The high pressure piping for the maximum pressure required. If the lighting plant is run by this system the boiler pressure will be 80 to 100 lbs.

Second: The piping for the sterilizers, 60 lbs. pressure.

Third: The piping for the laundry apparatus, 60 lbs. pressure.

Fourth: Piping for kitchen apparatus, 30 to 40 lbs. pressure.

Fifth: Piping for the heating apparatus, usually 2½ lbs.

Each system of piping is to be fed with steam from the boiler through independent automatic pressure-reducing valves.

The piping should not be concealed, unless behind covers that can be easily removed in case of necessary repairs.

Closely Related

Although the plumbing equipment of one hospital may be considered as being independent of the heating or ventilating system, there are certain units of each that are so mingled in their functions with that of the other that it becomes necessary to consider certain of the plumbing details when writing of the heating system. One of these details is that of the hot water supply.

It is generally the opinion of most authorities that the hot water supply is best furnished by means of large storage tanks containing steam coils. This provides for a large storage of hot water and guards against the sudden demands on boiler capacity caused by instantaneous water heaters and local mixing valves. The temperature of the water must be controlled by automatic thermostats so that patients will not be scalded.

No Standard System

Now to return to the subject of ventilation. No standard of ventilation can be set for all hospitals. A standard of requirements for air purity may be set, but no standard for equipment can be. That must be controlled by the nature of the location and the size of the building. As an illustration we may say that it is only a very small hospital that can possibly get along with a gravity system of ventilation, but at the same time it would be the height of folly to specify an elaborate ventilating system with air conditioning apparatus for a medium-sized building in a rural community. But when a hospital is situated amid dusty city streets the best system of artificial ventilation is hardly good enough.

Standard Requirements

The standard requirements of air conditions and temperatures are for a hospital approximately as follows:

Air supply, 2,100 to 5,000 cubic feet per hour per bed. A temperature not exceeding 68 degrees above zero, except at times in operating rooms. A relative humidity of from 30 to 50 per cent. The lower humidity is provided for very cold weather, as a higher humidity would frost the windows, and so far no proof has been given that a relative humidity as low as this is harmful.

In hospital work it is dsirable to have the air current moving horizontally, rather than up or down. This is more fully covered in the articles under the heading of "Ventilating the Modern School."

System Described

The tenth article of the same series was descriptive of a system of combined heating and ventilation for a school, but it could easily be adapted for the heating and ventilating of hospitals. When using a system similar to that there described, there should be an alternating damper set under the radiators in the enclosures, so that in the event of the fan stopping a certain measure of heat could be obtained by using the enclosed radiators just as ordinary direct radiators are used. More heating surface in proportion to the size of the rooms will be required here than in school house work.

When the problem is the heating and ventilating of a contagious disease hospital, there are some details peculiar to that which must receive our attention. Perhaps the easiest way of drawing the reader's attention to these details is that of describing how the usual requirements are met.

As a rule, no direct radiators are used in such a building, except in the service portion. The reason for this lies in the fact that a radiator is an additional surface, where dust and germ colonies may collect, especially during the summer months.

Fresh air is driven into the room, both as a heating and ventilating agency.

The air exhausts are greater in number than those found in general hospitals, and they are always connected to a powerful exhaust fan. All exhaust air is passed over fires, where the germs are killed, or the exhaust air is turned into a chamber where a jet of superheated steam is used to kill the germs. Either in general or in other hospitals the use of metal ducts is advisable in preference to those of masonry. They are cleaner than masonry and offer less resistance to the flow of air.

SHEET AND WIRE PRODUCTS

Continued from page 29

especially in the Pittsburgh district, and this is being taken into account in regulating future sales. A strike for higher wages has put out of commission temporarily three blast furnaces in the Jackson, O., district.

Automobile and farming implement manufacturers have been among the week's most conspicuous buyers. Accessory and parts manufacturers have continued to place sizable contracts and specifications. The Moline plant of the Republic Iron and Steel Co. has resumed operations especially to serve the farming tool demand.

Advances are appearing in some of the minor lines. Various nut and bolt makers have boosted their schedules 5 per cent. In small rivets, $10 to $15 a ton has been added. Some rerolled bar makers now quote 2.35c mill, a rise of $2 per ton. Talk of early advances in wire products persists and some makers are restricting their present offerings, especially for third quarter. Some buying of pig iron for 1920 delivery has been done, although makers generally are discouraging any contracting so far ahead.

Subscribers Are Urged to Send in Questions to be Answered, or to Comment on Letters Published--Description of Jobs Done or Shop Kinks Are Also Invited.

Editor, SANITARY ENGINEER,

Dear Sir,—Having been a subscriber to your paper for the last ten years and always interested in the question and answer department, I would greatly like to have you note the enclosed rough sketch of proposed steam-heating in local plant. The old low-pressure heating has been in the building about ten years and gives satisfaction, but the building is being taken over by another firm, who wish to use high-pressure steam in connection with some steam kettles. They also wish to heat the building from a new h.p. boiler. We would like you to send us a sketch of this work as you would consider the best way of doing same, also mark sizes of pipe used. We would like to hear from you as soon as possible in enclosed envelope as this work is waiting to be installed.

Yours truly,
A. C. FRASER.

Answer.—We note that your figures for the present system of heating is 7,000 sq. ft. of radiation. A 20 h.p. boiler is not enough to carry that load of radiation; neither is a 5 in. main large enough to carry that load properly unless very high pressures are carried.

It will not be practicable to use these boilers in conjunction on account of the different levels of water lines and the difference of pressure.

You do not give us any data regarding the number of steam kettles, nor the pressure required. It is necessary that we have this information before we can make any recommendation with regard to the piping required.

If no higher pressure is required at the kitchen than for the heating system, both systems of piping may be fed from one opening in the boiler header, but as the pressure required for kettles used

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

THE effects of the big steel strike in the United States is beginning to show in firmer prices for galvanized and black sheets, indefinite promises of deliveries and general uncertainty regarding future business. Dealers whose stocks were incomplete have been busy trying to fill up their shortages, with the result that as few of the jobbers had any great amount of stock supplies generally are low. The question of delivery looms large, with many firms who have business in hand for which they require the goods, and in many cases, it is stated, goods now on order may not reach the buyers until December or January, perhaps not then if a railway strike materializes.

There has been some improvement in the delivery of soil pipe, but it is only slight and buyers are still complaining of hand-to-mouth deliveries and shortage of supplies. The same condition applies to some lines of brass goods.

One result of the strike in the United States has been to make ingot metals easier, because manufacturers using lead, zinc, and other lines cannot get the supplies of raw materials they require, and hence the demand for ingot metals is temporarily slackened.

There is a prospect of an advance before very long in copper and brass goods. The situation centres around whether European nations, especially Germany, become heavy buyers of copper. It is generally expected that as soon as the question of credits has been satisfactorily arranged large shipments will be made and this will result in higher prices for copper.

Lead prices show a decline of a quarter of a cent a pound.

Business is reported as excellent, with inquiries that indicate a steady volume for some time to come. The only trouble dealers foresee now is in getting the goods to supply their customers. A lot of building continues to develop all over the country, and the house shortage continues general.

TORONTO, October 1.—Scarcity of goods in many lines rather than price changes is the feature of the markets at the present time. As a result of the difficulty in obtaining bathtubs and some other lines of enamelware, soil pipe and some lines of fittings, considerable work is being delayed. Deliveries have been very slow on some sizes of valves and there seems to be a steadily growing scarcity of wrought pipe. Some of these troubles are traceable in some degree to the big steel strike in the United States. Others are due to lower production.

The situation in regard to deliveries from American points seems somewhat uncertain and is affecting such goods as sheets, plates, tubes and bars. The strike, on the other hand, has had the effect of making the market for ingot metals somewhat easier by lessening the demand. There is a probability that the copper market may stiffen considerably very shortly as a result of large purchases to be made by Germany and other European countries. This advance, if it occurs, will affect brass and copper goods generally.

Business in general is reported remarkably good. Building activity continues and plans which are now going forward indicate that much new work is developing. The main trouble with many seems to be to get enough goods to supply the orders they have in hand.

Shortage in Some Lines of Enamelware

ENAMELWARE. — Considerable scarcity is reported in bath tubs and some other lines of enamelware and this is delaying work. Manufacturers are having difficulty in obtaining the labor required, and in some cases are further hampered by slow deliveries. Prices are unchanged and on a few of the well-known lines the quotations are:

Bath tubs, roll rim, 4. 4½, 5 feet, 24 to 30 in. wide	$37 07
Bath tubs, 5½ ft.	41 27
Lavatories—	
17x10" Apron F139 or P4045	11 00

18x21" Roll rim F197, F199 or P4655-6	11 10
17x19" Roll rim F241 or P4345	9.05
Sinks, roll rim, 18 x 30 in.	16 60
Sinks, flat rim, 20 x 30	6.77-6.65
Do., 18 x 30	6.07-6.19
Do., 16 x 24	5.29-5.45
Closets, oak tank and seat	26 50
Do., enamel iron or white vitro tank	30 00

Soil Pipe, Fittings None Too Plentiful

SOIL PIPE, FITTINGS.—While there has been an improvement in the situation in regard to soil pipe and fittings, there continues to be a scarcity. Enough goods is being turned out to keep many users going, but some others report that they are not getting goods as fast as they require them with the result that work is delayed. The situation generally is expected to show continued improvement. Quotations show no change and are as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	10%
Medium and extra heavy soil pipe, 4 in.	15%
Medium and extra heavy soil pipe fittings, 2 in. to 6 in.	25%
8 in. extra heavy pipe and fittings	5%

PIPE FITTINGS

Do., Class C, lb. net	0 19	0 25

Unchanged Prices For Range Boilers

RANGE BOILERS.—Sales of range

boilers as might be expected owing to the steady growth of binding, have been active. Deliveries are reasonably prompt. Quotations remain unchanged and are as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Some Brass Goods Are Reported Scarce

BRASS STEAM GOODS.—Prices so far show no change, but if reports regarding advances to be made in copper shortly materialize, it is likely that high quotations may be made. Reports indicate that European buyers are coming into the market heavily for copper before long, in fact as soon as the necessary credits now being arranged are completed. In this case, an immediate jump in copper is expected, and will be reflected in brass goods. Some scarcity is reported, especially of some lines of valves. While a fair amount of business in marine work is being handled, there has been some falling off in the volume owing to inactivity in British Columbia in shipbuilding. Generally speaking, though, business in brass goods has been very fair. Quotations are as follows:

Compression work, standard	35
Fuller work, standard	40
Bath cocks, compression	37
Bath cocks, Fuller	40
Flatway stop and waste cocks, standard	38
Roundway stop and waste cocks, standard	38
Brass steam cocks, standard	Net List
Globe, angle and check valves, standard	5%-23%

Radiator valves, standard	15%-23%
Do., removable disc	Net list to 40%
Basin Cocks—	
No. 0 and 1, Fuller pattern	40
Compression	30
Quick opening	40

Wrought Pipe Scarce; Prices May Be Advanced

WROUGHT PIPE.—While no change has yet been made in prices, an advance would occasion little surprise. Supplies are reported increasingly scarce with little outlook for improvement. Many of those in the trade have reached the point where they can barely keep going with the amount of goods that is reaching them, and this situation is causing some inconvenience. The quotations are as follows:

WROUGHT PIPE
Price List No. 40, July 4, 1919

Strike is Affecting Boiler Tube Market

BOILER TUBES.—The strike across the line has occurred at an opportune time, as far as the tube situation is concerned. Stocks are very low and it is practically impossible to obtain some sizes in any quantity. Just what the situation will be in the future depends on how long the strike lasts. An advance in prices is expected in many quarters. At the present time the outlook for deliveries seems to be slow. Quotations are as follows:

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$27 00	.....
1¼ inch	29 00	.....
1½ inch	29 50	.....
1¾ inch	32 00	$27 00
2 inch	31 00	26 00
2¼ inch	35 00	28 00
2½ inch	43 00	32 00
3 inch	48 00	40 00
3¼ inch	.....	47 00
3½ inch	60 00	44 00
4 inch	75 00	56 00

Sheets and Plates Likely to Advance

SHEETS AND PLATES.—The market for both sheets and plates is very firm. Following the strike there has been a rush on the part of dealers whose stocks were imcomplete to fill them up and as jobbers did not have heavy stocks on hand, many of these have been badly broken up. Higher prices are looked for with trouble developing as a result of slow deliveries. Canadian firms have large quantities of goods on order, but owing to the conditions prevailing, it is uncertain when they will get the stock. Quotations are being made on the following basis:

BLACK SHEETS—	
14 gauge	5 45
16 gauge	5 60
18-20 gauge	6 15
22-24 gauge	6 20
26 gauge	6 30
28 gauge	6 45
3-16 inch plate	6 25
¼-inch boiler plate	5 80

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS.		
10¾ oz.	$8 20	$8 85
U.S. 28	7 80	8 30
U.S. 26	7 30	7 90
22 and 24	7 15	7 65
18 and 20	7 00	7 45
16	6 85	7 25
12 and 14	6 70	7 05

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Prices Hold Firm For Waste and Oakum

WASTES, OAKUM.—A fairly good volume of business is being handled in both of these lines. Prices are holding firmly and quotations are on the following basis:

	Per 100 lbs.	
Best American	$21 00	$22 00
Clipper, spun	.....	21 00
Do., unspun	.....	10 50
Plumbers' spun	10 00	10 75

Market is Steady For Lead and Zinc

LEAD AND ZINC PRODUCTS.—Business has been good in these lines and the prospects are for continued activity. Prices are not expected to show any material change for some little time.

Lead pipe, list, per lb.		$0 12½
Lead waste pipe, list, per lb.		0 13½
Do., over 6 inches, list, per lb.		0 14½
Above subject to discount of 10%.		
Lead traps and bends		15%
Lead wool, lb.	0 11	0 12½
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 12	0 13
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 35½	$0 38
Solder, strictly, lb.	0 34½	0 37
Solder, commercial, lb.	0 32½	0 35
Solder, wiping, lb.	0 31½	0 34
Solder, wire, lb.	0 35½	0 41
Zinc sheets, per lb.		0 17

Scrap Market is Hit by the Strike

OLD MATERIALS.—The strike in the United States has had the effect of stagnating business in the scrap market and there has been a considerable weakening of prices. Prices prevailing at the present time are:

Dealers' Buying Prices—		
Tea lead		0 03½
Heavy lead pipe		0 05¼
Pipe scrap		8 00
Stove plate, per ton		12 50
No. 2 busheling		11 00
Yellow brass		0 10
Red Brass		0 16¾
Light brass		0 07
Scrap zinc		0 06
Heavy copper		0 18
Wrought iron, No. 1, per gr. ton		14 00
No. 1 machinery cast		18 00
Heavy melting steel		14 00
Old rubbers, boots and shoes		0 07
Overseas, lumbermen's rubber boots		0 05
Bicycle tires		0 1½
Automobile tires		0 03

Ingot Metals Easier As Results of Strike

INGOT METALS—A general tendency towards easier prices, with the exception of copper, is one of the results of the strike across the line. This is accounted for by the fact that firms cannot get the raw materials in which the various ingot metals are used in the course of manufacturing. Copper prices are firm and if European buyers come into the market shortly, an advance is expected. It is stated that Germany is arranging for large purchases.

COPPER.—Copper quotations remain steady at present at 27 cents a pound. The future depends largely upon the course taken by European buyers, and one jobber stated to SANITARY ENGINEER that if Germany comes into the market, there will be the biggest boom copper has had for some time.

TIN.—Trade in tin is quiet but the market shows a tendency to be firmer. This is a peculiar situation in view of the

fact that tin is easier at primary points, but it hinges on the fact that shipments from England owing to labor troubles are likely to be greatly delayed. Stocks are only fair. Present quotations range around 57½ cents a pound.

SPELTER.—With a fair volume of business offering quotations on spelter show no changes.

LEAD.—The demand for lead has slackened as a result of the strike, with the result that prices have declined a quarter of a cent a pound and quotations are now being made at 6¾ cents.

ANTIMONY.—Business is inclined to be quiet. The market remains unchanged and quotations range from 10 to 11½ cents a pound.

ALUMINUM.—Trade is reported somewhat quiet. Prices are holding without change at 35 cents a pound.

THE QUESTION BOX

Continued from Page 35

for cooking purposes ranges from 20 to 40 pounds, and as the pressure required for the heating plant should not be more than 5 pounds, in ordinary practice it would be necessary to feed the heating system through a pressure-reducing valve.

The water of condensation from both systems may be run into a common receiver and from there pumped back into the boiler. In this case it will be necessary to have a balance pipe connecting the return from the kettles and the receiver, so that the higher pressure from the kettle returns may not prevent the return of condensation from the heating system.

Or the condensation from the two systems may be returned to the boiler by means of a single or a double return-trap system instead of a pump.

If you will kindly verify these figures of 7,000 sq. ft. of radiation and give us the exact height of the water-line in the boiler, also the levels of the steam kettles, we will send you immediately a drawing showing how the feed and return connections should be made at the boiler.

Editor, SANITARY ENGINEER,

Dear Sir.—We should like to get improved pump part patented. Kindly let us know how we can get it done.

Yours truly,
JACQUES BROS.

Answer.—You may procure a patent on your improved pump part in the United States by making application to the Commissioner of Patents at Washington, D.C., and in the Dominion of Canada by making application to the patents branch of the Department of Agriculture at Ottawa, Ont.

It would be wise to make your application first to Washington, enclosing the first fee of $15, together with your petition, a specification of the pump part, an oath regarding your personal right to install'ed, and he now states that a dirty the claim and drawings, and, if required, a model.

The petition must give the name and full address of the applicant. It must give a title to the invention. It must contain a reference to the specification for a description of the invention, and it must be signed by the applicant.

In the specification there must appear in this order, name and residence of the applicant; title of invention; a general statement of the nature and object of the invention; a description of the views of the drawing (if the invention is shown in a drawing); a detailed claim or claims; signature of the inventor and signatures of two witnesses.

If the applicant is the inventor he must make oath that he believed himself to be the first inventor or discoverer of that which he seeks to have patented.

The oath must state of what country he is a citizen, and where he resides.

If you make your application in Canada before you do in the United States you must state this in your oath.

Drawings are to be made on white paper with india ink, and the sheets must be exactly 10 by 15 inches in size, with a margin of one inch. All details must be shown clearly and without any superfluous lines.

The United States fees are: First application, $15; on issue of patent, $20.

Now, while anyone may secure a patent without hiring an attorney, inventors have usually found that the small fees that such men charge are well earned. The wording of the statement of claim or claims has a great bearing on the protection a patent gives your right of invention. We understand that Prof. Bell hired no attorney when he made his application for a patent on the telephone, and his specification left no loophole as a convenience for the commercial pirate, but Prof. Bell must have given the subject of specifications long thought before he sent his in. It is the attorney's business to protect his client, and if there is any ground for protection the attorney will find it, because he is trained for that kind of work.

EXPORTS ARE HEAVY

Reports from the South state that the outlook favors good exports, particularly of rosins, the next two or three weeks. From all parts there will be an outward movement that will probably be in excess of the fresh receipts from the woods, to the foreign shipments being added a movement to the interior for the fall requirements of the consuming industries which promises to be of large proportions unless the strike spirit spreads and dominates the industrial situation to such an extent as to check production in the lines using naval stores. Labor seems to be showing some of the signs of the spirit that moved the blinded Samson when he pulled down the pillars of the temple and brought death to himself as well as to his enemies.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with wood handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

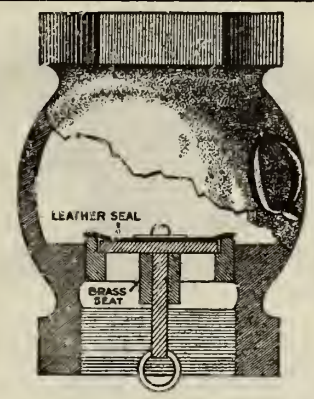
BRANTFORD, CANADA



This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

R. MACDOUGALL CO., LTD.

PIPE AND THE PUBLIC WELFARE

By R. C. McWANE

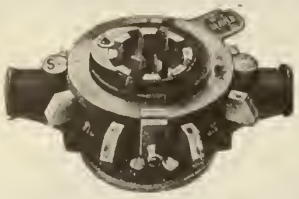
A Book Every Sanitary Engineer Should Possess.

Every sanitary engineer should read this book. It deals with pipe-making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives the users of pipe a true idea of how pipe lasts under various conditions when in service, and its uses in sanitary installations.

Price $1.00 Postpaid

MACLEAN PUBLISHING CO., LIMITED, Book Dept., University Ave., TORONTO

Constant Sales Increase



6 Beaverette to ¾ inch.

This efficient little die stock has been about 10 years on the market with constantly increasing sales.

The only tool that threads ¼, ⅜, ½ and ¾ without changing dies or bushings. Two sets of dies are operated by one handle.

Beaver 25 and 26 1 to 2" are alike except that 26 has ratchet attachment. They operate on the Beaver receding die principle—the further you thread the easier the labor. A man of ordinary strength can cut a 2-inch thread with one hand. Together these tools cut ¼ to 2-inch pipe without change of dies or bushings.

No. 25 Plain 1 to 2 inch.

They Are Not Going To Be Denied The Shower Now

A 932—Nickel plated Shower with rain shower head, rubber tubing faucet connection and round curtain ring, with white duck curtain and wall hook.

THEY met it first in the training camps—it was part of their treatment in the convalescent hospital—it was included in the routine of the demobilization camps.

So the best of Canada's young men have become educated to the Shower—they know what it means to their health.

It is up to you to see that they get a Shower in their homes—the kind of shower that will give satisfaction—an EMPIRE SHOWER.

Let them know that you can supply the Portable Shower illustrated here.

It is specially adapted for use when a permanent shower is not practicable in a rented house, an apartment, or other places where space is limited. It is all that a shower should be.

Empire Permanent Showers in the latest and improved designs will be in demand as well.

You are going to be called on for Shower estimates.

Write for our catalogue and order direct from us.

AMBITION

A Little "Straight Talk" To the Canadian Plumbing Trade

Let us NOT "fling away ambition" but make our ambitions worthy ones.

Our chief hope and desire in the present series of advertisements is to influence the Canadian plumber to establish high ideals, to realize his opportunities and place his profession and himself on a high plane in the life of the community. Fortunately this ambition is being realized more and more in Canada and in many towns and cities the plumbing establishment ranks very high in business circles.

The Canadian Brass Company endeavors to contribute for the assistance of the trade goods of high quality and to render the trade every possible service which will make for better conditions in all its branches. The TRADE MARKS of this Company are an assurance that the goods bearing them are manufactured with the purpose of backing the plumber in his ambition to install the best possible work.

Our service department is always ready to suggest ways and means and we will esteem it a compliment when our many friends in the trade consult us when desirous of securing the best aids to the attainment of high standards.

ARE YOU SATISFIED?

Do the prevailing conditions in the Plumbing and Heating business satisfy you?

What are you doing to improve your situation?

Take stock of your affairs and where do you find yourself?

If the majority of those carrying on in the Plumbing and Heating business throughout Canada will answer the above questions honestly to themselves, they will admit themselves business failures.

If this is the case, something should happen quick.

SOMETHING HAS TO HAPPEN QUICK, and now is the right time for it to happen.

All those operating in the Plumbing and Heating business throughout Canada have opportunity knocking at their door to share in the prosperous times in view for Canada.

But they must open the door, by joining hands with the progressive Sanitary and Heating Engineers throughout the Dominion of Canada, by becoming members of the Canadian Society of Domestic, Sanitary and Heating Engineers.

Answer the above for yourself.

You lend a hand to improve trade conditions by forwarding your name and address to the secretary at once.

ALL FOR ONE and ONE FOR ALL

Yours for Co-operation

JARDINE and TOLEDO PIPE THREADING TOOLS

"Toledo" Geared Adjustable Threading Tool No. 2½. Capacity 2 - to 6 in. inclusive. Weight 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

Is the Alien a Menace?

IN the October issue of MACLEAN'S MAGAZINE a strong presentation is made of the reason why the people of the West are against further foreign immigration.

"The Menace of the Alien" depicts the foreign problem in the Canadian West as it exists to-day, and shows every one of us why we must Canadianize our Ruthenians, Austrians, Slovaks, and our fifty-seven other varieties before we allow any further "unrestricted" immigration.

This article is written by a member of MACLEAN'S MAGAZINE staff who has just returned from a careful, personal investigation of the situation. Shall we have a "White West?" Many Westerners are demanding it. Are the aliens to swing labor into the bosom of the O.B.U.? It is being done—and what must we do to stop it?

The "inside" story of the routing of the Drumheller miner aliens by returned Canadian war veterans is here told by MACLEAN'S for the first time. What leadership must be substituted for the O.B.U. leadership of these foreigners?

The October issue of MACLEAN'S is a Western number in the sense that it contains many articles and stories of distinctly Western interest. For instance:

X "Those Pesky Farmers Out West"

By Hopkins Moorhouse, author of "Deep Furrows"

They have completely upset the old order of things. No longer will politics consist of the comfortable fight between the Ins and Outs with the old party lines maintained. The grain growers on the Prairies have upset the calculations of the professional politicians and completely changed the face of Dominion politics.

X "Fifty Years in the West"

By Professor W. T. Allison

A breezy and readable sketch of the business career of Winnipeg's veteran business man, James H. Ashdown.

"Further Discoveries of New Lands"

By Vilhjalmur Stefansson

The final and most interesting instalment of Mr. Stefansson's story of his wonderful trip of five years' duration in the Canadian north in which he tells for the first time of finding new continents in the Arctic and hoisting there the Canadian flag.

X "The Banshee Bell"

By Edith G. Bayne

A bright love story laid in the mountains of British Columbia.

Other Splendid Features of October MacLean's

X "The Turmoil at Ottawa"

By J. K. Munro

A comprehensive survey of Dominion politics, written with complete impartiality and absolute candor. It is bright and breezy, with a knock in every line for the politicial opportunists. It plucks many tail feathers from our party leaders.

"Spanish Doubloons"

By Camilla Kenyon

The start of a bright and fascinating serial story by a brilliant young writer. It is the Spanish Main brought up-to-date, treasure hunting with a background of fun and romance.

"The Airy Prince"

By Arthur Beverley Baxter

A complete novelette in which is presented a bird's-eye view of England in time of war. It is one of the most brilliant stories that has been written of recent years.

"His Majesty's Well-Beloved"

By Baroness Orczy

The latest novel by this popular authoress appearing exclusively in MACLEAN'S.

"Ebb and Flow"

By C. W. Stephens

A strong business story laid in the province of Quebec.

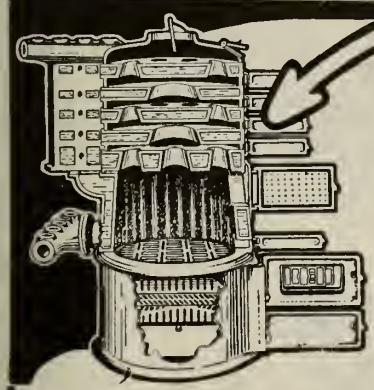
WHY "THE SOVEREIGN" HAS INDIVIDUAL CLEAN-OUT DOORS



Efficiency Detail in "Sovereign" Hot Water Boiler

"Individual Clean-Out Doors" is one of the minor features of improvement in the "Sovereign" Hot Water Boiler. It shows how finely the idea of conserving heat has been worked out. Opening only one door at a time, while removing soot or ashes from between the boiler sections, prevents unnecessarily chilling the heating medium.

The principals of the Taylor-Forbes Company introduced the screw-nipple wall radiator in Canada, and are the original designers of the **largest first section** in Hot Water Boilers, a feature which is now widely copied or imitated.

Follow the line of least resistance—"Sovereign" Boilers and Radiators make sales easy.

The Heating of the Small House

Practical Data Regarding the Essentials of a Most Important Problem Encountered by Every Man in the Trade—How to Get the Very Best Results—Fourteenth of the Series by N. A. Kearns

THE subject we have now for consideration is that of the heating of a small residence by a hot-water system.

The house is one uniform in design and construction with that of a number drawn for the Welland Housing Commission, and differs only from the houses erected in the type of heating plant that is to be used.

As a rule a house of this size is heated by a warm air apparatus, but in this case the owner has asked that his house be heated with water instead of warm air, so the problem placed before us is to design a hot-water heating system that will give the greatest service with little attention, and at a low cost of installation.

The Architectural Drawings

When we refer to the architectural drawings, we note that this house is to be built of frame with exterior walls of stucco and metal lath. The outside dimensions of the building are 21 ft. 8 in. by 26 ft., not including the verandah. The storey heights are 9 ft. for the ground floor and 8 ft. for the first floor.

We could draw the heating system directly on the architect's plans, but in doing so we could not show the layout of the heating system with as much clearness as we could when making a separate and distinct set of drawings for this purpose.

Making a Tracing

The best way to copy the floor plans is to trace them either on tracing cloth or on tracing paper. Tracing cloth costs more than paper, but as it will stand a great deal of hard usage and erasing before being destroyed, its use may prove economical in the matter of a draughtsman's time when compared to time wasted in the handling of tracing paper with the care required.

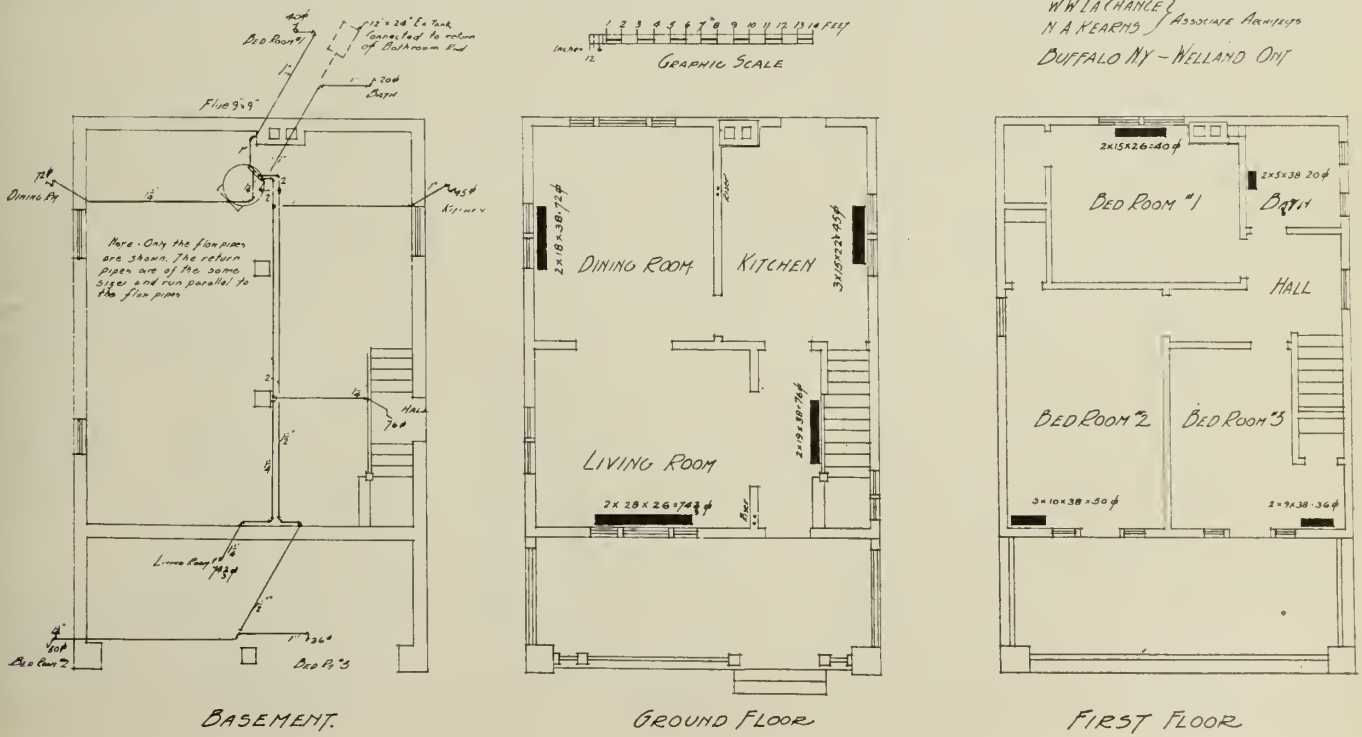
The tracings may be made in pencil or in ink. Blue prints may be made from pencilled drawings, but they are not so clear and distinct as those made from black "India" ink on tracing cloth.

When pencil work is to be done on the tracing, it is advisable to use the dull side of the cloth, as it is almost impossible to make a distinct pencil line on the glazed side.

Should be Dusted

Before attempting to draw with ink on the cloth, the cloth should be dusted all over the surface where ink is to be applied with powdered chalk. The chalk should be well rubbed in with a piece of chamois and then all of the surplus chalk should be dusted off the surface. The chalk removes all grease, etc., and permits the ink to flow from the ruling pen freely and in a uniform quantity.

We first carefully place the original drawings down on the draughting board and square the sheet to meet our set-square fair on the horizontal and vertical lines. Then over the drawings to be traced we place the tracing cloth, and after dusting the cloth with the chalk



as already described, we are ready to make our tracings.

All lines parallel to the bottom of the board are traced first. These lines are ruled along the upper edge of the T-square, then the lines perpendicular to the lines already drawn are ruled along the edge of the set-square. Last of all the diagonal lines are drawn.

What to Omit

In making a tracing off a plan for the purpose of showing the heating layout, do not draw in an extra line that may be left out. All extra lines only serve to confuse the man on the work. The main lines of the building must be drawn, as must also those indicative of the doors and windows. Any part of the construction that has a direct influence on the placing of the heating apparatus should be indicated, but all other lines must be omitted. It will be noticed that the main supporting beam under the ground floor is not shown on the plan of the basement, although the supporting posts are. If the beam had been shown, its lines would have become confused with the pipe lines.

To Figure Radiation

While the architectural drawings are still on the board we start to figure the radiation, and to do this have determined to use the heat loss method as a basis for our figures, and for our convenience may make use of the system presented in the April 15th number of the SANITARY ENGINEER. When we refer to the data there given we find that the heat loss formula for a temperature range of 80 degrees and a radiator efficiency of 155 B.t.u. per hour could be reduced to simple terms by a direct system of division of cubic contents and the exposed surfaces of walls and glass.

Thus we divide:
The cubic contents by 109.
The exposed wall by 7.6.
The exposed glass by 2.

And in adding the resulting figures find the total amount of radiations required for each room.

Radiation For Each Room

Starting at the dining room we find that this room is of the cube and the surfaces here given:

Cube: 11 ft. 4 in. × 13 ft. 8 in. × 9 ft. = 1,383 cu. ft.

Exposed wall: 11 ft. 4 in + 13 ft. 8 in. × 9 ft. = 225 sq. ft.

Windows: 1 ft. × 4 ft. × 4 ft. 6 in. = 18 sq. ft.; 1 × 6 ft. 6 in. × 3 ft. = 19 sq. ft.

Now we divide the cubic contents by 109 and find that for this we require 13 sq. ft. of radiation. This is only for one change of air per hour, and as in a room of this description we should allow for two changes of air in that time, we shall consider this as being 26 sq. ft. instead of 13.

Before we divide the wall surface by the factor given, the surface of the windows should be deducted, thus the wall surface is to be considered as 188 sq. ft., and after making the necessary calculation we find that there is 25 sq. ft. of radiation required to offset the heat loss occasioned by the wall.

Figuring for Windows

In figuring for windows and doors we assume that the entire area of the opening is of glass. This is to allow for the leakage around the casings, mullions and sash.

The window area of this room is 37 sq. ft., and, dividing these figures by the factor of 2, gives us 18 sq. ft. Fractions are ignored.

The total of 26, 25 and 18 sq. ft. is 69 sq. ft.

The other rooms are taken in turn thus:

Living room—
Cube: 1,372 cu. ft.
Exposed wall: 223 sq. ft.
Window: 47 sq. ft.
The radiation required for this room is found to be 78 sq. ft.

Hall—
Cube: 729 cu. ft.
Exposed wall: 166½ sq. ft.
1 door: 21 sq. ft.
1 window: 6 sq. ft.
The radiation required for this room is 51 sq. ft. In figuring radiation for an entrance hall like this, an allowance for three changes of air per hour must be made. In the upper hall two changes of air per hour is enough. The kitchen heating surface is based on a temperature of 60 deg. above zero and one air change per hour. Bedrooms are figured for one change of air per hour.

Locating the Radiation

In placing radiators in a room, the preference of the householder must be given some consideration. The most effective positions for radiation is under windows, but some people object to radiation there, sometimes on the ground of the higher cost of low radiators when compared with those of standard heights, and sometimes on other grounds.

The window in the dining room of this house is high enough from the floor to permit of the installation of a radiator 38 in. high, so we place a two-column radiator here of an area approximating that of our estimate of 69 sq. ft. A radiator must not be placed under the rear window because that space is reserved for an article of furniture.

The Living Room

The window in the living room is 30 in. from the floor, so here a 26 in. radiator is placed. A shorter radiator could be used if it was of the three column type instead of that of the two-column shown, but as the two-column radiator takes up less room for its width than does the three-column, and because in length it just about covers the window width, the two-column radiator is used.

The reader will note that there is more radiation indicated in the main hall than our estimate demands. The extra radiation shown here is to provide heat for the hall on the next floor.

Kitchen Radiator

The kitchen radiator is to come under the table at the edge of a sink. For that reason it is to be a low radiator.

The radiator in bedroom No. 1 is placed under a window not only because of its efficiency when so placed but also because there is no other space available.

Bedroom No. 2 has a radiator set in one corner. This radiator is of the three-column type and fits into that space to advantage.

The rad in the bathroom is set against an inside wall because all of the outer wall space is taken up with fixtures.

Locating Risers

After the radiators are drawn on the plans it becomes necessary to show where the pipes feeding these radiators are to be set. In a two-pipe system of hot water heating such as this, it is not necessary to show anything more than the feeding mains. The return pipes are of the same size as the feeds, and, as it is economical to run them in parallel lines, a system of single indication is all that is generally required.

Straight Across

The joists run straight across this building, so when the long lateral is run from the riser in the hall partition to the radiator in bedroom No. 2, no joists need be cut into. This same riser also feeds the radiator in bedroom No. 3.

All risers are concealed in partitions.

The riser that feeds the radiators in bedrooms Nos. 2 and 3 is not of an area equal to the combined areas of the two radiator toppings, but as the radiator in bedroom No. 2 could be served by a 1 in. topping, this riser will be quite large enough. Had that radiator been of an area of say 80 sq. ft., the 1½ riser would not be large enough.

In a future article it will be shown how much smaller pipe sizes can be used by properly proportioning the radiator toppings to the area of the radiator.

How To Reckon It

In the system here shown the pipe sizes are based entirely on the combined area of radiator toppings. In a small job of this kind no great saving will be effected by a different system.

The pipes connecting the boiler and the ground floor radiators are not connected to any of the first floor radiators, nor is the piping for the first floor radiators connected to any ground floor radiator. With a system like this there can be no danger of the rapid circulation through the radiators of the upper floors short circuiting the returns from the ground floor radiators. On a small job such a system of piping costs little, if any more, than that of a common main, and as it is so easy to instal we always advocate its use in work up to a certain number of radiators.

Requires Experience

A fitter who has had much experience in running common mains for radiators on floors of different levels may be able to so set and proportion his fittings that he can be satisfied of a perfectly uniform circulation resulting, but for most

Making Camp Sanitary for Soldiers

Fresh Changes of Clothing Available Every Ten Days—Making Bathing Conveniences For the Weary Fighters—Sanitary Closets — How a Montreal Plumber Did His Bit

TO a Montreal master plumber belongs the rather interesting and unique distinction of having served his king and country in Flanders, in a manner not altogether foreign to his own trade. This loyal individual was Captain Dan A. Bethune, head of the firm of D. A. Bethune, Limited, 483 Bleury street, Montreal.

Enlisting as a lieutenant with the Canadian forces, Mr. Bethune crossed to England and subsequently to France and Flanders. Here he was identified with the Third Division as Staff Officer of Details, and he was in charge of 125 men constantly for three and a half years. The particular effort of which he had charge, and in which he was able to do most creditable and important work, was that of erecting the baths, drying huts, etc., required by the division to which he was attached. A description of the details in simple language will doubtless be of interest to readers of SANITARY ENGINEER and for this data SANITARY ENGINEER is indebted to Captain Bethune.

The Bath House

One of the most carefully guarded things in connection with the modern army is that of the men's health. This is vital. It cannot be overlooked or in any way neglected. Such arrangements as are essential to the preservation of every man in the "pink of condition" are made quickly and unreservedly, regardless of the expense entailed. In fact the outlay should not be referred to as an expense, but rather as an investment. Without healthy fighting units, battles would be lost and the determination of great issues would be decided.

CAPT. D. A. BETHUNE

Of Montreal is a veteran, not only of his chosen vocation of Master Plumber, but of the great war as well. There he "carried on" for three years. As in connection with his own business, he is very modest regarding his exploits. He is held in high esteem by the Master Plumbers of Montreal.

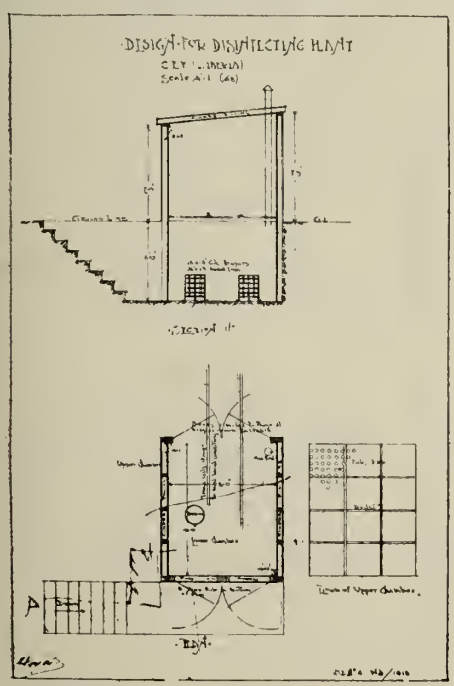
A Fixed Design

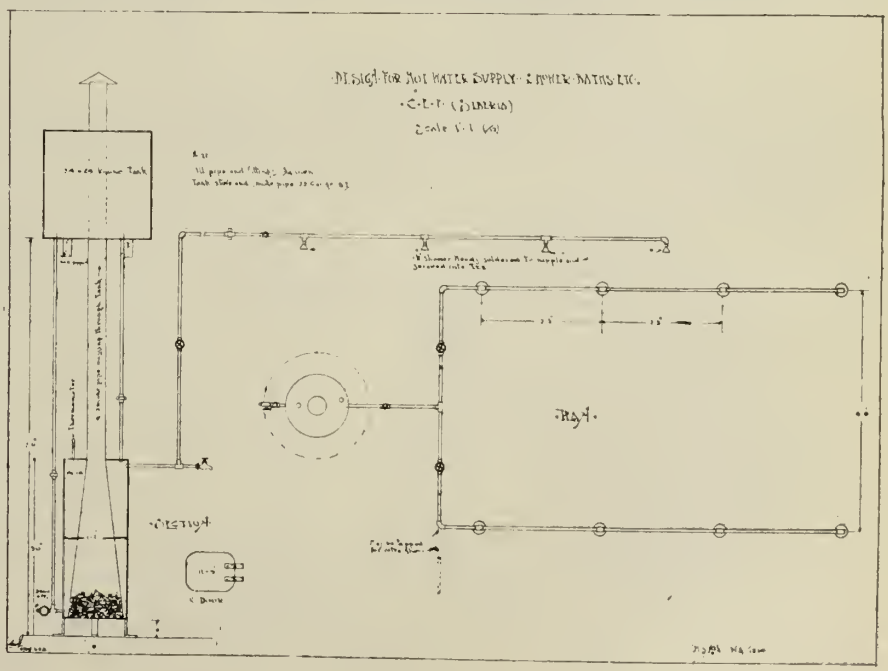
A fixed design of standard bath house was adopted by the military authorities which worked admirably in the field. This was of 23 feet width and in length the dimension was 36 feet. The roof was of the common gable pattern and the width of the building was planned with a view to making use, later, of seven-foot corrugated iron sheets. Two of these sheets, lapped, were sufficient to cover the width of 23 feet and to permit of a necessary extension over the side of six inches, and thus made a finished looking job and provided a good watershed.

In brief, the appointments of the bath house afford two compartments for clothing, one for soiled and one for cleaned. Reference to this in detail will be made later. There is also a private bathing compartment for officers and one for the men. The dressing room for the officers is 8 feet by 6 feet, and that for the men 16 feet by 7 feet 3 inches. Seats are provided, and a passageway of four feet is arranged. There are, of course, plenty of windows, and pegs for clothing.

The Water Supply

There is ample provision for a good water supply, and this is, of course, required in great quantity. The shower plan is necessarily adopted and the temperature of the water is made very comfortable through a unique arrangement of heating, which is known as the "dumb-bell shower bath," was used. If camp has been located near enough to a good river or stream, there is no need to look farther, but in the absence





of this natural asset wells must be bored. Incidentally, Captain Bethune stated that some very fine wells had been encountered with an endless supply of excellent water at all times.

The heat is introduced into the enlarged base of the smokestack which extends right through the centre of a 22 gauge galvanized iron tank 2 feet in diameter. This is the supply tank. The water passes in and against the base of this smoke pipe and the heat from the fire which has been lighted on the elevated grate at the base of the stack, and 4 inches above the ground, serves to warm the water quickly. It should be explained that a water jacket has been made to encircle the base of the smoke stack, and this, when made water-tight, permits a ready circulation of the water, and the same passes out to the pipe distributing system ready for use.

With five of these bath houses in each divisional area, forty men could be taking a bath at one time, aside from the officers who might wish to avail themselves of a shower. As many as 4,000 men sometimes took a shower bath in one day at one divisional quarters.

Filtering the Water

As it is imperative that the water passing out from the bath house be disposed of in such manner as to preclude the possibility of any disease spreading, a system of filtering is adopted.

The plan was not so elaborate, but it served the purpose well. This, after all, is the test of a sanitary measure.

From the bath house the water finds its way through a 3-inch pipe line and first enters a lime mixer. This is made from a barrel cut in two. From here the used water passes onward and is diverted, diagonally, to two settling tanks, each of which is 8 feet square. A baffle wall is fixed at one side, this to catch the solids, if there were any, although the water passing out from these showers would have a minimum of solid matter in it.

Passing through lime, sand, gravel, or cinders, it will be readily understood that any germ matter would be dealt with most effectively and disease-spread fully arrested.

No Joke This

Captain Bethune told the writer that there had been some serious accidents in connection with the movement of the mules and men over this pock-marked area, which, in places, had been a veritable hell during certain periods of the war.

In transporting certain material around the camp small two-wheeled carts are used, and to these are hitched the small but trusty mules. Much of this work, in the very nature of the risks, which would make it almost foolhardy in the daylight, must be undertaken at night. This involves the necessity of groping about in the dark more or less, and the is little opportunity to follow beaten roads or paths. As a consequence, Captain Bethune stated that cases had come to his notice where cart, mule and driver had toppled into these wells.

"How they ever got in I cannot understand," said the Captain. "The wells are only about four feet in diameter, and it did not seem possible for a cart to fit in there. But they went to the bottom, and, strange to say, they were not killed. Military crosses have been awarded for rescues made from these wells."

The Drying Apparatus

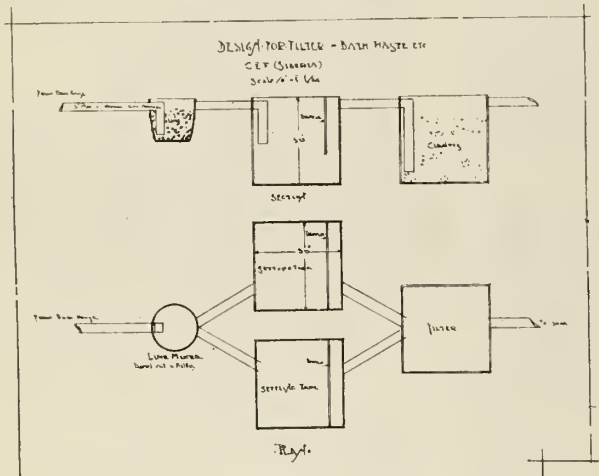
When a civilian bathes he immediately seeks a fresh change of wearing apparel. But even his appreciation of cleanliness cannot be as great as that of the soldier. Faced with dirt on every hand, he must come in contact with it, in the nature of his exploits from day to day, and what should be more natural, once his body is cleansed, but that he should have a clean change of wearables?

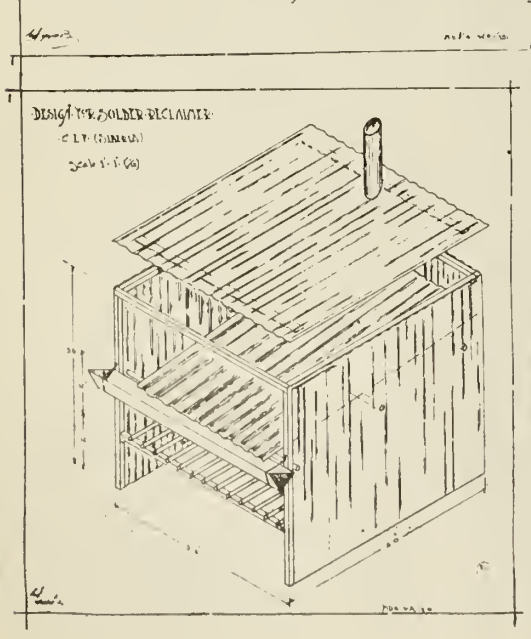
With a view to making necessary provision for cleansing the men's clothes, a separate building has been erected. This is of fifty foot length and six and a half foot width. The design is that of a shed or shanty and the appearance is much the same as that presented by a poultry house. The height above ground, at the front, is 7 ft. 6 in. and that at the rear is 6 ft. 6 in.

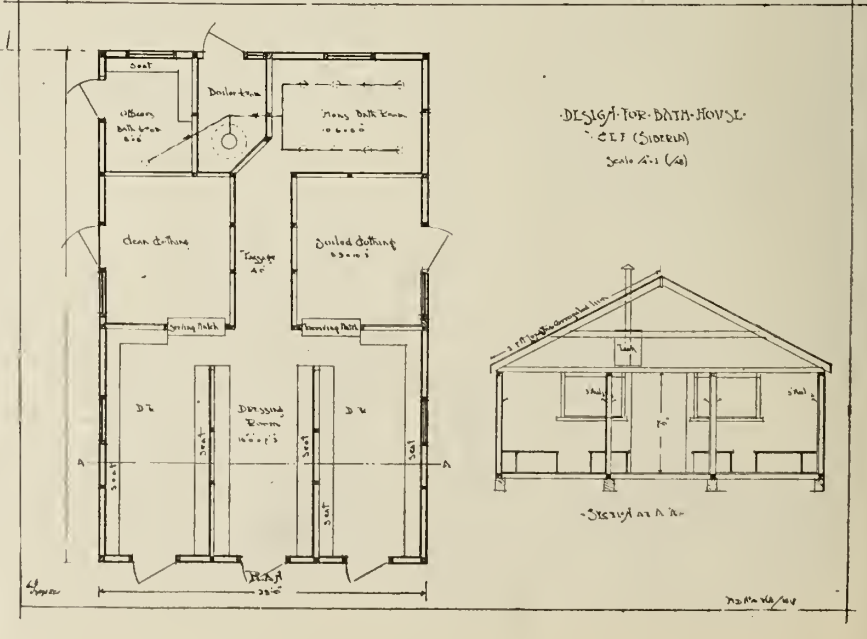
Inside the building is lined with corrugated galvanized iron and this is the material used on the exterior, also. Between this and the studding there is a filling of cinders. This helps retain the heat. It might be explained that there is also a double roof, the filling being similar to that used between the walls.

Heating Apparatus

The heating apparatus is quite simple. A small heating chamber is constructed of brick, three feet in depth, two feet high and five feet nine inches







wide. At a short distance above the ground, and between the two side walls of brick, a simple grate bar arrangement is provided to carry the fuel. The roof of this little chamber is of 4-inch pipes and these are 5 ft. 6 inches long. The space between is cement-filled.

Once the fire is started the smoke and heat passes through a 15-inch galvanized pipe, this being on studding just above the ground and the full length of the building. This great length affords a strong draught and the pipe passes out at the end farthest from the heating furnace, being carried through the roof a distance of three feet.

First Disinfected

Quite guiltless himself, the soldier may be the victim of his careless brother-in-arms, who has been none too careful to preserve his body and clothing free from vermin. Thus, the "wee things" try hard to get the upper hand and would succeed but for the precautions taken by the sanitary section of the big army.

As a general thing there are about 1,600 changes available from one disinfecting and drying plant every day. This means the issuance of no fewer than 8,400 pieces.

Discarding their clothes, which they have been wearing the allotted time, the soldiers' wearables pass into the disinfecting chamber at once.

This chamber is 8 ft. wide by 10 ft. long, and of the same shape and style as the drying chamber just described. The heat is supplied from below the ground line, an excavation having been made 6 feet deep.

The medium of generating heat is through the use of two braziers placed in the bottom of this excavation. These braziers are circular in shape, are 18 in. wide and 18 in. high and are constructed of ¼x1½ in. band iron. Holes 1½ in. in diameter are bored in the floor and permit the free passage of the disinfectant to the chamber above.

Load Distributed

Placed on trucks and which run on light rails, the load is distributed on a series of racks being provided for this truck. This truck load is then pushed into the disinfecting chamber and the thorough disinfecting is accomplished within twenty minutes.

The remaining operations are those of washing and then repairing and distributing. This washing and disinfecting is done once in ten days, that is, the men have a clean change every ten days. The operation of cleansing and repairing, of course, is continuous from day to day.

There are three plans of disinfecting. The first was that of a solution of 2½ per cent. creosote with hot water. Treatment of this kind lasted 20 minutes, and this was very effective and speedy.

Second Treatment

The second treatment was that of the same proportion of creosote, but cold water was used. This was much slower, the operation taking 24 hours. Ordinarily, this would constitute quite a loss of time.

The use of steam constituted the third plan. This steam was introduced into a small box of wood or metal and which was 4 feet in diameter. The clothes were placed in baskets and a steam pressure of five pounds was turned on. This lasted for 15 minutes and any "movies" subjected to this were quite dead at the finish.

Closet Arrangements

In making arrangements for closets, two plans are followed. In some instances a galvanized box plan is used. This works well and is quite satisfactory, but, of course, it cannot be used altogether as the number of boxes required would be numberless, almost.

The other plan is that of the pit arrangement. The pits are dug seven feet deep and recourse is had to chloride of lime, in order to combat the increase of flies. By exercising extreme care in this respect there has been little difficulty in caring for the sanitary requirements of the vast expeditionary forces, which, for four years, thronged France and Belgium.

Salving the Solder

The foregoing description will have given some idea as to the arrangements which modern war has called for in preserving to the men their health. For in no small measure the cleanliness of each unit is an index of its ultimate effectiveness in waging war.

Prosperous Towns Mean a Prosperous Canada

By E. M. Trowern, Secretary, Dominion Executive Council, The Retail Merchants' Association of Canada, Ottawa

THERE are very few people in Canada who have not heard the argument used, that in order to pay our national debt we must produce more goods, whether they are from the forest, the mine, the field or the sea, The object is to exchange these goods for other goods that we require, but which we cannot produce. The more goods, therefore, that Canada can produce the richer she becomes, and the richer that she becomes the better business place it is for those who live here. If the above argument is sound for Canada as a whole it should also be sound for any part of Canada.

Makes for Progress

Competition among nations is the strongest incentive toward progress. The Canadian people are proud of Canada because of the ideals she has set up, and she is, therefore, proud of her flag and proud of her race. This is the incentive for higher development. To build up Canada we must do as all sane men would do in their own private business; they must build up their treasury, and so we must build up the Canadian Treasury. Hundreds of millions of dollars in the treasury of any foreign country are of no use to the Canadian Treasury unless we can get some of it by exchanging our products for it.

Would Become Dormant

If the world was one great commonwealth and there was only one treasury, we would become dormant through want of competition, and we would become lost through enormity. Competition is the mainspring that forces us on toward higher ideals. This is true in every position in life. The citizens of every city, if they are happy and contented, take a pride in their surroundings. They want their city to be the best in Canada, and they strive toward that end. This produces a healthy rivalry, and so it is with the towns and villages of Canada.

Variety and Style

Follow the argument a little further, and competition among the citizens for better homes produces a variety and style that lends a charm to life, and which could not be found where every house was built after the same plan and of the same style of architecture. If legitimate competition, therefore, is an advantageous incentive among nations, cities, towns, villages and individuals, it must be encouraged and not destroyed, providing it receives no special privileges and does not undertake to take advantage of its position.

Goes Hand in Hand

Wherever there is prosperity there is usually progress. Prosperity is not always represented in dollars and cents. If it were so and all the dollars and cents in Canada got into the hands of two people, no one could say that Canada's prosperity was impaired if the amount this year remained the same as last year, or was somewhat greater, but if this condition was produced we would begin to see evidences of lack of prosperity all around us.

How About This?

In making a survey of all the towns and villages throughout Canada, can anyone say that they see great evidences of prosperity? Can they see more stores being built or new additions to old ones? Is there more paint used than formerly on the store fronts? Are the stocks doubling up or keeping pace with the population? Is there a general appearance of prosperity all around? Are there more and better pavements, better fire-fighting appliances, more contented civic employees, better paid public school teachers, etc.? If not, why not? Could it be because of the lack of pride in the town or village? Is the money that is paid to the farmers or producers passing through the town or village and circulating so that all engaged therein can have an opportunity of being rewarded for their services, or is the money going direct to one or two large mail order houses hundreds of miles away, and starving the trade of the town?

Reduce Its Power

Take the actual trade and business out of a town and you reduce its power to pay taxes. Taxes can only be paid by those who have money to pay them. Mendicants and beggars never pay taxes. Every retail merchant who has a store in a town should make it a rigid rule to buy all the things he requires from his fellow retail merchants in the town. If the goods you want are not in stock, leave your order and encourage your fellow retail merchant to stock them. If retail merchants themselves patronize and encourage mail order catalogue houses, how can they complain if others do the same thing?

Keep It At Home

If you want your town to thrive you must keep your money in local circulation. You must constitute yourself a town booster. Canada's continued prosperity depends upon her live, up-to-date towns. It is far better to have eight million happy and contented people in Canada, all having enough work to keep them busy and sufficient salaries to enable them to lay something away for a rainy day, than it is to have thousands out of employment, thousands receiving starvation wages, thousands in the poor houses, and a few living in luxury and abundance. The more active, energetic towns that we have the more equitable will be the distribution of wealth.

Vital To Our Future

Canada's future depends upon the prosperity of her towns and villages. If the towns and villages of Canada decline, Canada will also decline. If you want your town to die, take your money out of circulation and send it away to a mail order house. If you want a thriving, up-to-date place where the people love to congregate, be a town booster; take an interest in the stores in your town; encourage those who keep clean, comfortable hotels, where commercial travellers can stay with comfort and obtain good meals. If you have a local paper, weekly or daily, subscribe to it, and if you are a merchant or a manufacturer advertise in it and see that the proprietor keeps everlastingly boosting your town. If it is worth living in it is worth boosting; if it is not worth living in we would advise you to move out as quickly as possible and give place to better men.

Quality Work is Basis of His Success

"I Will Not Cut Prices for Anybody," Says Alex. Henderson, of Thornhill, Who in Three Years Has Built Up a Business That Keeps Himself and Men Busy the Year Round

Based on an interview by C. E. PARSONS, of SANITARY ENGINEER, with ALEX. C. HENDERSON, of Thornhill, Ont.

THREE years ago Alex. C. Henderson left Toronto, where he had been in the plumbing business for seven years, to locate in Thornhill, Ontario, a village of 850, located ten miles north of Toronto. He had an idea that there was a lot of good business to be obtained among the farmers and he had his own ideas about how to obtain and hold that business.

"My whole business policy," said Mr. Henderson to SANITARY ENGINEER, "was based on quality work. I came out to Thornhill an unknown man, and started in to build up a business. I soon found that there was plenty of work, and now after three years I am in the position where I have not an idle moment the year round and have three men working for me."

Likes the Farmers

"The farmers are good people," said Mr. Henderson, "I have had no trouble with them. They are often hard buyers and have to be shown, but I have found that the whole situation centres around getting the farmer's confidence. Once he knows that you will do good work, and that you will not allow any poor materials to be used on the job, in short when he knows he can thoroughly trust you, there is no better man to do business with. They have the money and they want good goods and they are willing to pay fair prices for them. I have never had any trouble with collections. In the three years that I have been here I have only lost $21 and that was my own fault."

Sells Water Systems

Mr. Henderson has had splendid success in the sale of water systems. Each season he finds the number of installations of these systems increasing. Next year, he says, he knows he will instal more water systems than he did this year; just as he put in more this season than he did a year ago.

"They sell themselves," said Mr. Henderson. "It is a question of getting a good system and then installing it right. One thing I insist upon absolutely is in satisfaction. My customers have got to have good goods and good workmanship. I want to be satisfied as far as my own conscience is concerned that no poor material went into a job and that there was no faulty workmanship. I am building for the future and this foundation is the only sure one to build on. I have proved it right along.

His Best Advertisement

"The people for whom I have done work are without any question my very best advertisement. I have tried in every way I can to give them good value for their money. I hold, and I think rightly so, that a man is entitled to a fair profit on his work. I figure on twenty per cent. I can do this because my overhead in Thornhill is lower than it would be in a large city. If I were in a bigger place I think 25 per cent. at least would be necessary.

Won't Cut Prices

"I will not cut my prices for any man. When I give him an estimate of a job, it is made after carefully investigating all the requirements. I will use no cheap materials, and the workmanship must be such that it will pass my standard. That means that it must be right. There must be no comebacks. Here is an example of what I mean. A man came to me early in the season and wanted a figure on a job. I gave him an estimate of $350. In a few days he came to me and told me that my price was $70 too high. I asked him what he meant, and he said that he could get it done for $70 less, that my price was too high. I told him he was absolutely wrong. My price was not too high. It was a fair and honest price based absolutely on the cost of the time and labor, with prices for good materials added and a fair allowance added for profit. I told him that I could not undertake to use materials that would allow me to do the job for $70 less because if I did, the people who bought the house would in a short time have trouble and they would never stop telling everybody in the neighborhood that 'Henderson did our plumbing work and he is to blame for all the trouble we are having.' That is the worst kind of advertising I could have and I do not want any of it. I would rather let some other fellow do the work and get talked about the wrong way if he does bad work."

Improve Their Homes

Mr. Henderson says that the farmers are continually improving their homes and that they want the conveniences and things that city people have. There is a big field in supplying these things, he says, and it is a question of getting started.

"Every installation I make," he says, "means just that much more business in the future. If I put in a pressure water system or bath room equipment for some farmer and it works out ten times better than he even expected it was going to, and that is what happens, he never tires talking about it and telling his friends and showing them what a convenience it is. The first thing I know one or more of his friends is around wanting to know how much the equipment I put in Mr. So and So's house cost. He tells me that Mr. So and So recommended me and my work, and said that I did a good job for him and used good material and he has had no trouble. That is the way I want them to talk and that is the way they have been coming ever since I started work. The best part of it is that they are coming in constantly larger numbers and as I said I have not had an idle period in the whole twelve months. I insist on my men doing good work and we are all kept very busy. I have enough work ahead now to keep me working at full time away on into the spring."

Blames Manufacturers

Mr. Henderson blames the manufacturers for promising to send out materials and then not keeping their word. If they would set a time for delivery, he says, even if it was a month ahead and then make good, it would enable him to plan his work and keep his men employed to the best advantage.

"I have a case right now," he said. "A firm has been promising me material for three weeks. Every two or three days they tell me it will be there sure. It isn't here yet, and it just means that I am not going to buy any more stuff from those people. They do not realize what it means to disappoint me in delivery like this. It puts me in wrong with the man for whom I am doing the work. He wants to get into his house before the cold weather comes and he blames me for the hold-up. It keeps my men waiting about, and men at present wages when they stand around soon count into money. If I knew the stuff was not coming, I could send them to some other job, but when the firm assures me the material will be there at such a time and the men go and do not get it it means a lot of trouble and loss."

What They Buy

Reverting to the farmers again, Mr. Henderson explained the course followed by the average farmer.

"When a man begins to get money coming in plentifully," he said, "the very first thing he wants to buy is an automobile. The next thing he thinks about making his home a more comfortable place to live. He begins to find out about better heating, better conveniences and so on. My experience is that it is not a question of price with most of these men. They want good goods and installations that are not going to give them trouble. They want things that are going to make life easier for them and their homes better places to live in. Many men in business perhaps do not realize how people talk. People are talking all the time about a store, or a plumber or somebody. If they are well treated and satisfied they never stop boosting, and if they are not satisfied they never stop knocking. One bad piece of work would do more to ruin my reputation than a dozen good

Plumbers Must Pass Examinations

Sanitary Engineer Subscriber in New Zealand Sends in Examination Papers—About 45 Per Cent. Successful in Passing — Licenses Needed and Renewable Yearly

Editor's Note.—Through the courtesy of one of our subscribers, W. S. Fisher, 135 Dominion Road, Mt. Eden, Auckland, New Zealand, we are reproducing papers used in connection with an examination in plumbing, conducted under the supervision of the Plumbers' Board, of New Zealand, and at which Mr. Fisher acted as one of the assistant supervisors. In New Zealand there is a Plumbers' Registration Act, which compels every man to pass an examination before he can engage in sanitary engineering. After passing the examination the plumber receives a Government license which is renewable yearly. Apprentices are also required to take a course in the technical school. Mr. Fisher advises us that in the examination here presented, about 45 per cent. successfully passed the examination. The accompanying drawings are obviously in greatly reduced size, but will serve to show how the questions are placed before those trying the examination.

UNDER the Plumbers' Registration Act of 1912, all those engaged in the plumbing trade in New Zealand must have passed a successful examination, and must also hold a license which is renewable yearly. The examination held on July 4 is herewith presented in detail. About 45 per cent. of the contestants were successful. The plans used in the examination are shown in greatly reduced size, and the instructions and questions were as follows:—

The Plumbers' Registration Act, 1912
(Plumbers' Board of New Zealand)

EXAMINATION IN PLUMBING

Written Examination, 4th July, 1919
Time allowed: 7 p.m. to 10 p.m.

NOTE.—**Any candidate who answers more than five questions will be disqualified.** Every candidate **must attempt** question No. 2. Candidates must use Plan A when answering question No. 2, and use Plan B if answering question No. 5. The maximum number of marks awarded to each question is the same.

1. Describe the materials and method necessary for adding a new branch to a galvanized sheet-iron vent-pipe already fixed.

2. (Compulsory). Show by single lines in Plan A a drainage system to connect the fittings with the sewer. Mark the names of the various vent-pipes and traps of the drains.

3. (a) What is the composition of good wiping solder?
(b) What are its characteristics?
(c) How may it become unworkable?
(d) How would you test its quality?
(e) How would you cleanse it?

4. Neatly sketch in section and describe how you would flash 4 in. cast-iron vent-pipes passing through rods covered with the following materials:—
(a) Ruberoid.
(b) Lead flat.
(c) Galvanized corrugated iron.
(d) Tiles.

5. In Plan B fill in single lines to show a first-class hot-water system to the fittings shown therein. Specify details of

The Plumbers' Registration Act, 1912.
Time Allowed: 8 a.m. to 12 noon, and 1 to 5 p.m.
5th July, 1919.

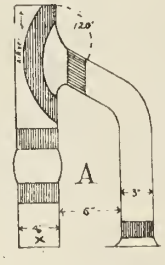
INSTRUCTIONS

All inquiries for information to be addressed to the Supervisors.

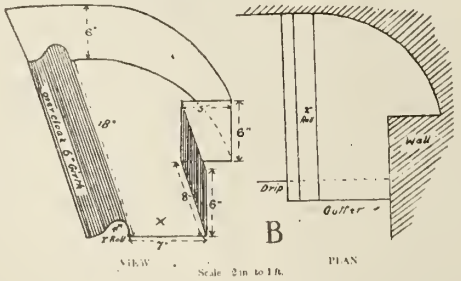
Candidates are not permitted to communicate with each other, nor to assist each other in the work they have to do.

Though the proper execution of the work is of the greatest importance, the time spent on each piece of work will be considered in judging its merits. Candidates need not, however, hurry over their work. Accuracy is required.

Each candidate must see that his number is stamped upon each piece of material, at the point marked X on sketches, before commencing if he so desire, but without fail **immediately after completion** of the work, so that the time spent upon it may be recorded.



A.—Cut 8 in. of 4 in. pipe from 2 ft. piece and wipe together with underhand joint. Bend 2 ft. piece of 3 in. pipe and join and wipe flange and branch joints in upright position as shown. Use spare lead for flange.



SIDE PLAN
Scale 2 in. to 1 ft.

B Bend up 2 ft. by 2 ft. of sheet lead to dimensions shown in view and plan

PLUMBERS' BOARD OF NEW ZEALAND

PLAN A

the materials, sizes of pipes, and capacities of boiler cylinder and cistern.

6. State particulars of the precautions you would take in constructing a vertical main stack of cast-iron vent-pipe (which receives branch vent-pipes at several floors) to prevent its lower part becoming choked with rust scale.

Also make a sketch showing this feature of construction.

The foregoing will undoubtedly prove of great interest to many members of the craft in Canada, and will show what brother members of the craft are doing in other parts of the world.

In a letter to SANITARY ENGINEER, Mr. Fisher states that business is brisk in New Zealand and that there is a great shortage of houses. Mr. Fisher states that many people held back for a long time expecting a drop in price, and absolute necessity has forced them to go ahead with building operations. Referring to prices, Mr. Fisher states that corrugated iron and galvanized flat sheets, used largely for roofing in New Zealand, is $250 a ton, as against a pre-war price of $90. Other lines are up 60 to 200 per cent. A six-room house that could be built for $3,000 in pre-war days now costs at least $4,500.

QUALITY WORK IS BASIS OF SUCCESS

Continued from page 21

jobs, and my plan is to leave no bad work behind at any time to advertise me the wrong way."

Keeps Close Track

Mr. Henderson does all his own bookkeeping, and says that keeping track of everything is of inestimable value to him.

"By going through my books I can tell you in a few minutes," he said, "exactly how much I have sold, how much is owing me, how much I owe and how much I have in the bank, and many other things that it is important for a man to know.

"I have had little trouble with collections. The farmers I find are honest and they have the money to pay for what they get and they pay. I do not do any credit business. I find out that the men I am going to work for are all right before I take a job and then go ahead."

Keeps An Auto

Mr. Henderson finds his field of operations continually widening. In order to cover a radius of several miles around Thornhill he invested in a car so that he can get around quickly. It was, he says, a splendid investment and he can cover quickly and at a minimum of expense an area that he could not begin to reach in any other way.

Mr. Henderson's policy in regard to repair work is never to try to fix any part that is not worth fixing.

"If I find after examining a piece," he said, "that it is worn out and that a new one would be the only means of making for permanent satisfaction, I refuse to fix the part. If I charged a customer up with repairs for some piece and then in a couple of weeks or a month it broke some other place, as it is sure to do, the customer would kick and he would have good grounds for complaining. If I explain to him that a new part will cost very little more and that it will make a job that will last for years perhaps, he usually sees the point and buys the new one. If he does not I refuse to take the work and let someone else get into trouble."

Apprentice Problem

Mr. Henderson thinks that the apprentice problem is one of the greatest in the trade to-day.

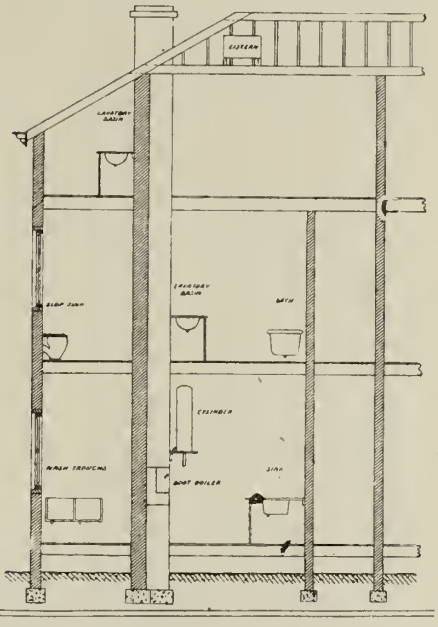
"The average citizen," he says, "takes altogether the wrong viewpoint in regard to apprentices. They object strongly to paying for them. This is wrong, as if no boys are allowed to learn the trade, it will be only a question of time before there are no plumbers. It is a big problem and one of the hardest to deal with at the present time."

PLUMBERS' BOARD OF NEW ZEALAND

PLAN B

Examination in Plumbing

Written Examination, July 4th, 1919
To be used with Question No. 5



MAKING CAMP SANITARY

Continued from page 19

Ho, you bully beef? This goes to the war camp by the million of tins and there is a fruitful source of waste, in a sense, in the discarded tins. Realizing that there would be a large aggregate weight of solder obtainable from the treatment of these tins, when empty, a simple "Recovering Plant" was evolved. This, as with so many successful little inventions, is the essence of simplicity from start to finish.

Corrugated iron, used by the ton on the army camping grounds, finds its place here, forming the roof, sides, ends and even the base on which the bully beef tins are thrown.

The little plant is three and a half feet wide and 4 feet long. The height is three and a half feet. In short, the plant is just a galvanized, corrugated box, open at the one end—the front.

Twelve inches above the ground a set of improvised grate bars have been arranged, these resting on three lengths of gas pipe, each 3 ft. 8 inches long. This provides a fire bed. Above this another set of gas pipes carries the sheet of corrugated iron on which the beef tins are thrown. This sheet is tilted so that solder will run. The fire now lighted, the solder melts from the cans and flows down the corrugations to a trough, which has been secured at the end of this sheet. Thus there is no loss. Coke is used as fuel.

Captain Bethune stated that one man had recovered 800 pounds of solder in this manner in one month from tins used by one division alone.

THE HEATING OF THE SMALL HOUSE

Continued from page 16

men, a system of piping as outlined is the safest to instal.

In most cases the mains leading to upper floor radiators are taken out of the end of the headers, but it will be noted that this plan shows such a main as being connected to one of the centre openings of the header. The connection is made that way in this case to compensate for the long lateral leading to the radiator in bedroom No. 2.

The pipe leading to the radiator in bedroom No. 1 should be taken out of the end of the header on account of its proximity to the boiler.

The Expansion Tank

The expansion tank is one of eleven-gallon capacity and is connected to the return pipe of the radiator in the bathroom. The system is fed with water from the city service by way of a valved connection set in expansion pipe, just below where the tank sets high up in the bathroom.

The Covering of Pipes and Boiler

The boiler is to be covered with 1¼ in. of plastic asbestos neatly troweled on, and the piping is to be covered with hair felt sewed up in canvas. The concealed risers will be covered with three-ply air cell covering.

Plans

Where pipe lines cross, one pipe line is shown as broken, so as to avoid the possible errors of assuming that a connection is indicated at such a point.

The drawings were made at a scale of ¼ inch to the foot, but, because of the necessity of reducing the drawings for reproduction we have shown a graphic scale that will always be in proportion to the drawings, no matter how much they may be reduced or enlarged.

Boiler

The boiler is to be a No. 3½ standard cast iron heater rated at 575 sq. ft.

What Causes Rate of Exchange

Simplified Explanation of Reason Why Canadian Money at Present Time is Worth Less Than That of United States—Natural Result of Our Immense Imports—Mistaken Ideas on Subject Prevalent.

By C. J. MORRIS

THE present disadvantage under which the Canadian merchant who has payments to make in U. S. is laboring, has brought to light an extraordinary lack of knowledge regarding the most elementary principles of international exchange, not only on the part of the general public, but also on the part of business men and even of newspapers which attempt to instruct their readers as to the causes governing the premium or discount at which one country's currency may stand in relation to that of another country.

It is by no means infrequently that we find in the daily press statements to the effect that the imposition of an exchange rate upon Canadian money by the United States is by no means a friendly proceeding, and advocating retaliation by the imposition of a similar rate of exchange upon all United States money spent in Canada. Such remarks only show how utterly the writers fail to realize the significance of an exchange rate.

To threaten to impose an exchange rate or discount upon United States money spent in Canada at the present time would be a proceeding equivalent to that of a householder, without a pound of coal in his cellar and with coal almost impossible to obtain, going to his coal dealer in mid-winter and informing him that unless he were willing to supply him with coal at a reduction of five per cent. on the ordinary rates he would refuse to purchase any from him.

U. S. Money Needed in Canada

It is the very fact of our being unable to get sufficient United States money in Canada to pay for all we buy from the States that makes it worth our while to pay a premium for it. It is really we ourselves who, by offering a premium for United States money because we have such urgent need of it, cause our own money to be at a discount in relation to that of the States.

A few days ago a Toronto paper informed a correspondent who enquired the reason for the rate of exchange, that such rate represented the exchange broker's estimate of the holder's chances of payment. Presumably the rate of exchange, in this writer's opinion, was an insurance premium paid to the broker, who in return guaranteed the solvency of Canada and due payment of her obligations. A moment's thought will show that this could not possibly be the meaning of the present exchange rate of 4 per cent. on Canadian money, as that would mean that the chances against Canada going bankrupt were only 25 to 1.

It is doubtful whether one business man in twenty understands what a rate of exchange really is and how it is caused. It is, therefore, the object of the present article to endeavor to make it clear by a simple illustration which can be understood by everyone.

The various nations of the world with their different paper currencies might be compared to the merchants of a community who agreed to trade together, accepting one another's vouchers in payment for their goods. Let us suppose that in such a community B is a baker and P a piano maker. B purchases a piano from P and also sells him bread. Till the piano is paid for B simply hands P back the latter's own vouchers in payment, and no difficulty arises. B does not require another piano, but P still requires bread, so B still accepts P's vouchers. P is still selling pianos to other members of the community, so B uses P's vouchers to pay them for goods he buys from them and the arrangement still works well. Let us suppose, however, that a time arrives when everyone in the community has bought a piano and P's vouchers become a glut in the market, as no one requires them. B, however, knowing that P is selling pianos to a dealer in a distant city, pays this dealer a visit and asks him to buy P's vouchers from him. The dealer says he would be able to use them at some future time and offers to take them if B will allow him a discount on them. B is obliged to agree to this, and disposes of the vouchers for cash, less the discount. He then informs P that if he accepts any more of his vouchers he will have to charge him a percentage on them.

The Two Cases Parallel

Here we see that P is buying from B more than he is selling to him, with the result that his money (vouchers) is at a discount. It is not in demand and its value consequently falls. In the same way Canada has made immense purchases from the United States and has not made sales to anything like a similar amount, the balance in favor of the States amounts to hundreds of millions of dollars, which we must pay in United States money. United States money is therefore much in demand, and we have to pay a premium to get it. Whether we pay a premium on United States money or sell our own money at a discount is the same thing.

Reverting to the above illustration, it is not B's fault that he has to charge P a discount on the currency with which P pays him. He gains nothing by so doing. On the contrary, he stands to lose, for it is evident that so long as P has to pay extra for his bread he will not buy from B more than he can possibly help. In fact, he may consider the advisability of getting the bread from the city to which he is sending his pianos and where his vouchers are probably not at a discount. B, therefore, far from benefiting from the exchange he is compelled to charge, stands a very good chance of losing a customer.

Merchant Not Benefited

In the same way the rate of exchange which the Canadian purchaser is compelled to pay to the United States merchant in no way benefits the latter, but has the effect of inducing the Canadian merchant to look elsewhere to fill his requirements. At the best he can only hope to get orders for as little as his Canadian customers can possibly get on with, and at the most he may lose his customers altogether.

The premium upon United States money has exactly the same effect upon commerce between the two countries as the imposition of a duty of the same amount upon all imports into Canada from the United States would have.

Where the Money Goes

The question will naturally arise: If the merchant gets no benefit from the exchange, who does get it? Where does it eventually go? This brings us to the part the broker plays in the matter. It is manifest that the Canadian merchant who has made a purchase of goods across the border has no time to go running around among his fellow merchants looking for somebody who has made a sale in order that the amount he has to send abroad may be offset by an equivalent amount which some merchant on the other side has to send into Canada. In fact, where the imports greatly exceed exports, it would frequently be impossible for him to find such a person. This is where the broker comes in. He undertakes to act as a clearing house for all parties and will either sell or buy United States drafts, and the broker in the United States will either buy or sell Canadian drafts. So long as the volume of transactions each way is fairly level no difficulty arises, and he makes only a small charge, a fraction of one per cent., to recompense himself for service he renders. But as soon as one country's purchases exceed its sales he is faced with the problem of what to do with the suplus of that country's money which begins to accumulate in his hands. He undertakes to absorb the surplus in one way or another. It is clear it would not pay him to hoard it and receive no interest upon it. If therefore, he cannot transfer it to some country which

What Others in the Trade Are Doing

How Sanitary and Heating Engineers From Coast to Coast Are Going After Business—Seasonable Appeals Just Now Will Mean More Business For You

Simmons Bros., Kingston, Ont., show an illustration of a workman installing a furnace. Their ad. is two columns wide and 3 inches deep. Under the heading in display type, "**Have Us Instal Your Furnace,**" they say, "Have us instal your furnace now so it will be all ready to use when needed. We are prepared to put in new flues, cold air boxes, or to build an entire furnace if required. We have ample facilities and equal skill. You can depend upon our work every time, and you'll find upon inquiry that our charges are always extremely reasonable."

* * *

Nutana Plumbing and Heating Co., Saskatoon, uses a single column space, 3½ inches deep, and says: "Nutana Plumbing and Heating Co., contractors and jobbers, plumbing, steam, water and warm air heating, sheet metal work, ornamental special designs, boilers, radiators, jacket heaters. Contractors' and builders' attention—We sell and instal Economy furnaces. This is positively the most compact, efficient and practical heating plant, barring none. Plans, specifications and full description furnished. Country work—write and tell us what you want done and we will give you an immediate reply."

* * *

W. J. Walsh, Hamilton, Ont., in a double column ad. 4½ inches deep, announces under the heading in heavy display type, "**Sale of Plumbing Fixtures,**" "Let us examine your heating system and have everything in first-class condition for the winter. We renew smoke pipes and all tin work. For the week we are having a sale of plumbing fixtures and sundries. Below are a few of our prices: 1—5 ft. porcelain enameled, 3 in. roll rim tub, $45.50. 1—18x21 porcelain enameled apron lavatory, $21.45. 1—Aristocrat, 2 division cement laundry trays, $45.00. 1—18x30 porcelain enameled, roll rim sink, all in one piece, at $22.00. 1—Low-down closet combination, $30.00. Plumbers' supplies, heating supplies. Call and see us."

* * *

C. J. Peppin, Belleville, Ont., plumber and electrician, in a single column ad. 4 inches deep, under the heading in display, "**Electric Lamps,**" says: "Just received a supply of genuine lamps, made in Canada and the best on the market at same price as inferior lamps. Prices given on electric wiring and plumbing. Prices right. Phone 462."

* * *

A. J. Wise Heating and Plumbing Co., Toronto, in a single column ad., says: "Beware. Don't wait for cold weather to have your heating system overhauled; consult our experts now. No job too distant; no service too great. Just call Hillcrest 1610."

* * *

James Brandon, Saskatoon, in a neatly arranged ad., one column wide and 3½ inches deep, shows a cut of a workman pointing to a hot water heater he has just installed and says, under the heading, "**Hot Water,**" in display, "Need not be a luxury in your home if you have us put in one of our hot water heaters. You can heat water in less time than it takes to tell about it and without building a big fire in the kitchen range. Besides saving you all kinds of inconvenience and bother our hot water heaters are real economy. Phone 4016."

* * *

Mainer & Bartindale, Orillia, Ont., use a double column space, 5 inches deep, and show an illustration at the top of a bath tub with the taps turned on and water pouring out. Under the caption, "Bath Plumbing," they say: "We supply quality goods and install them in the best manner, and our prices are right. Get our prices on wiring. We have a first-class electrician to look after your needs. Remember we sell fixtures, lamps, bulbs, etc. Furnaces—Look to us to clean and repair your furnace now. It ruins your furnace to leave it in a dirty state all summer, and rots and rusts it out. We also look after the repairing of your roofs, eavetroughs, etc. Call us at 'phone 124."

* * *

Adair, the Plumber, Kincardine, Ont., in a double column ad., six inches deep, says: "Adair, the plumber, Kincardine, is now settled in his new and up-to-date quarters in E. Miller's old stand, south of the Morgan House, and invites the public to call and inspect the well-assorted stock of plumbing supplies he has in stock. No one can afford to fumble with plumbers. That's logical. Quite true. That's why we are always on the lookout to protect our customers' interests in the way of acquiring good workmanship and materials. We aspire to give our customers the two greatest factors above mentioned, coupled with our always ready, six-days-a-week service. We aim to please. Are you going to rod your barn or house, Mr. Farmer? If so, let us demonstrate to you the superior qualities of —— lightning rods. Repairing of all kinds solicited. Estimates furnished on plumbing, heating, eavetroughing and everything in tinsmithing line."

* * *

E. Y. Lane, Truro, Nova Scotia, in a two-column ad. two inches deep shows an illustration of a workman repairing a down-pipe, and in the reading matter says: "Have you a leaky eavetrough or rain water conductor? We do all such work. We carry plumbing and heating goods of all description. Enameled and tin kitchen furnishings. Call E. Y. Lane, Phone 485-W, Plumbing, Heating and Furnaces."

* * *

Parrott & Byers, of Yorktown, Sask., in a double-column advertisement 3½ inches deep, feature in large display type, "Plumbing, Heating, Tinsmithing, Galvanized Iron Water Tanks, Pumps, Sinks. Estimates cheerfully furnished for contractors. No job too big—no job too small. Phone 126."

* * *

Adam Clark, Hamilton, Ont., in a single-column ad. 2½ inches deep says: "Now is the proper time to have inspection and contemplated alterations made to your heating and plumbing. Do not leave it until the fall when the rush is on. Heating, plumbing, ventilation, sprinkler systems."

* * *

Byrne Bros., Toronto, Ont., in a single-column ad. under the heading in display type "Plumbing Service," say: "It is a safety first asset to you. We can attend to your wants at a few moments' notice, and possibly save your building from expensive damage from leaking pipes, etc. Night or day is all the same to us. Our men are right there, no matter what time you are in need of our service car. Get your furnace put in order at once. You may need a temporary fire almost any time now, a dirty or out-of-repair furnace may be costly in coal consumption, and also dangerous. Phone Parkdale 3213."

* * *

P. Atkinson, Preston, Ont., in a single-column ad. features in display type: "Plumbing, Steam and Hot Water Heating. First-class workmanship guaranteed. Estimates given. Jobbing attended to. Phone 19."

EDITORIAL COMMENT

THE nearest that many people can get to a reason for the present cost of living is that everything is going up because everything else is.

* * *

THE man who does not advertise because he tried one ad. and did not get results should throw away his cigar because the match went out.

* * * *

TO-DAY in business, the greatest competition is in quality, not in price. It pays to sell the better goods, as people are realizing now as never before that the best is the cheapest in the long run.

* * *

THE only kind of advertising that does not pay is that which is not properly done. Good advertising is an investment that returns a profit. It is never an expense.

* * *

THE scarcity of housing accommodation all over the country is becoming increasingly acute. Many a young married couple set out these days to find just the kind of a house that will suit them and end up by being glad to rent any rooms they can get. As long as conditions of this kind prevail more and more building is inevitable.

* * *

UP TO the time of going to press, housewives had not called a strike for a thirteen-hour day or a minimum allowance of spending money, but most women are demanding more and more time and labor-saving devices to work with and the hardware men are selling ten where they sold one a few years ago.

CORRECTING A WRONG IMPRESSION

TO remove doubts which exist in some quarters as to the relation of the Income Tax Act to the new Victory Loan it is necessary to state that it is the interest on the bonds that will be subject to the taxation—not the principal.

An impression has been created to the effect that the amount of the investment on Victory Bonds is to be taxed. Of course such is not the case. The interest derived from the new bonds will bear taxation just as other items which go to make an income will be taxed. This, however, will not be a matter of much concern to the small investor as the income received by the average person is not touched to a great extent by the act. Total incomes not exceeding $2,000 in the case of a married person and $1,000 for a single person are exempt regardless of the source from which the money comes. There is further exemption for the married person with dependent children, the amount being two hundred dollars for each child under the age of eighteen years. For instance, the income of a person with four children is exempt to the extent of $2,800.

The idea that the amount of money invested in the Victory Loan is to be taxed is quite wrong. Only the interest on the bond comes under the tax.

THE REMEDY

CHARLES M. SCHWAB, the steel magnate, speaking in Chicago recently made the significant statement that all the theoretical questions in regard to the cost of living would be set at rest "when we get back to the practice of giving an honest day's work for an honest day's pay." Unquestionably one of the great causes for high prices is just that lack of honesty that is world-wide. The supreme need of the world at the present time is for production, and for the speeding up of the transport of food and other commodities from the point of production to the point of consumption, and as long as we have a Bolshevik Russia, and Europe generally torn by dissension, as long as we have strikes and lockouts and persistent demands for ever-shortened hours and ever-increased wages throughout the world, there can be no real remedy found for the cost of living. It is not claimed that all these industrial disturbances are unwarranted. They are in many instances, at least, entirely justified, but there are many cases in which even these just disputes might easily wait. The need of production is imperative beyond anything else and the world certainly needs to give up thinking too much of its wrongs and grievances and get down to thinking about giving its honest day's labor for an honest day's pay.

THE POWER OF ADVERTISING

FOR every person who knows what he wants and comes into your store and asks for it, there are scores of what might be called latent purchasers who know what they want only when it is placed clearly before them and suggested to them. This is one of the main reasons why sales forces exist, trained men and women who can show the advantage of a product to prospective buyers. Advertising is one of the greatest sales forces there is if intelligently used

and directed. Its power lies in its ability to reach and convince the maximum number of people in the shortest possible time. This is one of the reasons why the greatest merchants in the world are consistent users of advertising space. They not only use space, but they use large space and they fill it with matter that has a real interest to the thousands of men and women all over the country who read it. Many of the ads. suggest to the readers things they need and which they gladly buy when they remember that they require the goods or will require them.

CANADA'S STRONG POSITION

JUST a month from to-day the world will celebrate the first anniversary of the signing of the armistice. The nations have been at peace—or rather what has been called peace—for nearly a year. Looking back now one can hardly help contrasting the predictions of eleven months ago with what has actually transpired. Many retailers at that time confidently predicted falling commodity prices with the cessation of the war demands and acting on that assumption went light on buying, some of them very light. Not only retailers did this, but wholesalers in many cases as well. Yet prices have risen and risen until many of them stand at the highest levels in the memory of living merchants. Food and raw materials, instead of becoming cheaper and more plentiful, have become dearer and more expensive. War debts have grown greater instead of less. The currency of most of the belligerent nations, instead of contracting, has expanded faster than during the war period. Instead of returning to order from disorder, many nations have drifted further into disorder. It has been said in some cases that "War is hell, but Peace is worse." International financial relations inevitably reflect the tendencies of commercial intercourse and the inflation of national currencies. Exchange rates of foreign countries have shown remarkable variations. The rate of exchange against Canada in New York has been high, but not so high as against England. In the New York market recently, it would cost a Britisher $1.18 to buy $1.00 worth of goods. It would cost a Frenchman $1.78, an Italian $1.96, and a German $7.40. Naturally conditions of this kind have an enormous effect on trade. Added to this is the situation brought about by the strike of the steel workers in the United States and of the railway workers in England. The railway strike is settled and the steel strike is likely to wear itself out shortly, but their effects on business remain.

In striking contrast to these troubles of other nations is the strong position of Canada. Business has perhaps never been better in the history of the Dominion. The nation has real cause for thanksgiving this year in rich and abundant harvests, the return of peace and generally satisfactory conditions. There has been plenty of work at good wages and the people generally are prosperous. The great trouble of merchants generally, and of hardware men in particular, has been to get enough goods. Many of those who bought very conservatively, fearing a drop in prices, saw their mistake when it was too late to remedy it. "We could have sold just 25 per cent. more goods if we had only had them," said the buyer of a large wholesale hardware house to SANITARY ENGINEER. "We played it safe. While we have done an excellent business, we could have done a lot more." This condition is general. The business outlook is good. As far as Canada is concerned it looks as if this country is just entering upon the greatest era of prosperity it has ever known. While we have had labor troubles and other troubles, they have been insignificant compared with those which have been rending other nations. On the whole, business conditions in Canada are sound, in the hardware business especially, and the outlook is for them to be even better.

MAKING NEW RECORDS

"PERMITS Continue to Soar," "Building Figures Break All Records," "Hundreds of New Houses," headings like these are as common in the newspapers these days as dispatches about strikes, and there never was a time when strike stories were so numerous. It has unquestionably, though, been a wonderful building year, and there is every indication that the activity will increase right through the fall and break all past records in 1920. In spite of all the houses that have been built this year, it is practically impossible to obtain a house to rent in many places. In the larger cities conditions were never worse. Rents are higher than at any time in the history of the Dominion, and not only that, but there is an acute scarcity of houses to rent. A situation of this kind presents an opportunity to men with money to invest to make good returns and help their community grow by building dwellings. This is being done in many cases and among those building are several hardware merchants. All over the country plans are being prepared for new buildings. Some of this work will start this fall. Hundreds of thousands of dollars' worth will proceed in the spring. All this activity means business for the hardware merchant. It means business in two ways. The hardware merchants can supply not only the supplies for erecting the buildings, but also the hardware for the people who are going to live in them. Business has been exceptionally good this season and the greatest trouble most hardware merchants have had is to get enough goods to fill their orders.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

New Firms

Charest and Lamontagne, tinsmiths and plumbers, has been registered at Coaticook, Quebec, by Joseph O. Charest and Eugene O. Lamontagne.

Personal

E. H. Russell of London, Ont., was a recent visitor in Toronto, and while in the city called at the office of the Ontario Society of Domestic, Sanitary and Heating Engineers.

Trade Notes

Locke & West, plumbers, Toronto, have dissolved partnership.

Jodoin & Paquette, Montreal, manufacturers of patent sewer pipe, traps, have dissolved partnership.

The Plumbers' Exact Supplies, Limited, is negotiating with the council at Fredericton, New Brunswick, for a site on which it is planned to erect a new factory.

Obituary

The death occurred at Kingston, Ont., of Nicholas Timmerman, for many years Sanitary Inspector of the city. He was seventy years old and a native of Holland. For some time past Mr. Timmerman had been a member of the police force.

George Buchaupt, aged 66, for many years Sanitary Inspector at Kitchener, Ont., is dead. He had been ill for some time. His wife, a daughter and two sons survive.

Incorporations

Gravit Stoker Furnace Company, Limited, head office Winnipeg, capital $250,000, plans to carry on a general business in heating equipment and plumbers' supplies.

Lightning Devices, Limited, head office Winnipeg, capital $20,000, plans to manufacture and deal in heating ,lighting and burning devices operated by oil, coal oil and gasoline.

Lalley Farm Lighting Co., Limited, head office Winnipeg, capital $25,000, plans to manufacture and deal in lighting plants of all kinds.

Associated British Industries of Canada, Limited, head office Montreal, capital $100,000, plans to import and manufacture paints, varnishes, rope, twines and many other lines of hardware goods.

Canadian Consolidated Corporation, head office Toronto, capital $110,000, plans to manufacture and deal in electric lamps, iron, steel and brass goods.

Canada Brass Products, Limited, capital $50,000, head office Montreal, plans to manufacture and deal in electric light fixtures and brass goods.

The Salem Oil and Grease Company of Canada, Limited, head office Farnham, Quebec, capital $45,000, plans to manufacture and deal in oils, grease and lubricants generally.

MONCTON, N. B. FIRM IS BUSY

The St. Thomas Johnston Company, Limited, of Moncton, N. B., have received the contract for the hot water and plumbing of the new express building for the Canadian National Railways. The contract runs about $4,800. The firm also has a $15,500 contract for the hot water heating and plumbing for the new Liberty Block, L. Higgins, owner; contract for the electric lighting in the Academy Building, $10,000, and contract for electric lighting for the new Canadian Bank of Commerce at $2,500.

APPOINTED CITY ENGINEER

W. C. Miller, who recently returned from overseas, has been appointed City Engineer at St. Thomas, Ont. He is a graduate of Queen's University, and prior to graduation, was for several years with the Department of Railways and Canals as assistant engineer on the Severn Division of the Trent Canal and the Swift Rapids Power Development. Later he was Military Foreman of Works in the camp at Kingston. His duties at St. Thomas will include the looking after of waterworks and sanitation.

ENGINEER RESIGNS

James Boyd, chief engineer of the Waterworks Department of the city of Toronto, has resigned his position owing to ill-health after 44 years of continuous service. Mr. Boyd, who is now 78 years old, took over his duties in 1875.

PROFESSOR BATEMAN JOINS J. L. MOTT IRON WORKS STAFF

Professor Arthur Bateman, whose special articles have appeared many times in Sanitary Engineer during recent years, has resigned his position as head of the Sanitary Department of the American School of Correspondence, Chicago, and has become associated with the Chicago office of The J. L. Mott Iron Works. Mr. Bateman, it is understood, will call upon the architects of Chicago and do promotion work for the Mott Company in that territory.

PLUMBERS AT LONDON, ONT., GET HIGHER WAGES

Journeymen plumbers at London Ont., have completed an agreement with the Master Plumbers. The new rate will be from now on 60 cents an hour as a mini- and 70 cents an hour as a maximum, and and from January 1, 1920, to continue for one year, the wage scale will be 70 cents an hour as a maximum and 80 cents an hour as a maximum. The scale has been 55 cents flat. If either party wishes a change at the expiration of the agreement, he shall give three months' notice prior to December 31, 1920. The men will receive time and a half for overtime and work an eight-hour day. All bosses signed the new agreement.

WILL MEET IN JANUARY

A general conference of the members of the Canadian Association of Building and Construction Industries will be held at Ottawa, commencing January 27. In connection with this a joint meeting may be arranged at which members of the Domestic Heating and Sanitary Engineers will be present. The matter of attending the meeting of the Association of Canadian Building and Construction Industries to be held in Winnipeg at the end of November is being considered at the present time by the sanitary engineers of Manitoba and Saskatchewan, and it is likely that matters of national interest in which all the sanitary engineers of Canada are concerned may be brought up at Ottawa.

Tenders

Delmer Kearney, Alvinston, Ont., will call for tenders shortly for garage building to cost $10,000. Heating and plumbing.

F. W. Warren, Bank of Hamilton Building, Hamilton, will call for tenders about November 15, for work in connection with stores and apartments to cost $200,000.

Charles King, 312 Brock St., Brantford, Ont., plans to erect dwelling shortly and is interested in prices on plumbing and heating.

I. G. Komft, Calgary, Alberta, wants prices on heating and plumbing for $5,000 bungalow now under construction.

E. Butterworth, 183 Burris St., Hamilton, has commenced work on two resi-

dences to cost $4,000, and is interested in heating and plumbing prices.

H. H. Weeks wants prices on plumbing and electrical work for new $4,000 residence on which work is starting.

Barrett Bros., 260 St. Catherine St., Ottawa, want plumbing prices on dwelling costing $5,000.

M. E. Davis, 33 Bellwood Ave., Ottawa, wants prices on heating and plumbing for $5,000 residence on which work is started.

Griffin Contracting Co., 3 McRoberts Ave., Toronto, want prices on plumbing and heating for residence and garage costing $5,800.

Geo. Cross, 416 Kingston Road, Toronto, will let plumbing and heating work for two residences costing $7,000.

A. E. Painter, 131 Pinewood Ave., will let heating and plumbing work for residence costing $4,500.

H. C. Fisher, 37 West Lynn Ave., will let heating and plumbing for bungalow costing $4,000.

A. Stratford, 113 Constance St., Toronto, will let plumbing, heating and electrical work in connection with two residences to cost $8,000.

A. W. Kettlewell, 133 Gladstone Ave., Windsor, Ont., will let heating and plumbing for four flats to cost $9,000.

A. H. Harding, Brantford, Ont., will let heating, plumbing and electrical work in connection with residence costing $10,000.

T. L. Church, Chairman of the Board of Control, Toronto, will receive tenders until October 21, for plumbing work, electric wiring and fixtures for new public lavatories to be erected at Centre Island.

Credit Men Fight Discount Violators

The National Association of Credit Men has appealed to its 29,000 members in the United States for the enforcement on buyers of a strict observance of cash discount terms.

In a bulletin the association directs attention to the fact that no negligible part of the high prices to-day is directly traceable to the unnecessary burden of distribution expense, which the failure of a general observance of the discount terms has forced.

Failure to enforce the discount terms, it is argued, has fostered an aggressively independent attitude on the part of many buyers, who then carry their demands on the manufacturer to the point of special allowances which are not only unfair to him, but unfair to those merchants who do live up to the discount terms. In the last analysis the loss to the manufacturer must be made up through his aggregate receipts, and in his fixing of prices the innocent as well as guilty have to bear this burden.

"We say fearlessly to the seller and the buyer," the association announces, "that they are helping to maintain high prices, are imposing unnecessary burdens on business, are encouraging laxity and a lower level of character in business whenever a cash premium is demanded and allowed after the expiration of the time in which it properly should have been taken.

"No one, no matter how big or how prominent he may be, can escape the charge of an unwise and immoral transaction, whenever in the buying and selling of commodities he demands or permits the taking of a premium in the payment of an account when the premium has not been earned."

Joint Meeting May Be Held At Winnipeg in November

Domestic Sanitary and Heating Engineers of Manitoba and Saskatchewan Considering Co-operating With Association of Building and Construction Trades.

ARRANGEMENTS have been completed for a meeting at Winnipeg, in November, of the Canadian Association of Building and Construction Industries, to discuss various matters of importance to the trades, and a move is under way at the present time to have the Domestic Sanitary and Heating Engineers of Manitoba and Saskatchewan meet at the same time.

There are many matters in which both organizations are especially interested, and the Domestic Sanitary and Heating Engineers feel that by closer co-operation between the two bodies, some real results may be obtained. One of the matters which will be taken up if the joint meeting is arranged, will be revision of some of the existing laws in regard to both building and plumbing.

It is generally felt that in many municipalities there is room for a good deal of improvement in some of the existing statutes and also in the way in which some of the existing laws are enforced. By taking up these matters and adjusting matters it is believed that a progressive step will be taken that will improve sanitation matters and in doing this benefit health generally.

Both the Domestic Sanitary and Heating Engineers and the members of the Canadian Association of Building and Construction Industries are interested in the work of fire prevention that is being carried on all over the Dominion, and it is likely also that a discussion will take place regarding ways and means of bettering building construction and eliminating the enormous losses that have been occurring.

Toronto "Ender" Clubs Hear Discussion on Importance of Overhead

FOLLOWING a vacation period during the hot months, the "Ender" Clubs of Toronto, resumed their regular meetings this week. The same schedule as before is being followed, that of meetings for the various clubs on Monday, Tuesday and Thursday evenings.

At the meetings held this week, the feature of the program was a talk by Secretary Garrett Frankland of the Ontario Society on "Overhead".

Secretary Frankland declared that overhead is the first thing a man in business should worry about. Any number of men in all lines of business, he said, are not worrying about it because they do not appreciate what it is and what it means to their success or failure. It was impossible, he pointed out; for business to be run properly unless strict account of all outlays was kept. Simple as this seemed, many men who thought they were including all outlays were omitting some of them, wondering how it was, at the end of the year, they were not making money or not making the profits they should.

He discussed also the question of the Master Plumber paying himself a proper salary. Many men, he said, based their salaries on the wages paid to journeymen.

"If your business will not pay you more than this," he said, "why continue it? Why take all the worry and care and bother of looking after a business if you are only making journeymen's wages? Why not go back and take the journeyman's wages and get away from the bother? In days gone by all that was necessary for a man to start in business as a plumber was a kit of tools. That day is past. Now before a man can start in business, he must hire a bookkeeper or instal a set of books so that he can keep proper records to take care of his business. He must know all about his overhead in order to figure out the profits he needs to stay in business. Overhead is the principal item for him to consider. His whole success in business revolves around it and the more accurate his records are the surer is the foundation upon which he is building."

CORRECTION

In last issue it was stated that H. B. Wilcox, Toronto, had discontinued his plumbing and hardware business. Mr. Wilcox advises us that the hardware end of the business only, has been discontinued, and that the plumbing business will be carried on at 201 Jones Ave., Toronto, under the name of the Elite Plumbing Company.

Great Activity in Quebec Foreshadowed By the Housing Schemes

Co-Partnership Plan is Being Followed in Some Sections—The $7,000,000 Available from Government Has Been Oversubscribed.

A BIG market for sanitary equipment of all kinds and greatly increased activity in the plumbing trade generally is foreshadowed by developments in Quebec. Under the housing schemes of the Province of Quebec, $7,000,000 of the total amount of $25,000,000 appropriated by the Federal Government is to be expended. While the actual details of the scheme are still in the making, housing schemes are being inaugurated for a number of municipalities, including Hull, Sherbrooke, Ste. Anne de Bellevue, Quebec, Three Rivers, St. Jerome, and St. Lambert. These municipalities are at present negotiating with Dr. E. Nadeau, Provincial Director of Housing for Quebec. As evidence of the interest taken in the project, it is interesting to learn that the total amount involved in the applications received to date from the various municipalities is $17,000,000.

Follow English Plan

It is proposed to develop these housing schemes along the lines of the co-partnership principle, which has been applied so successfully in England. Garden cities will be laid out in blocks of from two hundred to five hundred houses, with ample space for playgrounds, and public improvements taken from the best town-planning experience available, and adapted to the Canadian schemes, will be provided. For example, central heating plants will be provided where possible. The expenditure of $7,000,000 will be spread over two or three years, the annual outlays being about equal. It is planned to complete the details of the various schemes this winter and to call for tenders next spring. Mr. F. G. Todd, of Montreal, is the town planning expert of the Quebec Technical Commission.

Adopted by Quebec

At Quebec City, a Citizens' Committee has been formed to co-operate with the municipal authorities in the matter of working out the details for the local housing scheme. The idea is to organize a housing company with a limited annual dividend of 6 per cent., interest to be paid semi-annually, and the capital to be redeemed in thirty years. The company will give the City of Quebec a first mortgage upon its land, and all houses to be erected thereon, and the city will appoint one of the members of the Company's Board of Directors. The aim of the company will be to develop a model garden suburb of some five hundred houses. The probable period of development will be five years, and the total estimated cost is $1,500,000.

Advances will be made on approved estimates from time to time by the City of Quebec providing the paid-up capital of the company is not less than 15 per cent. of the cost of the undertaking. The plans and specifications of the buildings and improvements, as well as the supervision of the actual work, will be furnished by the Provincial Technical Commission at a cost of 2½ per cent. The company will be organized under the system of the English housing societies, known as the Co-partnership Tenants, Limited, in which each tenant subscribes at least one share of the company's capital, from which he receives interest limited to 6 per cent., the tenant being encouraged to subscribe such shares until the amount of his subscriptions has reached the cost of the house he is occupying, at which time he may become the owner of the house. The annual rent of the houses is to be fixed at 10 per cent. of the total cost of each house and lot. Rents will vary from $15 to $50 a month.

DEATH OF FRANK D. LYMAN

Frank D. Lyman, vice-president and managing director of Lyman Tube and Supply Co., Ltd., Montreal, died in Montreal on Thursday, October 2. He had been at the club house of the Anglo-American Fish and Game Association, near Metis, Quebec, with a friend from the States, and suffered severe attack of indigestion. This was complicated through an attack of bronchitis.

For some ten years prior to the organizing of the Lyman Tube and Supply Co., Ltd., Mr. Lyman was manager of the Railway Supply Department of John Millen and Son, Ltd. When this business was taken over in 1916, the new firm formed as above was made an incorporated company, and the business has since been managed by the late Frank D. Lyman.

Among the activities with which he was associated were the Anglo-American Fish and Game Association, and of which he was secretary-treasurer; member of the Engineers' Club, Kanawaki Club, Montreal A.A.A., Rotary Club and the Automobile Club of Canada.

Mrs. Lyman (formerly Miss Ethel Wilson of Bridgeport, Conn.), and one little daughter, Kate Wilson Lyman, survive.

NEW HEALTH OFFICERS

Dr. N. O. Thomas, R.H., M.D., a returned soldier, of St. Thomas, Ont., has been appointed director of the Provincial Board of Health's new public laboratory at Fort William.

Col. Dr. Frederick Guest, M.D., of St. Thomas, who was overseas during the whole period of the war, has been appointed district officer of health in District No. 1, a position rendered vacant by the death overseas of Maj. D. B. Bentley of Sarnia. Dr. Guest's headquarters will be in London, and he will have charge of six counties, viz., Essex, Kent, Lambton, Norfolk, Middlesex and Elgin.

CATALOGUES and BOOKLETS

JOHN H. HALL & SONS, LIMITED, NEW CATALOGUE

John H. Hall & Sons, Limited, manufacturers of pipe cutting machines, rapid nipple machines, roller pipe cutters, and special machinery, etc., Brantford, Canada, have issued an attractively illustrated loose leaf catalogue, featuring the many lines made by this company. The catalogue is profusely illustrated and carries a great deal of practical information for jobbers, manufacturers, and the general users of power machines. The catalogue is printed on high quality of paper in two colors with an unusually attractive cover design, and on account of the loose leaf feature new additions may be made to the catalogue from time to time.

LETTER BOX

Query—Would you kindly advise us regarding the manufacturer of Kewanee valves?

These are made by the Kewanee Boiler Co., Kiwanee, Illinois, and the firm's Canadian representative is the Dominion Radiator Co., Toronto.—Editor.

Smead Dowd Repairs

Sam. J. Rendle, Paris, Ont.—Will you please advise me as to headquarters of the Smead Dowd Heating and Ventilating Co., formerly of Toronto, as I have two large furnaces to repair?

The American Foundry Company of Bloomington, Illinois, can supply repair parts, etc., for this line.—Editor.

"Well, my young lad," said the facetious man to the elevator boy, "I see in your position you have a chance to rise."

"Oh, yes," growled the boy, "but I get called down every time I do it."

Organizing the Niagara Peninsula

Directors of the Ontario Society of Domestic Sanitary and Heating Engineers Held a Most Successful Meeting at Welland—Practical Addresses Given on Organization, Co-operation and Overhead.

FOLLOWING the regular monthly meeting of the Directors of the Ontario Domestic Sanitary and Heating Engineers at Welland, Ontario, a meeting was held in the Builders' Exchange, at which a Welland branch of the organization was formed.

The joint meeting was attended by men in the trade from Welland, St. Catharines, Niagara Falls, Bridgeburg, Port Colborne, Thorold, Grimsby and Fort Erie, and plans were laid by which organization work is to be carried out throughout the entire Niagara Peninsula.

Series of Meetings

This will be done at a series of meetings, which are to be held in the near future. It is likely that they will be semi-monthly.

At the meeting held in Welland, J. H. Crowe presided, and during the time the directors were in town they were guests of the Welland plumbers and were entertained by them at dinner.

Keen interest was taken at the meeting in the Builders' Exchange by the men from the entire district in addresses given by President Frank R. Maxwell of the Dominion Society, President Thomas J. Minnes of Brantford, head of the Ontario Society, and Garrett Frankland of Toronto, secretary.

Practical Addresses

President Thomas J. Minnes spoke at some length on conditions as they prevail at the present time in Ontario, and the great good that may be accomplished by organization. "The men in the trade in Brantford," he said, "found out what it means to work together. Not so very long ago, while they had a common trade, they had failed to realize that they had interests in common, and that what affected the welfare of one affected the welfare of all. As long as they kept apart they did not get anywhere and found that they were constantly suspicious of one another and attributing wrong motives to one another.

The Wrong Way to Work

"This sort of thing is more or less general throughout the whole Province, as a matter of fact, throughout the whole trade in Canada," said President Minnes. "As long as it continues, no great good can be looked for if allowed to drift along. These things invariably go from bad to worse, and in the meantime troubles that might easily be rectified by a little co-operation on the part of the men in the trade are permitted to develop and become serious annoyances. What many of the men in business to-day do not realize apparently is that they cannot help themselves without helping the other fellow, and that they cannot be injured in their own business without indirectly injuring everyone in the business. No one man working by himself can expect to get the results that may be obtained by a great body of men pulling together with one common aim. There are splendid results to be obtained by organization and co-operation, and we cannot get together too quickly. If every man in the trade will realize this and work with this end in view it will only be a matter of short time when noticeable improvements will be seen."

Satisfactory Results

Frank R. Maxwell of Toronto, president of the Dominion Society, spoke on the need of co-operation. He gave a splendid account of the results which had followed the getting together of the men in the trade in Toronto, and pointed out that exactly the same benefits may be obtained by the men in the trade anywhere, if they will only work together.

"Good fellowship," said President Maxwell, "just seems to develop naturally once men get started working together. When they talk their problems over one with another, they get away from all animosity and suspicion and soon find out that the chap they were a little inclined to look askance at is not such a bad fellow after all, and that he has problems exactly similar to their own. By getting together and working together on these problems, they can solve them and solve them in a way that is most satisfactory to all."

Says Get Together

President Maxwell urged the men in the Niagara Peninsula to get together and work together and promised them that they would be surprised in a very short time at the change they would find in everything. As long as men kept to themselves and tried to work their own problems in their own little way they were not only losing time and money for themselves but indirectly making it worse for the others in the trade. On the other hand if every man in every town worked together and every man in every province worked together, a revolution would take place in conditions that the men in the trade in Canada would benefit and make their influence felt throughout the whole country.

Tells of "Overhead

Secretary Garrett R. Frankland of Toronto, gave an educational talk on "Overhead," pointing out the vital importance it is to every man whose business is to know exactly where he stands, what his costs are to a cent, whether he is making or losing money, and how he can stop all troubles that are costing time and money. Too many of the men in the trade, he pointed out, do not appreciate the importance of overhead and do not as a result know what it is costing them to do business, or how much profit they are making or whether they are making any. No man, he stated, can expect to meet conditions as they exist in the business world to-day and remain in business and get satisfactory results unless he knows all about overhead.

Those Who Attended

Those who attended the meeting besides the directors were J. H. Crowe, who was chairman; E. Cardwell, W. R. Chambers, James H. Cunningham, representing C. R. Hagan, W. T. Boyd, all of Welland; James F. Bird and James A. Wray of Grimsby, William E. Wilkinson of Bridgeburg, F. C. Kulow of Bridgeburg, and Messrs. Payne and Nesbitt of Niagara Falls.

During the meeting of the directors, applications for membership in the Ontario Society of Domestic Sanitary and Heating Engineers were received and approved from Shearer and Russell, S. Y. Meredith, Harry Derrick, George Cooperthwaite, A. A. Earl and Son, and W. E. Ramsay of W. G. Edge, Limited, Toronto branch.

The directors of the Ontario Society of Domestic Sanitary and Heating Engineers are busy with plans for an official visit to Chatham and Windsor. It is likely that this visit will be arranged for the end of the month.

The men in the trade in Windsor organized this year and it is stated that some excellent work is being done at the border. It is expected that organization of the men at Chatham will be effected before very long as considerable interest is being shown in what the Society is doing, and it is felt that good results can be obtained by all working together.

BUILDING AN INTAKE WELL

The town of Fort Erie, Ont., following work started in the neighboring town of Bridgeburg, has let the contract for an intake well in the Niagara River. The contract price is $1,900. With this auxiliary it is expected that the pumping pressure will be maintained at standard.

Contractor Johnson is now engaged in the construction of a $4,000 intake well in the Niagara River, to be used in connection with the Bridgeburg pumping station. The weeds, fish, etc., that are sucked into the electrical machinery under present conditions will then be eliminated.

Heating and Ventilating

Ventilating the Modern School

Thirteenth Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

FRICTION seems to be a bogey that continually haunts the young and inexperienced ventilating engineer. A question often asked by these men is: "How should we allow for the loss due to friction in the air ducts?"

Not the Only Cause

Friction is not the only cause of loss of velocity head in piping systems. There is another loss known as dynamic loss, and which is due to changes in the direction, or in the velocity of the air. There is a dynamic loss at the entrance of the air into the piping system, and this loss may run from 1 to 1½ times the velocity head.

The dynamic loss in elbows depends on the radius of the elbow. The size of the elbows and the velocity of the air has no bearing on the dynamic loss. The proportion of velocity head lost at an elbow may be considered thus:

Radius of 1 diameter on the centre line, 25 per cent.

Radius of 1½ diameter on the centre line, 17 per cent.

What is Required

As a rule a radius of 1½ diameter proves to be all that is required. Anything greater than this does not seem to affect the friction nor dynamic losses enough to justify the expense of longer sweep elbows.

The loss in velocity head is greater where elbows occur in round pipes than where they are set in square pipes. The ratio is about 17½:25.5.

One in Fifty

We may consider that 1 velocity head is lost in 50 diameters of straight pipe, and that in a round pipe an elbow with a radius of 1½ diameters would be equal in effect to 8½ diameters of pipe. A square elbow in a square pipe would be equal to 4½ widths of the pipe.

Roughly, one easy long radius elbow is equal in friction loss to 10 diameters of the pipe.

Pressure Required

The pressure required to overcome the friction of air passing through each 100 linear feet of pipe may be taken as follows:

Diam. of Pipe	Velocity	Loss
10	600	.069
14	600	.050
16	800	.076
18	800	.069
20	1,000	.097
22	1,000	.088
24	1,000	.080
26	1,500	.166
30	1,500	.144
34	1,500	.127
38	2,000	.200
42	2,000	.181
50	2,500	.240

The loss in pressure is given in inches of water.

With the data given regarding the equivalent friction loss of elbow, it should not be difficult for anyone to figure how far a pipe might be run with a certain number of elbows before an absolute loss would result.

Proportioning Branches

When branches run a very short distance off the main duct it is often found that these short branches carry far more air from the main ducts than do longer pipes of the same area set even closer to the fan, so it becomes necessary when branch ducts are short to make proper reductions in area to offset the advantage of the short lengths. Dampers should be always placed in branches so that any duct too much favored may be partly shut off.

A Bad Effect

There is an evil effect obtained in the choking down of ducts too large, and the evil lies in drawing down the whole plant to meet the deficiency part. Therefore it is the pride of a ventilating engineer when he can say that not a damper need be adjusted to check a single duct of the system he designed.

In most school installations the engineer need not worry much over loss due to friction if he runs the elbows out at a radius of 1½ diameters on their centres, and if he sets his fan to deliver an initial duct velocity of from 1,600 to 2,000 lin. ft. per minute.

Allowing for Friction

A basis for allowing for friction is given here, and it must be borne in mind that the losses in ducts are due to much more than friction alone. The losses depend upon the material and the length of the duct; upon the number of elbows and their radius, and also on the change of velocity of the air where it leaves the fan to enter the duct. A system where every factor is taken into account when the design is made will result in a uniform resistance all over the entire plant without regard to distance from the fan.

Finding Friction

The friction in each duct may be found by adding together the number of times that the velocity head is lost at the entrance to the duct system and elsewhere. This may be considered as being represented by the figures 2½, also the loss due to length and size of pipe, this may be considered as being $\frac{L}{4.W}$. L is length in feet and W is width in inches; then add the proportion of pressure lost in elbows.

As an example we will take a pipe 100 feet long, 18 inches wide, and with four easy elbows.

Thus:

$$2\tfrac{1}{2} + \frac{100}{72} + \frac{4}{5} = 4.55 \text{ velocity heads.}$$

SEES BIG MARKET FOR CANADIAN ZINC

Cables from London, England, state that important developments are foreshadowed in the Consolidated Mining & Smelting Company at Trail, B.C., in the statement made by its president, J. J. Warren, who is negotiating the sale of the company's zinc output here. Mr. Warren says the market possibilities for the company's product in Europe, South Africa and India are unlimited as regards the disposal of zinc and allied metals. He adds that his doubts regarding the possibility of expanding the industry have been entirely transformed to optimism since his arrival in England two weeks ago. Canada can supply 10 per cent. of the world's demand, equal to 780,000 tons of zinc, and is only producing 25,000 tons. The impression he has gained is that the condition of the market warrants expansion to supply these 780,000 tons. Mr. Warren foresees no difficulty in arranging for increasing smelting facilities.

The Transportation Outlook

Warning Issued to Business Men by the Canadian Railway War Board Owing to the Acute Shortage of Cars—Three Tons Have Fallen from the Average Load of Canadian Cars.

THE Canadian Railway War Board has just issued the following bulletin to merchants and manufacturers all over Canada, outlining the position that has resulted from car shortage and showing how the situation can be relieved:

Three tons have fallen from the average load of the Canadian freight car. Instead of carrying 27.4 tons, as in 1918, the average car is now carrying only 24.4 tons. This does not mean a decrease in the total volume of freight moving, but an increase in the number of cars required to handle a given tonnage; an increase in the amount of tare-weight (weight of cars less freight) to be handled in each train; an increase in the number of engines required, the crews on duty, the coal consumption and the track-room occupied. The reserve margin of cars and engines is thus diminished and an unfavorable situation created alike for the railways and the shippers. To the latter, it may therefore be of interest to consider the following review of the transportation situation and the prospect for the approaching winter.

Had a Big Task

The cessation of hostilities in Europe with its profound effect upon industry on the North American continent, as elsewhere, has had corresponding influence upon the traffic movements and railway problems. The task of moving munitions of war eastward was quickly replaced by the task of moving returning soldiers westward. Following a lull in all domestic freight movement, new currents of traffic set in tending to approximate, in some degree, the old movements prior to the war. On the whole, however, up to the first of July last, the transportation situation became easy. Cars were plentiful. The necessity for loading them to full capacity became less apparent, and, in spite of warnings from this Board, the average load dwindled seriously, as noted at the beginning of this article.

Not So Satisfactory

Conditions now, however, are not so satisfactory. In March and April, the usual movement of box-cars to the wheat-growing areas commenced in both the United States and Canada.

In the United States, where strikes in car repair departments were added to the natural disadvantages of the "car pooling" arrangement, and where cars are, on the average, older than in Canada, the superior condition of Canadian box-cars for carrying grain, led many of these cars into the American West where the wheat movement begins in July, two months before the Canadian movement is under way. The balance of cars owing by the United States to Canada was thus increased materially, so that to-day there are approximately 43,000 Canadian box-cars in the United States as against 19,000 American box-cars in Canada; a net balance of 24,000 cars due Canada and unlikely for some time to be available to this country. This figure, it should be observed, is equal to over 16 per cent. of the total Canadian box-car supply.

Serious Additions

While this loss of cars to the United States has been checked and will ultimately be rectified by the return of the Canadian cars, serious additions to the volume of traffic to be handled by the Canadian roads are imminent. The shipment of coal from the Western Canadian mines since the beginning of the fuel year, on April 1st is, to date, only one-third of the amount forwarded in the same period last year. Movement by rail is correspondingly delayed and cars will be detained in the West accordingly. More serious still is the prospect that American ports will be closed this winter to Canadian exports. Sixty per cent. of Canada's export grain usually passes out by American ports. This will remain to be handled across Canada to Montreal, St. John and Halifax in Canadian box-car—adding one hundred and fifty per cent. to the volume of export grain now taken care of through the ports of the Dominion, and adding much more than 150 per cent in terms of car-mileage.

Not One Third

The seven thousand new freight cars built since last year are not one-third of the number now detained in the United States. The additional requirements for coal carrying and for the wheat trade—if the proposed American action is taken—will be extremely serious. At this time of year, too, comes a heavy movement of perishable farm produce, moving before the cold weather will necessitate using special cars. Yet, in the face of these factors—the average load per car in Canada has fallen three tons!

What It Means

The very serious attention of all Canadian shippers is called to this fact. It means that where eight cars were formerly required, nine are now necessary! Where 160 tons of tare-weight were thrown upon an engine for every 216 tons of freight, there are now 180 tons! Labor scarcity, once the excuse for the light loading, is no longer a fact. It is important in the interests of the country, that the heavier loading practices be restored. Railway efficiency is part of your factory, mine, mill or warehouse efficiency!

WHAT CAUSES RATE OF EXCHANGE

Continued from page 24

needs it, he will be compelled to purchase stocks or bonds of the debtor country and either hold them himself or offer them for sale at a price sufficiently attractive to induce purchases. It is to cover the cost of doing this that he charges a rate of exchange which varies as the excess of imports over exports increases or decreases.

Gold Payments Avoid Rate

One way in which a nation can avoid paying exchange is to pay in gold. Gold is the international medium of payment and has a fixed value in all countries and by sending gold in sufficient quantity to cover its paper money any adverse rate of exchange is at once wiped out. In the same way in the hypothetical case of B and P above. If P can pay B in ordinary money the question of exchange does not arise, but where P and B are issuing their own vouchers instead of money the value of these vouchers depends upon the demand there is for them and that is regulated by the amount of business each is doing. B being a baker, practically everyone could use his vouchers to pay him for the bread they required. If, however, B began spending very heavily and issued vouchers much in excess of the value of the bread he sold, his vouchers, too, would soon become a glut in the market and would be at a discount.

The writer has in the last month or two spoken with several retailers who could not understand why the exchange rate should necessitate their paying more for an article than they previously paid when that same article is selling at the original price in the States. The above explanation will have made this clear. The wholesaler from whom they purchase has paid nominally the same price for the article, but whereas formerly he could purchase the article with the Canadian dollar, he now has to pay with U. S. currency. To obtain this he has to pay practically $1.05 in Canadian money, and he is obliged to pass this extra cost on to the retailer.

In a short article of this nature it is impossible to go into every circumstance affecting the fluctuation of the exchange rate, but enough has probably been said to enable the average business man to understand clearly why it is he is at present working at a disadvantage when dealing with United States merchandise.

Sharp Order From Ontario Railway Board Results in Action at Peterboro

Plans for Sewage Disposal Plant Must Be Ready by First of December—City is Taking Steps to Improve Plumbing Conditions.

IMPORTANT matters in connection with plumbing and sanitation were taken up by the council at Peterboro, Ont., at its regular meeting. The Property Committee reported that steps had been taken to improve the plumbing conditions. An outside plumber will be brought to investigate conditions, and if his report shows they are not satisfactory steps will be immediately taken to make them so.

The Property Committee was given instructions to carefully look over the plumbing regulation bylaw and if any changes are necessary bring them before the Council with recommendations to amend the bylaws.

City Engineer Parsons reported that plans and specifications for the city sewage disposal plant must be drawn up, ready for inspection by December 1, This is the ruling of the Ontario Railway and Municipal Board.

"The site must be selected immediately," said the Engineer, "as it is dangerous to have any more delay in the matter." This was expressly agreed to by the Mayor and Mr. Widdifield.

Mr. Parsons said it would be advisable to instal the plant on the east side of the river. No matter if the plant is guaranteed not to produce odor it is nevertheless a sewage disposal plant and should not be placed in a residential district.

Steps will be taken to select a site at once, and as soon as one is selected, the Engineer will commence his plans for the plant. This means that everything will be ready by December 1, as required by the ruling of the Board.

Both the City Engineer and City Solicitor Widdifield interpreted the Board's order as a sharp command to the city to undertake this project without delay.

Seven Lives Lost When Gas Pipe Snaps at Ottawa

Need for More Stringent Laws in Reference to Building—Inspectors Have No Authority to Look Over Gas Pipes and Appliances.

A TRAGEDY that is perhaps without a parallel in the history of the Dominion occurred at Ottawa, when Pierre Cardinal, his wife and five small children lost their lives by asphyxiation from illuminating gas, when the supply pipe was broken perhaps by a heavy beam snapping it. The pipe was found broken at the joint under the front main floor of the house. Just what caused the break in the matter of conjecture. It may have been due to the building having sunk in the soft, sandy soil or it may have been due to a beam coming down on the pipe. The gas came direct from the pipe connecting the main with the kitchen stove.

The gas entered the house through several holes in the flooring and the largest volume gushed through an opening in the hallway. All but one of the victims was dead when found.

Laws Are Too Lax

One thing emphasized by the tragedy is that there is laxity in Canadian building laws. It has been pointed out from time to time in SANITARY ENGINEER that in many sections of the country the laws are not what they should be and that while other sections often have proper bylaws they are not enforced. The matter of protecting public life by proper building and plumbing laws is a vital one and cannot be too strongly emphasized. In the Ottawa case it would appear that there was no bylaw to cover the case in point.

"City building inspectors have not the necessary authority to visit private premises to inspect gas pipes and appliances," said Robert Henham, Ottawa's building inspector, in discussing the case. "They have authority to inspect and order repairs to buildings which they know to be in a dangerous or unsanitary condition."

With 479 buildings in the city of Ottawa either undergoing repairs or in course of construction, Mr. Henham said that his time is largely occupied, but admitted that there are several buildings sinking as did the house of the late Pierre Cardinal.

Mr. Henham attributed the sinking of the Cardinal home to poor building and lack of foundations. Many houses in Ottawa, he declared, had been rushed up without proper foundations, and as a result, are now gradually sinking into the soft, sandy soil.

The building bylaw, which is being revised, provides that proper foundations must be placed under all buildings and that greater care must be exercised in the work of construction.

This bylaw is aimed at jerry building and ensures safer homes for the citizens of Ottawa.

RUSTICENE

"Rusticene," manufactured by the Gramoline Co., Ltd., Lumber Exchange Building, Chicago, is, it is stated, a distillate oil with exceptionally penetrating qualities. The manufacturers claim that it is particularly effective in releasing metal joints that are bound tightly so

Small Tin of Rusticene

that they resist all ordinary means of relaxation. It will, it is stated, loosen rubber tires from rims, release bolts, nuts, pins, thumb screws, spring clips, knuckles, shaft bearings, turnbuckles, brakes, radiator roads, battery connections, cylinder pistons, and all joint or action parts. It removes road oil and tar from windshields or car bodies, and is invaluable wherever metal joints or

Large Can of Rusticene

bolts are exposed to weather conditions or corroding effects. It is stated that it is indispensable to rebuilders or wreckers of motor cars, ships, aeroplanes, tanks or power machinery. Rusticene is non-inflammable and inoffensive, free from acids and alkali, and will not injure metal, wood, rubber, leather or fabrics. It is also stated that it will dissolve rust, verdigris, carbon, red or white lead, ammonia scale, paint, tar, grease or dirt.

PLAN SEWAGE SYSTEM

The problem of providing a sewerage system for North Danforth and Todmorden, suburbs of Toronto, is being considered. Engineer W. O. Wynne-Roberts presented a report on the engineering aspect of the scheme, and suggested that an immediate decision be reached on the question of taking care of sewage and storm water. It was decided to adopt the separate system idea. No action will be taken by the city until a plan of the whole sewerage system has been submitted.

New Express Packing Rules Will Affect Shipments From the States

Aim is to Safeguard Merchandise in Transit and Also to Facilitate the Handling of Shipments

ACCORDING to official notification being sent out by the American Railway Express new packing rules will be put into effect on December 10. This will, of course, affect all parcels and other goods sent into Canada for plumbing merchants and others. As far as the Canadian rules are concerned there will, it is stated at express offices, be no change as the new American ruling is an adaptation of the system put into effect in Canada some months ago. The American Railway Express in its statement says:

This is regarded by express traffic officials as one of the most effective steps taken to safeguard merchandise in transit by express since the unification of the various lines into the American Railway Express Company, which is agent of the Government in handling the express business of the entire country.

The new rules were put into effect to induce shippers to turn their business over to the carrier so that it can, with reasonable care on the part of the express company, be handled properly. The rules will not permit the use of paper wrapping for packages over 25 pounds, nor of ordinary paper boxes, wrapped or unwrapped, when the weight of the contents is over that limit. For shipments over 25 pounds, wooden containers, or fibreboard, pulpwood or corrugated strawboard containers of specified test strengths are required.

This standardization of express rules will place the express service on the same basis as freight, so far as the character of the cartons used is concerned.

Dominion Council of Health Meets at Ottawa

THE Dominion Council of Health at its sessions in Ottawa took up the following matters:

1. Control of venereal diseases, in reference particularly to the Dominion grant towards this object. 2. Measures against influenza. 3. Conservation of child life. 4. Industrial hygiene. 5. Rural hygiene. 6. Habit drugs.

The first subject occupied a great deal of time and plans for fighting venereal diseases by a nation-wide campaign were made.

The council has decided that out of the Appropriation Act set apart by the Federal Government for division among the provinces for the combating of the disease, the sum of $10,000 shall be given direct to the National Council for the combating of venereal diseases in their nationwide campaign of information and propaganda and measures of treatment, and a further sum of $1,000 to be expended by the Federal Department of Health along the same lines.

The balance of the grant, namely, $180,000, will be proportionately assigned to the provinces and the representatives of the provinces assuring the Department of Health that equivalent amounts of provincial funds will be set apart for the same purpose.

The Act provided for the constituting of this council consisting of the Deputy Minister of the Federal Department of Health, the chief executive officer of the Board of Health of each province, and five other members appointed by the Governor-in-Council, and in accordance with the above, the present meeting consists of: Dr. J. A. Amyot, Deputy Minister, chairman; Dr. J. W. S. McCullough, Ontario; Dr. Elzear Pelletier, Quebec; Dr. W. H. Hattie, Nova Scotia; Hon. W. F. Roberts, New Brunswick; Dr. H. E. Young, British Columbia; Dr. Gordon Bell, Manitoba; Dr. W. C. Laidlaw, Alberta; Dr. M. M. Seymour, Saskatchewan; Professor J. G. Fitzgerald, Professor of Hygiene, University of Toronto; Mr. W. F. Stephen, secretary Canadian Ayrshire Breeders' Association; Tom Moore, president Trades and Labor Congress, representing Walter Rollo, Hamilton, the labor representative; Miss Helen R. Y. Reid, convenor of Auxiliaries, Canadian Patriotic Fund, Montreal; Mrs. H. E. Todd, president of the Canadian Women's Institute.

Above lines subject to trade discount for quantity.

All Ingot Metals Are Holding Firm

INGOT METALS.—All these lines are holding firm with the exception of lead, which shows a tendency toward advance. Copper is firm at 27 cents a pound and is in fair demand, the other lines show only a fair volume of business. The strike in the United States is still being felt and shows its effect on the trade.

COPPER.—The copper market continues steady at 27 cents a pound. Up to the present, European buyers have not entered the market as expected, and until they do there is no immediate prospect of a change.

LEAD.—Prices of lead show a tendency toward advancing and this is partly a result of the strike conditions. Prices are around 7¼ cents per pound.

SPELTER.—Business is rather quiet in this line. Prices show no change.

TIN is maintaining its position fairly well, but may develop a little stronger tendency now that the strike in England has been settled and shipping will be resumed. Stocks are ample to take care of requirements, it is believed. Tin quotations are in the vicinity of 60 cents. per pound.

ANTIMONY.—The demand for the product is not heavy. Quotations show no change from 10 to 11½ cents a pound.

ALUMINUM.— Comparatively little business is in evidence. Prices are quoted on a basis of 35 cents a pound.

WILL READ THEIR OWN METERS

At a meeting of the Light and Heat Commission Tuesday the secretary outlined a new system of reading gas and electric light meters, on account of so many objections from the residential customers about meter readers going into their premises to read meters.

The commissioners decided to try out the scheme whereby the residential customers will be asked to mark the position of the hands of the meters on blank forms furnished from time to time by this department.

The success of this scheme will depend entirely on the co-operation of the customers.

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

DIFFICULTY in obtaining supplies with which to go ahead with work is delaying the men in the trade in all parts of the country. The situation in many lines seems to be growing slowly worse and the answer seems to be in lower production and in indirect results of the unsettled conditions in the United States.

Price changes have been very few, but there seems to be a general tendency upward. An advance of thirty cents over the base price has been made in galvanized sheets. Boiler tubes are very scarce, it being practically impossible to obtain some sizes in any quantity. There is every likelihood of an advance here shortly.

Pipe prices are holding firmly with a very active demand and considerable scarcity reported in some lines. There is an acute scarcity also in some lines of valves. Soil pipe and fittings are more plentiful and those who have been hampered in their work by lack of supplies are now able to proceed.

There is nothing to indicate any further advances in enamelware prices, although these goods continue very scarce, especially bath tubs.

The business situation is most satisfactory in every way and many firms have enough orders on hand now to keep them busy until next Spring. With the acute scarcity of housing accommodation, the volume of building steadily increasing and more building than ever before in prospect for next season, conditions generally never looked brighter.

Conditions brought about by unsettled labor conditions in both Canada and the United States and consequent lower production is resulting in a marked scarcity of goods. On all sides complaints are heard from men in the trade who are unable to get the materials they require. While prices are holding steady with one or two exceptions the general tendency is upwards.

In some quarters higher prices for copper are looked for before very long.

Galvanized Sheets Advance Thirty Cents

SHEETS AND PLATES.—An advance of thirty cents over the base price has taken place and a further advance is expected. Nearly all business done of late has been from warehouse stocks, which are now almost exhausted. The general situation in regard to both black and galvanized sheets seems somewhat uncertain. One manufacturer is sending out notice to the trade in which he gives it as his opinion that the main trouble, as far as galvanized sheets is concerned, will come after the strike is over and the mills start operating again. People, he points out, will begin to expect goods, and few shipments will reach them. Quotations are as follows. Some quotations vary from 35 to 70 cents over this base.

BLACK SHEETS—

14 gauge	$5 40 to $5 45
16 gauge	5 50 5 60
18-20 gauge	6 05 6 15
22-24 gauge	6 10 6 20
26 gauge	6 15 6 30
28 gauge	6 25 6 45
3-16 inch plate	4 90 6 25
¼-inch boiler plate	4 40 5 80

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS.

	Premier	Apollo
10¾ oz.	$8 05	$8 00
U.S. 28	7 75	7 60
U.S. 26	7 45	7 30
22 and 24	7 30	7 15
18 and 20	7 15	7 00
16	7 00	6 85
12 and 14	6 90	6 70

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Boiler Tubes Scarce; Prices Holding Firm

BOILER TUBES. — Although the strike in the United States has almost worn itself out, jobbers, it is believed, are not looking for any great volume of this commodity to enter Canada for a few weeks. Canada depends on United States manufacturers for a considerable supply, it is stated, and will have to conserve till business gets more settled. So far prices have not advanced. Quotations are as follows:

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$27 00	.....
1¼ inch	29 00	.....
1½ inch	29 50	.....
1¾ inch	32 00	$27 00
2 inch	31 00	26 00
2¼ inch	35 00	28 00
2½ inch	43 00	32 00
3 inch	48 00	40 00
3¼ inch	.....	47 00
3½ inch	60 00	44 00
4 inch	75 00	56 00

Pipe Not Plentiful; Prices Unchanged

WROUGHT PIPE.—Some sizes of pipe are extremely scarce, and, needless to say, they are the sizes that are in most demand. Jobbers state they are able to get some shipments through and by neighborly obliging of one another, are able to keep their customers partly supplied. The outlook is none too bright for a few weeks, as it is hard to say what the American mills will be able to do. Prices are very firm, with a tendency to advance, although some merchants figure they will remain firm on account of business generally settling down to a more normal basis. The quotations are as follows:

WROUGHT PIPE

in the market shortly, in fact, it is stated that the necessary credit arrangements are the main hold-back. However, when they are completed it is the general belief that prices will soar, as it is a well-known fact that copper is extremely scarce throughout almost all of Europe.

Brass valves and some lines of brass steam goods are reported to be scarce. Business in connection with marine work has been fair, although it has fallen off some on account of inactivity in the British Columbia shipbuilding. Other lines, though, are reported to be quite brisk. Market quotations are as follows:

Compression work, standard	35
Fuller work, standard	40

Seasonable Demand For Range Boilers

RANGE BOILERS.—Prices in this line are holding firm and no immediate change in quotations expected. There seems to be a strong seasonable demand. Some jobbers report a scarcity, but most jobbers are able to give fair delivery.

Quotations remain unchanged and are as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Soil Pipe, Fittings Easier to Get Now

SOIL PIPE, FITTINGS.—The scarcity seems to be easing off automatically, due, no doubt, to the nearing of the end of the season. Although the bulk of these goods are required in the earlier part of the season, the demand is still good. Manufacturers are better able to keep up with their orders, although some claim they are doing more of a warehouse business at present. Prices are unchanged and the general opinion seems to be that they will remain at present levels. Quotations are as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	10%
Medium and extra heavy soil pipe, 4 in.	15%
Medium and extra heavy soil pipe fittings, 2 in. to 6 in.	25%

Enamelware Scarce; Prices Hold Firmly

ENAMELWARE is still very scarce, especially bath tubs. Manufacturers claim they have not yet recovered from the Canadian strike which lasted for several months. The enamelled line is in good demand, particularly in some sizes and grades of bath tubs and wash bowls. There are a considerable number of houses, more particularly through the country, that are just being completed, and the builders are ready to install the bath room fixtures. There seems to be no shortage of raw materials, ingots being procurable in Canada. An advance in price is not looked for at present and yet no reduction is expected. Prices on a few of the well-known lines are as follows:

Bath tubs, roll rim, 4. 4½, 5 feet, 24 to 30 in. wide	$37 07
Bath tubs, 5½ ft.	41 27
Lavatories—	
17x10" Apron F139 or P4045	11 00

18x21" Roll rim F197, F199 or P4655-6	11 10
17x19" Roll rim F241 or P4345	9.05
Sinks, roll rim, 18 x 30 in.	16 60
Sinks, flat rim, 20 x 30	6.77-6.65
Do., 18 x 30	6.07-6.19
Do., 16 x 24	5.29-5.45
Closets, oak tank and seat	26 50
Do., enamel iron or white vitro tank	30 00

Advance May Be Made In Conductor Pipe

GALVANIZED CONDUCTOR PIPE.—This line still holds very firm. Manufacturers have not taken advantage of the advance in galvanized sheets as was expected, although there is nothing definite to indicate that they will not. The galvanized sheet stocks are nearly exhausted. Some manufacturers were fortunate enough to have sufficient on hand to make up enough stock for their fall requirements. Prices are quoted as follows:

PIPE (Conductor)
Plain

2 in., in 10-ft. lengths, list	8 00
3 in., in 10- ft. lengths, list	9 70
4 in., in 10-ft. lengths, list	12 80
5 in., in 10-ft. lengths, list	17 50
6 in., in 10-ft. lengths, list	21 30

F.o.b. Toronto, Ottawa, Oshawa.
List less 10%.

Bars, Angles, Ties Advance 25 Cents Base

BARS, ANGLES, TIES AND SECTIONS.—Some firms are quoting these from the one base at an advance of twenty-five cents over base prices, the present quotation being $4.25 base. The demand, it is stated, is very brisk on these lines, although it is mostly warehouse stocks that are selling owing to the steel strike, which accounts for the advance.

Lead and Zinc Products Steady

LEAD AND ZINC PRODUCTS.—These lines are steady, although lead has shown an advance of ¼ to ½ cent per pound. Business has been good in both lines and prospects are for continued activity. Present quotations are as follows:

Lead pipe, list, per lb.	....	$0 12½
Lead waste pipe, list, per lb.	....	0 13½
Do., over 8 inches, list, per lb.	....	0 14½
Above subject to discount of 10%.		
Lead traps and bends	....	15%
Lead wool, lb.	0 11	0 12½
Lead sheets, 4 to 6 lbs., sq. ft., in rolls, lb.	0 12	0 13
Cut sheets ½ to ¾c lb. extra and cut sheets to size, 1c lb. extra.		
Solder, guaranteed, lb.	$0 35½	$0 38
Solder, strictly, lb.	0 34½	0 37
Solder, commercial, lb.	0 32½	0 35
Solder, wiping, lb.	0 31½	0 34
Solder, wire, lb.	0 35½	0 41
Zinc sheets, per lb.	....	0 17

No Change in Scrap Market; Still Quiet

OLD MATERIALS.—No shipments of scrap are going across the border and it is uncertain when this business will be resumed. The gradual wearing out of the strike is having the effect of firm prices so far and the general tendency seems upward. This condition, it is expected, will improve at any time upon receipt of word that the strike has

"CRANDON"
Heat Regulators

Plain Thermostat
No. 10

The Crandon No. 10 Plain Pattern Thermostat is designed for use where it is not necessary for a clock thermostat. This instrument should be used where it is desired to maintain the same temperature at night as in the day time.

If it is possible to close off the bedrooms from the rest of the house it is a very desirable instrument to use. In apartment houses and in such places as a steam pressure is maintained during the daytime and lowered at night this instrument will do as well as any, for all that is needed, in this case, is to close the valve when the temperature has reached the desired point.

The Crandon No. 10 Thermostat is furnished in antiques and blast or oxidized copper finish.

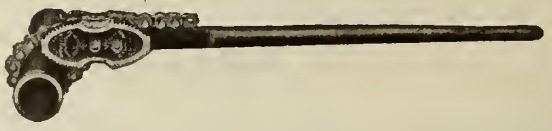
Williams' Improved "Vulcan" Drop-Forged Chain Pipe Wrench



FEW tools are called upon to stand greater strain and harder wear than the pipe wrench. Because Williams' "Vulcan" Chain Pipe Wrenches have withstood every test during years of hard, continuous service under all conditions, they have earned a well-deserved reputation for dependability, and are favorably known the world over. They embody every good feature for which Williams' *Superior* quality stands.

Made in 8 sizes for ⅛ to 18 inch pipe. All Flat Link Chains are "proof-tested" on a standard tension machine and "certified." Every wrench is unconditionally guaranteed.

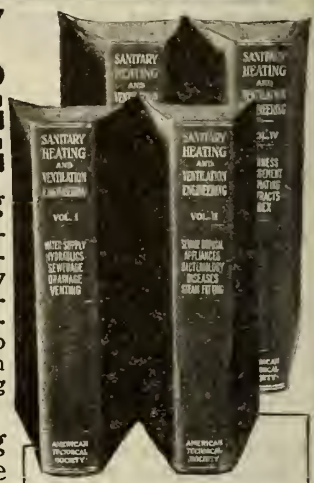
GET IN THE BIG MONEY CLASS NOW

SANITARY HEATING AND VENTILATING ENGINEERING



SANITARY Heating and Ventilating Engineering offers wonderful opportunities for advancement and money making right now. Modern methods and appliances are fast replacing the old ones, and the men who are up-to-date — the trained men — the men who know — are going to reap the benefit.

Get your share of the big money now. Here is the first thing for you to do — tear the coupon off this page and mail it to us today. It won't obligate you in any way and you don't have to send a penny, but it will bring you these four big volumes — just off the press — packed full of the very things you need to train yourself — all worked out for you in clear, understandable English by eighteen of the most successful men in these professions today.

No matter what your job is or how much you earn, you need these books — and you need them now. If you are in business for yourself, they will make your business bigger and better — the volume on business management, estimating and contracts and specifications alone will do it.

4 big volumes, size 5½ x 8¼ ins., bound in flexible American Morocco and trimmed in gold: 1454 pages: over 1100 pictures, diagrams and plates.

Here's what the Books Contain Thousands of problems under the following headlines are all worked out and made as simple as A-B-C.

Sanitary Science and Materials.
Water Supply. Hydraulics.
Sewers and Drains.
Drainage and Venting.
Sanitary Appliances.
Sewage Disposal.
Bacteriology and Sanitation.
Infectious Diseases.
Steam and Hot Water Fitting.
Domestic Hot Water Supply.
Heating and Ventilating Engineering.
Sheet Metal Work.
Business Management.
Estimating.
Contracts. Specifications.
Mechanical Drawing.
General Index and Review Questions and Index to Each Volume.

Free Consulting Service With these books goes free a year's consulting service in the American Technical Society, worth $12.00. This enables you to consult our engineers and experts for one year without charge. Ask as many questions within the scope of the book as you want for one year.

SHIPPED FREE

Examine the books and see for yourself just how valuable they are, but don't send us any money. The little coupon is all you need. Fill out all three lines and mail it NOW. It will bring you the whole set of books by express collect, and you can keep them seven days to use as you please—study them at home—take them to your shop—try to find some problem they won't answer, and ship them back at our expense if you think you can get along without them. If you want to keep the books after seven days' use, send us only $2.00. The balance can be sent in monthly payments of $2.00 each until the special introductory price of $14.80 is paid.

It will take years of hit-or-miss experience to gain what these books will give you in a short time; so don't pass up this opportunity—ACT NOW. We may never be able to offer this low price and these special terms again—only 7c a day. Tear off coupon before you lay this down and mail *today*.

X Laboratories 45

There's Something about an Original that Can Never be Imitated!

IF you've ever heard Harry Lauder sing his Scotch songs you could tell an imitation with your eyes shut.

You've seen Charlie Chaplin do his stunts—do you think an imitator could fool the people?

Whether it's real diamonds or paste —whether it's pure gold or brass—an imitation is simply an imitation—**and nothing else.**

That's why the thoughtful steamfitter isn't going to fall for anybody's talk about something "just as good" as "X" Boiler Liquid. He knows that for positive results it is safer to stick to the original. An imitation of the genuine "X" may look like it — but that's all. Patents are allowed on the "X" Liquid process. Its quality **can't** be imitated. Imitations of the genuine "X" Liquid cause foaming. **"X" will prevent foaming.**

No fitter can afford to experiment with his profits. When you get a leaky or cracked boiler job you want to know that you can send any man to that job —have him finish it quickly—otherwise there's the kicking, the arguing and the time-wasting that is utterly useless from a money-making standpoint.

Over 25,000 steamfitters now know that "X" Liquid is the **only** scientific process for repairing leaky and cracked boilers—and for making them LEAKPROOF—RUST-PROOF — AND SCALEPROOF. They know that with "X" they make three times the profit that they could by dismantling and welding.

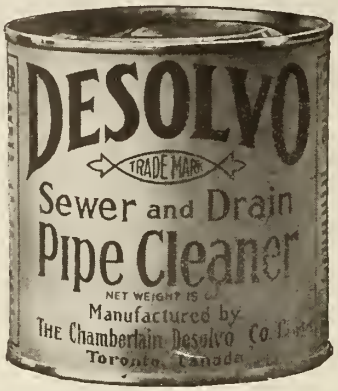
And they wouldn't risk their reputations experimenting with an imitation.

"X" LABORATORIES

636 Washington St. Boston, Mass., U.S.A.

For

Clogged Drains Frozen Pipes



Reason For Big Sales

It saves money, labor bills, tearing up the house and lawn. It clears drains. It mixes with cold water, requiring no heating and generates heat enough itself to thaw frozen pipes.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

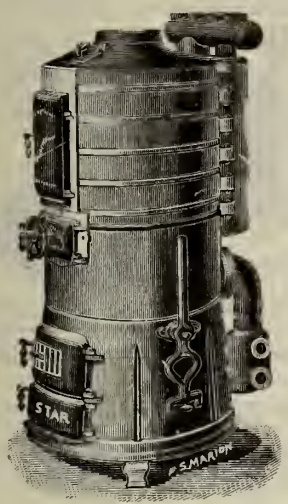
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.
The principal feature of the Star Boiler is that **no other round hot water boiler has any coal-saving improvement not embodied in** the "Star."

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

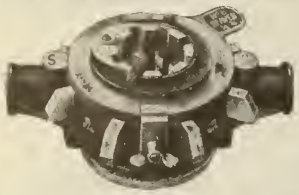
Allpriser Service Prevents It

This handy, annual service shows you where you are by means of exact understandable cost figures. Allpriser means elimination of loss, reduced overhead and a new sense of security against price mistakes.

Allpriser Service consists of a flexible leather bound book 7 x 9, of 150 loose leaf pages. The service includes a list of net prices of all staple articles and a regular service of new sheets revised to the latest changes. Allpriser Service is only $25.00 annually.

KENNETH B. ALLISON, 668 Yonge Street, Toronto

Constant Sales Increase

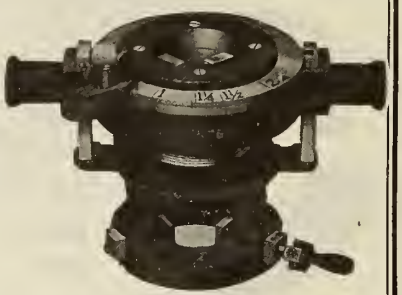


6 Beaverette to ¾ inch.

This efficient little die stock has been about 10 years on the market with constantly increasing sales.

The only tool that threads ¼, ⅜, ½ and ¾ without changing dies or bushings. Two sets of dies are operated by one handle.

Beaver 25 and 26 1 to 2" are alike except that 26 has ratchet attachment. They operate on the Beaver receding die principle—the further you thread the easier the labor. A man of ordinary strength can cut a 2-inch thread with one hand. Together these tools cut ¼ to 2-inch pipe without change of dies or bushings.



No. 25 Plain 1 to 2 inch.

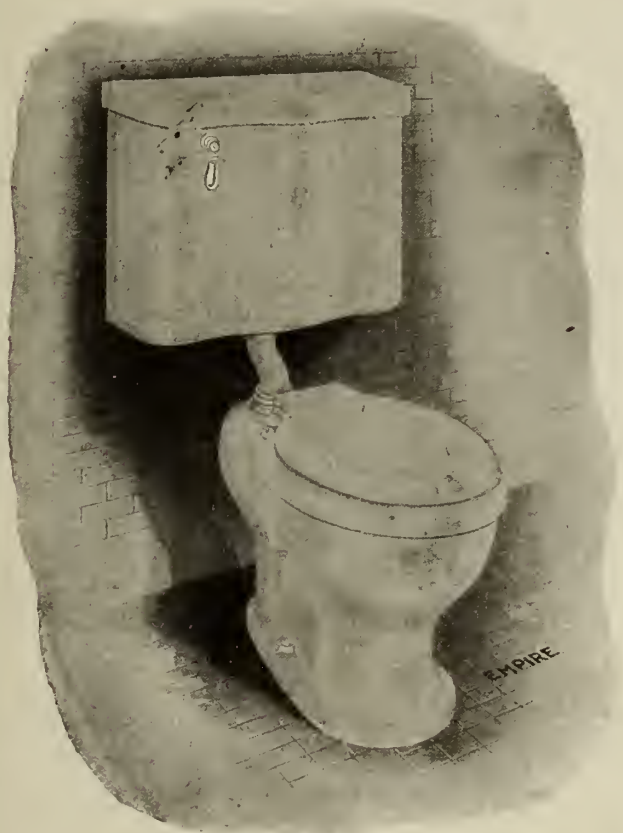
Sanitary Engineer
Plumber and Steamfitter of Canada
VOL. XIII. PUBLICATION OFFICE, TORONTO, NOVEMBER 1, 1919 No. 21

"Silentic" Was a Bold Step in Naming

It is a name that stands for a guarantee of silence.

The Empire Manufacturing Company has never fallen down on a guarantee, we never will.



Silentic Plate A 22-D. Empire Vitreous China Double Wavered Lowdown Tank white pyralin coated "Action D" and 2" white pyralin coated offset connection.

The "Silentic" is as near silent as any sanitary fixture can be. Every sanitary engineer who has installed "Silentics" is ready to back us in our guarantee.

The scores of householders who have enjoyed the freedom from embarrassment, that the "Silentic" makes possible, are our best advertisements.

But silence is not the only selling point of the "Silentic." Note its point of snow-white appearance —no nickle to tarnish and spoil its appearance. Like all our line of plumbing the "Silentic" meets every requirement. All our sanitary fixtures must be absolutely efficient, non-corrosive, durable, *Sanitary,* or they do not leave our factory.

This Helps You Sell Heating Systems

Send for One

IT'S a helpful hint book on heating systems. Not a book filled with text and tables. But one filled with a hundred and one suggestions, any one of which may be just the Happy Solution to some of your heating problems.

Not problems of how to pipe or what size boiler or radiator to use.

But the help hints for easily overcoming such problems as how to meet some folks' objections to radiators. Or ways of meeting requests for a heating system that ventilates and heats at the same time.

Likewise how to explain in a simple, easy to understand way, why some boilers burn less coal than others.

What we want to do is send you one, as well as one to every one of your employees who you think ought to have one.

Then after you have seen it, send us the names of some of your prospects who you think it will help you to help make a sale.

The name of the book is The Happy Solution.

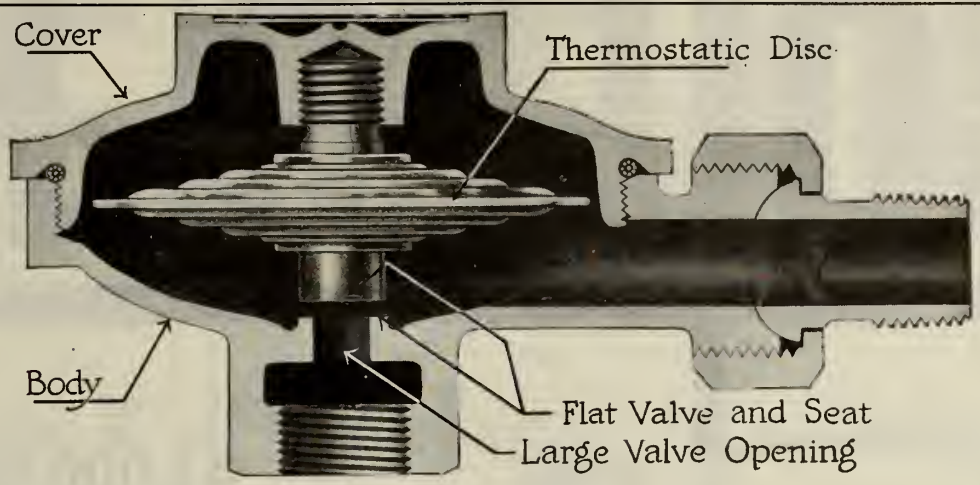
"MADE IN CANADA"



Inside Facts

The cover and thermostatic disc are securely fastened together: therefore there are only two major parts to a Dunham Radiator Trap. The disc is of special composition phosphor bronze, enclosing a volatile liquid which is extremely sensitive to temperature changes over a wide range—10 pounds pressure to 15 inches of vacuum. No adjustments are ever needed: we do that at the factory.

The DUNHAM HEATING SERVICE

The above illustration shows all of the trap. Note the absence of loose parts in the path of flow: there are no sliding contacts, nothing to gum up, no guide or pin. The valve seats squarely. No wonder that the efficiency of the Dunham Radiator Trap equals its simplicity.

The complete details will interest you

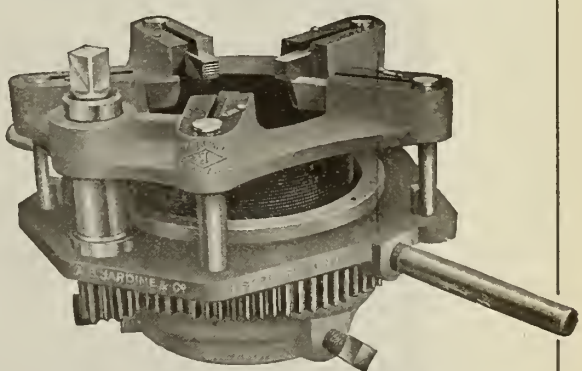
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool
No. 2 ½. Capacity 2 to 6 in. inclusive.
Weight 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

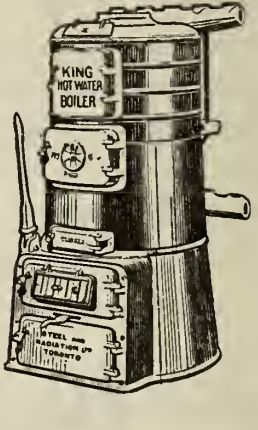
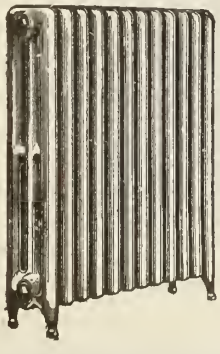
Recommend an Efficient Heating System to Your Customers



Character in a Heating System, like character in a man, is not fixed by any one quality. It is an aggregate of many qualities, and the value of the final product depends upon how well each and every one of these varying factors is assembled in the finished product.



KING HOT WATER BOILERS AND IMPERIAL RADIATORS

Considered as a whole, King Hot Water Boilers and Imperial Radiators possess these attributes in the highest degree, and are backed by a policy of manufacture which has developed and maintained this character for every product bearing our name. The result is "built-in" quality. Your customers will be perfectly satisfied with a King Hot Water System.

The Canadian Society of Domestic Sanitary and Heating Engineers

PRESIDENT
Frank R. Maxwell
TORONTO

VICE-PRES.
Harry Mahoney
GUELPH

SEC.-TREAS.
Garrett F. Frankland
TORONTO

COME ON IN

You are invited to become one of the Canadian Society of Domestic Sanitary and Heating Engineers.

Every man, firm and corporation engaged in the Plumbing and Heating business throughout the Dominion of Canada owes that duty to themselves first, and to their brother craftsmen second.

The need of an organization of this sort is so obvious that no great amount of argument should be necessary with a broad-minded man of business.

The need of Association has been proven and the existence of the Canadian Society justified in so many ways in the past, that every man of the Plumbing and Heating craft should see the necessity of supporting it, and should be proud to join it.

Commence a local organization at once, by getting in touch with your nearest competitor.

DO NOT HESITATE. DO IT NOW and put the weight of your influence and support with others, whose interests are similar to your own, by mailing your name or enquiring for further information to our Secretary.

ALL FOR ONE and ONE FOR ALL

Yours for Co-operation

A Little "Straight Talk" to the Canadian Plumbing Trade

TWO weeks ago the Ontario farmers sprang a surprise on this political province; in fact our rural friends were somewhat stunned at the results themselves. In this great victory at the polls, what is the lesson to be seriously taken to heart by ourselves and every Sanitary Engineer in the province? Simply this — that the farmer must not longer be considered as an individual who could not or would not appreciate modern conveniences and sanitation as we would. They have demonstrated their ability at organization in the recent election. They have shown their desire for education and pleasure, thoroughly, on an equal footing in the matter of provincial administration. Let us take up the challenge and determine to bring his needs and comforts as close to our trade as that of the city dweller. At the moment we may not need his patronage or goodwill, but the opportunity exists just the same and the time is coming when that vast field will increase our opportunity one hundred fold.

Yours for Efficiency and Service,

Don't be Afraid to Take on New Lines

Walter Brittain, of Bloom & Brittain, Hamilton, Ont., Tells How the Firm Has Multiplied Its Business Many Times—Finds Sales of Electrical Goods Steadily Increasing—Discusses Trade Problems

Based on an interview by C. E. PARSONS, of Sanitary Engineer, with Walter Brittain, of Bloom & Brittain, Hamilton, Ont.

TEN years ago Walter Brittain and Harry Bloom started in the plumbing business in Hamilton in a modest way. To-day they have two places of business and their turnover each year runs into really large figures which are still growing.

"I guess we grew because we were not afraid to take a chance and go into new lines," said Mr. Brittain, in discussing the matter with SANITARY ENGINEER. "We are still following in the same line. There is only one stipulation. We must see that there is a demand for whatever line of goods it is, and they must be goods that we can stand behind. We do not want to handle anything that is not going to give good service and good satisfaction to the party who buys it. If we did we would quickly get the wrong kind of advertising, because nobody talks louder or more persistently than the man or woman who pays good money for something that turns out unsatisfactorily. On the other hand, we have no better advertisement than customers who are satisfied.

The Firm's Motto

Long ago we adopted as our motto or our business policy the slogan: "The customer is always right." If, at any time there is even the slightest question about anything we take the stand that the customer decides the matter. If he thinks he has an article that is in any way unsatisfactory all he has to do is to bring it back and we will make it right and give him another. The same policy applies in regard to our plumbing and heating work. It has got to satisfy the customer. His word is final. The people all over the city and district know that we stand behind this policy

This display is located right up at the front of the Bloom and Brittain store. Note the splendid condition the stock is kept in, the attractive display of bathroom fixtures and the neatness of the show room.

The illustration shows an interior view of one of Bloom and Brittain's show windows and also the very front of the shop. Note the display of bathroom fixtures in the window, the neat arrangement of stock and the attractiveness of the show room.

and it has helped us to build up the trade we now enjoy."

Got Good Results

Mr. Brittain stated further in reference to the firm not being afraid to take on new lines that one of their first departures from the plumbing and heating business was to stock stoves. From that they have gone into electric stoves, aluminum ware, electric utilities, toasters, heaters, vacuum cleaners and washing machines. In addition to electric washers they carry a complete stock of washers operated by hand, water and gasoline power.

"No matter what line you are in," said Mr. Brittain, "it pays to carry the stock. People like to deal at a place where they can get a good selection. They like to see a lot of goods out about the store and they like to see it kept in good condition. Women particularly are apt to keep away from shops where they have to step around piles of merchandise and they will not handle goods that are not kept clean. It doesn't matter whether it is a display of bath tubs, bath-room fixtures, electric washers, stoves or anything else, it is good business to keep it out where people can see and inspect it and keep it clean and nice."

Cuts Down Overhead

"We soon found that handling other lines than plumbing goods not only brought a lot of people to our shop for both the other lines and plumbing goods, but the steadily increasing turnover made for more profits and at the same time cut down our overhead. We could do many times the business we had been doing when we only sold plumbing goods, and with litle increase in expense. We have been adding one line after another and at the present time would go into the handling of electrical fixtures if we could find a man to take charge of the work upon whom we could thoroughly depend."

Take All Discounts

Mr. Brittain pointed out that the firm's stove business has grown so big that they now buy by the carload. They buy for cash and they sell as nearly as possible on a cash basis. By doing business in this way they effect a material saving in the way of discounts and minimize all losses due to collection of credit accounts.

In connection with the selling of stoves, Bloom and Brittain keep half a dozen stoves for demonstration purposes only right up at the front of the store. These are combination stoves that will burn either coal, wood or gas. They are kept in perfect condition, the nickel shining brightly and all parts clean, so that any woman who comes in may, if she wishes, handle the stoves and see for herself just how they work.

Keep Them Separate

"The reason we keep several stoves for demonstration purposes," said Mr. Brittain, "is that we have found that it is bad business to interrupt a salesman who is trying to sell a stove. If we have half a dozen customers in at the same time and only had one stove to show, the customers would start talking to one another and the salesmen would get mixed up. In short, when selling stoves you must concentrate on the customer. Any interruption from outside sources disturbs both the salesman and the customer and may result in the loss of a sale."

Take Old Ones in Exchange

Mr. Brittain stated that if a party comes into the store and wants to buy a new stove and wants something allowed on an old one, that the firm always takes the old one.

"We handle from 450 to 500 stoves every year," said Mr. Brittain, "and in the course of our business we get a number of old ones. We fix them up and make a good profit out of them, in fact we frequently make as much out of an old stove as we do on a new one. We put them in good shape and have no trouble whatever in turning them over."

In connection with the trade in used stoves, Bloom and Brittain have fitted up a special section in the basement, where they are kept on display. All are neatly arranged and are kept in good condition.

Are Easily Handled

The department where the used stoves are rebuilt and fixed up generally is located on the third floor, up out of the way of everybody. In order to facilitate the handling of stoves and heating equipment generally, the firm has a

freight elevator which will take them to the basement or to any floor desired. Most of the stoves are mounted on wheels and are quickly and easily moved to the place desired.

Just how big a business Bloom and Brittain do in stoves may be gauged from the fact that they have sent out as many as 33 combination ranges in one day.

Bring Good Results

Mr. Brittain says that demonstrations are put on frequently and always bring good results. These are well advertised and very often the firm co-operates in its efforts with some leading woman's organization, which puts on a sale of cooking in connection with the stove sale. Some of the demonstrations last as long as two weeks. Others are shorter.

"Results vary," said Mr. Brittain, "but they are always satisfactory. The whole thing seems to depend on the weather. If the weather is such that people will naturally think about stoves or whatever we are demonstrating, we will probably sell twice as much goods as if the days are of the variety that people are outside and not thinking about heating equipment."

Helps Sales Also

Another thing that helps stove sales in Hamilton, Mr. Brittain says, is the gas situation. Sometimes there will be trouble with the natural gas supply, especially in zero weather, and there will be a rush for heating stoves.

"We thoroughly believe in advertising," said Mr. Brittain. "We get excellent results always. By arranging our demonstrations so that we are working with some local women's organization we also get a lot of business. Recently we put on a two weeks' demonstration, and during that time co-operated with the Women's Exchange, an organization through which Hamilton women sell anything they wish to sell. Naturally this brought a great number of women into the store, and they were easy to interest in stoves, washers and other lines."

In connection with the sale of stoves the firm makes a charge for setting up all stoves, unless they are purchased during the special demonstrations.

An auto delivery is a feature of the store service, and Mr. Brittain says it has proven most satisfactory in every way, not only to the firm, but to customers.

"We simply would not be without it," he said.

Other Demonstrations

Occasionally the firm puts on a demonstration of aluminumware and inserts a coupon in its ads. to be returned to the store with the name and address of the party.

"This gives us a new mailing list every couple of months containing perhaps 500 names," said Mr. Brittain. "We follow these up and many of them are prospects for other goods."

During the year four demonstrations of washing machines are put on with excellent results.

As stated above, the model laundry is a feature that is a real talking point when it comes to closing business.

Steadily Growing

The firm is doing a steadily increasing business in electric stoves and washers.

"We find the demand for electrical goods increasing all the time," said Mr. Brittain. "The goods sell themselves. Take washers for instance: We have no hesitation in allowing people whom we know to be reliable, to take home an electric washer. In practically every case the machine sells itself and they never come back. People like electrically-operated equipment, because it more than does the work claimed for it. The equipment works quickly and efficiently and economically. These are three big points that the buyer gives important consideration to. In addition he or she likes to have a nice-looking utility, and few lines are better or more attractively finished than the electric devices. On all the lines that we sell we give a guarantee that as far as I know is the broadest of its kind in Canada. It is simply following out our general policy that holds good in all departments that the customer has to be thoroughly satisfied."

Aggressive Policy

"We believe in an aggressive policy," said Mr. Brittain. "The business man who sits still and waits for trade to come to him, may get by, but if he hustles he will get many times the turnover. In our electric vacuum cleaner business we keep four men going about the city all the time demonstrating and selling. We get excellent results, and very often obtain prospects for other goods."

The firm not only sells stoves and ranges from now on, but during the summer months does a big trade in summer stoves and in coal oil heaters and gas plates. During the proper sea-

This model laundry, located at the rear of the store is proving a big business getter for Bloom and Brittain and is a centre of real interest for housewives who are interested in getting away from the drudgery of washing. The equipment is all connected up and can be demonstrated instantly.

Bloom & Brittain, 16-18 Macnab Street NORTH

Bloom and Brittain are not afraid to use newspaper space. The original of this illustration was 15 inches wide and twelve deep. The firm state that they get excellent results from their ads. and frequently use full pages. Note the attractive arrangement, the use of cuts and the punchy sales talk.

sons these lines are kept prominently displayed.

"We sell about 400 plates every season," said Mr. Brittain. "We get the business by advertising and by store and window displays. The merchant who sticks his goods back in a corner and waits for the public to come in and ask for it is working on the wrong plan. To sell stuff you have to let the people see it and let them know you have got it to sell."

Business Is Good

Mr. Brittain says business in the plumbing and heating lines has been excellent. The firm makes a specialty of looking after factory work, and as Hamilton is a big factory city, they have had any number of excellent contracts. The city has, in common with many other Canadian cities, an acute scarcity of dwellings. This has resulted in a great many people with large homes converting them into duplexes, apartments or family flats. Bloom and Brittain have undertaken a great many of the plumbing and heating contracts for these.

"One thing we have kept away from," said Mr. Brittain, "is the speculative builders. They are, as a rule, out to get something cheap. We will not cut prices for anybody, and we do not want any cheap jobs. As a rule, work of this kind would reflect back on our standing, because when the installation commenced to give trouble as it surely will sooner or later, the buyer would say we did the work and would never, if he lived to be a thousand years old, give us another contract. We do not want that kind of advertising. It is bad for business."

Range Boiler Troubles

Mr. Brittain discussed the trouble that is frequently with range boilers, and pointed out that this is a serious matter for the master plumber and runs into quite a loss. It frequently happens, he states, that after a range boiler is installed that it is defective. This means that the firm has to lose all the time its workmen have put on the job and also the time it takes to put in a new one.

"It is not a fair deal on the part of the manufacturers," said Mr. Brittain, "to send out goods which are guaranteed and turn out to be defective. I think the trouble is caused by the kind of ma-

Mechanical Features of an Office Building

Oil Fuel and Complete Equipment Make Power Plant Unusually Interesting to Engineers

The Welfare of Office Employees Has Been Well Taken Care Of.

By W. F. SUTHERLAND
OF POWER HOUSE

THE modern type of office building erected to-day for the use of industrial firms and business men has little in common with those formerly built. Aside from the excellent working conditions with which the occupant is surrounded a greater degree of interest in his or her physical well being or comfort is manifest. One of the most excellent examples of this type of office building is that of the Imperial Oil Co., on Church St., Toronto, where a gymnasium, a squash court, shower baths, etc., have been incorporated into the building design for those who wish to use them. The mechanical features of this plant are also of more than passing interest to the engineer, for it is seldom that a power plant reflects the attention to detail appearance seen in the present instance.

Heating Plant

Heating is done by a combination of direct radiation and the plenum system. Direct radiation is used for all the main offices, while for basement rooms, squash court, gymnasium, etc, etc., and for the lavatories warm air is supplied by air washing and heating apparatus of the usual type made by the Carrier Air Conditioning Co. of America, 39 Cortlandt St., New York. The usual tempering coils, air washer baffles and main heating coils are fitted and the fan is driven by a 5 h.p. Sprague variable speed motor. The spray pump is driven by a smaller 2.5 h.p. Peerless Motor. Fresh air is drawn in from the roof through a fresh air duct and after being humidified and warmed is distributed throughout the building where required by a plenum chamber and the usual air ducts.

The air temperature is regulated by automatic temperature controlling apparatus made by the Power Regulator Co., New York. Thermostats are located on the incoming cold air side of the tempering coils and also on the outgoing side of the main heating coils. These serve to control the temperature through remote controlled valves on the main steam lines. A uniform temperature is thus secured at all times, no matter what the condition of the air outside.

As mentioned above direct radiation is employed for the heating of the main offices, etc. The Dunham vacuum sysem, installed under the direction of the C. A. Dunham Co., Ltd., Toronto, is used and the excellent arrangement of the piping vacuum and feed pumps, together with the Fisher regulators, will be seen from Fig. 2. Two Blake and Knowles vacuum pumps are employed, each being fitted with a Fisher regulator as shown. These pumps are 8 x 8 x 12 in size and discharge into a hot water receiver above the feed pumps. This receiver is fitted with a float actuating the steam valves on the feed pumps so that they are only running when there is water in the receiver. When the receiver is empty the pumps automatically cut off. The feed pumps, of which there are two, are of the Worthington duplex type, 5½ x 3 x 5 in. in size.

Boilers

For the supplying of steam to the heating system and also to take care of the future power load if an isolated plant is ever thought desirable, two Heine boilers of 195 B. H. P. each are installed in a double setting. These boilers are fitted with circulating blow-offs, etc., and the breeching is carried over to a steel stack 3 ft. 6 in. diameter, which is carried to the roof in a brick well. The pressure carried at present is 65 lbs. with provision made for an increase to 125 lbs. when power is generated in the future. This pressure is reduced to a proper value by means of a Fisher reducing valve.

The boilers are oil fired and the installation presents many features of interest. Perhaps the most noticeable feature to the casual visitor is the extreme cleanliness of the plant in general. The floor throughout is of red tile and the entire absence of ashes and other dirt always present when coal is used makes it easily possible to keep the boiler room, and the apparatus installed in it, spick and span.

Four Simplex oil burners, two to each boiler, are installed. These burners are made by the Standard Oil Burner Co. of Oakland, Cal. Each burner is fitted with a one-half horsepower direct current motor, which serves to drive the blower for air supply and gear type oil pump, both mounted on the motor shaft. The oil pump pumps direct from the oil tank and the surplus over that which is allowed to flow through the regulating valve, flows back through a return header to the oil tank.

The whole mechanism is mounted on a swinging plate

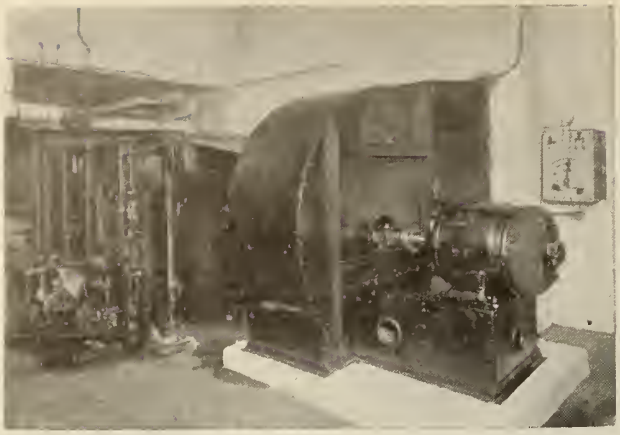

FIG. 1—CARRIER AIR CONDITIONING APPARATUS.

hinged to the boiler front so that when the burner is cut off it can be swung away and the elliptical hole, shown in Fig. 3, closed with a plate. This prevents injury to the burner from the incandescent brickwork of the connection chamber. Each motor is fitted with a starting rheostat and knife switch, this equipment being mounted on a marble panel adjacent to the boiler front.

Electrical connection is made to the motor by flexible conduit and the oil connections are made through a special union which permits the burner to swing easily through the necessary angle. Fig. 3 shows the front elevation of boilers and the different positions in which the burners are shown enable their details to be made clearly visible.

The oil tank supplying fuel oil to the burners is placed three feet below the basement floor and is capable of holding 2,015 Imperial gallons of oil. It is 15 ft. long by 5 ft. diameter and is provided with dished heads.

A small coal fired heater and a hot water tank are provided for the furnishing of hot water to wash basins, shower baths, etc.

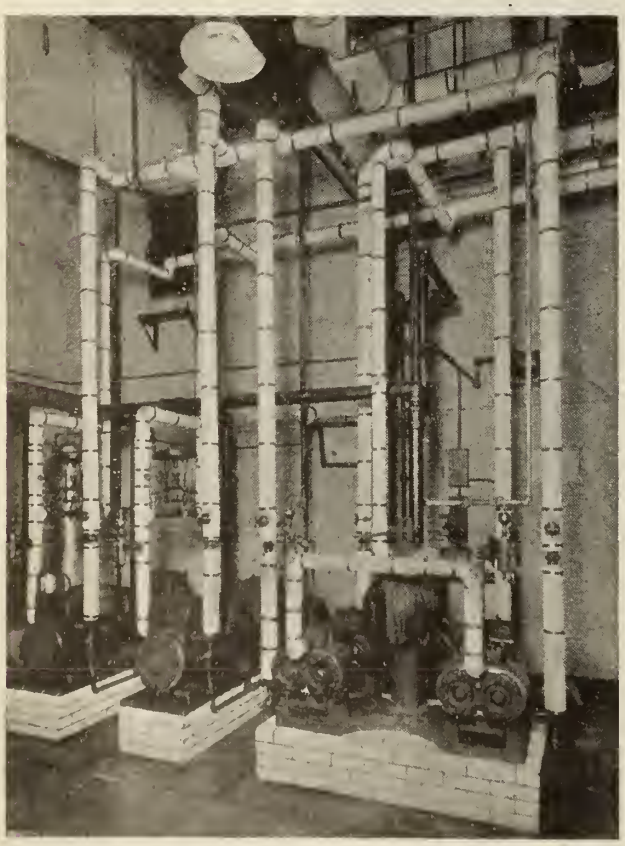

FIG. 2—BOILER FEED AND VACUUM PUMPS, NO. 1 DUNHAM VACUUM HEATING SYSTEM.

The drinking water is all filtered and cooled. Two sets of Loomis-Manning Filters, installed by the Loomis-Manning Distribution Co., Philadelphia, are used. These serve to render the water sparkling, clear and free from any contaminating influence. From the filters the water passes to a cooler operated by a small York vertical two cylinder ammonia compressor. This compressor is driven by a Westinghouse 5 h.p. d.c. motor. A Worthington single stage centrifugal pump driven by a one h.p. motor circulates the drinking water through the system. By keeping the water in constant circulation, it is always at the proper temperature at the faucets and no water need be run off to waste on account of its being too warm. The drinking water faucets are entirely separate from wash basin faucets, and the piping has no connection with the lavatory supply.

In connection with the wash basins throughout the building, it is interesting to note that they are fitted with special faucets made by The H. Mueller Mfg. Co., Ltd., Sarnia.

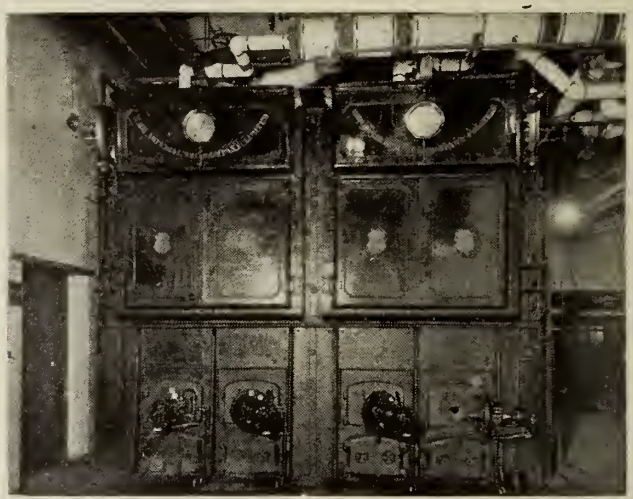

FIG. 3—BOILERS SHOWING OIL BURNERS. THE ONE ON THE LEFT IS IN RUNNING POSITION, THE TWO MIDDLE ONES SHUT DOWN AND SWUNG OUT, AND THE RIGHT-HAND ONE SWUNG CLEAR AROUND TO EXPOSE FIRE HOLE.

These work on the self-closing delayed principle so that they can be adjusted to remain open for any length of time desired. By this means the basins can be filled to any depth desired without danger of flooding and without the necessity of keeping the faucet open by hand as is the case with all other self-closing faucets.

Two fire pumps are installed, each of the two stage type made by Worthington, and each driven by a Sprague 7½ h.p. d.c. 230 v. motor. These pumps serve to fill two tanks on the roof of the building and are arranged for automatic or manual operation. The starting mechanism is unusually complete and the switchboard, of Cutler Hammer make, in addition to the control apparatus for the motors, is fitted with tank indicators and bell alarm.

A low voltage storage battery system is installed and furnishes control for the automatic feature of the fire pump installation, high and low water alarm, elevator signal lights and other features of a similar nature.

Two duplicate 18 volt batteries are installed and a one h.p. Sprague motor-generator set is used for charging. The battery switchboard carries battery charging switches, generator circuit breaker ammeters, voltmeters and the usual feeder circuit knife switches.

A marble distribution board also forms part of the electrical equipment. Energy for power and lighting is obtained from the central station through a 110/220 volt d.c. service. This board presents a very neat appearance through having all the fuses mounted on the back and only the knife switches showing.

Mr. Maxwell Mongraw is Chief Engineer, and Geo. Bains, Plant Superintendent.

The installation of this power plant was done by W. J. McGuire, Toronto.

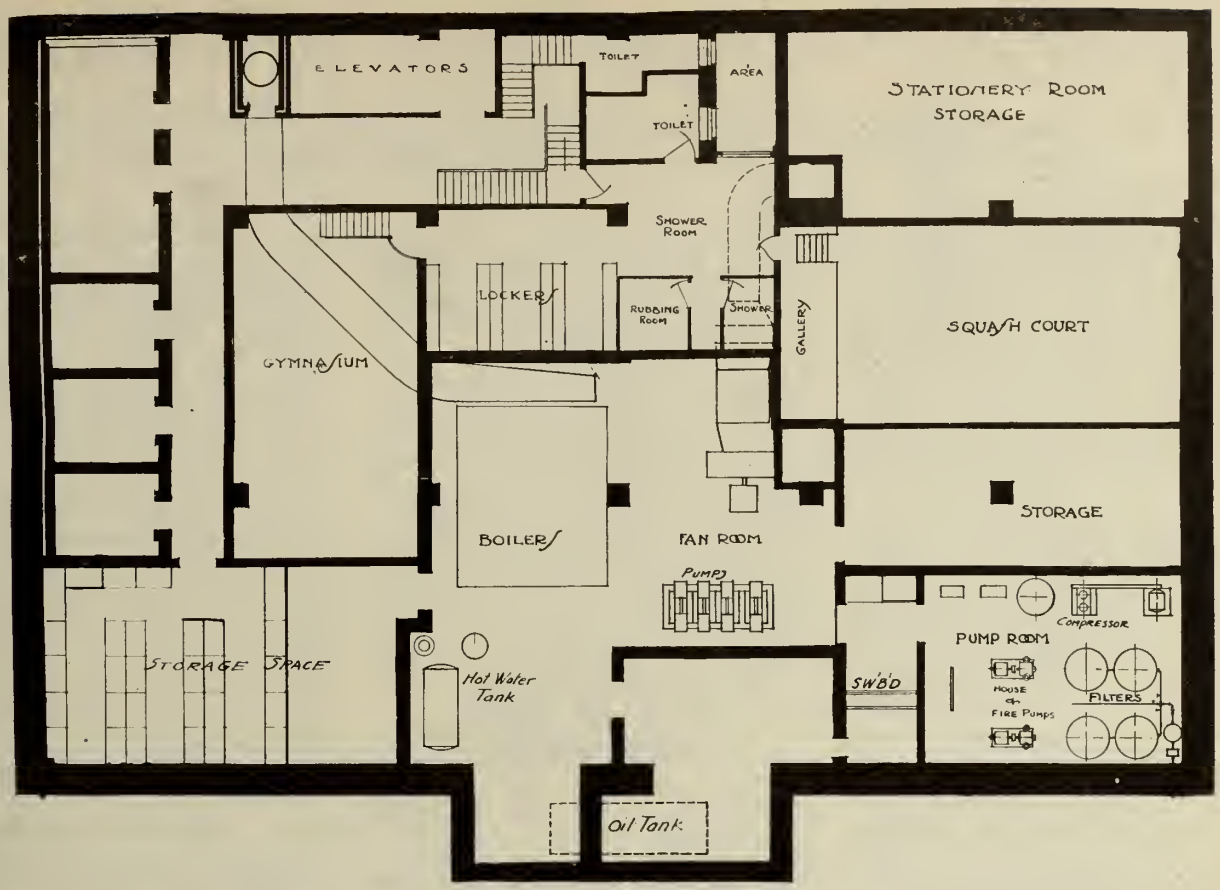

FIG. 4—BASEMENT PLAN SHOWING POWER PLANT EQUIPMENT AND OTHER FEATURES.

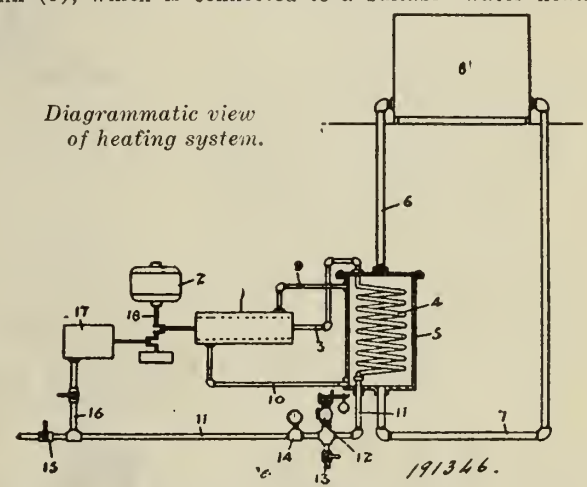
A New Heating System

A NEW heating system of considerable interest forms the basis of a recent patent issued to Robert Cairns, Chief Engineer of the Farmers' Dairy, Toronto. The accompanying illustration shows in diagrammatic form the principle of the system as outlined in the patent specifications.

The principle feature of the invention consists in the novel method of heating a circulating medium by the compression of air by electrical means and the passing of the compressed air through suitable radiating coils to convey the temperature to the water of the circulating heating system, and to utilize the reduced temperature compression for other purposes, or to expand the air to relieve the consumption of electrical energy in initial compression.

The air compressor (1), which can be of any suitable type, is operated by an electric motor (2). The compressed air is carried from the outlet of the compressor by a pipe (3) to a radiating coil (4). This coil is enclosed within a tank (5), which is connected to a suitable water heating

Diagrammatic view of heating system.



system of the circulating class by the pipes (6) and (7). The heat of the compressed air passing through the coil heats the water in the tank, which rises through to pipe 6 to the radiators and returns by pipe 7. The heat of this compressor is further utilized by the connection of the water jacket of the compressor to the tank (5) by means of the circulating pipes shown. A pipe (11) leading from the coil (4) is provided with an adjustable safety valve (12), which may be regulated to relieve at different pressures, and below the safety valve a drain cock is provided which will allow condensation to be drawn off.

A suitable pressure gauge is arranged in the lengths of the pipe and cut-off cock cuts off the pipe (11) from an extension which may be connected to any suitable apparatus which it is desired to operate by compressed air.

A branch pipe (16) leads from the pipe (11) to a re-expanding cylinder (17), which is connected with the shaft

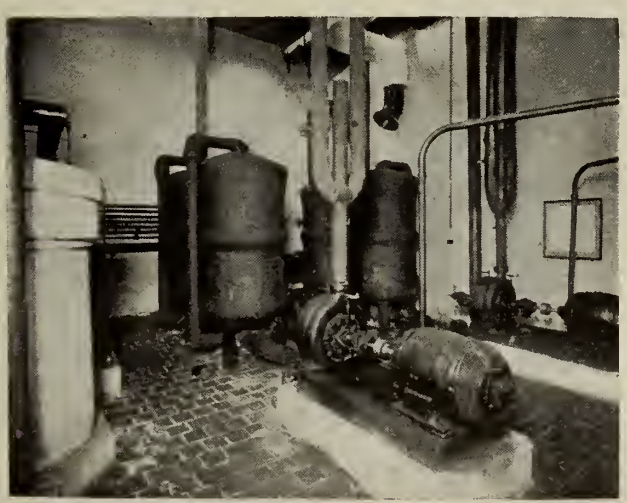

FIG. 5—SHOWING FIRE PUMPS AND FILTERS FOR COOLING WATER.

How to Arrange Your Advertising

Always Consider the Point of View of the Customer — Many Firms Always Feature the Price in Plain Figures—Use of Proper Illustrations is Important

SOME merchants have a gift in the matter of laying out advertisements, and in saying exactly the right thing to catch the public attention. There are others, and undoubtedly this is by far the larger class, who find the make-up of an advertisement one of the difficult tasks, a task that for that reason is often relegated to some spare minute that is hoped for, before the actual need for the writing of the advertisement arrives.

As a matter of assistance to those who find it difficult to get anything to say to introduce themselves, or their store or their goods to the public, the following may prove useful, and a perusal of the advertisements reproduced offer suggestions that are practical, and may be adopted with profit in arranging your own copy.

Start A "Drive"

Advertise one thing at a time if your space is limited. You will leave a definite impression that way. People know you sell other things, and if you do that you will stand as good a chance as the biggest store in your community.

Your strongest line of display should be at the top of your advertisement—or a little above the centre. And your headline should be strong enough to give an appearance of strength to the top of your advertisement.

Use A Good Margin

Use a good margin every time. It is not a waste of space. Margin is breathing space for type. It sets out your message. It makes your advertisement stand out from the page. It makes your message easier to read when it is noticed. It forms a frame for your type picture.

Some of the most notable advertising successes in the country have been built up on small space. A small advertisement intelligently planned is worth two large ones constructed on the principle of the dominance of big space.

But simply a promiscuous use of white space is worse than none at all; scattering it all around without ar consistency will retard rather than aid the readability of your message.

Keep Them Short

Keep your headlines short, or they won't be headlines. Six words is the golden length. And always make sure that you get some gray into your advertisements by writing a bit of matter between your headline and your item.

Making an advertisement attractive is important; but what is advertised is much more important than how it is advertised. That's why so many good looking "ads" fall down—and why so great a number of apparently inartistic advertisements bring results.

Cowans

81 Colborne St.

PLUMBING COWANS BRANTFORD ELECTRIC

"The Store With the Blue Front"

This is the way Cowans of Brantford, Ont., boost the sale of electric vacuum cleaners. The original of this ad. was 6 inches wide, and 11½ inches deep. Note the firm's trade mark in the night-hand corner. This is always used in their ads.

Get Customer's View

Desirability and seasonableness are half the battle. Take the customer's side when selecting merchandise to be advertised. Many stores work themselves into a frenzy trying to force unseasonable or undesirable merchandise—its only claim for publicity lying in the store's desire to be rid of it.

Don't spend money telling about the unattractive side of your store. A bargain once in a while isn't a bad thing for a store, but you can go on doing it day after day—legitimately—and make money. And you can't get people to think you are in business for your health.

Some one once said: "Advertising is used too much as a cathartic and too little as a food." There's a lot in that. Use advertising to tell of the finest things in your store—not of its least desirable.

Must Use Judgment

The man who has the proper merchandising perspective of a store is the most valuable factor in that business, and if that store's publicity is successful he is the man to whom most of the credit for increased business should be given. The difference between merchants is the difference between their merchandising perspective. The real advertising man—and often he is the proprietor himself—knows what to play up, and which department ought to take a back seat for the moment.

What People Wanted

If you have seen a "homely" advertisement, and found out later that the store than ran it had a big day's business, you can bet your life that there was something in that advertisement that supplied a human want. The designer of that advertisement might have gotten his types mixed—but he evidently had the big thing right; he advertised what people wanted—and his message carried conviction through its earnestness, even if it broke the laws of artistic display.

Tell Them Something

Before displaying an advertisement effectively make sure that your message is right; that you are telling about something that people want—rather than what you want to get rid of. Making an advertisement good-looking won't add pulling power to a message that lacks incentive to move the readers to action. The reader wants to know "What is in it for me?"—and you'll have to write from his side of the fence.

Consider This

Too many advertisements are planned by artistic standards alone. That

Plumbing, Heating and Electrical Work

Get my Prices on any one of these lines of work. I give you an exact cost of work complete so thrt there will be no bill ofextra items going to you after the work is complete.

At present we are busy, but not to be too busy to give you a price on any work you may want done.

We have a good line of electrical fixtures in stock and there is no need of sending your money to out of town concerns when you can buy right in your own town.

No Job TooSmall
None Too Large

Fred Uncles,
Plumbing, Heating and Electrical Contractor
Phone, 195 Newcastle, N. B.

Here is an attractively arranged and convincing talk, that will interest all those who have any work of the kind mentioned. The illustration is half the size of the original.

is not to be construed as an attack on perfectly displayed advertisements. It is meant to point out that little things are often allowed to outweigh the big considerations in advertising. The most beautiful advertisement in the world will fail if the wrong merchandise is featured.

Has An Advantage

Did you ever stop to think that the bigger a business gets the harder it is to maintain the personality that attracted its first following? Smaller merchants have a much simpler advertising problem than the big store. When the proprietor of a smaller store signs his name to his advertisement his public can see his very person loom up in front of them as they read his message. They know him personally and if he stands for something in his town his word is powerful and his waste circulation, due to folks who are skeptical of advertisements, amounts to virtually nothing.

Don't Try Frills

Above all be yourself in your advertising. Don't pose, be natural; talk about your merchandise instead of about yourself.

The use of "boxes" can be overdone, too. A box here and there in an advertisement will emphasize and direct attention to those items which you want brought out. But all boxing is no boxing.

Use of Borders

The principal function of the border is to unify the various elements of your advertisement—to hold it together. It should not attract atention to itself. The border is to an advertisement what a frame is to a picture. You want folks to look at the picture—not at the frame.

The border must blend with the type picture. It must be in keeping with the thing advertised, and in "tone" with the rest of the store. If the border is the the first thing you notice in an advertisement it was not chosen with discrimination, and it is detracting from the message. You are not selling border: attention should be concentrated on what you are saying.

Don't be afraid to study the ads. of other merchants and of the department stores, as you can often get many excellent ideas that you may adopt.

Electric Heater For Summer Use

Heat Your Water By Hydro at Little Expense

During the hot weather the problem of heating water is easily solved by the new electric heater. Easily attached and costs little to operate

Electric pump and Hand Pressure Systems also installed.

Phone No. 3255 at our expense.

Chas. West

244 Queens Ave., London, Ont.

This is the way Charles West of London, Ont., goes after business in a town located in a farming district thirty miles north of London. The ad. is one-half the size of the original.

Illustrations Are Always Useful

Especially if the cuts are good. They brighten up an ad and people always like to see a picture of what is offered. They also like to know the price, and many of the best firms in the country invariably feature the price in larger type than the body matter.

DON'T BE AFRAID TO TAKE

(Continued from page 20)

terial they are using now. We seldom had these troubles with the old boilers.

Suggest New Ones

Bloom and Brittain have a staff of eighteen workmen. They do a great deal of repair work all over the city and district.

"When we are called to a repair job," said Mr. Brittain, "our men are instructed to make an investigation, and if the part that is to be repaired is past repairing, to point out the weakness to the owner and suggest that a new part be installed. If we are satisfied that the repair will not, owing to conditions, give every satisfaction, and the owner refuses to put in a new part, we will make the repair he wants, but on the distinct understanding that we do not guarantee the work. We generally find, however, that once a party understands that a new piece means permanency, and that fixing up the old one simply means more trouble later, that he is only too glad to accept our recommendation."

Apprentice Problem

Mr. Brittain regards the apprentice problem as one of the most acute things with which the trade in general has to deal. As far as his firm is concerned it has for the present, at least, given up any idea of training apprentices.

"If the unions would let us alone," said Mr. Brittain, "we would be in a better position. I think that as far as the trade as a whole is concerned, the policy of the unions at the present time is a short-sighted one. If we could retain control of the apprentice until he was out of his time, as used to be possible under the old indenture system, it would help solve the problem. But as things are now, if a boy comes to us he is of little use for the first year or so. Then he begins to get the hang of things and we send him out. The union takes control of him and demands more money than he is worth. The result is that we are not training any apprentices, and if this is carried on generally, where are the plumbers of the future coming from? The men who are doing the work now are not going to live forever, and someone should be ready to take their place."

Co-operation Essential

Mr. Brittain spoke of the good work that is being accomplished as a result of the men in the trade in Hamilton co-operating. They are, he says, making steady progress. They are not only working to solve their own local problems, but with the Ontario organization and the Dominion organization to solve provincial and national problems.

"The only way to get anywhere is to work together," said Mr. Brittain. "As long as men who are engaged in the same business and who have the same interests pull away from one another, instead of together, they are not going to get results. The master plumbers in this city are finding that out. They are realizing as never before just what it means to them to get together and work out our common problems. We hold regular meetings and at them we have practical talks on trade matters and on business matters. Such things as overhead and business management are taken up and some of the boys are seeing things in connection with running their business that they never knew anything about before."

Eliminating Troubles

There have been local problems to settle in Hamilton just as there are in most cities or districts. Mr. Brittain states that the master plumbers and the local plumbing inspector are working together well and getting things in good shape. The city by-laws, in regard to plumbing, are being improved. At the present time the Board of Health has no jurisdiction over the inspector, who works under the direction of the Building Inspector. The master plumbers are working to have the Plumbing Inspector's Department work with the Board of Health, believing that this is directly in the interests of the citizens as a body.

EDITORIAL COMMENT

FINANCE MINISTER'S WARNING

THE new Minister of Finance, Sir Henry Drayton, speaking recently on the subject of the 1919 Victory Loan, emphasized the very important fact that the late war had not only been a fighter's war but a producer's war. The soldier had been indispensable to the producer; but the producer had also been indispensable to the soldier. "The fighters have finished their work, and written the name of Canada most high," he said, "but the work of the rest of the community is not finished; they are the last of the participants to be discharged. The war will not be won until we all make good the pledge to clean up the war mess, honestly, fully and fairly."

Everyone should understand that if these pledges are to be fulfilled, the 1919 Victory Loan must be pressed through to success. The Finance Minister also dwelt on the absolute necessity of a heavy subscription if Canada's markets are to be maintained and built up abroad. The importance to the Canadian producer of the overseas credits, which depend wholly on the success of the Loan, cannot be too frequently insisted on, for the matter is one of vital concern to everyone. Canada can only seize her present trade opportunities in Europe, and face the future with confidence, if these credits are continued; and the only way to assure that result is to pile up big subscriptions for the Victory Loan.

THE COAL STRIKE

ALL Canada is intimately concerned with the walkout of 500,000 miners of bituminous coal, which has been ordered for to-day. The miners have chosen this time for a walk-out well as there is a world-wide shortage of coal. Their demands involve a sixty per cent. wage increase and a reduction of working hours to thirty per week, that is a five-day week of six hours per day. On the face of it the demand seems most unreasonable and looks like a barefaced attempt at extortion. It remains to be seen whether the American Government will allow the nation to be held up by the miners or not, and the developments will be watched with the keenest interest all over Canada, as we are dependent upon American mines for the great part of our supplies. The coal strike will be far more of a menace to the country than the steel strike, because it not only affects industrial life, but the health and comfort of the people. If the demands should be granted, and there seems to be little possibility of this, prices of fuel will be so advanced that big increases will have to be made in a great number of products and public suffering from high cost of living will be further added to. This is inadvisable, especially at a time when business men the country over are doing their best in the interests of trade to get prices stabilized. Should the strike be a prolonged one, trouble is looked for in operating railways and steamship lines, and the entire world trade would be seriously interfered with.

THE RETAILER CRITICIZED

THE Montreal *Star,* in a recent editorial, slates the Retail Merchants' Association for its opposition to the methods of investigation adopted by the Board of Commerce.

"It has seemed to the *Star* for some time that the Association is inclined to labor under the delusion of persecution. If the retail merchants of Canada have been more closely quizzed than has any other class of Canadian business men in the Government's endeavor to throw some light on the cost of living puzzle, it is only because their business gives them special information the Board requires. As a class they have not been the victims of more loose accusations of profiteering than others.

"As a matter of fact, the Association has been badly advised from the start in its attitude of opposition to the Government's inquisitorial methods. Because it did not approve of the constitution of the Board it objected to giving evidence before it; it still protests against being examined by the Board, and, at the same time, it wonders why this refusal is misunderstood by the public."

While the *Star* is ready to admit that "the retail merchant is no more guilty of profiteering than any other member of the community," it sees in its attitude to the Board of Commerce an excuse for the contrary belief.

Granting a judicious attitude of mind on the part of the public, this contention might be correct. Unfortunately it is impossible to believe in such an attitude, and the public takes the Board of Commerce investigation as an accusation of guilt and certainly there is little in the methods that the Board has adopted to date that would tend to disabuse their minds of such an impression.

PROTECTING THE PEOPLE

ON another page will be found an account of the findings and recommendation of the jury which investigated the tragedy at Ottawa, in which, as stated in a previous issue of SANITARY ENGINEER, seven lives were last by asphyxiation from illuminating gas. It seems a pity that seven lives had to pay the penalty before the authorities had it brought to their notice so forcibly that their civic by-laws were lacking. Action is being taken now to remedy the trouble and prevent further occurrences. The Ottawa case is only one of thousands which exist all over the Dominion. There are any number of menaces to health and life. The men in the plumbing and heating trade are keenly interested in seeing that these are removed. Unless they take action nothing will be done in the majority of cases because the people at large do not understand the seriousness of the matter or what should be done to provide for their safety. The men in the trade should co-operate with the Boards of Health in their towns and districts and also with the recently organized Federal Board. If things are wrong and a menace to the people, it is only by taking action that they can be remedied. If the local authorities are indifferent in the matter, as they very often are, the matter should be reported to either the Provincial or Federal authorities. It sometimes takes courage to do this, especially in the face of opposition at home, but by doing so lives may be saved and serious outbreaks of sickness prevented.

THE INDUSTRIAL PROBLEM

THE vital point about the industrial problem is not the rate per day or week, but the rate per unit of production. Efficient labor is worth high wages. But the man who demands high wages without giving efficient production in return not only injures himself but numerous other people. Suppose for instance, he is making a plumbing line. If he gets high wages for poor work he increases the cost of the goods. That means that the man who lives in Halifax or Winnipeg or Vancouver or any other place in the Dominion has to pay more for his bath tubs, his furnaces, or whatever the line may be. He will be forced to demand more for his own labor and then up goes the cost of whatever he is making to the man who is making hardware. This thing has been working out all along the line until everyone has been hit and it has not been good for business. Business has been good but it would have been better if this condition had not prevailed. There is little question that hundreds of thousands of dollars' worth of building is held up. Any number of individuals have been holding back buying in the hope that things would be cheaper. The average employer knows that it is to his interest that his employees shall be well paid. The higher the wages the higher the purchasing power of the people, but the employee has an obligation to be efficient. Unless he realizes this, he is going to injure business and himself eventually.

JUDGE GARY'S STRONG POINT

THE position taken by Judge Gary, head of the United States Steel Corporation, in favor of what is termed the "open shop," is based upon equality of rights and freedom of action without any class distinction and it seems unfortunate if the American Federation of Labor, particularly after the experiences it has been having with foreigners, is not prepared to accept it. Judge Gary expresses a "fixed opinion" that there should be no arbitration or compromise for settling the American steel strike, because he believes in the open shop principle, that every man, whether a member of the union or not, should have the opportunity to engage in any line of legitimate employment on terms and conditions agreed upon between employee and employer. He states that he has no objection to labor unions for a common interest and believes in the means of consultation and reaching satisfactory terms between employers and those employed. He will not, however, he says, have a powerful outside organization, with more of a centralized autocratic power than one of individual rights, exerting dictation or control over employers in various lines of industry. This stand, he claims, is the very basis of democratic government, of government for the people by the people. Admitting fully that laws that may have been framed in the past, either for national government or for bodies of men in various trades, may have become obsolete owing to changing conditions, he holds that the remedy lies not in violation of the existing laws, but in their revision, always keeping in view the principle of equal rights. Constitution and laws are necessary to such a system, he holds, and without them any country will drift into the chaos that has demoralized Russia. Judge Gary intimates that he is fully prepared to stand firm in his attitude indefinitely, because he believes it is the only basis on which permanent relations between capital and labor can be worked out.

ANYTHING that is desirable is advertisable and the way to sell more is to tell the people about it and that they can get it at your store.

* * *

SLOW moving lines will often eat into the profits of half a dozen fast sellers and a dead department in what is otherwise a live store means waste in distribution and increased costs.

* * *

NEWSPAPER advertising for the retailer brings greater returns because you can talk to more people in less time and at a more resonable cost through the newspaper than in any other way.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

Business Changes

TORONTO.—E. Lee has purchased the plumbing business of W. R. H. Daniels.

Tenders

T. L. Church, chairman of the Board of Control, Toronto, will receive tenders until November 18 for the supply and delivery of water meters.

New Firms

Charles Reid, plumber, has been registered at Montreal.

E. Lusignan & Co., plumbers, has been registered at Montreal by Mrs. Camille Lusignan.

Incorporations

The Canadian John Wood Manufacturing Company Ltd., capital $200,000, head office Toronto, plans to manufacture range boilers and similar lines.

Trade Notes

The Standard Plumbing and Heating Co. of Halifax, N.S., has discontinued business.

Beck & Heavyside, plumbers, have been registered at Montreal by James Beck and John Heavyside.

A pipe galvanizing plant to cost $35,000 is being erected by the Canadian Allis-Chalmers Company at Toronto.

Obituary

The death occurred at his home in Burlington, Ont., of Adam Clark, aged 75. He had been in the plumbing and heating business in Hamilton for 42 years. He was a native of Perthshire, Scotland, and came with his parents to Canada nearly 70 years ago. Soon after learning his trade he established himself in business, in 1877, carrying it on so successfully that his premises had to be enlarged from time to time, so that, at the time of his death, he had one of the most extensive in the district.

Mr. Clark was of a retiring disposition, devoted rather to his home than to public life, and during his long career he took no part in civic affairs. He was an enthusiastic Mason, being identified with Doric lodge, and a member of Central Presbyterian church.

Mr. Clark is survived by his wife and three sons, W. J. Clark, Norman Clark and Fred G. Clark, all of Hamilton.

The death occurred at Brockville, Ont., on Tuesday, of Dr. A. L. Macaulay, for the past nineteen years Medical Officer of Health for the town. He was 56 years old.

MUST UNDERGO OPERATION

Archibald J. Mackmin of Toronto will have to undergo an operation in a Toronto hospital as a result of injuries he sustained while playing baseball during the summer. In one of the games between Toronto and Hamilton teams a player ran him down, and it is believed broke a cartilage in his knee. Mr. Mackmin has been incapacitated ever since.

ADAM TAYLOR OF GUELPH IS SERIOUSLY INJURED

Adam Taylor, secretary-treasurer of the Taylor, Forbes Co., Ltd., at Guelph, Ont., was seriously injured by falling from a second storey window at his home. After being taken to the hospital he lapsed into unconsciousness, and for a time was in a very critical condition. On Monday he underwent an operation and latest reports indicate that his condition is favorable.

SITE SELECTED FOR SEWAGE DISPOSAL PLANT FOR PETERBORO

City Engineer Parsons of Peterboro, Ont., has returned after a trip to various points in the United States where he obtained much information regarding sewage disposal plans. He made an exhaustive report on the matter to the council regarding plans in Fitchburg, Mass., and Schenectady, Albany and Rochester, New York. The Council did not decide upon a system, but passed a resolution to procure the 35 acres of A. Wilson's farm in Otonabee on which to erect the plant.

MUST HAVE SAFETY VALVES

The city council at Quebec City has passed the following by-law concerning safety valves on private drainage:

"The proprietor of every building that shall be erected in the future, in the City of Quebec, shall place on his private drainage, in a place designated by the city, an automatic safety valve approved of by the City Engineer.

"The proprietor of every such building, if he wishes to connect the drainage on the roof of said building with the private drainage, shall make such connection between the safety valve above mentioned and the street sewer.

"Whoever infringes the present by-law is liable to a fine not exceeding forty dollars for every infraction, and in default of payment to an imprisonment for a space of time not exceeding two months."

APPOINTED ENGINEER

Norman R. Wilson has been appointed chief engineer of the waterworks at Brantford, Ont., succeeding Mr. David L. Webster, who resigned on July 8. Mr. Wilson was formerly an inspector with the Canadian Fire Underwriters' Association.

CATALOGUES and BOOKLETS

The McAlear Mfg. Company, Catalogue No. 25

The McAlear Mfg. Company, 1901 Western Ave., Chicago, Ill., have issued Catalogue No. 25, covering high-grade and modern steam, water and air specialties for high and low pressure heating and power plants and devices for plumbing installation. The company's catalogue "25 Years of Know How," covering vacuum, vapor and air line heating specialties, is also ready for distribution. The catalogue covers a wide range of goods and copies and will be forwarded to readers of SANITARY ENGINEER upon request.

* * *

Pulverized Fuel

"Pulverized Fuel, Its Use and Possibilities," is the title of a 57-page booklet by William J. Dick, M.Sc., issued by the Commission of Conservation. Mr. Dick points out that the use of coal in pulverized form will make available large supplies which are now valueless, and discusses in considerable detail the methods for using these supplies. Readers of SANITARY ENGINEER who desire copies may obtain same by writing to the Conservation Commission at Ottawa.

London, Ont., Plumbers License Fee Set at $25

The Board of Health at London, Ont., has decided to make the license fee for plumbers $25 per annum. During the discussion over the matter one member declared that in his opinion the license suggested was too high and that it discriminated against the small man. In view, however, of the fact that in Stratford and other cities as much as $50 is asked, the Board decided that the amount was not out of reason.

The plumbing inspector has prepared a by-law regarding plumbing and drainage in the city, with special reference to inspecting drainage from the houses to the street, and having a standard drain adopted for future use. The by-law was approved and sent to the city engineer for his approval.

It was moved that the board of directors be requested to improve the lavatory conditions of the Western Fair. The accommodation, especially on the ladies' side, is entirely inadequate at present, according to the plumbing inspector.

RATS GNAWED LEAD PIPE

Harry Knechtel, of Kitchener, Ont., reports an unusual occurrence. While at a job in a residence on Victoria st., he found a lead hot water pipe which was almost cut into two parts. Upon examination he found that rats had been gnawing at the pipe and caused the damage.

Ask Service Charge For Gas Installation

The city council at Edmonton, Alberta, has decided to join with the Alberta Natural Gas Development Company, Limited, in an effort to secure higher rates. The following resolution was passed by the council: "That the report of the special committee on gas be adopted and that the city of Edmonton join in an application with or by the Northern Alberta Natural Gas Development Company, Limited, to the board of public utility commissioners, for the purpose of increasing the rates at which gas may be sold under its franchise by the company to the city and the inhabitants thereof so that the net price to be charged for natural gas supplied by the company to consumers in the city for domestic purposes will be thirty-five cents per thousand cubic feet, and the net price for all natural gas used in the city for power or manufacturing purposes will be 20 cents per thousand cubic feet, while the question of a ready to serve charge of 50 cents per month be submitted to the commission to satisfy themselves that such a charge is reasonable, usual and justified or a minimum charge should be established."

A new feature has been introduced into the application by the fact that the company are asking for a service charge.

This means that everywhere the gas is put in the consumer will have, in addition to paying 35 cents per 1,000 for gas consumed, to pay a meter rent of 50 cents per month, totalling $6 per year.

Indications Are That Extensive Building Activity Will Continue

Manufacturer States That Reports Received From Authoritative Sources Indicate That There Will be no Falling Off in Construction

NOTWITHSTANDING the approach of winter, extensive building operations are not only under way but are being planned throughout many towns and cities of Canada and the United States. This is the statement of a leading manufacturer of Toronto whose enamelled goods go into private homes and public buildings all over this continent. He keeps in closest touch with building operations, and his word is that, so far as residential buildings are concerned, records from the United States are equal to the best that have been in the past with no indication of there being a falling off of the business that comes to him through their construction. Speaking generally, he says that conditions here are much the same as in the United States, conditions arising from abnormally high prices and labor unrest.

Capacity Was Taxed

Six months ago orders being received by this firm were such that their capacity was being taxed to its utmost. There is no cessation of orders and, according to this manufacturer, they are touching but the very fringe of the large buildings under construction and which are to be equipped with their enamelled goods. With many other manufacturers, they are constantly faced with the problem of shortage of labor of the kind they want. Building operations are being held up because of the scarcity of workingmen; and behind this again, there is a scarcity of material due to the fact that factories cannot get workmen.

So far as the steel strike in the United States is concerned, this manufacturer informed SANITARY ENGINEER that, as yet, it was not affecting the trade. No large buildings are under construction at the present time which require great quantities of steel.

An interesting comparison of the increase in the cost of building and the advance in rents in the United States was given to SANITARY ENGINEER by this informant. It was pointed out that too little is known of these comparative figures and their bearing upon the high cost of living. An investigation was made of moderate and low-priced buildings in 150 of the principal American centres, and a report was compiled by the National Industrial Conference Board of the United States. It was shown that, whereas the cost of building had increased 83 per cent., the advance in rent was only 28 per cent. from June, 1915, to September, 1919. This comparison, so thought this manufacturer, applied equally to Canada where conditions were much the same.

APPOINTED SANITARY INSPECTOR

Sergt. W. H. Rau has been appointed Sanitary Inspector at Kitchener, Ont., to fill the position made vacant by the death of J. G. Buchhaupt. Sergt. Rau enlisted early in the war, and has been in charge of the sanitation department of the Petawawa camp during the war. His salary has been fixed at $1,000.

MAY BUILD INCINERATOR

The city council at Saskatoon has under consideration the question of building an incinerator and estimates will likely be secured shortly.

CONSTRUCTING SEWAGE SYSTEM

The town of Sutherland, Saskatchewan, now has a sewerage system under way, which, when completed, will afford modern conveniences to the largest part of the town, including an up-to-date school.

At present waterworks are in operation through the greater part of the town, and by contract with the Dominion Government, water is supplied to the Forestry farm through a main owned by the Government.

WILL AMEND BY-LAW

The recent tragedy at Ottawa, which cost seven lives by asphyxiation by illuminating gas has resulted in the jury recommending that the building permit by-law be amended to cover gas inspection. The jury found that Pierre Cardinal and his family, an account of whose death appeared in the last issue of SANITARY ENGINEER, were victims of a crack in a gas pipe which was caused by the gradual sinking of the house in which they resided. They were also of the opinion that the gas pipe was improperly placed for a house without foundation or cellar. The jurors made a careful personal inspection into the case.

Crawling under the house they found one of the joists that supports the floor resting on the pipe not far from the crack at the elbow. The pipe was forced down eight and one-half inches from its normal position. It was also discovered that the house had settled about ten inches since the pipe had been installed some 15 years ago.

Ontario Executive Visits Border City

Rousing Meeting Was Held at Windsor—On Way Down Visit Was Paid to Chatham and Fine Meeting Held—Practical Talks on Organization and Co-operation by the Officers

THE October meeting of the executive committee of the Ontario Society of Domestic, Sanitary and Heating Engineers, held in the rooms of the Builders' Exchange at Windsor, Ont., was one of unusual interest.

On the way to the Border City, President Thomas H. Minnes, of Brantford, Secretary Garrett Frankland, of Toronto, and K. B. Allison, of Toronto, were joined at London by E. H. Russell. The party stopped off at Chatham, and during the afternoon met the men in the trade. John W. Draper presided, and the gathering turned out to be the inaugural gathering of the Chatham branch of the society. Those in attendance were C. R. Bowers, M. J. Baxter, Ed. Wanless, G. D. Watts, and R. McG. Coyle. The applications of Messrs. Wanless, Baxter, Bowers and Draper for membership in the Ontario society were received and accepted.

Gave Interesting Talks

During the meeting interesting talks on organization work and on matters of interest to the trade were given by President Minnes, E. H. Russell, Garrett Frankland, and K. B. Allison.

Vice-President George B. Grinyer, of Guelph, joined the party at Chatham and proceeded with them to Windsor for a big meeting in the evening. It was decided before leaving Chatham to hold another meeting in the near future, to which others in the trade will be invited.

The meeting at Windsor was presided over by Alex. White, of the Windsor Hardware Co., and those in attendance were Secretary Charles E. Paddon, G. Edwards, Alfred L'Heureux, C. Jessop, G. Smith, R. Hicks, W. Baker, W. Hutchinson, A. L. Pickering, all of Windsor, J. C. Service, N. Fielding and A. Trott, of Walkerville.

Applications Accepted

The applications of Alex. White, R. Paddon & Co., Edwards Plumbing Co., Roy Hicks, A. L'Heureux, Geo. C. Smith, and A. L. Pickering, of Windsor, and of N. Fielding and J. C. Service, of Welkerville, for membership in the Ontario Society, were received and accepted.

It is expected that the remainder of those in the trade will affiliate with the Ontario Society, and in that way secure the local privileges under the Ontario charter.

President Minnes gave a splendid address on the work that is being done in connection with organization in Ontario, and made a broad appeal for the support of every man in the plumbing and heating business. He pointed out that the only way in which the best results will be obtained will be by hearty co-operation.

All Will Benefit

If every man in every town works together in solving local problems there will be little difficulty in solving them. This has been the general experience. President Minnes showed that in addition to helping one another locally, those in the trade can, by working in close co-operation with one another, solve Provincial and Dominion problems, all of which have a direct bearing upon local conditions and problems.

E. H. Russell, of London, Ont., also spoke on organization work. He emphasized the importance of getting together and working together for the common good. The first object of the trade, he said, is to serve the people, and benefits will only accrue through the association in proportion to the amount of good accomplished for the greatest number. He urged every man in the trade to lend all the assistance he can toward the great work of co-operation and organization.

Made Strong Appeal

Vice-President Geo. B. Grinyer, of Guelph, made a strong appeal for co-operation among every member of the trade. The good results of working together, he said, were becoming apparent in many places in Ontario to-day, and while much has been accomplished there is a great deal to be done yet. No work was more important not only for the men in the trade but for the great mass of people whose health and comfort are closely dependent upon the work done by the sanitary and heating engineers. He urged the men in Windsor and district to get together and work together, to meet regularly and talk things over, to get to know one another, and in a short time they would see the results that follow co-operation.

Secretary Garrett Frankland gave a talk on the vital importance of overhead in the successful conduct of business.

K. B. Allison, who is chairman of the Ontario Committee on Education gave a practical address in which he pointed out the importance of proper bookkeeping and accounting. These, he said are essential to any business if a man is to know where he stands.

Ontario Executive Plans Meetings at Oakville and in the Galt-Kitchener District

THE members of the executive of the Ontario Society of Domestic Sanitary and Heating Engineers are planning to hold their November meeting so as to meet the men in the trade in Galt, Preston, Kitchener and Waterloo. Just where the meeting will be held has not yet been decided, but it will be held about the end of the month and a series of practical talks on matters of interest will be given.

Arrangements are also being made for a meeting at Oakville at which all the men in the trade along the Toronto and Hamilton highway will be invited to attend. This meeting will be held during the last week in November, the date not yet having been chosen.

The executive committee is planning an aggressive campaign which will reach throughout Ontario. It is felt that there is a big work to do and that the encouragement that is coming from all quarters warrants the efforts that are being put forth to get big results.

MONTREAL STRIKE LIKELY NEAR SETTLEMENT

There is every indication that a settlement may be effected in the strike at Montreal. The Master Plumbers, at a special meeting, decided that they would treat with the men who are out on strike provided they would return to work and discuss wages and working conditions for the ensuing year, and appoint John W. Bruce, general organizer of the United Association of Plumbers and Steamfitters as their representative.

There are about 800 union plumbers in the city, and of this total it is estimated that 200 are on maintenance work, or work which brings them under the jurisdiction of unions other than that of the official plumbers' body. It is estimated that about 550 men are on strike. Some have left the city to go on with their work elsewhere.

Union officials claim that there has been a great increase in the number of members in the union since the strike began, and that the trade in Montreal is now 97 per cent. organized.

PLAN TO USE ELECTRICITY

A delegation from the Water Commission at St. Thomas, Ont., visited Stratford last week inspecting the local Waterworks plant. St. Thomas board intend changing their system from steam to electricity.

Prices of Sheets May Not be Lower for Two Years

This Opinion is Held by Men in the Trade in the United States, Says A. T. Enlow, After Attending Meeting in New York

A. T. ENLOW, president of the Dominion Sheet Metal Company, Hamilton, Ont., who has just returned after attending the annual meeting of the American Iron and Steel Institute in New York, stated to SANITARY ENGINEER that the general belief among the men in the trade is that prices of sheets will not be lower for at least two years.

"We have lost through this strike," said Mr. Enlow, in referring to the steel strike in the United States., "at least 2,000 tons of material which would have been shipped had it not been for the strike. Notwithstanding all, our idea has been to keep prices down, except to that point where cost overtakes the selling price. We are opposed to higher prices for sheets. Rather help the consumer than the Government, because, in the end, the consumer is the Government and we avoid the loss of handling."

Increasing Capacity

"We are preparing to add to our equipment sufficiently to enable us to produce 50 per cent. more than we have in the past. In other words, our capacity will be about 20,000 tons of galvanized sheets per year from the first of January. We are also building a new warehouse, which, when completed, will enable us to carry in stock not less than 2,000 tons for immediate shipment," said Mr. Enlow.

While temporarily inconvenienced by the steel strike in the United States to the extent that their plant is only running at about one-half its normal capacity, the Dominion Sheet Metal Company is planning for bigger business for the future.

He says that this country is not producing enough galvanized sheets for the trade, the result being that large quantities have to be imported. The present situation is aggravated by the strike in the United States; supplies of raw material are cut off, and they are picking over their stock for black sheets and even getting some from the jobbers.

At Old Prices

"We have, naturally, and the jobbers naturally have, a lot off stuff contracted for at old prices, but most of this is sold so that on any old business, no matter how long delayed, the price will be the old price. This will have a tendency to keep the prices down; but to anyone who must have quick delivery and where it is possible to accommodate them, the higher prices must prevail," said Mr. Enlow.

It is not the intention of the Dominion Sheet Metal Company, however, to launch higher prices for their manufactured article. Mr. Enlow shies clear of the word "profiteering" at a time when it is in everybody's mouth. While conditions may more or less warrant an increase in price, the aim of this company is to keep the prices normal and reasonable.

"Our tendency is to hold prices down to a reasonable basis," said Mr. Enlow, "for if sheet metal is to continue to hold its place on the market, it must be able to compete with similar articles." Though Mr. Enlow does not anticipate any immediate increase in prices, he does not see any reduction for some time, at all events.

Many New Devices At Electrical Show

Visitors to the electrical show, which closed last week in New York, were impressed by the multitude of new devices all aimed to make life easier, or make work easier. The efficiency and wide range of application of electricity as a servant was never more fully demonstrated. The show served to give an idea of the size and scope which the electrical industry has assumed. It is growing larger every day and any number of sanitary and heating engineers who have been handling various electrical lines, fixtures, irons, washers, vacuum cleaners, etc., may be interested in some of the devices shown. There were machines for milking cows, making ice, hatching chickens, stimulating the growth of plants, reducing weight, growing hair, removing hair, pulling teeth, washing clothes, counting money, operating typewriters, and almost everything one could imagine.

Among the brand new electrical innovations shown were a machine which both washes and dries clothes in the same tub, an attachment which provides steaming hot water from the cold water faucet, and a carpet washer which cleans, restores color, and kills germs at one operation.

Among the feature exhibits were the electrical dairy with six thoroughbred Guernseys and Holsteins which were milked at half-hourly intervals, the milk passing from the cow's udder and through the cooling process to the bottle without once coming in contact with the air; the electrical hospital and therapeutic display, the modern electrical apartment, the electrical bakery, the motion picture theatre, and others, all in actual operation.

START NOW TO FIGHT AGAINST A RECURRENCE OF THE INFLUENZA EPIDEMIC

Build Up Your Strength

THE possibility of a recurrence of the influenza epidemic this Fall or Winter has caused health commissioners in various cities to issue instructions to aid in its prevention.

Here they are:

1. Obey all regulations of the city health authorities.

2. Avoid crowds.

3. Stay away from anyone having a cough or a cold.

4. Drink plenty of fresh water.

5. Keep the home well ventilated and be sure there is plenty of fresh air day and night.

6. Sleep with the windows open.

7. Avoid fatigue and get plenty of rest; in particular, avoid fatigue of the stomach and excessive eating of unsuitable food. Sleep is one of the most important things, and the thing that is most neglected.

8. Be as much as possible in the open air and walk to your work if practicable.

9. Eat three uniform meals a day, and avoid a breakfast of mere coffee, and only a piece of cake or something of the kind for lunch. Special precautions should be taken against gorging at dinner time, when the stomach is least able to cope with the largest meal of the day, and which practice is bound to lower the resistance of the system.

10. Keep warm and keep dry; wrapping up the neck or exposing the neck and arms unduly are undesirable in the changing weather of the fall.

11. Bathe frequently. The skin is part of the breathing system of the body and must be aired.

12. Exercise regularly, both in the open and indoors, if possible.

13. Avoid the common drinking cup or glass.

14. If you feel sick and have a cold coming on, go to bed. Call the doctor. Stay in bed until the doctor says you can get up. Don't receive callers or visitors until the doctor says that danger of infection is passed.

A NEW HEATING SYSTEM

(Continued from page 23)

(18) of the electric motor so that the pressure of the cooled compressed air remaining may be utilized to relieve to a certain extent the work of the motor. The safety valve is of the adjustable type so that it may be adjusted to relieve at various pressures. The adjustment may be regulated to increase or decrease the temperature of the circulating water through the heating system, for as the pressure increases the temperature rises.

It is stated that a system such as described has in experimental tests shown extremely satisfactory results, and when it is considered that the compression of air to 100 lbs. produces a temperature of approximately 450° Fahrenheit with an intake temperature of 60° Fahrenheit, the heating of water can be accomplished to suit the requirements of very extreme weather, besides providing cold air for refrigerating or cooling purposes, and the inventor further states that the application of electric energy to the production of heat in the manner described is entirely novel, and it is further stated that many variations in the actual apparatus may be made without departing from the principles of the invention.

Fall Program of "Ender" Clubs One of the Best That Has Ever Been Arranged

Meetings Commence on Monday Evening—Practical Talks on Practical Subjects by Men Who Know — Informal Discussions to Take Place After

Not in a long time have the "Ender" clubs of Toronto had such a fine program of interesting and practical topics arranged for discussion as is ready for the inaugural meeting of the season on Monday evening.

During the spring months keen interest was taken in the meetings and many of the men in the trade learned much that was of real help to the members in making for better business. From present indications the fall program will completely eclipse that which was put on earlier in the year. The attendance at many of the spring meetings was such as to fill the meeting rooms to capacity. This interest is most encouraging and speaks well for the future.

The following program, which covers the next two months, speaks for itself and contains topics which are of keen interest to everyone in the business. They will be dealt with by men who know their subjects, and not only this, but there will be discussions afterwards in which much helpful information may be gained from the questions asked. Informal discussions following practical talks proved most interesting and helpful during former meetings and this practice will be carried out in the fall series of meetings. The program is as follows:—

Club.	Topic.	Speaker.
Nov. 3—West.	Water Test	B. Kirk
Nov. 4—East.	Sewerage	W. Worthington
Nov. 6—North.	Water Meters	W. Randall
Nov. 10—West.	6½-Piece Job	W. H. Daw
Nov. 11—East.	Smoke Testing	H. Fitzsimmons
Nov. 13—North.	House Heating by Gas	M. Dodds
Nov. 19—General.	Nomination Night Credits	P. W. Michael
Nov. 24—West.	Allpriser	K. B. Allison
Nov. 25—East.	Allpriser	K. B. Allison
Nov. 27—North.	Collective Bargaining.	J. W. Bruce
Nov. 28—Oakville.	Ontario Society.	
Dec. 1—West.	Cast Iron vs. Tile.	L. Anthes
Dec. 2—East.	Technical Education	J. E. Fullerton
Dec. 4—North.	Septic Tanks	E. Newsome
Dec. 8—West.	Accounting	D. McLulich
Dec. 9—East.	Overhead	J. Erskine
Dec. 11—North.	Allpriser	K. B. Allison
Dec. 17—General.	Election Night; Municipal Affairs.	Cont. McBride
Dec. 29—Special.	Santa Claus Night Better Plumbing. Moving Pictures Kazoo Band	Fred Armstrong

Canadian Supplies of Soft Coal Sufficient for Immediate Needs

TIMELY warning to all users of bituminous coal to secure their winter supplies as soon as possible is given by S. B. Brown, assistant manager of the Transportation Department of the Canadian Manufacturers' Association. Information, or the lack of it, reaching this department of the C.M.A. leads Mr. Brown to the conclusion that manufacturers throughout Ontario are either well supplied with the necessary coal for the winter, or they have such supply on the way to their bins. No requests are reaching him for assistance in getting coal with which to keep the wheels of industry revolving during the winter months.

Two Reasons For This

The reason for this is, according to Mr. Brown, two-fold. Up until November 11, Armistice Day, of last year munition plants were running at full blast. Manufacturers had secured sufficient supplies to last them through the winter and well on into the summer. With the signing of the armistice, munition contracts ceased and plants were closed down, with the result that large quantities of coal were still on hand. Added to this is the second cause—frequent strikes. The mild winter was also a contributory factor in the conservation of coal.

Manufacturers Warned

A warning was issued to manufacturers by the C.M.A. recently to look after their coal supplies; and Mr. Brown believes that this warning was heeded because no representations have been made to the C.M.A. of any shortage that might paralyze industry. To confirm this view, the Gas Company has issued a statement that it is not worrying over the situation so far as this winter is concerned.

Mr. Brown states, however, that it is difficult because of lack of information in their offices to say just what the situation is: and he advises that users of coal should waste no time in assuring themselves of a winter supply. The strike in the United States, despite the action taken by President Wilson and Secretary Baker to insure the necessary output, may also adversely affect the situation in Canada, particularly in the Eastern part of the Dominion, which is almost entirely dependent upon United States coal fields for its supply.

VENTILATING THE MODERN SCHOOL

(Continued from page 35)

terial than masonry for the smooth ducts required in a gravity system of ventilation.

In every case the air leaves the class room by way of the wardrobes, so that there is a continuous flow of warm, dry air flowing through, and keeping the cloak rooms as sanitary as any part of the building. This should be noted because far too often the ventilation of cloak rooms does not receive the attention that it should.

The ventilation of the toilet rooms in the basement and those on the first floor is effected by direct foul air extraction shafts that are not connected in any way with the main ventilating system.

At the rear of the toilet fixtures on the first floor, there is a service passage that also serves for a ventilating shaft. This shaft connects with a separate flue in the main chimney.

Located in the Centre

Although the gymnasium is situated right in the centre of the main part of the basement there are no galvanized iron ducts showing at its ceiling, neither is there any galvanized iron showing in the cloak rooms above the basement. The unsightly appearance of galvanized iron in such rooms cannot easily be avoided unless the design for the ventilating system is carried along with the general design of the building just as in this example.

Direct radiation made up of wall sections is used in all class rooms. Wall sections were chosen as a pattern that takes up less room than the ordinary standard radiator. The sections are 2 ft. wide by 1 ft. long; they stretch clear across the window bays and thus distribute their heating surfaces much better than do other types of radiators.

Standard cast iron radiators are used in all small rooms, in the assembly hall, and in the corridors.

System of Space

The system of piping for the indirect radiators is that of the two pipes. Each return from the sections enclosed in the fresh air chambers has a swing check on its return. The water level of the boilers is at least 4 ft. lower than the lowest point of the indirect radiators.

The direct radiators are fed from a one-pipe steam line, with dry returns.

Automatic air vents are of the expansion post type and are connected by way of a small air line to a syphon in the boiler room. The syphon is attached to the domestic water supply, with an exhaust opening visible to the boiler attendant.

The boilers are of the self-feeding water-tube type and are probably the first two boilers of that kind used in a public building in Canada.

There is approximately 6,000 sq. ft. of radiating surface in this building, including both direct and indirect radiators.

Heating and Ventilating

Ventilating the Modern School

Fourteenth Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

THE building shown in the accompanying photograph is the Collegiate Institute at Yorkton, Saskatchewan.

This building was erected about ten years ago, and for that reason is not so modern in many of its details as other buildings we might take as an example of advanced school architecture, still it receives many favorable expressions of opinion from educational authorities, and as the ventilating system in this building illustrates many of the working principles of a gravity plant, the presentation of this article should be of value to the man who wishes to study what is even, aften ten years of use, considered as a modern gravity system of ventilation.

The building is much larger than it appears to be in the photograph, as there is an extension at the rear that does not show in the picture.

Details of Building

The size of the building can be appreciated when one understands that there is contained within the walls of the building the following rooms:

Gymnasium, 40 ft. x 50 ft. x 16 ft.; manual training room, 24 ft. x 32 ft.; domestic science room, 24 ft. x 32 ft.; six class rooms, each 24 ft. x 32 ft.; chemical laboratory, 24 ft. x 32 ft.; physical laboratory, 24 ft. x 32 ft.; biological laboratory, 27 ft. x 27 ft.; balance room; dark room; preparation room; male teachers' room; lady teachers' room; girls' lunch room, 25 ft. x 32 ft.; boys' lunch room, 25 ft. x 32 ft.; assembly hall, 40 ft. x 60 x 15 ft. (with large stage and two dressing rooms); boys' locker room and showers; girls' locker room and showers; two toilet rooms in basement; two toilet rooms on first floor; fireproof machine booth in assembly hall; library, 16 ft. x 20 ft.; principal's private office, 15 ft. x 9 ft.; principal's public office, 15 ft. x 9 ft.

The Other Rooms

In addition to the rooms listed, there are cloak rooms adjacent to every classroom and laboratory in the building, as at the time of its erection it was the custom to provide each class room with a cloak room instead of having common locker rooms as found to-day in high schools. The store rooms are all large and well lighted.

It is not often that a school as large as this is equipped with a gravity system of ventilation, and at the time of its design many of the details, as specified, received vigorous criticism from men who have since adopted the standards set in this building.

The Compound Type

One of the terms of the specification covering the temperature regulating system was that the thermostats must be of the compound type. By this it was meant that the thermostat controlling the valves of the direct radiators in a room must be also set to control the temperature of the incoming fresh air. In this connection it may be remembered by the High School Board that a salesman for a temperature-regulating device said that such a requirement was impossible of fulfilment. He contended that there was not such a thing on the market. That salesman was honest in his opinion, but he was not keeping abreast of the times.

There were conditions obtaining at the time of the installation that made the design of a gravity system preferable to that of mechanical ventilation. Not one of the least of these was that electric power could not be obtained for the driving of fans.

In a very cold climate, where there is such a great temperature range, a gravity system of ventilation may be designed with much smaller flues than those required in a warmer climate.

Favored Gas Engine

One of the advocates of the plenum system of ventilation recommended the installation of a gas engine in this building, and to prove his point of the superiority of the plenum system attempted to illustrate it where he had forgotten to complete his work of coupling up the fan with the motor.

After carefully weighing all the claims for various systems, the engineer in charge of this work could not feel safe in specifying anything but a gravity system of ventilation after seeing so many fans standing idle in Western schools. Since that time great strides have been made in the art of mechanical ventilating systems, and it is altogether likely that to-day a plenum system of ventilation might be specified for such a building instead of that now described.

Experience Difficulty

Ordinarily a good deal of difficulty is experienced in getting janitors willing to adjust the dampers in the ducts of gravity ventilating systems as the conditions of weather change. This in a measure was obviated in this system by having most of the checking dampers arranged so that they may be controlled from the boiler room by opening and closing valves in the air lines leading to the spring motor of each damper.

Standing alone in the centre of a large lot, no air washing system is required in this building. Had there been a necessity for an air washer, a fan system would have been specified.

The design for the ventilating system was carried along with the structural design of the building. The floor levels, the joist centering, the space for the fresh and foul air ducts, all were arranged so that such a system could be properly installed.

Fresh Air Chambers

There are four separate fresh air

chambers where the cold fresh air is heated to the temperatures required. The fresh air chambers are arranged something in the manner of that described in the fourth article of this series (June 1, SANITARY ENGINEER). The principal difference in the fresh air chambers installed and those illustrated is in the arrangement of the air tempering dampers.

Each fresh air chamber is connected to fresh air ducts running straight up to class rooms. The lower side of the fresh air chamber connects to a cold air opening in the exterior wall. All cold air openings are protected with weather proof louvers and wire screens. Just inside of each opening there is placed a damper that may be adjusted to suit different conditions of weather.

Without going into the method used in setting a standard for the indirect heating surface set in these stocks, we may say that for each class room there was specified about 192 sq. ft. of extended surface radiation of the cast iron type.

Capacity of Flues

The fresh air flues leading to the class rooms have an area of a little more than 6 sq. ft. each.

The fresh air faces in each class room are made of galvanized iron. They are of that type where the top and bottom frame are formed as segments of a circle having vanes arranged so as to radiate from a common centre and thus split up the air into streams of varying directions.

The foul air escapes from each room by way of an opening set in the flue at the floor line. These openings have no faces. The flooring runs right into the flue, and the base board returns around the angles. The flues are all large enough to admit of cleaning if at any time such a thing is required.

Opening at Ceiling

It is not only at the floor line of the foul air flues that there is an opening for the admission of vitiated air; there is another opening, and it is at the ceiling line. The opening at the ceiling line is provided to allow foul air to escape from the class room during the summer months, when the windows are used as an aid to the natural system of cross ventilation. This opening is closed in the winter.

The foul air flues are carried up to the attic space where they are connected to two large vent shafts. The roof of one of the shafts may be noticed in the photo, just where it shows at the apex of the south-west hip. The building is facing south.

The vent shafts are 8 ft. square and may be entered from the main stairways. Each ventilating shaft has a graduating damper set in the air escape opening. The function of such a damper is to either close the opening entirely or to vary its size to meet different conditions of weather.

Of Galvanized Iron

All air flues are made of galvanized iron, it being considered a better ma-

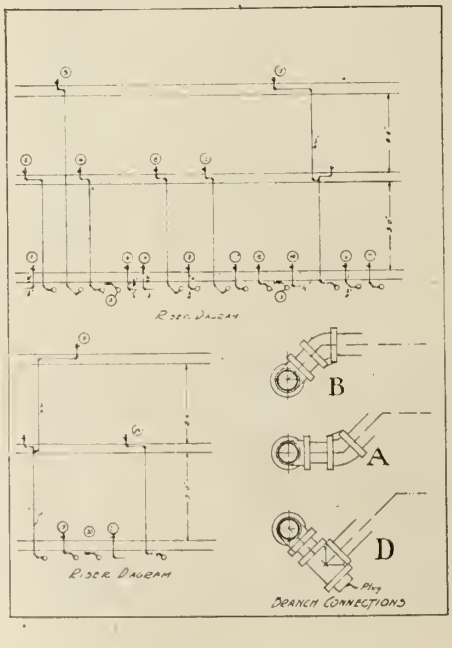
Taking Care of Forty Below Zero

Fifteenth Article of Series Prepared for Readers of "Sanitary Engineer" by N. A. Kearns

Editor's Note—This article is the fifteenth of a series, prepared especially for the readers of SANITARY ENGINEER, covering heating and engineering practice reduced to its simples terms. Readers will find this article on "Taking Care of Forty Below Zero" a most illuminative one. The first article of the series appeared in the April 1 issue. Descriptions of installations made in different classes of buildings will be given, together with the method used in making the design for these installations. It is not our purpose to give complicated formulas, but rather to present the simple rules that have been based on these formulas, in such a way that the reader will be enabled to design a heating and ventilating system without having to refer to the data given in engineers' hand-books. The author of these articles, Mr. N. A. Kearns, has designed heating and ventilating equipment for all classes of buildings in practically every province of the Dominion. Some of the buildings were such that the heating and ventilating equipment had to be installed under the most adverse conditions, whereas in other buildings the design for the heating and ventilating equipment was incorporated in the constructional drawings. The sixteenth article of the series will appear in the next issue.

THE drawings accompanying this article are the plans of a heating system to be installed in a residence in Central Saskatchewan, where the thermometer goes down to forty degrees below zero, and stays there for weeks at a time.

Before taking up the subject of the piping system or any other details we shall explain the method used in making an estimate of the radiating surfaces required in a residence situated in such a cold climate. The reader who has studied the functions of the B.t.u. will have no difficulty in setting standards for any temperature range. In the articles that have appeared in this series our endeavor has ever been to make clear the fact that the B.t.u. may be used as an aid in setting a definite standard for a rapid and accurate system of estimating radiation.



Many are Bothered

Many engineers have a conscience that bothers them greatly in estimating radiation when they do not go through all of the motions of dividing and multiplying, and then dividing their figures again. They waste a great deal of time because they cover the same ground an unnecessary number of times. They use the B.t.u. system with such fearful care that an understanding of its real purpose escapes their attention. So they go ahead estimating radiation by the letter of the rule instead of its spirit.

The radiating surfaces necessary to keep the rooms of this building at a temperature of 70 degrees above zero when the outdoor thermometer registers 40 degrees below, could be readily arrived at by using the figures given in former articles for 10 degrees below zero weather, and then adding 37 per cent. to the amount of radiating surfaces estimated.

Are Much Warmer

As a rule the houses built in Western Canada are of a much warmer system of construction than those in the East, so this must usually be taken into consideration when figuring the radiating surfaces. Many of the Western houses have storm windows, and this also must be allowed for.

However, this house is to be considered as having the same kind of outer walls as may be found in the East. No storm windows will be used.

Radiating Surface

The heat loss system for estimating the amount of radiating surface required is expressed in the following rule:

$$\frac{\frac{C}{55}+\frac{W}{4}+\frac{G}{1}\times T.R.}{E}$$

C indicates cubic contents.
W indicates exposed wall.
G indicates window and door surface.
E = indicates efficiency of the radiating surface.
T. R. indicates temperature range.

Are to be Divided

This means that the cubic contents are to be divided by 55 for one change of air per hour. If more than one change of air is required the answer found by the division must be multiplied by a number corresponding to the number of changes required. The temperature range from 70 degrees above to 40 degrees below is 110 degrees.

In this rule all heat loss factors are transformed into an equivalent glass surface by the dividing constants indicated before the factors of temperature ranges and of radiating surface enters the calculations.

To Simplify Rule

To simplify this rule we shall estimate by one division the radiation required for each factor. As an example we shall take the cubic contents first.

It will be noted that in following the above rule that there is first a division, then a multiplication, and then another division. Instead of dividing by 55 and then multiplying by 110 and then dividing by 155, we shall make one division that must give us a similar result. The dividing factor equal to the three calculations is approximately 77.5.

Following the same system for the wall and glass surfaces gives us the dividing factors of 5.7 for the wall and 1.4 for the windows and doors. But we shall go a step beyond this. Calculations by divisions entail more figuring than those made by multiplication so we change the dividing factors into terms of percentages, thus:

77.5 = .0128
5.7 = .175
1.4 = .71

The Next Step

Our next step is to make a list of the rooms requiring heat, together with their cubes, wall exposures and window surfaces.

Basement

Laundry: 1,125 cubic ft., 50 sq. ft. of wall, 33 sq. ft. of windows.
Playroom: 3,000 cubic ft., 52 sq. ft. of wall, 18 qs. ft. of windows.

Ground Floor

Kitchen: 1,180 cubic ft., 150 sq. ft. wall, 30 sq. ft. of window.
Pantry: 198 cubic ft., 25 sq. ft. wall, 15 sq. ft. of window.
Rear Entry: 168 cubic ft., 27 sq. ft. of wall, 21 sq. ft. of window.
Coat Room: 160 cubic ft., 25 sq. ft. of wall, 7 sq. ft. of window.
Hall, 1,008 cubic ft.
Toilet: 108 cubic ft., 20 sq. ft. of wall, 7 sq. ft. of window.
Vest.: 144 cubic ft., 15 sq. ft. of wall, 21 sq. ft. of window.
Dining Room: 1,962 cubic ft., 243 sq. ft. of wall, 45 sq. ft. of window.
Living Room: 2,871 cubic ft., 179 sq. ft. of wall, 55 sq. ft. of window.
Sun Room. 182 sq. ft. of window.

First Floor

Hall: 1,389 cubic ft., 55 sq. ft. of wall, 20 sq. ft. of window.
Bath: 357 cubic ft., 45 sq. ft. of wall, 14 sq. ft. of window.
Bedroom No. 1: 892 cubic ft., 169 sq. ft. of wall, 15 sq. ft. of window.
Bedroom No. 2: 1,717 cubic ft., 242 sq. ft., 30 sq. ft. of window.
Closet: 191 cubic ft., 32 sq. ft. of wall, 6 sq. ft. of window.
Bedroom No. 2: 1,717 cubic ft., 242 sq. ft. of wall, 30 sq. ft. of window.
Bedroom No. 4: 1,215 cubic ft., 151 sq. ft. of wall, 43 sq. ft. of window.

Second Floor

Attic: 7,421 cubic ft., 466 sq. ft. of wall, 88 sq. ft. of window.

Are Not Given

It should be noted that the cubic contents of the sunroom are not given, nor the wall surface. In a room having so much glass it is not necessary to consider the wall surface and the cubic contents.

Several of the rooms that will not have heating surfaces are included in the list. It is our practice to put enough radiating surface in the surrounding rooms to make up for the heat lost by reason of the proximity of any unheated room.

The heating surfaces required are found to be:

Laundry, 44 sq. ft.; playroom, 60 sq. ft.; kitchen, 47 sq. ft.; pantry, 17.3 sq. ft.; entry, 23 sq. ft.; coat room, 13 sq. ft.; hall, 26 sq. ft. vestibule, 21 sq. ft.; dining-room, 147 sq. ft.; living-room, 138 sq. ft.; sunroom, 129 sq. ft.; bedroom No. 1, 59.5 sq. ft.; bedroom No. 2, 94 sq. ft.; closet, 12 sq. ft.; hall, 59.2 sq. ft.; bath, 27 sq. ft.; bedroom No. 3, 71 sq. ft.; bedroom No. 4, 71 sq. ft.; attic, 238 sq. ft.

To be Changed Twice

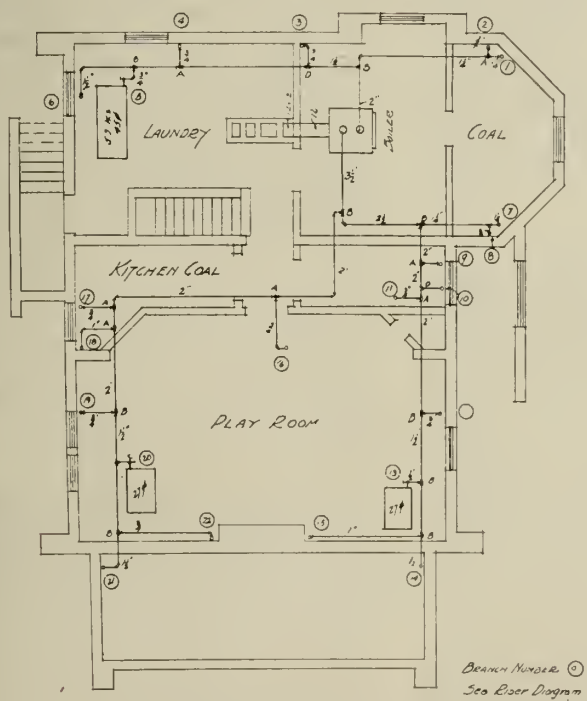
The air is to be changed twice per hour in every room on the ground floor, except the kitchen, where it is to be changed but once. An air change of three times per hour is allowed for the vestibule.

Bedrooms have one change of air per hour.

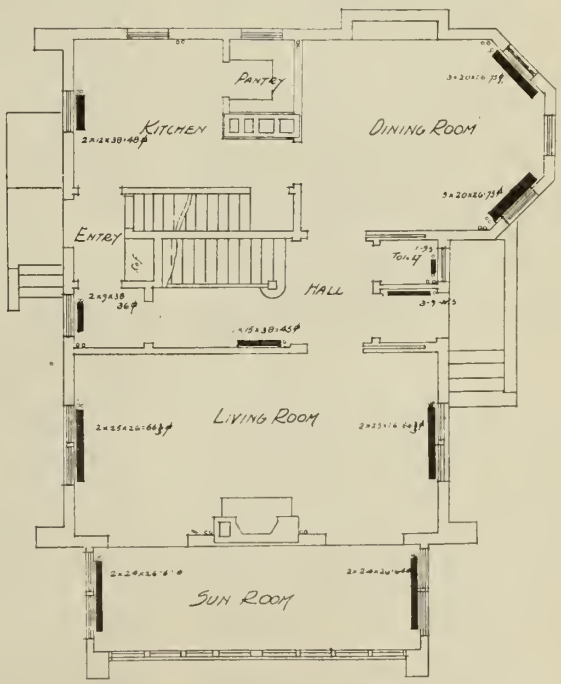
Reference to the plan will show how the radiating surfaces are arranged so as to provide approximately the surfaces estimated. The rooms with north or windward exposure have from 10 per cent. to 15 per cent. more radiating surface indicated than our estimate demands.

Fairly Extensive

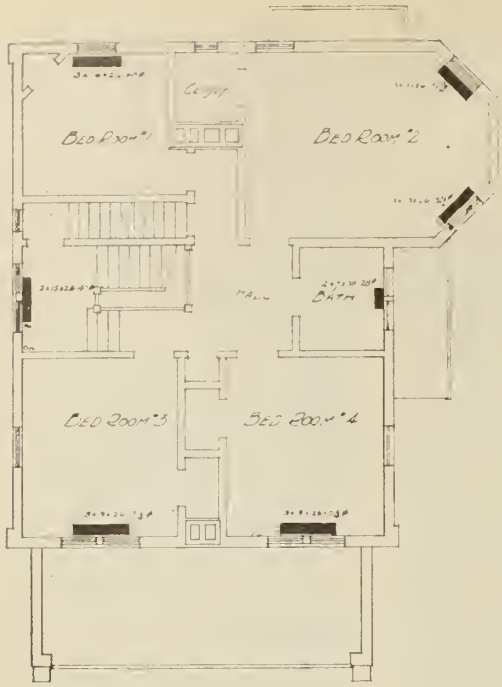
This is a fairly extensive hot water heating plant. There are twenty-four radiators to be installed, most of them



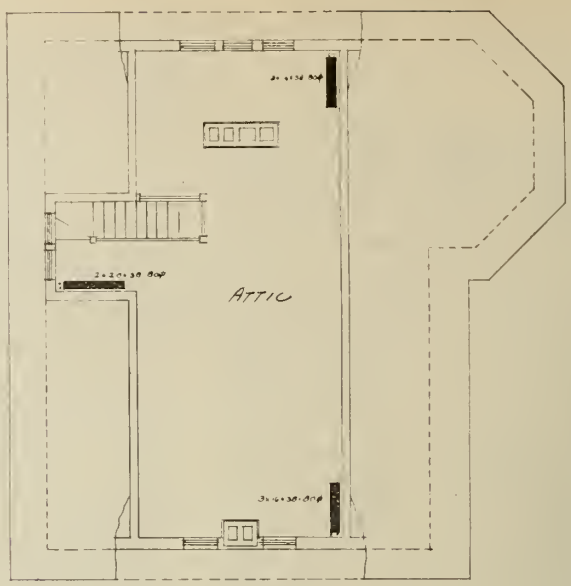
PLAN OF BASEMENT.
NOTE - Flow mains only are shown. The returns are of the same size, and run parallel with the feeds



GROUND FLOOR



FIRST FLOOR



SECOND FLOOR

of a large size. The boiler is situated in one end of the building, and for this reason as well as on account of the size of the plant, we should design the piping system on the principle where one main feeds hot water to the radiators on all floors, and a corresponding main is used for the return. To do this in the most economical way, it becomes necessary to reduce the tappings of the radiators to the following sizes:

	Ground Floor	First Floor	Second Floor
½ in.....	30 sq. ft.	40 sq. ft.	50 sq. ft.
¾ in.....	160 sq. ft.	100 sq. ft.	125 sq. ft.
1 in.....	100 sq. ft.	125 sq. ft.	150 sq. ft.
1¼ in.....	over 100	over 125	over 150

Are Less in Few Cases

In a few cases the tappings of the radiators on this plan are less than given in the table. An examination of the conditions under which such radiators are installed will show why the tappings have been reduced. For example, take the two radiators in the living room. According to the schedule those radiators should have 1 inch tappings, but because their branches are taken out of the top of the main the tappings are reduced one size.

One of the features of this style of piping is the unusual way of taking branches from the mains. On the basement plan each branch connection is marked with a letter corresponding to a letter indicating a detail on the drawing showing the branch connections. It is the proper use of these fittings that makes possible the installation of large hot water heating plants under the gravity principle.

Branches Taken Out

The radiators that are close to the boiler have their branches taken out of the side or bottom of the main. Those some distance from the boiler are taken out of the top of the main.

The fitting marked "A" is the one most frequently used. It is used for all branches when no reduction in main takes place or when a branch is not taken out of the bottom of the main.

The fitting marked "B" is used when a long lateral branches from the main, or when reductions occur. It should only be used for ground floor radiators, ecept in such cases where a runout to an upper floor radiator is very long. The reason for using this fitting when mains are reduced is to avoid the formation of air pockets. The mains could be reduced by means of eccentric reducers turned with the reduced end on top; in fact, when a pipe must be run some distance before reaching a ground floor radiator, it would be well to use the eccentric reducer in preference to running a full-sized main to an unreasonable length.

Used to Branch Out

The "D" connection is used to branch out to the risers close to the boiler. Nearly all of the risers in the first half of the main should have "D" connections. Each D connection should have a plugged opening in its lower end for the purpose of drainage.

One other connection to which we should draw attention is that where a riser is continued up past a radiator on the first floor. It will be noted that the riser does not continue straight up, but that it branches out below the first radiator.

To Lay Out Pipe Sizes

In laying out the pipe sizes we proportion the mains to the tappings of the radiators. In this way we are enabled to use rather small pipe in proportion to the amount of radiating surface. In all cases the mains should be equal to, or slightly in excess of the combined area of the tappings fed.

Mains under 2 inches in diameter should not be reduced more than one size in their entire length.

The last radiator fed should be on the ceiling of the basement or on the ground floor, and it must be fed out of the top of the main. The mains all grade up from the boiler to the radiators.

Instal Good Generator

In a small pipe system of this description it is advisable to instal some good generator as an expansion sealing device. The generator may be placed just below the tank if it is of the air-seal or counterweight pattern. The best place for the generator is in the basement. There are some types of generators that can only be properly placed above the circulation. In such a case the expansion pipe can be connected directly to the return of the highest radiator.

The boiler specified, for the plant here illustrated, has a gross rating of 1,850 sq. ft. of direct radiation. Because it is of the square type, wood may be burned in it during the fall and spring months.

RECOMMENDS MORE BAFFLES

As a special meeting of the Board of Health at St. Thomas, Ont., a letter was received from F. A. Dallyn, Provincial Sanitary Engineer, regarding the septic tank at the foot of Walnut Street, which has been causing some trouble of late. He stated that one of the chief troubles with the tank was that there was too much of a fall before the water entered the tank, and believed the installation of more baffles would overcome this difficulty.

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

SCARCITY of material is greatly interfering with trade just now. No trouble is experienced in securing business; the problem seems to be how to handle it and give any kind of service. Stove manufacturers are behind with orders and this has a direct effect on the stove and heating business. Air-tight heaters are selling well. Wood furnace business is reviving. One maker stated to SANITARY ENGINEER that his firm were over one hundred wood furnaces behind in their orders. A sudden cold snap, it is thought, will generally cause a stove famine.

Enamelware continues to be scarce, notwithstanding the assertion of makers that they would be back on their old footing in short order. The situation is made more difficult by a number of plumbers who have no follow-up system and book orders with no delivery stated, then call for immediate delivery. Others order six to eight weeks ahead for immediate shipment to the job with the result that they are not getting any benefit while other plumbers are handicapped.

Soil pipe continues scarce with no relief expected till labor conditions are straightened out and the demand automatically relieves itself with the cold weather.

Galvanized sheets show a stronger figure owing to strikes, transportation and labor conditions generally, and especially the fact that stocks are almost exhausted with little chance of any immediate relief. This also applies to black sheets. Solder is very firm on account of the strong tendency lead has taken. Antimony also shows a stronger figure. Wrought nipples advance as predicted. Old materials are quiet. Stilson wrenches advance.

It would be very hard to predict just how the impending coal strike will affect ingot metals. Some think it will not materially effect Canada as some manufacturers have mountains of some classes of ingots, it is reported.

TORONTO, October 31.—Galvanized sheets show a stronger figure owing to the condition and almost exhausted stocks, with little chance of any immediate relief. Black sheets are in the same predicament and also show a higher figure. Copper shows a decline, while antimony is stronger. Lead prices also show firm. Enamelware continues to be scarce and is inconveniencing manufacturer and consumer, not to mention what the troubles of the merchant are. Soil pipe fittings are higher, and soil pipe continues to be scarce. Solder is also firm on account of the lead situation.

Caulking Lead Advances 1½c Per Pound

CAULKING LEAD is recorded with an advance of approximately 1½ cents per pound. It would be hard to state any special factor unless it is the fact that metals along this line have been getting firmer. This new price on caulking lead has caused no surprise as this class of metal is very sensitive on the open markets, and is easily affected by fluctuations on various other lines. The price quoting at present is 9 cents per pound.

Soil Pipe Prices Holding Firm

SOIL PIPE AND FITTINGS are still selling and the demand still continues. This line, especially soil pipe, continues to be very scarce and notwithstanding the fact that the volume of business is on hand very few are able to handle their offerings with prompt delivery, but are forced from the scarcity prevailing to hold up orders and frequently ship only a portion of the goods previously ordered. Labor conditions are still the main factor as most firms manufacturing these goods are just getting back to normal. Wherever a firm manufacturing several articles are held up for material in one line it often ties up their whole operation. And this holds regarding soil pipe. No increased production is looked for till the winter sets in, as it is stated manufacturers are working to capacity. However, when winter sets in it is expected to catch up with orders on account of the falling off of the demand. Prices are unchanged on soil pipe. And the general opinion seems to be that they will remain at present levels. Quotations are as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	10%
Medium and extra heavy soil pipe, 4 in..	15%
Medium and extra heavy soil pipe fittings, 2 in. to 6 in.	25%
8 in. extra heavy pipe and fittings	5%

Do., Class B, lb. net	0 25	0 35
Do., Class C, lb. net	0 19	0 25

Soil Pipe Fittings Advance 5 Per Cent.

SOIL PIPE FITTINGS advance 5 per cent. This line has been in good demand for some time, with a gradual firming of prices, till finally the raise, which was not altogether unexpected. The scarcity of this commodity, due to unsettled conditions, has been given as the reason for this latest change. The prices are as here quoted: Nipples up to 4 inch, the discount is 77½ per cent.; from 4½ inch to 10 inch the discount is 67½ per cent., and running thread for 4 inch and under the discount is 47½ per cent.

Conductor Pipe and Eavetrough Hold Firm

CONDUCTOR PIPE AND EAVETROUGH show no change, and the price still holds firm. A good volume of business is being done for the season of the year. It would be hard to say at present just what the market will show, but a decline is certainly not expected. The galvanized sheet situation is still in a very unsettled condition, and notwithstanding the fact that the steel strike is ceasing to be a factor, mills are watching very anxiously the impending coal strike, which would, it is stated, have almost a more serious effect on the manufacture of different products than the steel strike.

Enamelware Still Scarce; Firm

ENAMELWARE, especially bathtubs, is a very scarce commodity. Some manufacturers felt confident that they could catch up with their orders, which were held back materially by the strike which took place this spring and lasted well into the summer. However, these manufacturers so far have not been able to catch up in this line, more on account of the increased demand than anything, it is stated.

Some manufacturers state that the plumber often books his order indefinitely, then without much notice demands the goods immediately. Then too, a great factor may be the fact that so many people have this year been forced to move into their new houses before the houses were completed, and naturally are more impatient over delays than they would be otherwise. One manufacturer stated to SANITARY ENGINEER that some plumbers had enamelware delivered on jobs that would not be ready to use perhaps for a month, and stated this was a great handicap to others who were held up for the goods.

Quotations on a few of the better known lines are:

Bath tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide			$37 07
Bath tubs, 5½ ft.			41 27

Range Boilers Firm; Demand Brisk

RANGE BOILERS remain firm. No price changes are noted or no immediate changes are expected at present. The seasonable demand is said to be a strong one. Many people have moved into new houses before the houses have been completed, and now are rushing and pressing dealers to supply their needs, with the result that there is a big demand with a temporary shortage, although most jobbers can give very reasonable deliveries. Quotations remain firm and unchanged, as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Valves and Brass Goods Scarce; Remain Firm

VALVES remain firm and in some cases the demand is greater than the supply. The fact that European buyers are not in the market yet has surprised many. However, it is expected that credit arrangements will soon be adjusted and when this happens prices will soar as the scarcity of metal is being forcibly noticed under present demand. Europe will need an enormous amount of copper, it is believed, and looks to this country to supply most of it. So with her demands as well as the brisk demand already here, no lower prices are looked for. Business in connection with marine work is falling off, especially in British Columbia. Other lines, though, are reported quite brisk with a firm tone. Prices are as follows:

Compression work, standard	35
Fuller work, standard	40
Bath cocks, compression	37
Bath cocks, Fuller	40
Flatway stop and waste cocks, standard	38
Roundway stop and waste cocks, standard	38
Brass steam cocks, standard	Net List

Basin Cocks—	
No. 0 and 1, Fuller pattern	40
Compression	30
Quick opening	40

Wrought Pipe Still Very Scarce

WROUGHT PIPE, especially the most popular sizes, is very hard to procure and the situation does not seem to be getting much better. The shortage of skelp is reported to be the main factor. It is hard to state when this situation will be relieved. It is believed eventually that it will automatically adjust itself with the falling off of the demand during the coming winter. Quotations are as follows:

WROUGHT PIPE

Boiler Tubes Prices Unchanged

BOILER TUBES continue to be very scarce and prices remain firm. Raw material is given as the reason some Americans have advanced their prices 70 per cent. on tubes. There is also a very unsatisfactory outlook on delivery of American tubes, and as Canada depends largely on United States for her supply of tubes, will have to conserve till conditions get more settled. Prices are quoted as follows:

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$27 00	.....
1¼ inch	29 00	.....
1½ inch	29 50	.....
1¾ inch	32 00	$27 00
2 inch	31 00	26 00
2¼ inch	35 00	28 00
2½ inch	43 00	32 00
3 inch	48 00	40 00
3¼ inch	.....	47 00
3½ inch	60 00	44 00
4 inch	75 00	56 00

Sheets and Plates Advance 25c Cents Base

SHEETS AND PLATES.—An advance of twenty-five cents over base prices has taken place, and further higher prices would not be surprising. With the steel strike well in hand producers are giving serious consideration to the effect of a possible suspension in the coal fields. Deliveries from mills are not likely to arrive in any quantities for a few weeks at least, which leaves most jobbers with stocks depleted. Some have been doing a pick-up business for a month or more, while the jobbers with slightly larger stocks are not generally selling at a premium. Some have raised slightly, which makes a varied quotation. The most standard are as follows:

BLACK SHEETS—		
14 gauge	5 45	5 65
16 gauge	5 60	5 75
18-20 gauge	5 15	6 30
22-24 gauge	6 20	6 35
26 gauge	6 30	6 40
28 gauge	6 45	6 50
3-16 inch plate	4 90	6 25
¼-inch boiler plate	4 50	5 80

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS.

	Premier		Apollo

16	7 25	7 50	....	7 60
12 and 14	7 05	7 25	....	7 35

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Lead and Zinc Products Firm

LEAD AND ZINC PRODUCTS—Owing to the advances made in metals and the firming of tin and lead these products remain very firm. The demand, although seasonable, is very good. It would be hard to state if there will be an immediate advance, as the metals used in the manufacture fluctuate to such an extent. Quotations are as follows:

Lead pipe, list, per lb.		$0 13½
Lead waste pipe, list, per lb.		0 13½
Do., over 6 inches, list, per lb.		0 14½
Above subject to discount of 10%.

MADE IN CANADA

MUELLER

Compound Lever Action Ball Cock

Made for High Up and Low Down Tanks

NOTE—Can be furnished with either 5/8" or 1/2" shank with tail-pieces for 3/8" I.P. or 1/4" I.P. respectively.

THE A-1270 MUELLER Compound Lever Action Ball Cock is high grade in every respect and like other Mueller Products is "Fully Warranted." All parts are made of Red Brass with high copper content; tested at 200 lbs. pressure. The hush tube on the High up Cock surrounding Cast Brass Supply Tube ensures silent action; fitted with compound lever action controlled by thumb screws. Easy access to all working parts enable repairs to be made without removing Ballcock from tank. Rigid inspection after every process of manufacture ensures perfect operation.

Copper Lower; Other Ingots Advance

INGOT METALS.—The tendency for the majority of ingot metals is quite firm, although most markets are very erratic on account of exceptional conditions. Copper shows a sign of weakness and is recorded at from 25 to 26 cents per pound. Antimony is on a higher level, with spelter on the Toronto market showing a firm tendency. The coal strike may prove a serious factor if it takes effect, and it would be impossible to forecast what it will do to prices. Some think it may not materially affect Canada as far as ingots are concerned as a number of large mills have tons of ingots in store.

COPPER.—Copper this week shows a weaker tendency, but this is not any indication of the actual situation as it is believed that copper producers will see to it that copper production is measurably in keeping with actual consumption.

TIN.—Tin shows no change this week although it is holding firm with satisfactory amount of business showing. Present quotations still read 59 to 60 cents per pound.

SPELTER.—The Toronto market for spelter shows a higher tone, wtih a good volume of business showing at 10 cents per pound.

ANTIMONY.—Antimony shows a new price, and, as predicted by SANITARY ENGINEER in last issue, the demand still continues favorable. The new price is 11½ cents per pound.

ALUMINUM.—There is no noticeable change in aluminum, the price still contiues firm and a fair quantity is being handled. The present quotation remains at 34 cents per pound.

LEAD.—Lead continues firm and selling at a price of 8 cents per pound. Dealers seem to have taken greater interest in the market and apparently are still laying in supplies, giving extra strength to the markets generally.

PLAN NEW WATER SUPPLY

Engineers who have charge of the solution of the water problem at Chatham, Ont., have made a preliminary report of the cost of alternative schemes for the future source of supply. It is estimated that to bring water from the Snye Carte will cost $750,000, from Lake Erie $600,000, and from the River Thames $300,000. Tests show that the lake water is the most satisfactory.

MUST INSTAL MAINS

A by-law requiring property owners to instal water main connection where their property adjoins a road on which a pavement is to be laid has been recommended at Hamilton, Ont.

A sub-committee was appointed by the Works Committee to deal with a proposal that the Burlington Street sewer be extended at a cost of $34,000 for the benefit of the Firestone Tire and Rubber Company, which desires to locate shortly in the county, outside of the city limits.

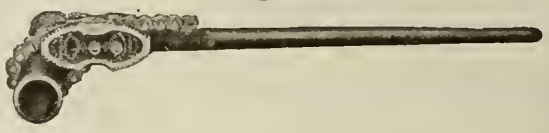
Williams' Improved "Vulcan" Drop-Forged Chain Pipe Wrench



FEW tools are called upon to stand greater strain and harder wear than the pipe wrench. Because Williams' "Vulcan" Chain Pipe Wrenches have withstood every test during years of hard, continuous service under all conditions, they have earned a well-deserved reputation for dependability, and are favorably known the world over. They embody every good feature for which Williams' *Superior* quality stands.

Made in 8 sizes for ⅛ to 18 inch pipe. All Flat Link Chains are "proof-tested" on a standard tension machine and "certified." Every wrench is unconditionally guaranteed.

Ask for our descriptive Booklet of Pipe Tools

Agts. for Manitoba, Saskatchewan, Alberta and British Columbia.

The Wrench of 25% Greater Efficiency

TRIMO PIPE WRENCH

Two new features have been recently added to the Trimo Pipe Wrench, namely Nut-Guards, in all sizes, and unbreakable steel frames, in leading sizes.

The Nut-Guards prevent the accidental rotation of the nut while in use.

These improvements add 25% to the usefulness of the tool.

The Trimo Pipe Wrench is made with good handles in 4 sizes, 6-in., 8-in., 10-in., 14-in. and in steel handles in all sizes, 6-in. to 48-in. inclusive.

All Trimo Pipe Wrench parts are interchangeable.

The inserted jaw in the handle can be readily replaced when worn, thus adding to the life of the tool.

Inquiries from Importers and Dealers Solicited. Send for Catalogue No. 55.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

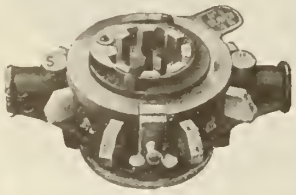
Constant Sales Increase

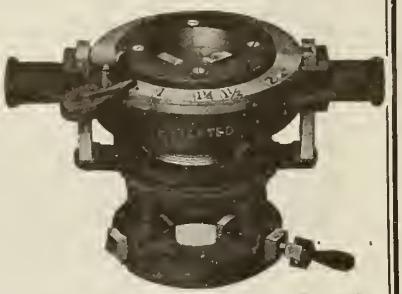


6 Beaverette to ¾ inch.

This efficient little die stock has been about 10 years on the market with constantly increasing sales.

The only tool that threads ¼, ⅜, ½ and ¾ without changing dies or bushings. Two sets of dies are operated by one handle.

Beaver 25 and 26 1 to 2" are alike except that 26 has ratchet attachment. They operate on the Beaver receding die principle—the further you thread the easier the labor. A man of ordinary strength can cut a 2-inch thread with one hand. Together these tools cut ¼ to 2-inch pipe without change of dies or bushings.



No. 25 Plain 1 to 2 inch.

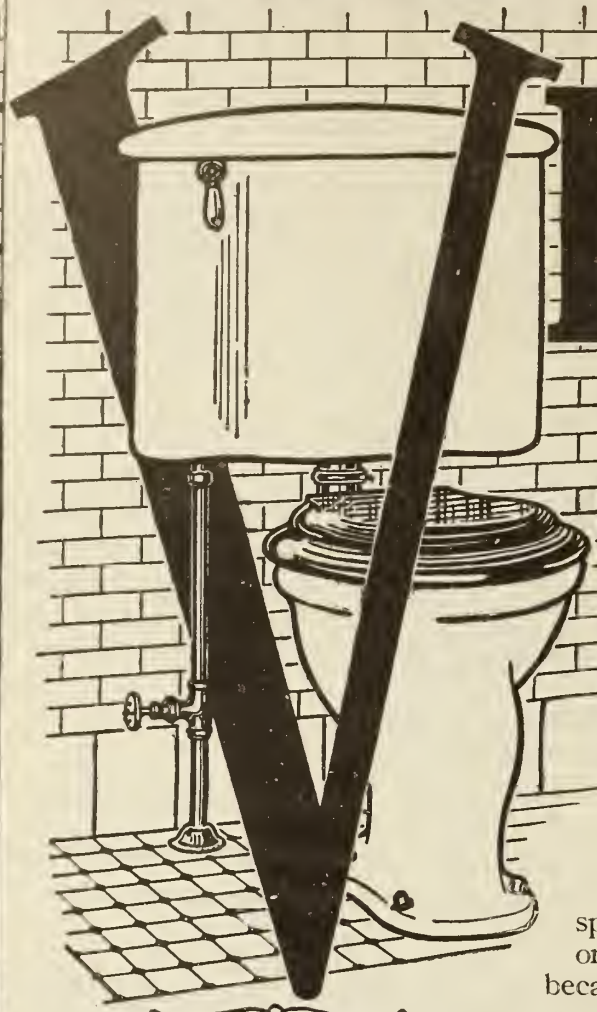
THE KERR ENGINE COMPANY, LIMITED - Walkerville, Ontario



VITRO NO TROUBLE TANK

SATISFIED customers are the best advertisers we have and the best advertisers you have. You want more of them and so do we. Specify VitrO closet tanks.

The VitrO Tank is made all in one piece of a special composition. Needs no lining of copper or anything else. It never plays out, never leaks because it has no joints to open up, nor metal to corrode. Never gives trouble after it is once installed.

Fitted with a VitrO ball cock tested to close off at any pressure from 1 to 150 pounds—and guaranteed to do it.

It is a handsome tank. We make it in three finishes—for bathrooms, for basement closets, for lavatories of public buildings—wherever a tank is required.

And the VitrO Tank is guaranteed against defects of material or workmanship—absolutely. We'll take a VitrO Tank back any time a defect is discovered, providing that misuse is not the cause.

Your customers will appreciate the VitrO Tank. Experience with it will make them better friends of yours and better customers.

Guarantee

WE guarantee that should a VitrO Tank at any time prove defective through either material or workmanship, a new one will be given to the plumber by the jobber from whom he purchased it. In no case will credit be given to the jobber until the defective tank is returned and examined, and when a tank is returned same must be complete with all fittings; otherwise, credit will be given based only on the value of the goods returned.

Exception

This guarantee does not apply to defects caused by carelessness or abusive wear and practice.

Note

A VitrO Tank must not be returned because of a defective fitting or cover. A defective fitting or cover will be replaced at once; however, the defective one must be returned for examination.

When tanks are broken in transit, claim must be made against the Railroad Company.

Specify VitrO Tanks

Catalogue on request. Write us or write your jobber.

Sanitary Engineer
Plumber and Steamfitter of Canada
VOL. XIII. PUBLICATION OFFICE, TORONTO, NOVEMBER 15, 1919 No. 22

Perfection Is Our Guarantee

ALL sanitary fixtures must be absolutely efficient, non-corrosive, durable, SANITARY.

Our lines of Plumbing and Sanitary Fixtures meet every requirement. They are the most modern obtainable, in their application. Our engineers are constantly seeking and devising means of improving them.

Our own plants are equipped with the most modern facilities for the manufacture of the lines we turn out.

The highest quality metals are used in the manufacture of Empire Brass Goods — The very latest methods and machinery are employed to assure perfection—They are subjected to expert supervision and severe hydraulic tests to satisfy us that they will live up to the guarantee.

Write for our illustrated Catalogue, which contains complete descriptions and photos of our lines — We guarantee prompt shipments.

(TRADE MARK)
SYSTEMS

Antoforee Ventilator

Steam Turbine

Does Ventilation Pay?

That depends upon the system of ventilating you select, its initial cost, the up-keep cost, how you figure the ultimate costs and the percentage of efficiency.

1. The system should be designed for your needs by trained engineers, specializing in ventilation.

2. Its initial cost is determined by the particular problem you have. Any system which does not fit your requirements is dear at any price. It should be designed to handle your problem with the least possible outlay of capital. To be sure of that, you gamble needlessly unless you take advantage of our sixty years of experience and of the services of our trained engineering staff.

3. STURTEVANT AUTOFORCE VENTILATORS use Nature as the source of energy, so you have no operating cost. We guarantee their efficiency which is 100% to 200% in excess of any other type of natural ventilator.

Our engineering staff will analyze your conditions and recommend a solution; all without obligation to you. Would this not be valuable information to have? Just drop us a line.

Why Ignore Ventilation?

NO ONE FACTOR has been so potent in combating sickness as pure, fresh air. One of the best assets for any office for obtaining maximum efficiency from employees is plenty of fresh air. Yet, in the face of that, many buildings are designed and the question of proper ventilation is lost to sight.

Where economy is a governing factor and the building one or two stories, we recommend our Autoforce Natural Ventilator. It is one of the family of STURTEVANT. We show a table of comparisons between a well-known roof ventilator of the ordinary type and the AUTOFORCE.

The AUTOFORCE derives its energy from the moving atmosphere; it is positive. Our engineering staff is at your service to assist; our service department assures complete satisfaction, and back of it all is the sixty years of Sturtevant progressive achievement to warrant you in SPECIFYING the AUTOFORCE.

Detailed Description on Request.

The Canadian Society of Domestic Sanitary and Heating Engineers

PRESIDENT
Frank R. Maxwell, Toronto

VICE-PRESIDENT
Harry Mahoney, Guelph

SECRETARY-TREASURER
Garrett F. Frankland, Toronto

Why You Should Join The Canadian Society of Domestic Sanitary and Heating Engineers

Because as a Canadian citizen, it is your duty to

YOUR COUNTRY,
YOUR COUNTRYMEN,
YOUR CRAFT,
YOUR FAMILY,
YOURSELF.

FIRST—Your duty to your country, to make it the best place in the world to live in.

SECOND—Your duty to your countrymen, to assure them the highest standard of sanitary plumbing, heating and ventilating systems in their homes and buildings.

THIRD—Your duty to your craft, to assure the highest standard of business methods and principles for the Domestic Sanitary and Heating Engineers throughout the Dominion of Canada.

FOURTH—Your duty to your family, to assure them every comfort and pleasure that rightfully belongs to them.

FIFTH—Your duty to yourself, to assure the honor and respect that is your due from the world as a capable and successful sanitary and heating engineer.

That is what the Canadian Society of Domestic Sanitary and Heating Engineers stands for. Are you with us? If so, forward your name at once to the Secretary. Remember, we are ALL FOR ONE and ONE FOR ALL.

Thanking you for your co-operation,

FRANK R. MAXWELL, President

Address all Communications to
GARRETT F. FRANKLAND, Secretary-Treasurer,

Over 60,000 Daisy Hot Water Boilers Now in Use---Are You Selling Your Share?

Daisy Boiler No. 5

Every Daisy Sale Means More Business

Daisy Hot Water Boilers have stood the test of satisfying the public over fifty years. In buying and installing the Daisy Boiler you are not experimenting.

Daisy Boilers are supplied in 22 sizes that will handle from 167 to 4,000 feet of radiation.

They sell easily on their reputation and they pay you.

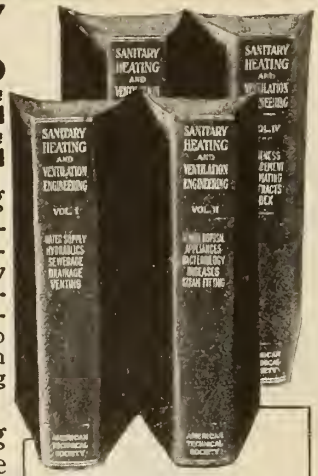
WARDEN KING, Limited, Montreal

BRANCH OFFICE: 136 SIMCOE ST., TORONTO

When writing advertisers please mention that you saw their advertisement in the SANITARY ENGINEER.

GET IN THE BIG MONEY CLASS NOW

SANITARY HEATING AND VENTILATING ENGINEERING



SANITARY Heating and Ventilating Engineering offers wonderful opportunities for advancement and money making right now. Modern methods and appliances are fast replacing the old ones, and the men who are up-to-date — the trained men — the men who know — are going to reap the benefit.

Get your share of the big money now. Here is the first thing for you to do — tear the coupon off this page and mail it to us today. It won't obligate you in any way and you don't have to send a penny, but it will bring you these four big volumes — just off the press — packed full of the very things you need to train yourself — all worked out for you in clear, understandable English by eighteen of the most successful men in these professions today.

No matter what your job is or how much you earn, you need these books — and you need them now. If you are in business for yourself, they will make your business bigger and better — the volume on business management, estimating and contracts and specifications alone will do it.

4 big volumes, size 5½ x 8¼ ins., bound in flexible American Morocco and trimmed in gold: 1454 pages: over 1100 pictures, diagrams and plates.

Here's what the Books Contain Thousands of problems under the following headlines are all worked out and made as simple as A-B-C.

Sanitary Science and Materials.
Water Supply. Hydraulics.
Sewers and Drains.
Drainage and Venting.
Sanitary Appliauces.
Sewage Disposal.
Bacteriology and Sanitation.
Infectious Diseases.
Steam and Hot Water Fitting.
Domestic Hot Water Supply.
Heating and Ventilating Engineering.
Sheet Metal Work.
Business Management.
Estimating.
Contracts. Specifications.
Mechanical Drawing.
General Index and Review Questions and Index to Each Volume.

Free Consulting Service With these books goes free a year's consulting service in the American Technical Society, worth $12.00. This enables you to consult our engineers and experts for one year without charge. Ask as many questions within the scope of the book as you want for one year.

SHIPPED FREE

Examine the books and see for yourself just how valuable they are, but don't send us any money. The little coupon is all you need. Fill out all three lines and mail it NOW. It will bring you the whole set of books by express collect, and you can keep them seven days to use as you please—study them at home—take them to your shop—try to find some problem they won't answer, and ship them back at our expense if you think you can get along without them. If you want to keep the books after seven days' use, send us only $2.00. The balance can be sent in monthly payments of $2.00 each until the special introductory price of $14.80 is paid.

It will take years of hit-or-miss experience to gain what these books will give you in a short time; so don't pass up this opportunity—ACT NOW. We may never be able to offer this low price and these special terms again—only 7c a day. Tear off coupon before you lay this down and mail *today*.

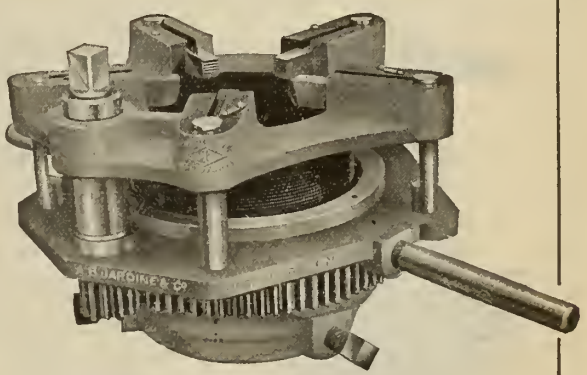
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool No. 2 . Capacity 2 to 6 in. inclusive. Weight 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

RALPH CONNOR

On "The New Canada and Its Needs"

RALPH CONNOR, the famous Canadian novelist, who served for several years at the front and saw the war from many angles, is convinced that Canada must be prepared to make important changes if she is to profit by the lessons of the war. He has written a series of articles embodying his views and calling vigorously on patriotic Canadians to awake to the needs of the hour. The articles, which deal with economic, social and Imperial topics, were written for MACLEAN'S MAGAZINE and the first appears in the November issue, under the title: "The New Canada and Its Needs."

Every Mother Who Lost a Son at the Front

will read with deepest feeling Nellie McClung's wonderful story, "Men and Money," which also appears in November MACLEAN'S. Mrs. McClung wrote this story with a purpose—to show the ease with which the world forgets the contribution these mothers made. But it is also a very fine story—real, human and gripping.

"The Idle Hands at Ottawa"

By J. K. MUNRO

The recent session of the Dominion House was in many respects an idle one. There was not a great deal done, so the members had a lot of time to stir up things, and the result was some hugely interesting political situations. All of which J. K. Munro tells about in his usual unsparing and tersely humorous way.

Remarkable Features of a Remarkable Number

The November MACLEAN'S is cram full of other big features—famous writers on vital subjects and everything Canadian. Look over this list:

Baroness Orczy.—The author of "The Scarlet Pimpernel," best seller of best sellers, is represented by a serial story, "His Majesty's Well Beloved."

Robert W. Service.—The great poet of the Yukon and the battlefront contributes a strong poem, "The Outlaw."

Basil King.—This great novelist who lives abroad contributes an interesting discussion on "Why I Remain a Canadian."

Janey Canuck.—An article on Mrs. Murphy's experiences as the first woman magistrate in the whole of Canada.

Camilla Kenyon.—A new novelist who promises to become a great favorite, tells a humorous story of adventure, and treasure, "Spanish Doubloons."

Stephen Leacock.—A humorous sketch entitled, "My Memories and Miseries as a School Master."

"Two Men and an Idea That Grew and Grew and Grew."—By Charles Christopher Jenkins.—A sketch of two remarkable and practically unknown Western Millionaires.

"A Little Bit of Chicken Feed."—By Allen C. Shore. A bright story combining love and business themes.

"The Rainbow Death,"—By Madge Macbeth. An intensely interesting detective story.

"The Search for Missing Men."—By Gertrude Arnold. An article on hospital experiences at the front by a young Canadian V.A.D.

MACLEAN'S will be Twice-A-Month

starting February 1st, next year. An important point to remember. If you want to keep up with things nationally Canadian, you'll have to get the MACLEAN'S Twice-A-Month habit.

"GO TO IT!"

A Little "Straight Talk" to the Canadian Plumbing Trade

A few days ago a young man in the city wrote a letter to his father who lives in a country town. It was a long letter, filled with details of a proposed new business venture; the son weighed all the "pros and cons," the dangers of loss, the possibilities of profit. He hesitated on the brink, waiting for the encouragement or the detaining hand of his senior.

The father's reply came by return mail. With few other words it read: "GO TO IT!"

This aggressive spirit is needed in business to-day—very particularly by the business men who read this paper. This is not the hour for sitting down and waiting for things to turn up, we must be TURNING THINGS UP. The field for large business is unlimited.

NEW CONSTRUCTION is proceeding and RECONSTRUCTION is everywhere contemplated. There is every reason why the Canadian plumber and heating specialist should be in the front rank of this advance, stimulating the ideas of those erecting new buildings, pointing out to owners the possibilities for increased health, comfort, and profit in the use of really modern and efficient installations.

Quality should be ever foremost. People should be shown how to get something at first that will last instead of getting the thing at last which they should have had first. Service must be always kept on a high pinnacle, never forgotten.

The Canadian Brass Co. endeavor to advance the interests of the trade in every way possible, by producing for its clients high quality goods. The service department is always ready to assist when consulted for special advice.

Talks to Public Through Displays

Attractive Store Arrangement and Timely Window Trims Bring Business, Says W. F. Snow—His Windows Are Dressed Every Friday

Based on an interview by J. H. COLE, of Sanitary Engineer, with W. F. Snow, of Toronto.

"MY store arrangement and window displays do most of the talking," says W. F. Snow, proprietor of the Danforth Plumbing and Heating Co., 103 Danforth Avenue, Toronto, "and many a transient customer has accepted their invitation to come in and purchase. Once people come into the store we do our utmost to give service and satisfaction, which is our motto, and we nearly always succeed in securing them for staunch customers."

Changes Windows Every Friday

"We almost invariably change our windows every Friday. The reason for this is that the general pay day for the majority of people in this neighborhood is on Saturday. From Saturday afternoon till late Saturday night, Danforth Avenue in this vicinity is alive with people, and nearly all with money in their pockets. Naturally an attractive display draws their attention, and, as is often the case, reminds or suggests some article, which they come in and buy.

Get Acquainted With New Customers

"No matter how busy we are we try to recognize new customers and get acquainted with them. This they greatly appreciate, as the average person likes to be specially noticed and think his wants are your only concern."

A unique feature of Mr. Snow's methods of merchandising is the store arrangement. The walls, instead of being decorated in the usual way, have been covered with a good quality of pure white oil cloth, which was pasted on in a very workmanlike manner. This not only gives the effect of white glazed tile walls, but seems to create the atmosphere of a spotlessly clean bathroom. It also permits the walls to be frequently washed without injury.

Photographs Itself

Another feature is the way it photographs itself in the minds of the people. Parents often send their children on errands to this store and instruct them to go to the plumbing store "all white inside," a very profitable distinction indeed.

Mr. Snow takes great pains to have a sample of all lines of fittings and supplies that he carries, connected up to show how they will actually look when in service. Of course on account of the scarcity of supplies it makes it necessary to handle more often, but there are a few dull moments when these may be adjusted without interfering with other work, and he claims it more than pays him for his extra work, which is a pleasure.

Getting More Up-to-Date

The up-to-date plumber is getting more on a mercantile basis, he says, and the day is fast approaching when the plumber's method of keeping

An attractive showing of goods of this kind is a big help in boosting business. The stock is kept in spotless condition. In the accompanying story will be found details of the simple plans used by the firm to obtain the snow-white walls which make such a splendid background for the equipment on display.

Window displays are regarded by the Danforth Heating and Plumbing Company as one of their very best means of advertising. The windows are kept looking their best and are changed regularly.

his store or show rooms in a litter will be ancient history. Women do not care to soil their clothes by coming in contact with old coils or furnace repairs, or to be tripping over stock that should have been neatly displayed. Many merchants think the average window too small to display plumbing supplies, whereas a small window is a great advantage, taking a much smaller stock to dress it, and also allowing the merchant to specially feature one particular article. Numerous merchants in different lines are adopting this method of putting in a whole window of one article, and claim excellent results.

Mr. Snow is very enthusiastic about displaying goods, and thinks there is no line shows up more favorably than sanitary plumbing and supplies. Then again, the window takes the place of a show case and shows to even greater advantage. Many plumbers put nickel-plated and polished brass goods in a show case, but will not put them in the window for fear they will look shop worn, but by changing windows regularly, the short time they would be exposed would hardly affect their appearance. People are often changing districts, and often look for a window or sign of some kind to show them where they may secure goods or leave their order for plumbing. Naturally if they see an up-to-date, attractive window display asking for the very business they are anxious to get off their hands, they will be doubly impressed and will often go out of their way to patronize such a merchant. Once they have dealt with him, the impression he creates is that he is very particular about his own store, and he surely must be particular about any work he may do for them.

Store Reminds Some That They Owe the Firm Money

Another feature Mr. Snow pointed out to SANITARY ENGINEER, was the way his window displays and store arrangements remind people of their weekly accounts. The firm does a large business in general repair work as well as contract work, and allow customers to run weekly accounts. Many a customer has remarked, "I would have forgotten all about paying my account had it not been for your attractive window display or your pure white store," or some similar remark, says Mr. Snow, "so you see I am naturally enthusiastic over showing my wares, and I think sanitary supplies one of the most attractive lines when properly displayed. The nickel-plate and pure white enamel of porcelain appeal to nearly every woman, and where is there a good housekeeper who does not like to polish brass taps, etc.? She seems to think she has accomplished something when she sees the lustre gradually coming up under the polishing cloth, till finally it glitters.

Haggling Days Over

Like most merchants, he has found that higher prices of merchandise in comparison with normal times does not depress sales or seem to make goods harder to market. On the contrary, he claims that the scarcity of goods and the fact that prices have been so active, make most customers forget about prices to a certain extent and makes them more intent on procuring the goods. The general opinion seems to be that at one time the buying public was very canny, buyers thinking no doubt that by waiting a few weeks the bottom would fall out of the market in general and prices would tumble, perhaps to their old level. Picture then the disappointment as well of "some" merchants, when prices on the very goods they had immediate use for, instead of dropping, kept on climbing steadily upwards. A few experiences such as these have educated the people to purchase while goods are obtainable. It might be mentioned here this this relates to the general tendency of the buying public throughout most of Canada. Numerous merchants report that people are buying a better quality of merchandise, figuring that a cheap article means considerable outlay anyway, and for a slightly greater expenditure they can secure the better article and have longer and more satisfactory service without having to put up with some of the disadvantages of the cheaper article.

Men Very Busy

Mr. Snow keeps a large staff of men and reports an exceptionally busy season.

Asked by SANITARY ENGINEER if he had any trouble securing goods, he stated that he had considerable trouble at times, but by hustling and keeping after deliveries, he mostly managed to give satisfactory service, in fact, thinks a little better than the average.

A very profitable way of handling contract work, he says, is to cover for the heavy wares at the time the contract is accepted, and when the job is ready to start, have material shipped direct to the job. This not only saves two cartage charges, but eliminates a lot of handling and hauling, also conserves space in warehouses, which leaves space for other purposes.

Due to Early Training

"I have reason to look back with satisfaction on my early training," says Mr. Snow. "I learned my trade under the thorough methods of W. K. Beairsto and Chas. D. Kirk, Sydney, Nova Scotia, although I understand they have located in Wininpeg since. When I first started with W. K. Beairsto I thought I was running in opposition to the Gold Dust twins, as I was continually kept dusting and polishing and moving stock around, and then more cleaning, polishing, dusting, etc. It wasn't long, however, till I saw the benefit of cleanliness and system, and now I am trying to pass it on to the boys."

New houses like those shown above, comfortable, well-built dwellings, are being erected in large numbers in various parts of the country and the call is always for more to relieve the shortage. This activity in building offers splendid opportunities for hardware merchants, not only in selling building materials and tools but in supplying the needs of those who are going to live in the new homes.

4000 New Houses Planned for Spring

Are You Ready to Take Care of the Rush of Business That is Coming? — Record Demand for Hardware and Plumbing Goods is Expected — What the Housing Commission is Planning for the Future

CONSIDERABLE impetus to many lines in the hardware and plumbing trade has been given during the past eight months because of the Ontario Housing Act, which is responsible for the completion and occupation of some 400 houses since last April, and which will result in the completion and occupation of 1,500 houses by the end of November. A still greater impetus will be felt next year when, according to J. A. Ellis, Director of Municipal Affairs for Ontario, on whose shoulders the responsibility falls for directing the whole provincial scheme, some 4,000 houses will be built.

Good Class of Houses

What this has meant to the trade can be judged from information given by Mr. Ellis to SANITARY ENGINEER, in which he stated that in the case of 90 per cent. of the houses built or now under construction existing sewerage systems or adequate water supply have made it possible and desirable to install high-class bathroom fixtures and other sanitary conveniences. In the case of two-thirds of these houses, hot-air furnaces have been installed and where the furnace has not been used, high-grade heaters are being purchased by the owner.

$12,000,000 In the Spring

While 93 municipalities have already come within the provisions of the Act, the Government has assumed financial obligations, as yet, in only 83 of these, obligations amounting to $10,620.000. Actual cash advances have been made amounting to some $4,000,000; and plans already under way will mean a further demand upon the provincial purse to the extent of $12,000,000 by next spring.

Not a little of the success of the Ontario Housing scheme is, according to Mr. Ellis, due to the fact that the widest possible choice has been given the prospective builder in the selection of his style of house. This refers particularly to the exterior of the building. The interior may not vary to any great extent; but the Government experts have prepared many plans showing different plans for the exterior. This avoids the danger of erecting a long line of houses identically the same in appearance; incidentally, it helps to keep up the value of the property, because a prospective purchaser wants something just a little different from his next door neighbor.

Local Conditions

Discussing with SANITARY ENGINEER the building of these houses and the effect upon the trade. Mr. Ellis said that each municipality was treated, as much as possible, according to local conditions.

"Where there is a sewerage system," he said, "we insist upon them connecting with it and installing all sanitary conveniences. Where there is no sewerage, we advocate septic tanks where the soil is suitable; and where there is neither of these we approve of a closet which, in turn, must be approved by the Provincial Board of Health. In 90 per cent. of these cases there is either sewerage or water connection. With regard to the sanitary conveniences and water supply, we have insisted that the best that can be done shall be done under local conditions. My policy has been to get the best possible results under local conditions.

Hot Air Heating

"With regard to heating, the furnaces installed for this class of house are exclusively hot air furnaces. We do not insist upon a furnace being installed, but allow the house to be heated by stoves where the owner prefers it; but in the latter case we do insist upon the house being so constructed that a furnace can afterwards be installed, if so desired, without any structural alterations. I should say, roughly, that perhaps two-thirds of the houses built or under construction this year are equipped with hot air furnaces."

Mostly $3,000 Houses Built

Mr. Ellis was questioned regarding the cost of the majority of the houses that had been built under the Act. "As a matter of fact," he said, "our limit is $3,000 for frame, stucco or brick veneer; $4,000 for a house of solid construction, that is, solid brick, stone, hollow tile, or concrete. These were the limits fixed by the Act when passed last March. Since then it has been found that the cost of construction has increased at least ten per cent. and, perhaps 15 per cent. all over the province. However, taking this into account, I think the only change necessary is to make a loan of $3,500 or $3,600 for brick veneer, leaving the other limits as they are.

Few Brick Veneer

"The 1,500 houses that have either been built or are nearing completion have been built within the limits of the Act but we have had very few brick

veneer houses. I should say that two-thirds of the houses are $3,000 or less; and the balance are solid construction, or $4,000 houses. What we find by experience is that the cost of a brick veneer house is several hundred dollars more than the frame house, but that the cost of the solid brick house is only two or three hundred dollars more than the brick veneer. My conclusion is that where people can afford it they should build houses of solid construction, for under present cost of construction, they are getting more for their money than in any other way. The reason why there is so little difference between frame and solid brick is that lumber is so abnormally high in price."

Will Prepare Many Plans

"I intend at the beginning of the year," said Mr. Ellis, in referring to the work that had been done as a guide to the work of the future, "to get out a report showing exactly how many houses have been built in each municipality, and the class of construction and what the cost has been. There will also be photographs of the houses actually constructed and the plans of the same. I hope to have about thirty or forty of these so that the people will know exactly what the cost has been for each kind of house.

Plans of Heating and Plumbing

"In addition to these, I have had plumbing and heating plans of the six-roomed house prepared which I also intend to have published. The keynote throughout has been to get the very best in everything with the minimum of cost to the builder. New Toronto is just about finishing 60 houses of solid construction which are costing not more than $3,200 or $3,300 each. Port Credit has also a number of six-roomed houses of solid construction, costing them about the same price."

Change Made in Income War Tax Act

Important Amendment Provides for Penalties for Those Not Making Returns as Required by Law—Time for Giving Information Has Been Extended

AN important amendment to the original act regarding income war tax has been made. It will, in one respect, alter the machinery by which the Act is enforced. Instead of imposing the penalty of a fine collectible in the courts of the land, a departure is made whereby this penalty is collected in the same manner in which taxes are assessed and collected.

The New Clause

The clause reads:

"Every person required to make a return under sub-section one of this section who fails to make a return within the time limited therefor, shall be subject to a penalty of twenty-five per centum of the amount of the tax payable, and every other person who is required to make a return under the provisions of this section who fails to do so within the time limited therefor, will be subject to a penalty of ten dollars for each day during which the default continues, and all such penalties SHALL BE ASSESSED AND COLLECTED FROM THE PERSON LIABLE TO MAKE THE RETURN IN THE SAME MANNER IN WHICH TAXES ARE ASSESSED AND COLLECTED."

Time Is Extended

This clause, of course, refers to the returns to be made for the present year. There is also one other change in the Act with reference to the time when such returns must be filed with the proper officers. This time has now been extended to the thirtieth of April, and all 1919 returns must be forwarded to the proper authorities by that date.

An innovation in taxation like the Income War Tax naturally has required and has received a good deal of leniency in enforcement. Under the provisions of the Act, as originally passed in 1917, no obligation rested on the officers of the Crown, whose duty it became to enforce it, to give any notice whatever to those liable for the tax. It was specifically set out that,

> "Every person liable to taxation under this Act shall, on or before the twenty-eighth day of February of each year, WITHOUT ANY NOTICE OR DEMAND, deliver to the Minister a return.....of his total income during the last preceding calendar year."

Took Precautions

Recognizing that the Act was an innovation in taxation, extra precautions were taken by the Government to see that it would not become necessary, in the working out of the Act, to impose the penalty prescribed, namely, a fine of "one hundred dollars for each day during which the default continues"; and, in the case of false statements, "a penalty not exceeding ten thousand dollars or to six months' imprisonment, or to both fine and imprisonment." Notices have been sent out by the officers of the Crown ever since the Act came into force, not once but two and three times, to persons who, either knowingly or unknowingly, have failed to file the proper information with the Income Tax Commissioner or such other person deputed to receive the information.

Were Not Imposed

While a complete record of fines and convictions under the Act is not available to the public, it will probably be found that the extreme penalty of the law, or anything like the extreme penalty, has never been imposed. Justice has been tempered with mercy, and the exact letter of the law has not been carried out. Ever since the Act came into force, the daily newspapers have contained notices, at the proper time, of the provisions of the Act and the penalty of failing to comply with it. So far, there have been few, if any, cases of conviction due to absolute ignorance of the law, but rather to an unwise determination on the part of the person fined, to refuse to forward the proper information to the officers of the Crown.

Houses Put In Sanitary Condition, But Now It is Claimed Rent is Much Higher

ACCORDING to press reports from Hamilton there is a great deal of work to be done because of the number of houses bare of sanitary conveniences. The matter came up when, following a visit by an inspector of the Board of Health, the C.N.R. closed some of its houses to put them in a sanitary condition. The tenants are complaining, now that the houses are reopened, that rents were boosted $5 and $12, and in some cases $15 a month.

The Hamilton "Herald" says regarding the matter:

"When apprised of this fact to-day Dr. Roberts, M.H.O., indignantly exclaimed: 'Rotten' is not a strong enough word to describe such injustice. There is no reason why tenants be penalized because landlords fail to provide sanitary homes and are forced to clean them up. Such high-handed action on the part of the owners isn't going to deter us from continuing to do our duty by inspecting and condemning houses, but there should be some power to prevent exorbitant rents being charged.

"Rentals could quite easily be controlled by the Government, and an equitable scale of rents could be fixed. If they were based on the assessment, not the investment, the assessors could go to grasping landlords and say, 'You're getting a big rent for this place, so we'll have to put your assessment up,' said Dr. Roberts. 'It is quite a common thing for landlords to boost the rent

Practical Talk on Vents and Venting

Inspector Kirk of the Toronto Civic Plumbing Department Outlines Problems at Meeting of the West "Ender" Club—Declares "Local Vent" is a Good and Very Useful Device

Written for Sanitary Engineer by C. E. PARSONS

AT THE regular meeting of the West "Ender" Club in Toronto, Inspector B. Kirk, of the Plumbing Department at the City Hall, gave a most interesting and practical address on "Vents and Venting." By means of diagrams drawn on a blackboard, he illustrated various matters in connection with questions that were asked and explained them fully. Inspector Kirk's address was as follows:

"Vents and venting as related to the plumbing trade derive their chief interest for us from their close relation to the trap, that device so hoary with age that I could not venture a guess as to the date of its introduction into the mechanism of a plumbing job.

"Let it suffice for us, however, to consider its functions as related to the sanitary appliances of a house or building. As the waste from the domestic appurtenances of a house is expelled because of its offensive nature, there is a natural desire to provide against the return of any portion of it even in the form of odors, which, from the fact that it is waste matter and that it possesses an inherent tendency to adhere to the inner surface of lining of the pipe or conduit through which it is discharged from the house, it follows that decomposition must set in and give off offensive odor.

Flushing Will Help

"Liberal dilution and flushing with clean water will minmize this evil but cannot remove it. Some means must be found to bar the entrance of such offensive odors into a building. Doubtless many devices had been tried before our old acquaintance, the trap, was adopted. It possesses so many advantages that we are not surprised that it has so long remained the favorite; its name is a misnomer, and its design and shape is such a mystery to the uninitiated householder that the workman who installs it could as easily get away with the reputation of being a wizard as that of a sanitary engineer. The design is such that it automatically permits the free discharge of liquid refuse and its short column of water presents an effective barrier to seal against the entry of gas or odor into the building.

Equal Air Pressure

"As an effective seal, however, it is entirely dependent on the maintenance of an equal air pressure on each side of it, that is on the surface of the water in the inlet side and on the surface of the water in the outlet side, and to maintain these essential conditions in an effective water seal-vents and venting becomes a necessity.

"It had long been known that the seals of traps were broken or rendered ineffective by syphonic action, but the precaution of resealing by a slight afterwash was considered sufficient until the futility of depending on such uncertain vigilance led to more thorough treatment of the whole question of house sanitation, which culminated in adding to the already mystical arrangements of a job, the further seemingly intricacies of a series of pipes, which, to the bewildered house-owner, seemed to begin nowhere and end at the same place.

Had Many Vents

"I recall an incident illustrative of this. I had installed a Zane plunger closet, trap below floor, as for pan closet, and as the overflow from reservoir was an effective automatic back water valve, there was no escape for air confined between the solid plunger and the trap below, a relief vent was provided, which we called a 'plunger vent.' The trap was a 'back vent'; there was also a local vent, which we called 'seat vent.' Then there was the fresh air inlet we called a 'foot vent,' and the soil pipe through the roof we called the 'sewer vent.' The bewildered owner, desiring to get acquainted with the names of the various pipes he was going to live with, made due enquiry concerning each pipe as we came to it. Water pipes and waste pipes occasioned no remark, but each vent pipe was regarded with great curiosity and wonder, and when we had gone over them all, he said: 'Well, I never knew there were so many kinds of vents.'

A Useful Device

"I think, however, it will be conceded by all thoughtful plumbers that our much-abused 'local vent' is a good and useful device. So also may we take it for granted that, while there may be instances where the venting of a trap may seem to be superfluous, as a general rule it is a wise and beneficent rule to require each trap to be vented.

"The fresh air inlet comes in for much criticism, and its utility or desirability is frequently debated, with the odds fluctuating from one side to the other and vice versa.

"The soil pipe continuation full size through the roof, is, I think, universally conceded to be a necessity.

Require Much Thought

"In venting of traps and in the arrangement of the vent pipes, branching in below level of fixtures and increasing sizes to secure efficient and ample movement of air, allowing for such retarding influences as friction, freezing of pipes exposed to cold, etc., require much thought, and the civic authorities find it very difficult to frame regulations which will at the same time provide security against unsanitary conditions and keep the cost of installation within the means of citizens.

"Continuous vents are now in vogue to some extent in Toronto, but the expansion of that practice by what is known as return venting, connecting lateral ends to vent stock, is popular."

PRICE MAINTENANCE QUESTION STILL IN COURT

When Colgate & Company won its decision from the Supreme Court of the United States and established the legality of what has since come to be known as the "Colgate Plan" for meeting price cutting, it was thought by many interested manufacturers that the matter had been settled and that the means were at hand for preventing the cut-rate dealer from pursuing his course without resort to special legislation to meet the trade evil.

Even this decision left a loop-hole, since the "Colgate Plan" merely provided that the manufacturer should refuse to sell to dealers who did not maintain the manufacturer's list price. It did not meet the possibility that a dealer who, though in his own retail trade maintaining the manufacturer's price, might sell to another who would resort to price cutting.

In its sales policy the Beech-Nut Packing Company has made this extension of the "Colgate Plan" and is now haled into court because of it. What is perhaps more important to all manufacturers is that the entire principle of the "Colgate Plan" is challenged, despite the fact that it has been sustained by the Supreme Court. The present action lies against the Beech-Nut Packing Company for violation of a law other than that on which Colgate & Company won their decision. It is now the Federal Trade Commission that declares that the Federal Trade Commission Act, rather than the Sherman Law, is violated and it has issued an order requiring the Beech-Nut Packing Company to desist from its practice of refusing to sell to the price cutters.

From this order the Beech-Nut Company has appealed, and the case will be argued before the United States Circuit Court of Appeals sitting in New York in October, Hon. Charles Evans Hughes appearing for the packing company as he did previously for Colgate & Company.

Buying in Home Town is Economy

By E. M. TROWERN, Secretary, Dominion Executive Council, the Retail Merchants' Association of Canada, Ottawa

IF a city or town is good enough to live in, and good enough to take a salary from, it should be good enough to buy in. If the teachers, the preachers, the professors, the firemen, the policemen and the civic servants want increased salaries, the most direct route to bring about that desired end is to keep the money circulating in the home town. If all the money in Canada ever got into the hands of one or two men, business in general would stagnate. The proper and healthy condition is to have money circulated so that everyone will, through his or her industry, get some of it.

The first expectation of a producer is to be able to sell his crop after it has been grown. To sell it he must have customers, with money, who are able to buy it. The further the producer is away from the consumer the more the transportation costs. Farms near thriving towns and cities are more valuable than those which are isolated in the backwoods. The best way to make backwoods farms valuable is to buy in the cities and towns near them.

Co-operation Counts

Prosperous cities and towns are built up through proper co-operation between retail merchants and their customers. They must work together. The customer requires the retail merchant, and the retail merchant requires the customer. If customers send all their money away to mail order houses for staple goods and expect the corner store to live on the sale of lamp chimneys, eggs and coal oil they will awaken some day to find the little store closed. Goods when you want them and where you want them are worth more than goods thousands of miles away. Ten cents' worth of toothache gum in the corner drug store in the home town is worth more to a suffering child with an aching tooth than ten tons of the same article in Hong Kong, China.

A Double Mission

Retail merchants endeavor to locate in places where they are required. They have a double mission to perform; they buy goods to suit their customers and they expect to make a living by selling and caring for them. The better service a retail merchant gives his customers the better business he should receive in return. The service should be mutual and the customer should be equally anxious to see that the retail stores in his city or town succeed.

The statement that by buying through mail order houses you are saving the middleman's profit on all you buy is only a glaring deception, to say nothing whatever about the question of lack of loyalty to your home town. Let us follow the process and see if less labor is required. A person living in a town, and whose position depends upon the prosperity of the town, receives a catalogue. In order that the said catalogue should reach the person the following process must take place:—

1. The catalogue is designed.
2. Printed.
3. Cuts made.
4. Delivered to the mail order house office.
5. Addresses secured.
6. Catalogue wrapped up and addressed.
7. Stamped.
8. Placed in the mail bag.
9. Mail bag taken to the station.
10. Carried on the train.
11. Taken off the train.
12. Taken to the Post Office.
13. Delivered to the customer in the town.
14. The customer spends time reading it over and selects an article.
15. Writes a letter.
16. Secures Post Office Order, or encloses the cash and takes the risk.
17. The postmaster enters it up and puts it in the mail bag.
18. The mail driver takes it to the station.
19. Mail clerk in charge of the train delivers it at the other end.
20. Post Office delivery wagon clerk delivers it to the Post Office.
21. Postal clerk checks it and sorts it ready for the postman.
22. Postman delivers it to the mail order house.
23. Mail order house clerk opens the letter.
24. The bookkeeper credits the cash.
25. The order clerk selects the order.
26. Stenographer acknowledges the receipt.
27. The shipping clerk mails away the order.
28. The postal clerk sorts it out for the mail delivery.
29. Places it on the train.
30. Mail clerk takes it off the train.
31. Delivers it to the local Post Office.
32. The underpaid postmaster delivers it either direct to the customer or gives it to the rural mail delivery service that is costing Canada a large sum of money to mostly benefit mail order houses.
33. The customer receives the article, and after a careful examination, finds that he or she could have bought a better article in the home town and have had the good will of the retail merchant, and helped to build up the home town by keeping the cash in local circulation.

No Economy

No sane person could say that there is any economy in that system of doing business, especially when fourteen transactions out of the thirty-three are made by the Government mail order service at less than cost price, thus benefiting the mail order house proprietors at the expense of the whole people of Canada.

True economy and sound patriotism, therefore, call upon every loyal citizen of Canada to patronize his home town and keep the wheels of commerce moving in the direction in which most persons can be mutually benefited.

Found Sewage Running Under Buildings and Many Toilets Not Connected

Report of Plumbing and Sanitary Inspectors is Expected to Result in Big Clean Up at New Westminster, B.C.

SOME extremely interesting developments that will likely make for better sanitary conditions and also remove what is alleged to be a serious fire menace, are expected at New Westminster, B.C. The council recently asked for reports from the plumbing inspector and the sanitary inspector regarding conditions in Chinatown at New Westminster. Press reports regarding the matter are as follows:

Chinatown in the Limelight

"A report was received from the plumbing inspector and the sanitary inspector on buildings in the blocks bounded by Columbia, McInnes, Carnarvon, and Blackie Streets, as instructed by the council at its last meeting. This report stated that with the exception of the Cunningham and Quong On Wo blocks, the buildings are in a most unsanitary condition. In places the inspectors found sewerage running under the buildings. Some toilets were not connected, and others so badly out of repair as to be useless. There is a lack of ventilation in rooms used for sleeping purposes, and the conditions generally are unhealthy.

Unfit for Habitation

"Ald. Dodd said he did not wish to insist on any drastic action. He had tried all sorts of motions, but always with the same result. These buildings are unfit for habitation, and are violating every law, municipal and provincial, that can be violated. Why should the council wait to be told its duties by some provincial or Dominion officer? There are some people in the city, he declared, who are saying that the council is unfit to look after its own business, and he had to confess that in this matter it appeared as if the council really was unable to enforce its own laws.

"Ald. Johnston thought that if the owners of these buildings are flagrantly violating the law there should be no need for city officials to write to the council about it. Merchants are frequently hauled into the police court for some very slight misdemeanor. Why is the same course not pursued in this matter?

Fire Protection

"Ald. Kellington declared that there was no doubt some of these buildings must come down as a measure of protection against fire. He suggested that the council wait till it had a report from the Dominion fire prevention officer, who is due here shortly. Then, with that and the report of the provincial fire prevention officer and one from Fire Chief Watson, the council would be able to proceed on an intelligent policy.

"This Ald. Dodd flatly declared was merely a move to delay matters and block efforts to have these buildings removed.

"It was finally decided on a 3-3 division by Mayor Gray's casting vote, to invite to a council meeting on November 17 the owners of all buildings in the block bounded by Blackie, Columbia, McNeely and Carnarvon. This is the block in which are the merchants and cosmopolitan hotels. These owners, most of whom have already been before the council, will again be asked to show cause why their buildings should not be torn down.

Wants More Included

"Ald. Lynch objected to picking out this block on the ground that it does not include the building on which a life first expired. He asserted that a building in the next block was first to be condemned. On his motion, it was decided to invite also the owners of all buildings in this other block, on which a life had been placed to attend the same meeting, although Ald. Dodd again declared that this was a move to block proceedings by bringing in too many owners to handle successfully in one evening.

In due course of the debate, Ald. Dodd said that if the present council does not tear down these buildings the "Purity League that is coming in" will do it.

Sewage Disposal Plant Recommended for the Town of Lindsay

Engineer of Provincial Board of Health Makes Investigation and Reports Serious Pollution of the River

ENGINEER DALLYN, of the Provincial Board of Health, has submitted a report on a new system for sewage disposal planned by the town of Lindsay, Ont. He points out that at the present time no less than five sewer outlets drain into the Scugog River, causing great pollution. He suggests that it will be more economical to construct three disposal plants than to operate several pumping stations to force the sewerage to one plant at any of the available sites.

The machinery required for compressing air might be located at the waterworks pumping station and looked after without employing additional attendants.

The immediate problem is the outlet for the South Ward sewerage system.

The report says in part:

"My suggestion is that a concrete structure suitable for the activated sludge sewerage disposal system be constructed on a small lot, owned by the town, opposite the locks, and that provision be made for diverting the drainage from the two existing outlets which are just to the north of this point.

"From the proposed works a new outlet could then be constructed capable of discharging the combined flow some little distance down the stream past the shallows. The South Ward system, as constructed, could drain to the tank to be subjected to sedimentation until such time as the more extensive treatment by the activated sludge process is required by the town.

"I do not see that the suggested concrete structures would impose an unreasonable burden on the municipality and interfere with the South Ward system being proceeded with at once."

Conserve Supplies of Galvanized Sheets is Advice of Manufacturer

THE following announcement regarding the galvanized sheet situation and the outlook for the future is being sent out to the trade by the Dominion Sheet Metal Corporation, Limited, of Hamilton, Ont.:

"Our stock is practically exhausted and we cannot hope to get in any considerable amount of steel from the lone Canadian producer, from whom we secure their limited maximum. The U. S. mills are shipping nothing, notwithstanding reports of partial operation.

"We caution you to observe the greatest conservation in disposing of your stock, as it will be three to four weeks after the strike ends before new supplies are available."

Discussing the matter with SANITARY ENGINEER, Mr. A. T. Enlow, President of the Company, said:

"I understand that the Steel Co. of Canada is loaded up for the entire balance of this year, selling only occasional small orders from stock at a good stiff advance. I firmly believe that the main trouble will come after the strike is over and the mills start operation and people will begin to expect goods, whereas nothing will reach Canada of any importance until three or four weeks, at least, after operations have been resumed in general.

"The occasional carload that straggles through is just about like a small chicken bone to a hungry Airedale dog. It only makes him seem hungrier."

EDITORIAL COMMENT

EDITORIAL BRIEFS

COURTESY costs nothing and is an invaluable help in building up business.

* * *

EVERY man who is selling goods needs three kinds of faith—first, faith in himself; second, faith in his store, and third, faith in the product he is selling.

* * *

DON'T underestimate the importance of customers because you see so many of them all day long. Remember, every dollar you get comes from the great shopping public.

THAT manufacturer who predicted that the price of shoes is going to come down April 1, might have been believed if he had named any other date.

* * *

BE very careful regarding credits. Use money and credits wisely as they are among your first requisites for making business either a success or failure.

* * *

MANY a young man has found that concern for his employer's interests is one of the most powerful levers for raising himself to a better position.

* * * *

THERE is little distinction between the man who refuses to sell at a fair price and the man who refuses to buy at a fair price—either one can turn business upside down.

WILL MEAN PROSPERITY

THE outstanding event of the week in the financial world has been the arrival of the long-expected time when a policy of contraction and anti-inflation could be inaugurated. What has happened is a result of the action of the Federal Reserve Board of the United States in raising rates of rediscount and of the Bank of England in advancing its rates. The policy thus inaugurated will be followed by other countries because England and the United States are the only two nations in the world to-day in a position to control financial conditions, and especially the rates of return for money. The fact that they are in this position makes the policy they have decided upon of world-wide significance no matter what any other nations may do. During the years of the war and the year that has elapsed since the signing of the Armistice tremendous inflation has occurred throughout the world. Much of this resulted from the activity caused by providing the Governments with what they needed. It was usually a question of getting what was needed and getting it quickly regardless of the price. This produced conditions such as merchants have never before experienced. There is little doubt that the action just taken will mean a new era, and the broad significance of the change portends more or less contraction of credit and hence of purchasing power. The contraction or limitation of prices of commodities necessarily follows. Business has been good but there is little doubt that it will be better because any number of people have been holding off buying except for immediate needs because they felt that sooner or later the conditions that have been prevailing would be checked. The time has arrived and to say that it will be welcomed by business men is to state a fact.

MERCHANTS HELPING THEMSELVES

NO less than 1,600 local tribunals have been established in England with a view of investigating all cases of alleged profiteering. W. McCurdy, M.P., secretary of the Central Committee, recently made some interesting comments on the general situation. "One of the causes of profiteering," he said, "is the fact that the public seems to have lost all sense of what is a reasonable price. To meet this situation, which is really, perhaps, one of the most important phases of the work, the Investigation of Prices Committee is giving the people general information so as to enable them to know what are fair prices. This will help not only the people but the retailers, and I am glad to be able to say that in several of the most important retail trades there is now a movement to assist the Government in every possible way by organizing plans under which the trades themselves will take steps to reduce prices to the public and eliminate all profiteering. The grocers, for instance, are planning to draw up price lists for all articles which are uncontrolled and they expect to be able to make substantial reductions."

PROTECTING THE MARKETS

ANY danger that may have existed in regard to Germany trying to use Canadian or other British colonies as a dumping ground for German goods, has been removed by the appointment of a president of the British Chamber of Commerce in Germany. His

duties will give him complete control of the license department. It is announced that all goods leaving Germany for British ports without license will be confiscated. It would be difficult to imagine a more complete protection of British markets from the Hun.

BUSINESS MEN FIGHT BOLSHEVISM

IT is gratifying to know that the business men of the United States have as a body joined in the fight to rid the country of Bolshevism. Quick, decisive action which resulted in the arrest of several hundred of the most active Reds was one of the first results of the business men's co-operation with the authorities. It is only a matter of a short time when a great many of those who were placed behind the bars will be deported. This work of cleaning up the country is one in which Canada is vitally interested and has also done good work, as the collapse of the Winnipeg walkout shows. It sometimes takes a long time to get the business men away from their stores or factories long enough to act, but once they are aroused to the seriousness of a condition they are usually not long in remedying it. With the clean-up in progress across the line it is likely that the end is in sight of the unprecedented strikes and troubles that have been occurring, and the sooner these things are settled the sooner business will go back to normal conditions.

A CASE FOR STANDARDIZATION

THE need for electrical goods with a standard plug is becoming more apparent every day. This has already been done with electric light bulbs and with the steadily increasing popularity of other lines, there is no reason why the householder should be seriously inconvenienced as at present. There is no justification at all for the housekeeper having to keep a dozen different cords hanging around the house, each with a different plug at one end and very frequently at both ends. One is for the toaster, another for the iron, another for the vacuum cleaner, another for the washing machine and so on. This means real annoyance and inconvenience for many women and is entirely unnecesary if the manufacturers would get together and agree on a standard plug. Incidentally, it would help in increasing the sales of merchandise. In St. Thomas, Ont., a citizen recently had his house wired for electricity and planned to instal all the latest conveniences. He had sockets for irons, etc., and when he endeavored to make use of the appliances, he discovered that the sockets were built for the metallic power conveyors to be inserted horizontally, while the new equipment he was putting in had parallel conveyors. He was forced to remove the sockets and instal new ones. This matter, it is stated, is to be taken up with the Ontario Hydro Commission, as it is not the first complaint of the kind that has been reported. The average citizen is "sold" on electricity and the value of convenience of electrical utilities, but it is little things like this that make endless trouble and often cause people who would buy washers, vacuum cleaners and other things to go slow. The men handling electrical goods can do a great deal if they will get togther and put it up to the manufacturers to standardize.

HELP ALONG THIS WORK

IT is the aim of both the Dominion and Provincial Governments as well as of many of the large manufacturing firms to encourage home owning. This year has seen considerable progress along this line, and while there is still an acute shortage of residences, especially in the larger cities, a good deal has been done to alleviate a condition that was becoming almost intolerable. It is still bad enough. The housing question is occupying almost as prominent a place in the news columns these days as labor unrest or any other big problem. Not only is the scarcity of houses driving many people to own their own homes, but also the exorbitant rents being asked by landlords. Brisk as building has been this year, it will apparently be small compared with the programme that will get under way next spring. All movements to encourage home owning are of keen interest to the plumbing trade and offer splendid opportunities for selling bathroom fixtures, heating equipment or other lines, and also for the installation of these goods. The plumber who is in a position not only to advise those who are building about the best materials to use, but to show them a well-selected stock of electrical fixtures, bathroom equipment and fixtures, electrical washing machines, vacuum cleaners, toasters, irons, and other lines is going to get some nice business. Many plumbers have been making the most of these opportunities and with excellent profit to themselves. While business has been splendid this year, they see even more trade of this kind ahead next season and are making their arrangements for getting their share of it. As was stated by a master plumber in a previous issue of SANITARY ENGINEER, one of the best ways of securing business and of bringing people back to your store, is to be in the position where you can supply their every need in plumbing goods, in other words, carry the stock. This is a sure foundation for any plumber to work upon and those who are conducting their shops on that basis are not worrying about selling the goods. Their trouble very often is to get enough goods to sell. There is every indication that the shortage of goods will not be relieved for some time. Between the American steel strike and conditions prevailing generally, production is not nearly enough to keep up with demands and many manufacturers are having great difficulty in getting raw materials.

SUPERIORITY PURITY DURABLE AS THE PYRAMIDS

Port Hope Sanitary Plumbing Ware

Every Fixture is unconditionally guaranteed and bears our label as a protection for you and your customers.

THE "LEIGHTON" LAVATORY

5,400 New Homes in Ontario to be Completed This Year

It is estimated that the above number of houses have been put under way and will be completed this year ready for occupancy.

This is showing a healthy business for the plumber in sanitary installations.

What has been done this year is only a fraction of what will be accomplished next year in house building, so the plumber can look forward for at least another year of thriving business.

It will pay readers of SANITARY ENGINEER to be prepared for the 1920 house-building boom.

The Port Hope Sanitary Catalog is at your service. Yours for the asking.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

New Firms

C. Hutchinson & Co., plumbers, have been registered at Montreal by Chas. T. Hutchinson, Joshua Gamble and Geo. Philip.

Milton Robinson has opened a plumbing shop at Arnprior, Ont.

George Millward, formerly with the plumbing firm of George Millward & Son, Port Hope, Ont., is starting in business for himself at Port Hope.

Personals

The young son of David Norwich, secretary of the West Ender Club, Toronto, had his arm fractured by falling from a siwng.

Archie Macknin, who, as stated in a previous issue of SANITARY ENGINEER, had his knee badly hurt in a ball game last summer, underwent an operation in Toronto General Hospital last week, and it is now expected that a complete cure will result.

The marriage takes place in Toronto on November 18, of Mr. Lou Palter and Miss Smith.

Trade Notes

Dauphin, Manitoba. — H. H. Moore succeeds F. W. Bumstead, plumber.

S. W. Whetstone, of Edmonton, Alta., has disposed of his plumbing business.

Maulson & Buchanan, 40 King Street E., Toronto, have received the agency for Canada for the sanitary clay products, sanitary fixtures, etc., manufactured by George Howson & Son, of Hanby, England.

W. A. Bradford & Co., plumbers, has been registered at Montreal (West) by Gilbert S. Bradford.

TENDERS

Plans are completed and work will be commenced shortly on a new club house at Regina for the Imperial Oil Company. The building will cost $20,000, and shower baths and complete plumbing and heating will be installed.

The London, Ont., Housing Commission, S. Baker, secretary, plans the erection of thirty more dwellings and wants prices on all plumbing and heating goods.

J. C. Wanless & Co., Chatham, Ont., have plans for a new hardware store, three storeys and basement, 26x145. Steam heating. Construction will commence as early as possible in the spring.

Plumbers' License Fee May Be Set At $25

The proposed Plumbers' License By-law, which will come before the council at London, Ont., shortly, is expected to make provision for the protection of local plumbers and also look to the increasing of the efficiency of the trade by imposing strict theoretical and practical examinations on future applicants. The by-law, which may be framed along the lines of similar by-laws now in force in various municipalities, will provide an easy examination for those who are already engaged in plumbing work in the city, and special consideration will possibly be shown men who have spent years in the trade.

Chairman Saunders, of the Board of Health, said that there were many who could do a certain job, but they were unable to tell how it was done. He hoped that discretion would be shown and that the quality of work turned out would be the highest criterion of a man's ability. The by-law. it was explained, would operate at first against plumbers working in the city but living elsewhere. They would have to pay a license fee, and in the case of master plumbers would have to have a "regular place of business in the city."

Plumbing Inspector Young stated that the license fee for master plumbers would probably be $25 and for journeymen plumbers $5.

Some difficulty might be experienced in the first two or three years in getting the law efficiently and wisely administered. but the lengthening period of time would see conformity to recognized standards and general satisfaction.

Plans for a new general hospital at Brandon, Man., are being prepared. R. Darrach is chairman of the building committee.

Work is to be commenced as soon as posible or a large number of new residences at Kitchener, Ont., for the Housing Company. Ald. George J. Lippert is a director of the company. Prices are wanted on plumbing and heating goods.

Tenders are open for a new school at Windsor, Ont., 21 rooms, to cost $400,000.

Work will commence shortly at Charlottetown, P.E.I., on a new country club house, 65x90, two storeys. E. S. Blanchard has plans.

D. L. Shafer, of St. Thomas, Ont., has commenced excavating at Windsor, Ont., for two dwellings, to cost $8,000. Interested in prices of plumbing and heating goods.

Work on a new barracks, 30x70, two storeys, for the Salvation Army at Melfort, Sask. Work will be commenced at once. Plumbing and heating to be let.

A vote of the ratepayers to provide for the installation of a water system in Scarboro Tp., Ont., will be taken on January 1.

The Gold Medal Manufacturing Co. of Uxbridge, Ont., is calling for tenders for all work in connection with the erection of five new dwellings.

T. L. Church, City Hall, Toronto, will receive tenders until November 20 for plumbing and heating, electric wiring and fixtures for new office building and stables.

Incorporations

The Hoover Suction Sweeper Company of Canada, Limited, capital $1,000,000, head office Hamilton, Ont., plans to manufacture and deal in suction sweepers.

Porrits & Spencer (Canada) Limited, capital $1,000,000, head office Hamilton, Ont., plans to manufacture and deal in flax, hemp and jute products.

Dominion Gas Saver, Limited, head office Sherbrooke, Quebec, capital $40,000, plans to manufacture and deal in gas stove equipment.

900 HOUSES NEEDED IN GUELPH

James Govan, provincial architect for the Ontario Housing Commission; J. W. Siddall, his assistant, and R. Hall, town planner, were in Guelph last week inspecting the houses now being erected by the Guelph Housing Commission, and also to get first-hand information regarding the need for building five hundred homes here in 1920. It was announced that in the event of these houses being gone on with, J. Siddall would come here and devote his whole time and attention to the proper erection of the houses. The Government officials intimated that there would be no difficulty in securing the necessary money. It is believed that 900 houses will be required in Guelph by next year, and if this number were erected the cost would be in the neighborhood of $3,000,000.

AWARDED $70,000 CONTRACT

Bennett & Wright, of Toronto, have been awarded the plumbing contract at $70,000 for the new Western University Medical School at London, Ont.

INSPECTION AT PETERBORO

Plumbing Inspector Meadows, of Toronto, was in Peterboro', Ont., last week, making an inspection of the city's plumbing work. The inspection is the outcome of allegations that plumbing work in Peterboro in many cases did not measure up to the standard of that in other cities.

Mr. Meadows was given a copy of the city's plumbing by-laws, and will report what work, if any, is in contravention of that measure, and also any which, while within the requirements of the by-law is, in his opinion, not up to the generally accepted standard.

MUST APPOINT INSPECTOR

Cobalt.—Sanitary Inspector Johnston is leaving Cobalt for Toronto at the end of the month, and certain members of the town council thought that, in the interests of economy, the job could be united with that of Chief of Police, Councillor Gaudreault, fathering a motion to this effect. The Board of Health, however, has objected to any such policy, Dr. Lidell, the Medical Officer of Health, declared it would be false economy. The board has recommended to the council that a successor to Mr. Johnston be appointed, and this was agreed to by members of the council.

BRICKS CLOGGED SEWER

A press report from St. John, N.B., says:

"Recent troubles with the plumbing in the King George School have brought to mind some interesting episodes in the past history of the building. A short time ago it was found that the sewer pipes in the school were badly clogged, and on investigation it was discovered that the clogging was due to bricks which had been forced into the pipes and became jammed. To remedy the trouble it was necessary to go to some expense in breaking up the concrete floor to get to the pipes and remove the bricks."

CONTRACTS AWARDED

Ecclestone & Bates, Ltd., sanitary engineers, Bracebridge, Ont., have been awarded the contract for twenty-two private bathrooms in the south wing of the Beaumaris Hotel at Lake Muskoka, which is being remodelled. Mr. S. Bates is looking after the plumbing and gas.

APPOINTED INSPECTOR

Alfred J. Bolus, of Weyburn, Sask., has been appointed Sanitary Inspector by the Board of Health at Fort William, Ont.

CATALOGUES AND BOOKLETS

The United Brass Founder and Engineers, Ltd., Woodchester, Eng., have sent out a number of additions and revisions for their catalogue as follows: Label gummed ready for pasting on front of catalogue; emergency index leaflet for insertion in front of catalogue after our specialty page; reprinted conditions of sale page; set of pages which have been revised and reprinted of Section P.

Ontario Executive to Visit Master Plumbers at Galt and Kitchener

A VISIT to Galt and Kitchener will be made on November 27 by the members of the executive of the Ontario Society of Domestic Sanitary and Heating Engineers.

In the afternoon a meeting will be held at Galt, when matters of interest to the men in the trade will be taken up and organization discussed.

The evening meeting will be held at Kitchener, and master plumbers from both Kitchener and Waterloo will be in attendance. It is also expected that visitors from Preston and Hespeler will attend the afternoon session.

Addresses on the work that is being done will be given by President T. J. Minnes of Brantford, Vice-President George Grinyer of Guelph, and Secretary Garrett Frankland, of Toronto.

Will Meet at Oakville on November 26

Ontario Executive to Discuss Trade Matters With Master Plumbers on the Toronto-Hamilton Highway

A MEETING of the executive committee of the Ontario Society of Domestic Sanitary and Heating Engineers, with the men in the trade along the highway between Toronto and Hamilton, has been arranged for the evening of November 26.

Matters in connection with organization work will be discussed and addresses will be given by President Thomas J. Minnes, of Brantford; Treasurer Thomas R. Maxwell, of Toronto; John Wright, of Toronto; C. G. Stewart, of Hamilton; J. H. Doherty, of Mimico, and Secretary Garrett F. Frankland, of Toronto.

Toronto "Ender" Clubs Hope to Have Fine New Club Rooms Before Very Long

THE "Ender" clubs of Toronto are now in full swing for the fall and winter season, and very satisfactory meetings are being held. The "Ender" clubs are considering purchasing a home of their own, and hearty support was offered the project by all present at a meeting of the East Enders on Tuesday. There was an open discussion along the lines of financing the proposed new home, which, according to figures submitted, will pay a good dividend besides affording the members more comfortable and larger quarters. It was proposed that the new club house would be an ideal location for business offices of those who are directly interested in the sanitary and heating trades and also that suitable show rooms could be equipped, all having a tendency to increase trade.

The new club house, it is expected, would prove a great asset to the clubs which have accomplished so much, especially of late. Some members did not hesitate to state that even for the short time they had been in touch with the clubs they had figures to show increased results of uniform prices and fair profits.

The West Enders' club is in the running also and for the new club house already has a longing eye on the silver cup, that is to go to the "Ender" club showing the most new members at the close of the campaign. The discussions chiefly were the new club.

W. H. Daw gave a very interesting as well as practical demonstration with figures of the most profitable way to handle a 6½ in. piece job. The address was much appreciated by all present.

HOUSES PUT IN SANITARY CONDITIONS

Continued from page 18

after they have been forced to clean up. Tenants living in condemned houses should get a rebate in rent for the time that the house was unsanitary."

Later in the day the agent of the C.N.R. called upon Dr. Roberts. He declared that the decision to clean up the houses, get a more desirable class of tenants (he blamed the tenants for the conditions of the buildings) and charge higher rentals was reached before the Board of Health condemned the houses.

Dr. Roberts stated that the clean-up order was not the result of a complaint to the Board, but followed a routine inspection.

"Complaints from tenants of C.N.R. houses in the north-end that rents had been raised to exorbitant rates have been received by Controller Halford, who appeared in the city hall armed with a schedule showing that the increased rentals were $10 to $15, $12 to $18, and $22 to $40, the assessment on one of the last class of houses being only $1,700. The controller termed it an outrage inasmuch as some of the houses are practically bare of any conveniences or fixings."

Says Skilled Sanitarians Vital to Health of Community

Dr. Aykroyd, of Kingston, Makes Interesting Comment on Work of Sanitary Engineers in Pointing Out Dangers of Polluted Civic Water Supply

DR. S. A. AYKROYD, of Kingston, Ont., has written to the press of that city a strong letter in which he points out the serious dangers citizens face by delaying action in getting a more pure supply of drinking water.

Dr. Aykroyd says in part:

"One of the problems confronting a great many cities is a pure water supply. We have that problem in Kingston, and the question is how are we going to solve it? What is the best solution? Everybody knows Kingston's water is polluted, and what we are doing to make this water at all safe to use is only a temporary expedient.

A Big Problem

"Will the time ever come when all the cities and towns on the great lakes and rivers between Canadian and the United States stop emptying their sewage into these waters? Until the Governments of the two countries prohibit this practice these waters are barred as a source of pure water supply. Even if this were done these waters would still be subject to contamination, by the ever-increasing lake, river and canal traffic, unless the boats, too, were strictly prohibited from dumping their sewage into the water.

Says It Is Disgrace

"It is a disgrace to our modern civilization, with all our knowledge of sanitary science, that these greatest and purest of natural waters on the face of the globe are made the receptacles of millions of cesspools. It ought to be stopped, but it is not likely to be for many years yet. The cost would be great, and there would have to be international agreements; besides, there is always the tendency among many to allow matters to continue as they are or as they have been in the past, and a decided objection by others to incurring additional expense for what may seem to them only aesthetic reasons; but, no matter what may be the cost of providing a reasonable supply of pure water for a city's personal domestic uses, a very little consideration will show that such expenditure is true economy from solely a financial point of view, even though we ignore the misery and sorrow of sickness and deaths that are due to the use of a polluted water.

Infectious Disease

"A polluted water may carry the organisms of infectious diseases, or it may produce or favor the development of diseases which are not due to specific germs. In addition to this, and of at least equal importance from a sanitary point of view, is the depressed state of the system that the habitual use of impure drinking water causes, and the predisposition to disease that ensues. By the power of accommodation and through long habit, a community may become so 'protected' (?) against an impure water as to manifest no striking symptoms, while strangers may be seriously affected by it; but even in such cases the condition of those habitually using the water yill probably be more or less depressed and far from good.

A Fool's Paradise

"If we apply the above quotation, from an authority on the subject, to the situation in Kingston, we may see in what a fool's paradise we are living. The lowering of the vitality and reduced resistance to disease caused by impure water, cannot be emphasized too strongly. Suppose an epidemic like 'flu' comes along and finds a depressed state of the system, due perhaps to drinking impure water, are we not more liable to attack and to succumb to the disease? In fact diseases of so many kinds are so largely a question of sanitation we should have skilled sanitarians in every community, independent of the medical profession, whose function is to treat disease when it occurs rather than to prevent it; while the sanitarians would seek exclusively to prevent disease.

Prevention is Best

"It is an old saying that 'an ounce of prevention is worth a pound of cure.' Then one sanitarian should be worth as much to the community as twelve doctors, drug measure. I don't mean to say by this statement that the doctor is not a very useful member of society, but I do mean to say that less doctors would be required, and the profession could be more highly specialized if our sanitary conditions were improved.

Health Improves

"The health of a community always improves when an abundant and pure water supply is given. You will excuse me, Mr. Editor, if I am dwelling at some length on this question. I do not wish to ring the changes on reconstruction and the new era now dawning upon the world, but it would be hard to find a more important subject for consideration at the present time than that of obtaining the purest possible water supply for the people. We are abolishing 'booze,' and I am in favor of doing that, but what are we giving the people to drink in its place, chemically treated sewage water? Why, that is not better than 'two per cent.' We should at least give them the purest of 'Adam's ale' distilled in nature's great laboratory, unadulterated by man."

Says Board of Commerce Efforts Unsettle the Public and Disturb Business

THAT the efforts of the Board of Commerce to find a solution of the high cost of living are not only failing of their purpose, but are unsettling the public mind and disturbing the manufacturing and industrial world, is the opinion of Mr. Henry Watters, treasurer of the Dominion Board of the Retail Merchants' Association of Canada. In an issued statement, Mr. Watters strongly resents any imputation that retail merchants are "profiteering"; and as a proof of it he calls attention to the fact that competition amongst the retailers is so keen that big profits are impossible, and that a survey of Canadian retailers will show that exceedingly few of them belong to the millionaire class.

Not only is the board failing to obtain the desired result, says Mr. Watters, but "we are further of the opinion that instead of ascertaining the real cause of the increased cost of living, the agitation has unsettled the public mind and disturbed the manufacturing, as well as the producing and distributing industries."

The treasurer follows with some ten suggestions to the board, which, in brief, are as follows:

First, that consideration should first be given to basic principles of manufacture, production and distribution and costs involved in same.

Second, that increase in profits, if any, may be ascertained.

Third, increase in wages, freight and other charges.

Fourth, foreign demand for articles.

Fifth, effect of war profits and income war tax on cost of raw material and manufactured articles.

Sixth, increase in orders and profits by jobbers and wholesalers, on what lines, and bearing in mind increased cost of production.

Necessary Overhead

Seventh, necessary overhead charges to properly conduct retail trade.

Eighth, submission to the board of all forms of contract fixing prices by manufacturer to wholesale, retail and buying public.

Ninth, that yearly turnover of every class of merchandise should be the basis of computation of financial returns, not an investigation into one special article.

Tenth, that all possible assistance will be given by the association to the board in their investigation.

Added to this is a statement by Mr. E. M. Trowern, secretary of the Dominion Executive of the Retail Merchants, in which he states that the retailers no longer want to be branded as thieves and scoundrels. He contended that there was no use in continuing to fool the public with regard to the high cost of living; prices would only come down in the natural order. Ninety per cent. of the people, he held, do not know what they were talking about when they ask for arbitrary reduction of prices.

Ventilating the Modern School

Fifteenth Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of the Series Appeared in April 1 Issue

IN many of the smaller towns of America it is still the custom to heat and ventilate the school buildings by means of the warm air furnace.

The drawings here shown illustrate in one case, a system of direct extraction of the foul air, and in the other, the indirect system.

The plans first referred to are those used in the building of a school at Wynyard, Sask., when indirect extraction of the foul air is the principle of the system as installed.

Two Class Rooms

The building contains two class rooms; and an assembly hall, that may be converted into class rooms when such are required. Ultimately four class rooms will be built on the other side of the tower, thus making the building symmetrical in outline.

The floor plans are not shown, as the location of the ducts on the basement plan and in the sections indicates clearly enough when the discharge and exhaust faces are set at positions remote from the outer walls.

It is sometimes the practice to place the exhaust openings under the windows, conveying the foul air across to the vent stock by way of ducts set between the joists. There is no advantage in so doing unless the room is very large, say, 34 feet in its narrowest dimension.

Where Fresh Air Enters

Drawing No. 1 shows the rear elevation of the school and indicates where the fresh, cold air enters the building at the grade line. A grass plot lies in front of the opening, so there is little danger of dust entering with the air. The wood louvers shown prevent rain or snow passing into the cold air chamber. The louvers are backed with ⅜-in. bird-proof screens.

The foul air exhaust is shown at the top of the stock, and it is also provided with weather-proof louvers and bird netting.

Fresh Air Intake

Drawing No. 2 is a section showing the fresh air intake; the heater chambers, a fresh air flue, a return air flue, and the direct and by-pass openings of the chamber and of the flues.

The heater chamber is built with brick walls and roof. There is a brick dividing partition between the heaters.

The base of every warm air flue opens to the cold air chamber, so that air may enter without passing over the heater when a class room becomes too dampers, shown on drawings No. 2 and No. 3

Equalizing Damper

In addition to the mixing dampers, each warm air flue has an equalizing damper that can be set to counteract the effects of outer wind currents.

The return air flues are built as ordinary stud partitions, over the air return passages in the basement.

Drawing No. 3 shows a heater chamber in cross section, a foul air return flue, and a fresh air flue, with its by-pass, its mixing and equalizing dampers, complete with their controlling handles and cables. This drawing also shows part of the main vent shaft and a chimney of tile pipe.

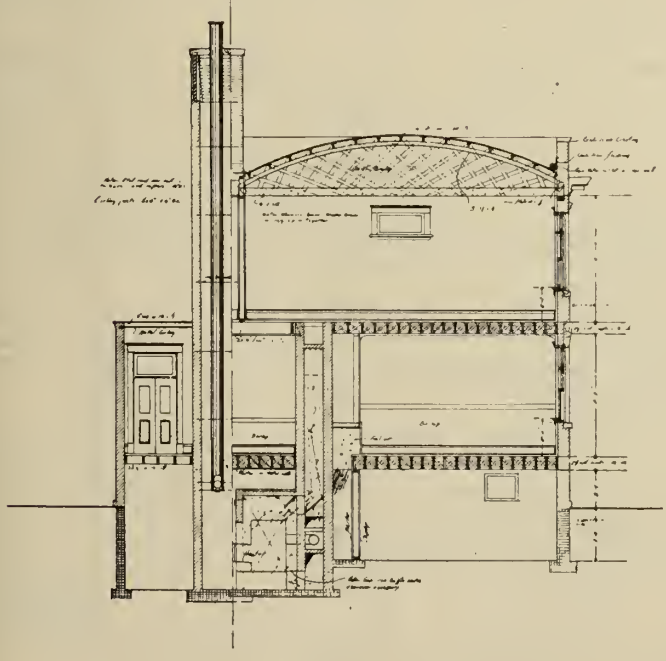
Basement Plan

Drawing No. 4 is the plan of the basement. The warm air furnaces are set close to all of the flues.

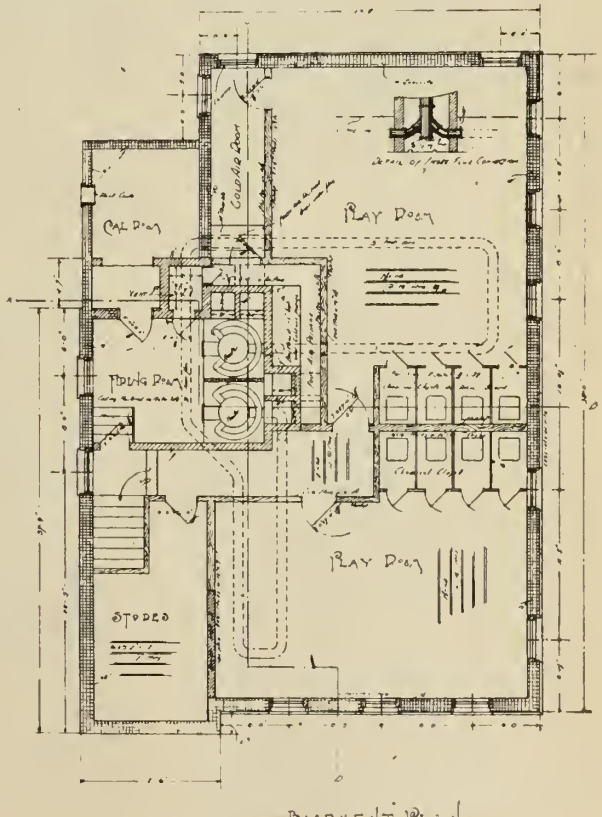
The flues connecting to faces on the ground floor are 24 in. wide and 20 in. deep. The flues leading to and from the first floor are 21 in. wide and 20 in. deep.

Referring to the plan, we note that the foul air return passage lies directly across the path of the incoming cold air. Reference to drawing No. 2 will show how the cold air passage drops at this point to avoid the interception. A door may be observed set in the wall between the cold air room and the foul air passage; the reason for this door will appear later on when we describe how the system is operated.

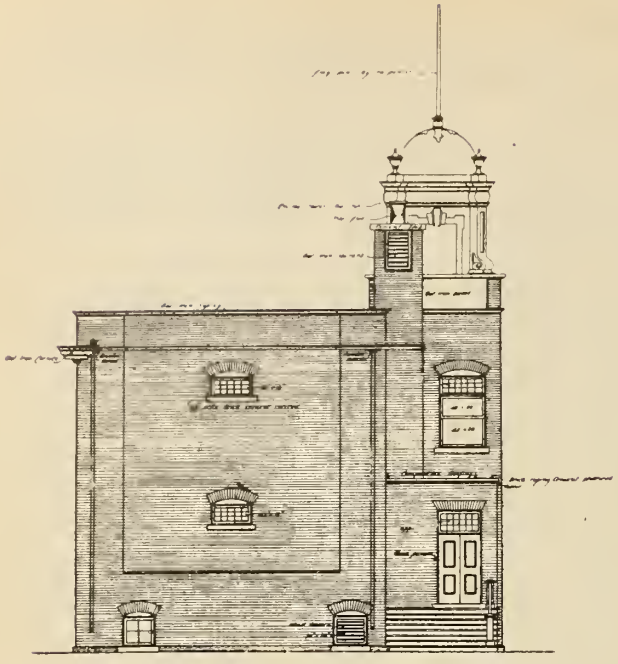
The main vent shaft is 3 ft. 0 in. wide and 4 ft. 0 in. deep, and contains a tile smoke flue, as shown on the plan and cross section. The door in the vent shaft wall, on the firing room side, is simply for the purpose of access to the air passages and is a thing apart from the ventilating system. The door, marked 1 ft. 6 in. x 6 ft. 0 in. serves as a controlling damper on the foul air escape.



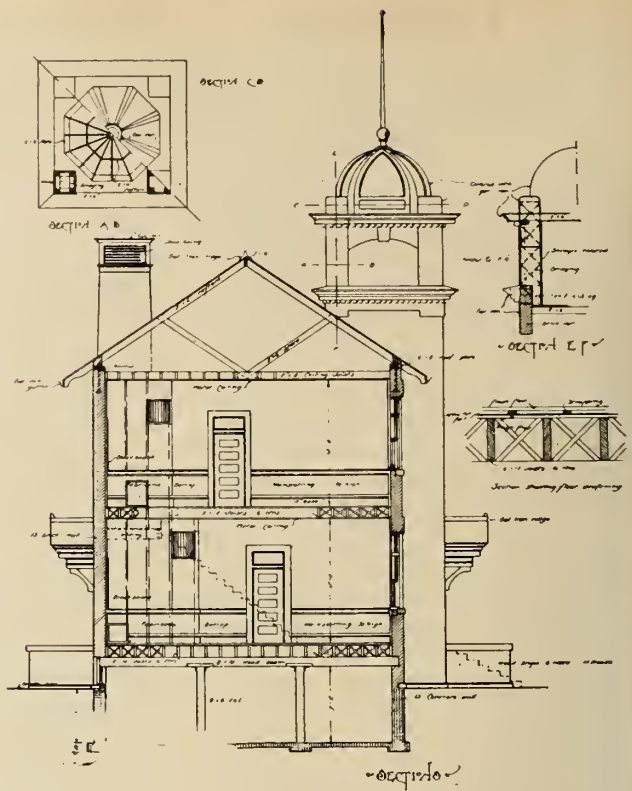
Cross Section.



Basement Plan.



Rear Elevation.



Section.

Operation of the System

Fresh, cold air enters the cold air room and passes to the heater chamber by way of the openings set at the floor line of the chamber. The cold air is here heated to the temperature required, and is then driven into the class rooms by the weight of cold out-door air. At a height of 7 ft. 0 in. from the class room floor lines, the air is driven from the ducts through galvanized iron diffusing faces. The warm air travels across the room close to the ceiling, drops to the floor along the outer walls, and then back to the foul air openings, placed close to the warm air flues, and at the floor line. In this way there is a complete circulation of air in the room.

Foul Air Passage

The foul air passage in the basement connects to an opening in the main vent shaft. This opening is covered by a door built in three sections. The object of constructing the door in this way is to provide a means for regulating the area of the vent opening.

At the top of the main vent shaft there is provided a system of automatic check dampers that close on the windward side of the flues during the time of brisk winds. At such a time the dampers on the lee side of the shaft are wide open; so it then becomes necessary to throttle the vent shaft at its base to offset the powerful pulling effect of the naturally induced vacuum.

When Heating Only

Before the pupils assemble in the class rooms, and at other times when the ventilating system is not required, the damper-door is closed and then the door between the foul air passage and the cold air room is opened. The cold air entries, in the walls of the cold air chamber, are closed. The air returning from the class rooms passes out of the foul air passage to the cold air room, and thence back to the heater chamber.

When using the apparatus as a heating system, the air is warmed to a much higher temperature than during the time of ventilation. With the higher temperature there is naturally a higher draft obtained in the flues, and sufficient to make up for the lack of temperature head existing when the main shaft and fresh air intakes are open.

The Smoke Pipes

The smoke pipes are run in circuits in the basement to heat that part of the building. In warm air systems there is often a great deal of heat lost by way of the smoke flue; so in this instance it was deemed advisable to run the smoke pipes just as in many other schools heated by warm air: in the long circuits.

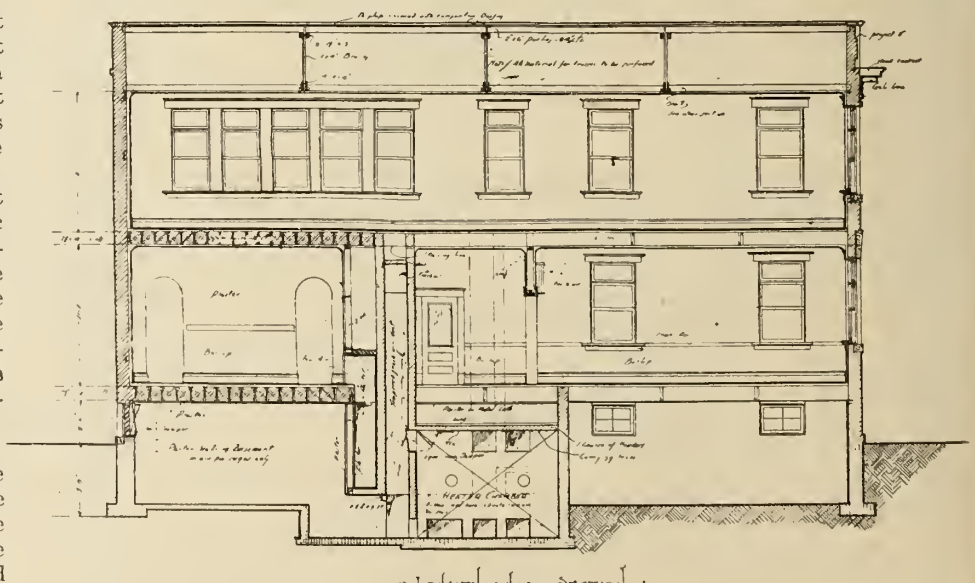
Such a long run of pipe would not be advisable when combination warm air and steam, or steam or water systems were to be used.

Direct Extraction Systems

Drawings Nos. 5 and 6 show a system used for the direct extraction of foul air.

This system differs with that already described in the paths taken by the foul air in escaping.

The cold air enters the heater cham-



Longitudinal Section.

ber; is heated, and discharged into the class room, much as in the previously described system.

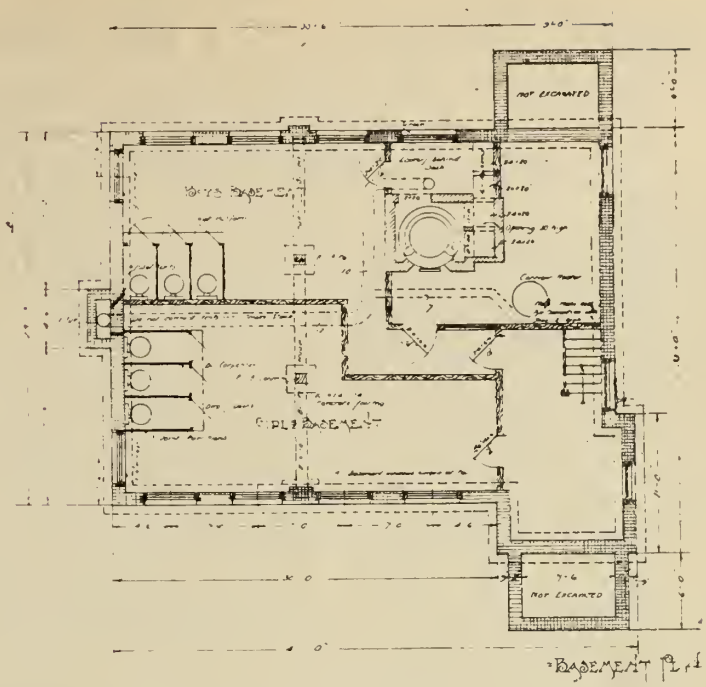
There is no main vent shaft provided. The foul air is discharged straight up to the outlet above the roof, as it is shown on the cross section, drawing No. 6.

A Return Duct

Immediately behind the foul air opening in each class room there is a damper that may be set to convert the vent flue into a return duct. When these alternating dampers are adjusted to close the outer passages, and to open the way of return, the cold air intake in the basement is closed. Then the ventilating system is no longer in operation and the plant becomes simply a heating apparatus.

In Saskatchewan Buildings

These heating and ventilating systems were installed in schools, set amid the unvaried plains of Central Saskatchewan. The rigors of the climate there call for installations of heating and ventilating systems that surely set a gauge for the easier problems coming in warmer lands.



THE QUESTION BOX

(Continued from page 35)

Say, Mr. Plumbing Editor, I sometimes get a chance to see your paper, and I was just wondering if you could tell me something. It is something I hear them talking about in the shop sometimes; the different classes of fittings, A, B, and C.

What does it all mean?

Is A class all up to and including ½-inch or all up to 1-inch, or what?

Does B class mean galvanized, or what?

I wouldn't bother you about this, but I can't get anybody in the shop to tell me. I asked the boss the other day, and he said he guessed it meant the different qualities.

And say, here's another thing I'd like to know. Why don't the brass companies put the official number on the boxes that have the goods in instead of their own number. I got the devil the other day for making a mistake on account of this mix up. These makers could just as well all put the official number on the boxes. Perhaps you know a good reason why they don't. I'll call and see you some time when I get my trade learned and I save enough money to go to Toronto Fair. Good-bye.

TINY TIM.

Will Send Full Details

Replying to the query of "Tiny Tim" with regard to the different classes of fittings: It would require a good deal of technical explanation to give a complete answer to this question. Fittings, Limited, of Oshawa, have placed upon the market a catalogue dealing with the several classes of fittings. Roughly speaking, "A" class consists of one-eighth inch fittings; "B" class of one-quarter, three-eighths, and one-half; and "C" class one-half up to two and one-half inch. At the same time it will be found that similar sizes of elbows are to be found in different classes of elbow. The class does not refer to galvanized, as the questioner suggests; all these classes are to be had in galvanized and black.

We would suggest that "Tiny Tim" communicate with us and we will be glad to provide him with the catalogue above referred to.

With regard to the question concerning the reason why brass companies do not put the official number on the boxes containing the goods, one wholesaler explained to SANITARY ENGINEER that it was, more or less, a matter of advertising.

"That is done," said our informant, "so that in case they want a certain fixed bibb, they will look up the number and be able to find out who makes it."

We trust these explanations will be satisfactory to "Tiny Tim" and that he may be able to call on us before the next Toronto Fair.

Editor, SANITARY ENGINEER,

Dear Editor,—Could you give the necessary information on the following: A friend of mine had a wood furnace in his house and had a new coal furnace put in, but since that has been done wet soot soaks through the brick and runs down the chimney. He claims that all the while he was burning the old wood furnace they never saw anything of such soot. Could you give me a remedy for same, and oblige?

AN INTERESTED READER.

Answer.—The heavy oily liquid that is running down the inside of the chimney is probably condensed hydrocarbon vapors, and the way to cure this trouble is to prevent condensation in the flue.

The condensation in the flue is due to a downward circulation of cold air within part of the flue, or by the cooling surface of the walls of the flue.

First look to the chimney and see if it is not much larger than the smoke collar on the furnace. If it is you should reduce its area at the top to the size of the smoke pipe, and in reducing it, be sure that the reduction is not made too abruptly. The reduction should be made with a pitch of not less than 60 degrees with the horizontal.

But perhaps the flue is shallow, but too wide. In that case build a new flue. There is another thing that may cause a downward movement of cold air within the flue: The too tight checking of the air supply to the fire. Don't check the air supply too much; use the open check damper on the pipe, and see that there is a plentiful supply of air to furnace room.

Examine the teeth of the grate to see if they are not plugged up with core sand.

The whole secret of preventing condensation in a chimney is to prevent air from travelling downward within the flue.

MARKET CONDITIONS

(Continued from page 38)

factorily overcome, to adjust the great difference existing between the different moneys. Nearly all ingots, however, are showing a strong tendency to to advance and are firming towards that end.

COPPER remains unchanged with a strong tendency showing towards advance Not much is offering, however, and the market is rather quiet. The present quotations are from a basis of 25 to 26 cents per pound.

SPELTER is quoting half a cent higher, with a slight demand offering. The tendency though is firm and unsettled. Quotations are now 10½ cents per pound.

Says Meters Will Effect Big Saving

W. H. Randall Tells of the Huge Waste of Water and How to Stop It—Practical Discussion at North-Ender Club Meeting in Toronto

Written for Sanitary Engineer by E. D. HEITT

MEMBERS of the North-enders' Educational Club of the Domestic Sanitary and Heating Engineers of Toronto listened to a most interesting and instructive address on "Water Meters" by W. H. Randall, for many years connected with the Waterworks Department at the Toronto City Hall, at their regular meeting on Thursday evening. Mr. Randall's entire address was a refutation of the plea that "water should be made as free as air"; and in the course of his remarks he showed the vast waste of water that was going on in many of the cities of Canada and the United States because it was not properly metered. That a tremendous saving could be effected to the householders of Toronto and to the city as a corporation by the installation of meters was the claim of Mr. Randall. The members of the club present took a very serious view of the situation and it was suggested by the president of the club, Roy E. Belyea, that the plumbers put a candidate in the field for municipal honors to run on the ticket of water conservation and the installation of meters.

The Meter Question

After expressing his pleasure at being present to address the plumbers on this important matter, Mr. Randall proceeded:—

"The general meter question has been before the public in the United States for many years, but in Canada it is only starting to become a live subject. You, sir, and gentlemen, being so closely connected with water distribution must have found that something in the way of a check must be done to offset the waste, due largely to the carelessness of the public, who, in many cases, allow their plumbing to become defective, and in others, allow the water to run waste down the sewer instead of the valve or tap being closed after each operation. This, as you know, is a common practice in garages and other places where they have cement floors drained to the sewer. The washer drops the hose on the floor and lets it run until he is ready to use it again. Thousands of gallons of water are allowed to go to waste daily in this manner.

Another Feature

"Then another important feature has arisen which practically makes it a compulsory for every city to consider the selling of water by meter to-day, viz., filtration plants, which have become a necessity in practically all parts of Canada, so that the pumping and filtering of water, with the cost of labor and the price of coal, is a very expensive proposition for any city; and to allow people to use water indiscriminately without any restriction will be, in the very near future, a thing of the past.

"One would, at once, ask the question, Why should a man pay for electricity by meter, or gas by meter, and he allowed to take water just as he saw fit at a rate based upon the number of rooms in the house? I think none of you would agree to start a private water company on any such basis as that. I have with me to-night some statistics showing the amount of water per capita used in many of the cities in England, Ireland and Scotland; also a statement showing water used in some of the cities of the United States."

Mr. Randall showed a table of figures and commenting upon them said that European cities used about 50 gallons, on the average, while the City of Toronto, for instance, used 128 gallons during the year 1918.

Results of Waste

Continuing Mr. Randall said: "You will notice in the statistics of the United States that Buffalo showed 310 gallons per capita, while New Orleans showed only 54. While we admit that there may be circumstances why one city would vary more or less in its per capita consumption, this should only be a matter of a few gallons. Buffalo, however, used about five times as much as New Orleans. This, surely, must be due to waste along the lines which I have already mentioned. The London Metropolitan Board, after an investigation, showed that 40 gallons per capita was enough for all sanitary purposes, yet it was found that only 34 gallons were actually used.

"Scarcely any one doubts the strong tendency of water meters, as of gas and electric meters, to prevent waste and leakage and secure careful use. How far meters will accomplish this requires very careful and exhaustive study.

"In the United States, according to the census figures, every million gallons of supply of water allowed to run to waste through leaking underground piping and bad plumbing cost a city for operation and interest charges $65.00 a day, or about $23,000 a year. With our high tax rate and the rapid increase in the cost of living, the financial advantages of checking leakage and other waste of water can hardly be exaggerated.

Business Properties

"The metering of business properties is agreed to by all. It will surprise most people, however, to know that the average house owner, as well as the city, gains by the installation of a water meter and every tenement house owner in this city would gain by having a meter installed.

"Take for example an eight-roomed house under the present system of rating in Toronto:

8 rooms at 65 cents	$5.20
Basin or tap in sink	1.25
One bath	1.25
Closet	2.00
Hose	1.00
Pair of laundry tubs	1.25
Total	$11.95

"With four persons in the house and taking a maximum use of 40 gallons per head through the meter, it would figure for the 12 months, 28,000 gallons. This at 13 cents net would only amount to $3.74 2-5 per year by meter, while the flat rate shows $11.95.

Save the Difference

"The minimum rate in the city, however, for meter rent is $2.00 per quarter, which would mean $8.00 per year; so that a person with a meter on an eight-roomed house would at least save the difference between $11.95 and $8.00, or $3.95, providing his plumbing and everything else was kept in proper condition. From this you will see that anyone with a house of eight rooms up would be better off by having a meter and would, in a few years, even if he had to buy the meter himself pay for same.

"My opinion on this question could be best given as follows:

First—That the water supply should be metered.

Second—That the meters should be purchased and installed by the city at its expense and not by the property owners as at present.

Third—That the city make all repairs to the meters at the city's expense.

Fourth—Installation spread over five or six years.

Fifth—A minimum rate should be fixed."

Would Cost $2,000,000

Following his address, several of the members of the club asked questions of Mr. Randall. The opinion was expressed by the speaker that it would take about $2,000,000 to instal meters in Toronto, spread over a period of five or six years, which would not equal the cost of a new filtration and pumping plant. He believed that the Commissioner of Works would soon be faced with the problem of providing either a new filtration and pumping plant or installing meters throughout the city. He looked forward to the day when the whole Waterworks Department would be run by a commis-

sion as the Hydro-Electric scheme was, because that would be the only revenue-producing form of government.

Overcoming Difficulties

Referring to the manufacture of meters in which he is engaged, Mr. Randall stated that they had had additional difficulties to overcome because of the strike of the metal workers in Toronto, but he believed this would soon be overcome. They were obliged to import many meters from the United States and pay a big duty on them; but they had finally succeeded in manufacturing a meter. This meter was shown to the members of the club, who evinced a great deal of interest in it.

President Belyea, in giving a report of the Conference Board, stated that they had recommended that all plumbers use the contract form for their work. Confusion was caused by only a few of them using it and the Board strongly advised that it be generally used amongst all plumbers.

It was also reported that the Conference Board was sending out feelers to the different associations to obtain their opinion regarding a new club house for all the Toronto clubs. The matter was discussed for a few minutes by the North-enders and their feeling was that the time was a little premature for the outlay of so large an amount as would be necessary to obtain this house.

The thanks of the meeting to Mr. Randall for his address was expressed by the president and secretary, Mr. Frankland.

COMMERCIAL TRAVELLERS' ASSOCIATION OF CANADA NOMINATE REPRESENTATIVE

The general meeting of the Commercial Travellers' Association of Canada was held in St. George's Hall, Toronto, on Saturday last. C. J. Tuthill, president, was in the chair, and in his opening remarks congratulated the members on the continued prosperity of the association, the year closing having been, he said, the most prosperous in its history, notwithstanding that the association had contributed over $75,000 during the five years of war to the various funds called for by the Government and had also invested $400,000 on Victory bonds, making the assets of the permanent reserve over one and a half million dollars invested in gilt-edged securities.

The following nominations were made for the Board of Management for the incoming year:

Toronto Board—C. J. Tuthill, president; Walter Moore, first vice-president; J. H. Dodgson, second vice-president, and E. Fielding, treasurer.

Directors for Toronto Board—C. A. E. Colwell, Jas. G. Cane, John Cormack, John W. Charles, John Curtis, F. W. S. Davis, John Everett, R. G. Hector, M. Matthews, B. E. Miller, C. E. Prime, J. Angus Taylor, Geo. L. Willmot, Geo. G. York and F. J. Zammers.

For the Hamilton Board the following nominations were received of which nine are to be elected: C. C. Smye, first vice-president, and Geo. A. Matheson, second vice-president; directors for Hamilton Board—E. J. Fenwick, David Fraser, R. T. Hunter, M. P. Malone, D. C. McKeon, C. P. Rason, John Stoneman, P. A. Sommerville and H. G. Wright.

The following boards were all elected by acclamation: Kitchener Board, W. J. Moody and F. S. Urstadt; Kingston Board, W. H. Graham and J. E. Singleton; Guelph Board, Adam Taylor, vice-president, and T. H. Gommell, director; Brantford Board, J. H. Hamilton, D. J. Waterous; Montreal Board, W. Williamson; Winnipeg Board, A. C. Merrett, vice-president, and A. E. Rowland, director; Vancouver Board, F. W. Sterling, Robt. Stewart; Ottawa, Board, J. H. Laurie; Brockville Board, F. L. De Wolfe; Peterboro' Board, W. J. Hopwood.

The scrutineers of the ballot are H. C. Clearihue, John H. Kenney and Walter Madill.

The result of the ballot will be declared at the annual meeting in St. George's Hall, Saturday, December 27th.

Expects Little Change In Prices of Stoves

Discussing with SANITARY ENGINEER the outlook in the stove trade, Col. W. M. Gartshore, of the McClary Mfg., Co., London, Ont., stated that business has been excellent, especially in the West. Unless there are developments due to scarcity of raw materials or labor disturbances, he does not look for any change in prices.

The McClary Mfg. Co. will commence the erection of a $100,000 addition to its foundry in the course of a few days. Work is now in progress on a five-storey warehouse that will cost $50,000.

Col. Gartshore states that there has been a good demand for merchandise for export, but the firm has not been able to fill anything like what is looked for because all home demands are being met first. He is looking for splendid business in 1920.

Discusses House Heating by Gas

Members of North-Ender Club of Toronto Hear Practical Address—Many Questions Asked Regarding the Results to be Obtained

"HOUSE Heating by Gas," was the subject of an illustrated lecture by H. S. Dodd of the Dodd Heating Systems to the members of the North-Ender Educational Club at their regular meeting on Thursday night. Besides the North-Enders several visitors from the other "Ender" Clubs attended.

Prior to the address a somewhat lengthy discussion ensued over the proposed new club house, which would be at the disposal of the various "Ender" clubs and which would be the headquarters of the Ontario Society of Domestic Sanitary and Heating Engineers. The special committee appointed to look into this matter have secured a site which they feel will be suitable for the purpose and they are now asking the individual members of the "Ender" clubs to express their approval, in hard cash. Lists are being circulated amongst the members, and they are asked to subscribe $100 each. The house selected for the purpose will, it is understood, cost about $10,000; and the annual maintenance cost in connection with the local and the Ontario societies about $6,250.

Are Enthusiastic

Considerable enthusiasm was manifested by the members in the discussion of the question and the consensus of opinion was decidedly in favor of the proposed club house. Moreover, the enthusiasm was expressed in a very tangible form, for many of the members of the North-Enders unhesitatingly signed for the $100. President Belyea intimated to the members of the club that he had told the central executive that the North-Enders would subscribe up to 90 per cent. of their membership and already they are within sight of this objective.

Mr. Dodd's Address

Mr. Dodd's address was illustrated by slides showing the construction of the Dodd gas furnace, a number of houses in which one of their furnaces has been installed, and charts showing the actual consumption of gas for such houses. In describing the Dodd furnace, Mr. Dodd directed attention to several of the more important features of the system. The heater element was removable so that the furnace could be cleaned; the observation window gave access to the pilot light and to the thermostat which could be fixed for the winter, thus securing a uniform heat during the entire winter season; to the safety valve which obviated all possibility of an explosion. Mr. Dodd said they advised installing a tile pipe so that the diffusion of the gas from condensation would not eat and finally destroy bricks and mortar.

Bricks Crumbled.

Reference was made by the speaker to one house where this was not done originally with the result that bricks in the chimney began to show evidence of crumbling but when this fibre pipe was installed, the trouble was overcome. Mr. Dodd explained that the varying pressure of gas was taken care of by the governor. The working efficiency of the system was about, on the average, 93 per cent, if the boilers were properly covered.

Illustrations of a number of houses in which the Dodd system had been installed were shown. One of these was a 13-roomed house, which included two bathrooms and a sunroom. It was of solid brick and had 880 feet radiation. From the first of December to the end of May the gas bill was $201. In the winter of 1917-18, about 18 tons of coal had been burned in this house. The gas company, said Mr. Dodd, were in the habit of giving a rebate on the use of gas for heating purposes, and in the case of the house he described, as well as others, the chart shown gave the figures after the rebate had been given.

Many Questions Asked

Following his address, a number of the members asked several questions of Mr. Dodd. In answer to these questions, Mr. Dodd explained that no extra premium was charged by insurance companies when a house was heated with gas used in their furnaces. The underwriters had examined the system and approved it. Their furnace, he said, would work with either steam radiation or hot water.

Several members wanted to know about the comparative cost of heating by gas and coal in an 8-roomed house. Mr. Dodd stated that they had estimated that in such a house the cost of heating by gas would be from ten to fifteen per cent. higher, if you did not include the cost of having a man to attend to the furnace. In that case, gas was a little the cheaper. At present, they had a 1,000 foot boiler, and a 750 foot boiler. They hoped, in the near future, to have a 500 foot boiler.

Mr. Dodd's address was listened to with great interest and at the conclusion of it, the thanks of the society was expressed by President Belyea.

Asking for First-Class Rates on Express Shipments of Electric Bulbs

A CASE in which the manufacturers and shippers of electric bulbs are vitally interested was recently brought to the attention of the Dominion Railway Board, which held a sitting in Toronto. As the law now stands, these bulbs are carried by the express companies at double first-class rate. The Canadian Manufacturers' Association, in taking up the cudgels for the producers and shippers, are asking for the normal first-class rate. They submitted evidence showing that electric lamps were carried in the United States and from the United States into Canada at the first-class rate. If was further shown that 22 per cent. of the export trade in this article from the United States in 1918 came to Canada.

The Company's Claim

The attitude of the express companies as voiced by the secretary of the Express Traffic Association, Mr. C. N. Hamm, was that incandescent lamps were very bulky and light in proportion to other goods, the result being that cars were often loaded with electric bulbs to the exclusion of the more profitable goods. To the contention of J. S. Walsh of the C. M. A. that lighter articles such as musical instruments, wicker furniture, tins, wire goods, etc., were carried at normal rates, Mr. Hamm replied that these articles were not sent in such quantities.

The Chairman's View

The chairman of the Board, F. B. Carvell, in championing the rights of the people, said: "I do not accept the idea that the express companies can say we won't accept a certain class of goods because it does not suit us. The express company is a public utility, and the people are entitled to use it if they like."

No decision was given by the board at the time of the hearing; and SANITARY ENGINEER learns from the C. M. A. that no judgment has yet been received by them of the attitude of the board in the matter.

The attitude of the C. M. A. in the matter is that the only justification the express companies would have for charging such a rate would be the percentage of breakages as being very high. This was not shown by the companies in the case which they presented to the board.

The Chemical and Engineering Company, Ltd., head office Ottawa, capital $50,000, plans to carry on a general engineering business including water, gas, sewage and drainage works.

EDITOR, SANITARY ENGINEER

Dear Sir,—

Would you please answer the following, as per sketches submitted, and oblige

How long would it take to heat the water in the tank in sketch No. 1? Stop-valve A is closed when tank is being filled from service. After tank is filled, valve B is closed and A opened. Both down and up pipes are level or flush with the tank bottom. Your reply will be much appreciated.

Subscriber, London, Ont.

About Ten Hours

Subscriber.—Lacking information regarding the heating capacity of the heater, and the required temperature of the water, it is difficult to give a very definite reply to the query: "How long will it take to heat the water in the tank?"

We are, however, assuming that the heater shown is one of that size ordinarily used in connection with a 30-gallon domestic tank, and that the water is to be raised from an initial temperature of, approximately, 42 degrees to a final temperature of 120 degrees above zero. If this assumption is correct, we may say that the time taken to effect the temperature change will be about ten hours. This is figuring for clean burners and a good quality of illuminating gas.

Of the two arrangements, the tank connections shown in the drawing marked Fig. 2 are superior to those shown in Fig. 1.

The stop-valve marked A in Fig. 1, and its corresponding valve in the return pipe of Fig. 2, should be omitted, as they serve no useful purpose, and may prove a source of destruction to the heaters in the event of being closed when the gas in the heaters is alight.

EDITOR, SANITARY ENGINEER

I want to instal a radiator as shown in the sketch enclosed, "Proposed radiator," which will be at the same height as the present heater which is in the house. Would this be effective?

E. N. ROOCH.

Should Run Pipe

E. N. Rooch.—To insure any degree of hot water circulation through a radiator set at the same level, or below the boiler, a pipe should be run up as high as possible and the radiator fed from that pipe, as indicated by the dotted lines that we have drawn on your sketch. The purpose of the overhead loop is to establish a temperature head sufficient to overcome the resistance of the trapped connection, that must be made in the radiator return to prevent the hot water in the lower part of the boiler backing into the radiator. The overhead loop may be vented to the expansion tank.

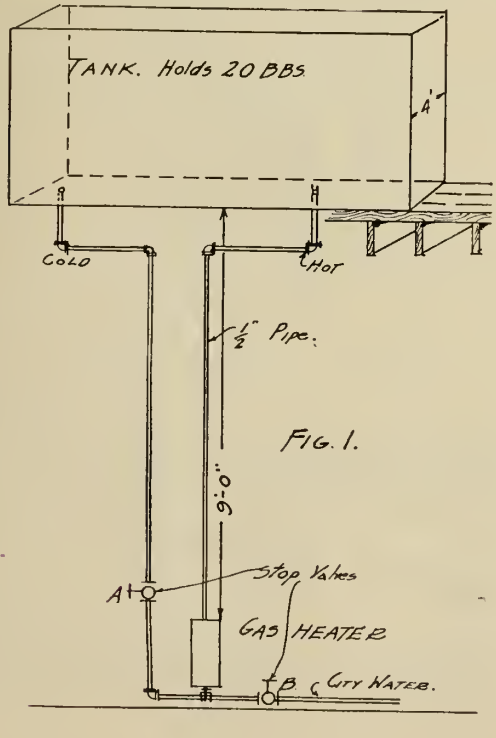

FIG. 1.

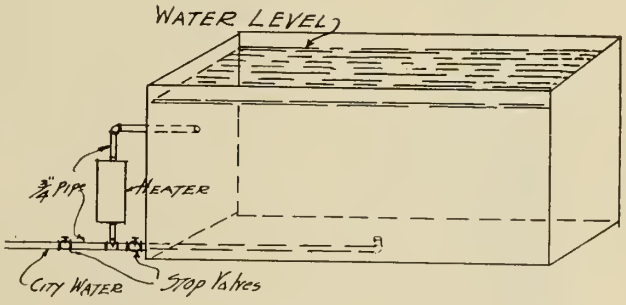

FIG. 2.

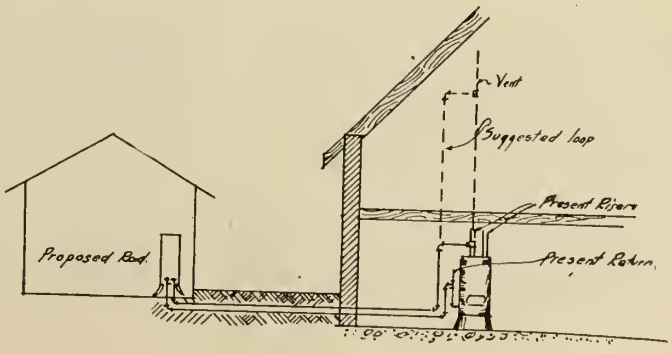

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

THERE still continues to be a very strong tendency in nearly all lines of plumbers' and steamfitters' supplies and many important price changes have gone into effect. The continued industrial disturbances are causing serious shortages in many lines. Jobbers as a body are not generally charging premiums, but rather are trying to steady prices by selling at the official quotation, but claim it is necessary to charge a premium where they have to buy indirectly and at a higher figure.

Plumbers' brass work shows an advance of approximately 15 per cent. over former prices. Cement laundry tubs are now quoting at $2.00 each net higher than previously; closet combinations have advanced $2 each net, while white china closet combinations have advanced $3. Wrought pipe continues to be very scarce owing to the shortage of skelp; in enamelware the demand is said to be greater than the supply, although manufacturers have been increasing their output.

Steel showed an advance at the mills of $3 per ton and as this has a direct bearing on all steel or iron products, black sheets are reported higher. Compression work shows a 15 per cent. advance. Bath tubs are showing a demand greater than the supply. Ingots are firming with not much offering. Tin is some stronger, also spelter, with not much offering.

TORONTO, Ont., Nov. 14.—Higher prices are still the order and some changes have been noted. The general tendency is for higher prices, and reports indicate that further disruptions would have a very bad effect on the market generally. Sheets show a strong tendency owing to the scarcity. Ingots are firming, with tin and spelter showing stronger prices. Plumbers' brass and compression work advanced approximately 15 per cent. Some scrap materials advance while others show a decline with the market temporarily quiet. Enamelware still remains scarce, and manufacturers are finding difficulty keeping up with orders.

Closet Combinations Advance $2 and $3 Net

CLOSET COMBINATIONS have followed the general trend of enamelware; business has been exceptionally brisk in these, manufacturers having difficulty to keep anywhere within reach of the large orders that are pouring in from all sides. The advance noted above former prices is $2.00 net, while white china is up $3.00 net.

Cement Laundry Tubs Are Up $2 Net

CEMENT LAUNDRY TUBS.—The demand has been very brisk for cement tubs and has exceeded the supply, owing to the increased amount of building which has taken place this season, it is stated, and building, instead of slackening off, seems to be increasing, which makes it harder for jobbers to catch up with orders. The new price shows $2.00 net higher than previous prices.

Waste and Oakum Firm; Show No Change

WASTE AND OAKUM.—No change has been noted, although cotton has been very active on the American markets. A good demand is reported, and no immediate change is expected in the price. The quotations are as follows:

	Per 100 lbs.	
Best American	$21 00	$22 00
Clipper, spun	....	21 00
Do., unspun	....	19 50
Plumbers' spun	10 00	10 75

Boiler Tubes Show No Change

BOILER TUBES.—While the boiler tube situation is not so serious as the pipe, there is a slight scarcity. Jobbers, however, state that tubes are coming in fairly well, and they are able to handle all business offering with a fair amount of service. The prices now quoting are as follows:

	Per 100 feet	
BOILER TUBES—	Seamless	Lapweld
1 inch	$27 00	.....
1¼ inch	29 00	.....
1½ inch	29 50	.....
1¾ inch	32 00	$27 00
2 inch	31 00	26 00

3¼ inch	.....	47 00
3½ inch	60 00	44 00
4 inch	75 00	56 00

Lead and Zinc Products Show No Change

LEAD AND ZINC PRODUCTS.—Although the raw materials for manufacturing these products have changed to somewhat higher levels there is no change made in them to date. The seasonable demand is said to be excellent. It would be difficult to predict whether a change will take place in the near future, but none is looked for at present. Quotations are as follows:

Lead pipe, list, per lb.	....	$0 12½
Lead waste pipe, list, per lb.	....	0 13½
Do., over 8 inches, list, per lb.	....	0 14½

Solder, wiping, lb.	0 31½	0 34
Solder, wire, lb.	0 35½	0 41
Zinc sheets, per lb.	....	0 17

Some Scrap Materials Up, Others Weaker

SCRAP AND WASTE MATERIALS show some advances with a firmer market noted on heavy lead pipe, stove plate, heavy copper machinery. While a lower price is noted on old rubbers, boots and shoes, overseas, lumbermen's rubber boots. As industrial disturbances gradually settle it would not be surprising to note numerous changes in scrap materials of all kinds. At present, however, the tendency seems to be a rather quiet one. Quotations are as follows:

DEALERS' BUYING PRICES

MADE IN CANADA

MUELLER

Compound Lever Action Ball Cock

Made for High Up and Low Down Tanks

NOTE—Can be furnished with either 5/8" or 1/2" shank with tail-pieces for 3/8" I.P. or 1/4" I.P. respectively.

THE A-1270 MUELLER Compound Lever Action Ball Cock is high grade in every respect and like other Mueller Products is "Fully Warranted." All parts are made of Red Brass with high copper content; tested at 200 lbs. pressure. The hush tube on the High up Cock surrounding Cast Brass Supply Tube ensures silent action; fitted with compound lever action controlled by thumb screws. Easy access to all working parts enable repairs to be made without removing Ballcock from tank. Rigid inspection after every process of manufacture ensures perfect operation.

Soil Pipe and Fittings, Prices Still Hold

SOIL PIPE AND FITTINGS.—The demand still continues for soil pipe, and no change in prices are noted. Labor conditions are still a factor in the high price of this commodity. No increased production is looked for till winter sets in as manufacturers are working to capacity. However, when the winter sets in it is expected production will catch up with the demand, and probably get ahead in order to be able to cope with the large demand expected in the spring. Quotations are as follows:

Wrought Pipe Unchanged; Continues Scarce

WROUGHT PIPE.— At present almost a famine in wrought pipe is being felt; that is to say, in some sizes. The shortage of skelp continues to be the main factor and as considerable skelp comes from the United States, the recent strikes have disrupted shipments. However, some relief is offering by substituting steel where consumers are willing to accept and pay the difference in price. Quotations are as follows:

WROUGHT PIPE

Compression and Plumbers' Brass Work Up 15%

COMPRESSION AND PLUMBERS' BRASS work show an advance of practically 15 per cent. This is not unexpected, and it has been stated if Europe comes into the market another advance would not be unlikely. The demand for this commodity has continued very brisk and seems to be increasing. Quotations are as follows:

Compression work, standard	28%
Fuller work, standard	34%
Bath cocks, compression	30%
Bath cocks, Fuller	34%
Flatway stop and waste cocks, standard	32%
Roundway stop and waste cocks, standard	32%
Brass steam cocks, standard	Net List
Globe, angle and check vales, standard	5-9%

Basin Cocks	
No. 0 and 1, Fuller pattern	34%
Compression	23%
Quick opening	34%

Range Boilers Steady; in Good Demand

RANGE BOILERS.—There has been a good demand for range boilers. Prices do not show any change, and manufacturers are not generally looking for any at present, they state. A general business increase is noted in nearly all lines of plumbers' supplies, and is no doubt due to the large amount of building which is being done. Following are present quotations:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Conductor Pipe Firm; Showing No Change

CONDUCTOR PIPE AND EAVE-TROUGH continue firm with a good business offering. An immediate change is not expected, although higher prices would not be surprising, owing to the scarcity of galvanized sheets. Following are quotations:

PIPE (Conductor)	Plain
2 in., in 10-ft. lengths, list	8 00
3 in., in 10-ft. lengths, list	9 70
4 in., in 10-ft. lengths, list	12 80
5 in., in 10-ft. lengths, list	17 50
6 in., in 10-ft. lengths, list	21 30

F.o.b. Toronto, Ottawa, Oshawa.
List less 10%.

Enamelware Firm; Continuing Scarce

ENAMELWARE continues, if anything, to be scarcer than before, bathtubs particularly. Manufacturers a while back felt confident they could catch up with their orders, which were held up by the strike which occurred in the spring and lasted well into the summer, but on account of the increased demand have not been able to do this and have difficulty in keeping within two or three weeks of the amount called for. It was unofficially mentioned by one maker that the increased demand was so great that notwithstanding the fact of increased labor, and providing they were able to manufacture five hundred bath per day of the present output, at the end of six weeks' time they would just be comfortably able to take care of the business offering. The following are quotations on some of the better known lines:

Bath tubs, roll rim, 4. 4½, 5 feet, 24 to 30 in. wide	$37 05
Bath tubs, 5½ ft.	41 20
Lavatories—	
17x10" Apron F139 or P4045	11 05
18x24" Apron F154 or P3845 or P3847.	17 00
18x21" Apron F169 or P4205	12 70
18x21" Roll rim F197, F199 or P4655-6	11 10
17x19" Roll rim F241 or P4345	9.05
Sinks, roll rim, 18 x 30 in.	16 60

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	$5 40	$5 35	$5 30
18 x 30	6 20	6 50	6 10
20 x 30	7 10	7 05	7 00
Closets, oak tank and seat			26 50
Do., enamel iron or white vitro tank			30 00

Sheets and Plates Scarce; Black Shows Advances

SHEETS AND PLATES—Owing to recent steel strikes and also coal strikes black sheets are reported to have reached a higher figure, which is not surprising. Another factor is the extreme scarcity of both black and galvanized sheets, which are said to be almost a famine, and any shipments that do reach are used up before there is a chance to stock up the warehouse, and very little has a chance to trickle through as far as the warehouse. There seems no available stocks at the mills, and it is stated that any shipments that do reach are stocks of odds and ends that have been laying around the mills. It was expected that manufacturers would be able to put some on the market to relieve the situation, but apparently they have been so far behind, that what is being manufactured is handed around in small dribs, and a hand-to-mouth proposition prevails. The following quotations are current at present:

BLACK SHEETS—		
14 gauge	5 45	6 00
16 gauge	5 60	6 50
18-20 gauge	5 15	6 55
22-24 gauge	6 20	6 60
26 gauge	6 30	6 65
28 gauge	6 45	6 75
3-16 inch plate	4 90	5 25
¼-inch boiler plate	4 50	5 80

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS.

	Premier		Apollo	
10¾ oz.	8 90	9 50	8 00	9 25
U.S. 28	8 30	9 90	7 60	8 55
U.S. 26	7 90	8 50	7 30	8 20
22 and 24	7 70	7 90	7 15	8 00
18 and 20	7 50	7 70	7 00	7 80
16	7 25	7 50	6 85	7 60
12 and 14	7 05	7 25	6 70	7 35

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Ingots, While Quiet, Show Upward Tendency

INGOT METALS.—The tone of the market generally are strong, and if it is possible to arrange finance with Europe, higher prices will undoubtedly be paid. Up to the present time, however, ways and means have not been satisfac-

Look on Drawings for

"J.M.T."

It's on most specifications

Morrison Valves are so well known to men in the mechanical field that they seldom think of specifying others.

Engineers, draughtsmen and designers are responsible and answerable for the work they plan, so their action infers perfect confidence in Morrison Products. Customers buy them readily for the same reason.

IS THIS THE SOLUTION?

Another scheme to rectify the distressing prices now prevalent, by other than sound economic measures, was outlined before the Union of Canadian Municipalities which recently convened at Kingston.

THIS RESOLUTION HITS YOU WHERE YOU LIVE

"We submit the principal root of the evil is the present wasteful, inefficient and antiquated method, or rather lack of method, of distributing the goods from the producer and manufacturer to the consumer—wasteful of time, labor, health, happiness and even human life—inefficient and antiquated in this age and to such an extent that even the huge economies effected by the greatest array of labor-saving machinery the world has ever seen are in a large measure rendered null and void. An ever-increasing army of unregulated distributors and relatively an ever-decreasing army of producers with the leaders of all these practising profiteering and price-manipulation as their fancy may dictate or opportunity may permit.

"Among the minor causes are the various classes of idlers and usurers, who in devious ways levy toll on labor and industry. Waste of time in high schools and colleges teaching dead languages and other unpractical subjects to the partial or total exclusion of vocational training, economics and useful branches of learning which would be of greater value for purposes of mind development and discipline and thereafter more useful to the individual and the country."

SAYS THE FINANCIAL POST IN REPLY:

"It is, of course, possible that there might be a dissenting voice, heard above this chorus of condemnation. A voice that might suggest, for instance, that the fact that the producer is getting $24.50 per hundred for hogs, where he formerly got $6, might, perhaps, have as much to do with the matter of increased cost as the inefficient handling that gives to the packer 5-16 of a cent per pound on bacon, or to the retailer a bare 5 cents a pound. Or the fact that the farmer is now guaranteed a price of $2.15 a bushel for wheat that formerly he sold with satisfaction for 90 cents, may be as much responsible as the half cent a loaf profit of the baker, or the cent profit of the retailer.

"It is a question, too, whether all the blame for the trying conditions of the present time should be laid at the door of established trade, any more than at any other door. There seems no good evidence for believing that the business morals of the merchant class are worse than any other, and there might be those who might reply to the stricture that our schools and colleges are not devoting their attention strongly enough to the bread and butter needs that "man does not live by bread alone."

The frank object of this resolution was "to attain a substantial reduction in the cost of living generally, but without increase of hours of labor or reduction of wages." It is the possibility of this which THE FINANCIAL POST doubts.

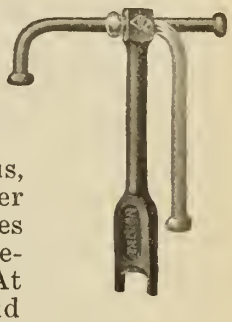
Williams' Falcon Drop-Forged Waste Plug Spanner



THE old adage tells us, "Necessity is the mother of Invention," but makes no mention of the father; presumably he is "mere man." At any rate, we are rather proud to have "fathered" the invention of the useful and badly needed tool here illustrated.

It is far more efficient than any possible makeshift, and its folding handle allows it to be readily carried in the pocket. The dimensions of the "finger ends" make it universally adaptable to all sizes and forms of basin and sink plugs and grates. The tool is hardened for severe service. Descriptive Booklet on request.

Pipe and the Public Welfare

By R. C. McWane

A Book of the Greatest Value to Every Sanitary Engineer

Every sanitary engineer should possess this book. It deals with pipe making of all kinds, cast iron, wrought iron, steel, wood and tile pipe. It is valuable because it gives a true idea of how much service pipe should give under various conditions.

Price $1.00 Postpaid

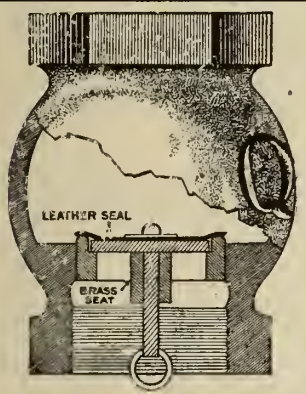
Works: Lachine, Can.



This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

R. MACDOUGALL CO., LTD.
GALT., CANADA

A Quick Selling Pair

For all around domestic utility, they appeal to the housewife.

Desolvo clears clogged pipes instantly by heat and chemical action.

K. K. Cleans Closets in a jiffy and makes a disagreeable job pleasant.

Saves You Money

Allpriser Service

Why stand losses, unnecessary overhead and confusion of cost data? Allpriser Service is a direct saving of money and pays for itself—pays you a profit on itself, in fact. Did you never sell an article costing 12c for 10c?

Allpriser Service consists of a flexible leather bound book 7 x 9, of 150 loose-leaf pages. The service includes a list of net prices of all staple articles and a regular service of new sheets revised to the latest changes. Allpriser Service is only $25.00 annually.

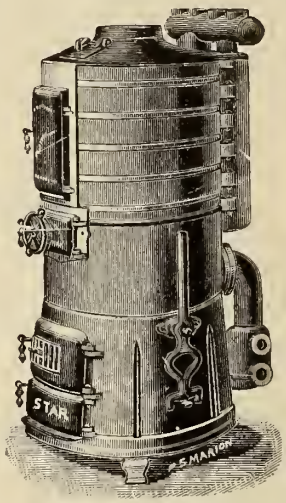
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.

The principal feature of the Star Boiler is that no other round hot water boiler has any coal-saving improvement not embodied in the "Star."

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

O. BELANGER, REG'D.

"Crandon" Heat Regulators

Here's a Question

Would you send out a team without reins—would you try to drive an auto without a steering wheel? That's what you do when you instal a heating system without a heat controlling service.

Don't Do it again. But Remember this

Every heating system now installed is like a runaway horse. It is running away with the world's coal supply, and you are casting lots of profit by neglecting to sell the Crandon heat regulator. Get right in line at once. Make more profit and become a real fuel conserver at the same time.

There's Something about an Original that Can Never be Imitated!

IF you've ever heard Harry Lauder sing his Scotch songs you could tell an imitation with your eyes shut.

You've seen Charlie Chaplin do his stunts—do you think an imitator could fool the people?

Whether it's real diamonds or paste—whether it's pure gold or brass—an imitation is simply an imitation—**and nothing else.**

That's why the thoughtful steamfitter isn't going to fall for anybody's talk about something "just as good" as "X" Boiler Liquid. He knows that for positive results it is safer to stick to the original. An imitation of the genuine "X" may look like it — but that's all. Patents are allowed on the "X" Liquid process. Its quality **can't** be imitated. Imitations of the genuine "X" Liquid cause foaming. **"X" will prevent foaming.**

No fitter can afford to experiment with his profits. When you get a leaky or cracked boiler job you want to know that you can send any man to that job—have him finish it quickly—otherwise there's the kicking, the arguing and the time-wasting that is utterly useless from a money-making standpoint.

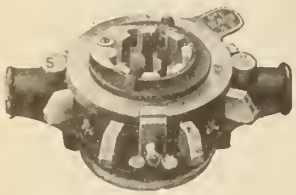
Over 25,000 steamfitters now know that "X" Liquid is the **only** scientific process for repairing leaky and cracked boilers—and for making them LEAKPROOF—RUSTPROOF — AND SCALEPROOF. They know that with "X" they make three times the profit that they could by dismantling and welding.

And they wouldn't risk their reputations experimenting with an imitation.

"X" LABORATORIES

636 Washington St. Boston, Mass., U.S.A.

Constant Sales Increase

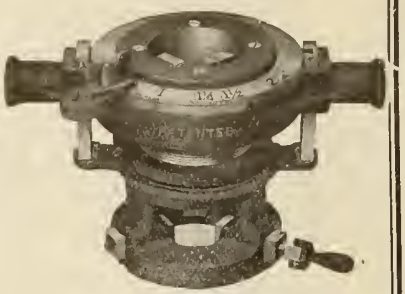


6 Beaverette to ¾ inch.

This efficient little die stock has been about 10 years on the market with constantly increasing sales.

The only tool that threads ¼, ⅜, ½ and ¾ without changing dies or bushings. Two sets of dies are operated by one handle.

Beaver 25 and 26 1 to 2" are alike except that 26 has ratchet attachment. They operate on the Beaver receding die principle—the further you thread the easier the labor. A man of ordinary strength can cut a 2-inch thread with one hand. Together these tools cut ¼ to 2-inch pipe without change of dies or bushings.



No. 25 Plain 1 to 2 inch.

Have You Taken Down Your Sign?

A prominent merchant who has made a great success of all branches of his business has said that withdrawing advertising from a good trade paper is like taking down your sign. Advertising to the trade you serve is business insurance, but premiums must be kept up or the policy will lapse.

There never was a time when the trade was keener for business information. That is why the advertising pages of the Sanitary Engineer are being followed so closely at the present time.

Pipe Fittings

Made in Canada

The Brand that has the Quality

M Brand Pipe Fittings, etc., give a service and satisfaction that will invariably get you re-orders and much new business as well.

A trial of the goods will prove this claim.

CAST IRON FITTINGS

With this brand mean fittings made with iron of high tensile strength—proper proportions and correct tappings.

RECESSED DRAINAGE FITTINGS

MALLEABLE FITTINGS

With this brand mean fittings made of Air Furnace Refined Iron, reamed and tapped to gauge with perfect threads

Standard and Extra Heavy Flanged Fittings and Flanges. Galvanizing Malleable and Gray Iron Castings of all Kinds.

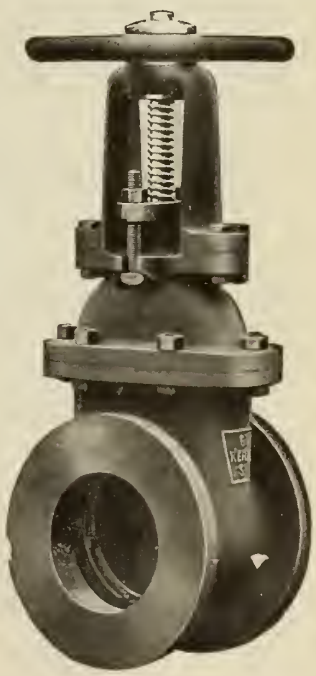
There Are Lots of Gate Valves

Advertised and Sold

but not all of them possess that neat appearance, combined with strength and stability, which characterizes

KERR IRON BODY GATE VALVES



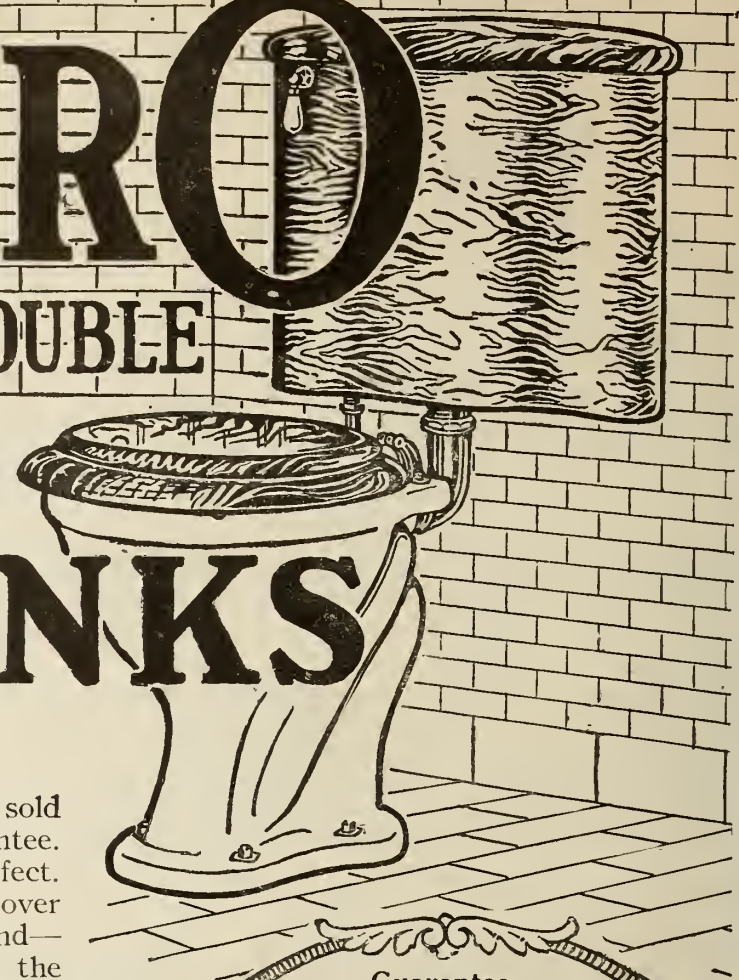
Specify KERR'S (KEYSTONE) Iron Body Gate Valves on your next order, and let us prove what we claim for them.

Our Catalogue No. 5 tells all about them. It is yours for the asking. Write us to-day.

Approved by the Fire Underwriters' Association, and Registered by Boiler Inspection Departments of Ontario, Saskatchewan and Alberta.

THE KERR ENGINE COMPANY, LIMITED - Walkerville, Ontario

VitrO NO-TROUBLE TANKS



THE VitrO Tank is sold by us and sold by you under an absolute guarantee. Workmanship and material is perfect. If not—if you or your customers discover a flaw that our inspectors failed to find—you get a new tank. Simply return the defective tank to the jobber where you got it and he is authorized by us to exchange it for one that *is* perfect. This guarantee holds good any time, provided, of course, the defects are not the effects of carelessness or abuse.

Absolutely Guaranteed

The VitrO Tank won't be found defective very often—rest assured on that. No trouble with the VitrO—either for the customer, the plumber or the jobber. It never leaks because it is all in one piece with no seams or lining. It can't corrode, crack, or warp—the VitrO isn't built that way.

Fitted with VitrO Lever, VitrO Flush Valve and VitrO Ball Cock tested to close off at any pressure from 1 to 150 pounds—and guaranteed to do so. All finishes, enamel, oak, mahogany.

Have you seen the VitrO Catalogue? Write us or your jobber. You'll appreciate our Guarantee.

Guarantee

WE guarantee that should a VitrO Tank at any time prove defective through either material or workmanship, a new one will be given to the plumber by the jobber from whom he purchased it. In no case will credit be given to the jobber until the defective tank is returned and examined, and when a tank is returned same must be complete with all fittings; otherwise, credit will be given based only on the value of the goods returned.

Exception

This guarantee does not apply to defects caused by carelessness or abusive wear and practice.

Note

A VitrO Tank must not be returned because of a defective fitting or cover. A defective fitting or cover will be replaced at once; however, the defective one must be returned for examination.

When tanks are broken in transit, claim must be made against the Railroad Company.

UNIFORM HEAVY BONNET
SEATS WHEN OPEN TO ALLOW FOR PACKING UNDER PRESSURE
LARGE HEAVY HEXAGON TO ALLOW LONG THREAD ON PIPE AND GOOD CLEARANCE ON END OF PIPE
FULL WATERWAY
HEAVY UNIFORM BODY

PLATE A840
JENKINS DISC GLOBE VALVE

THE whole steam system will be dubbed wrong if a faulty valve is installed, no matter how good the other fittings are.

The sanitary engineer cannot afford to have his good work reflected upon by so small, yet so important, a factor of the work.

Make sure that the valve is right above everything else.

"Emco" valves are fitted with special high heat-resisting "Radium" discs which last a lifetime.

They are registered in all provinces of the Dominion, our ordinary line being approved for 175 lbs. working pressure.

All goods are thoroughly inspected and tested before they leave our factory.

Send for our catalogue. Specify "Emco" valves from your jobber or order direct from us.

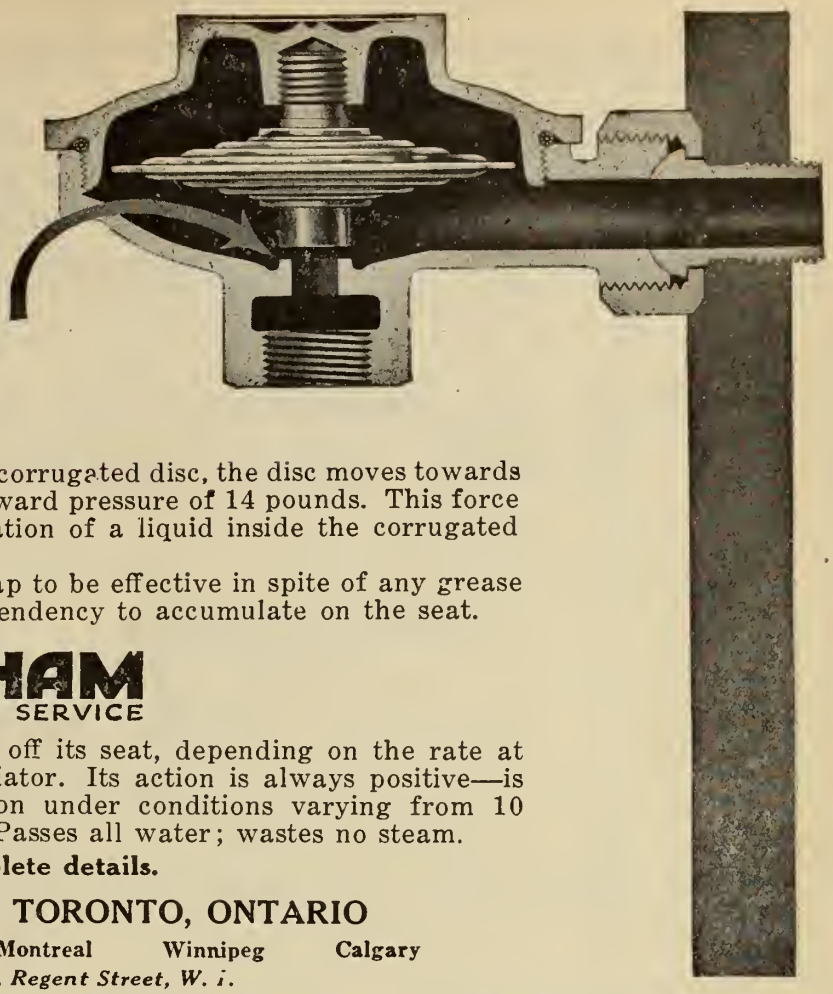
"MADE IN CANADA"

14 Lbs. Pressure downward



AS soon as steam strikes the sensitive corrugated disc, the disc moves towards its seat and exerts a maximum downward pressure of 14 pounds. This force is exerted uniformly by the vaporization of a liquid inside the corrugated disc.

This downward pressure causes the trap to be effective in spite of any grease and foreign matter which might have a tendency to accumulate on the seat.

The DUNHAM HEATING SERVICE

In action, the disc is alternately on and off its seat, depending on the rate at which the steam is condensed in the radiator. Its action is always positive—is never sluggish—and can be depended on under conditions varying from 10 pound pressure to 15 inches of vacuum. Passes all water; wastes no steam.

Write for complete details.

The Canadian Society of Domestic Sanitary and Heating Engineers

PRESIDENT
Frank R. Maxwell, Toronto

VICE-PRESIDENT
Harry Mahoney, Guelph

SECRETARY-TREASURER
Garrett F. Frankland, Toronto

Why You Should Join The Canadian Society of Domestic Sanitary and Heating Engineers

Because as a Canadian citizen, it is your duty to

YOUR COUNTRY,
YOUR COUNTRYMEN,
YOUR CRAFT,
YOUR FAMILY,
YOURSELF.

FIRST—Your duty to your country, to make it the best place in the world to live in.

SECOND—Your duty to your countrymen, to assure them the highest standard of sanitary plumbing, heating and ventilating systems in their homes and buildings.

THIRD—Your duty to your craft, to assure the highest standard of business methods and principles for the Domestic Sanitary and Heating Engineers throughout the Dominion of Canada.

FOURTH—Your duty to your family, to assure them every comfort and pleasure that rightfully belongs to them.

FIFTH—Your duty to yourself, to assure the honor and respect that is your due from the world as a capable and successful sanitary and heating engineer.

That is what the Canadian Society of Domestic Sanitary and Heating Engineers stands for. Are you with us? If so, forward your name at once to the Secretary. Remember, we are ALL FOR ONE and ONE FOR ALL.

Thanking you for your co-operation,

FRANK R. MAXWELL, President

Address all Communications to
GARRETT F. FRANKLAND, Secretary-Treasurer,

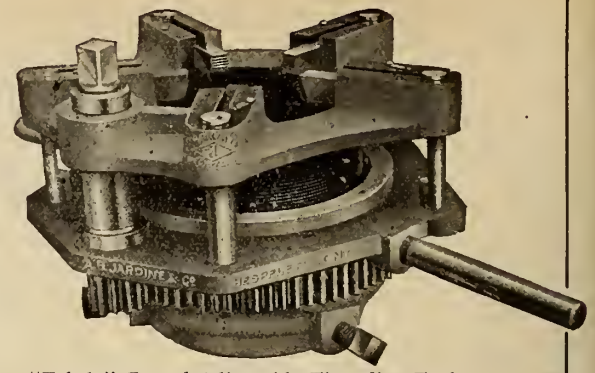
JARDINE and TOLEDO PIPE THREADING TOOLS



"Toledo" Geared Adjustable Threading Tool, No. 2½. Capacity 2½ to 6 in. inclusive. Weight 120 lbs.

THE ratchet feature of Jardine and Toledo Tools permits their being used to thread pipe which is already in place, no matter how awkward it may be to reach. The Jardine and Toledo have no cams or jim cracks to get out of order; and the dies only cut with the mouth of the cutter. Also, as the tool advances on the thread the dies open out so as to make the proper taper. This means there is no friction on the pipe and every ounce of strength is used in making the cut, so saving time and labor. These are only a few of the valuable features of these tools.

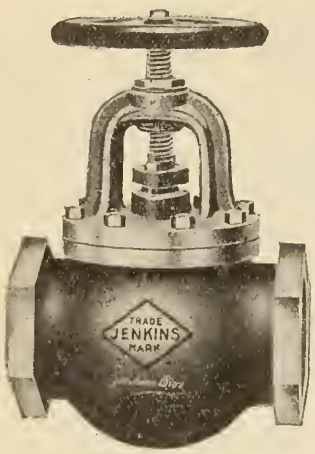

FIG. 141
JENKINS BROS.
Standard Pattern Iron Body Globe Valve Screwed with Yoke.

For use under steam service there are no valves quite as satisfactory as

JENKINS BROS.
Globe and Angle Valves
Fitted with Jenkins' No. 119 Discs

The composition of the disc is very hard, but becomes tough and flexible in service when under steam pressure.

It shows remarkable freedom from cracking and flaking and unrivalled durability in working steam pressures up to 150 pounds.

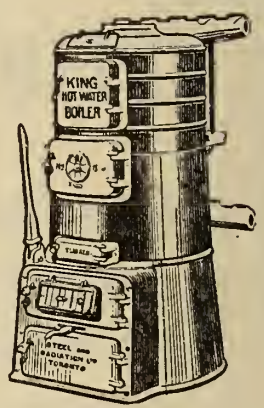
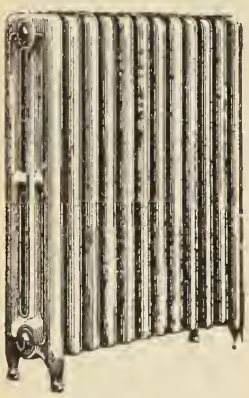
KING HOT WATER BOILERS AND IMPERIAL RADIATORS





King Boilers and Imperial Radiators will exceed the expectations of your customers. The "thin waterway" construction of King Boilers ensures maximum heat with a minimum of coal. A feature that all your customers want.

When customers come to you for a heating plant, recommend and install the King Hot Water System, if you wish to completely satisfy them. Every corner in every room in the house will be comfortable if you give your customers the best hot water system—King Boilers and Imperial Radiators.

How To Get and Handle MORE Business

REPEATEDLY, profitable business is lost because of unrecognized and unavailed opportunity. Right in your own locality are countless Factories, Theatres, Churches, Restaurants, and public buildings in dire need of **reliable** Heating and Ventilating systems. With the aid of consulting engineers and architects economical systems can be designed and installed that will reflect credit and profit to yourself and client. On jobs where no architect or engineer is engaged our engineers will gladly assist in obtaining the proper size fan, drive, etc.

Sturtevant
(TRADE MARK)

HEATING and VENTILATING SYSTEMS

For greater strength and efficiency Sturtevant multivane fan wheels have patented cup-shaped vanes which enable Sturtevant multivane fans to deliver largest volumes of air at smallest cost.

WHEN quality of material, efficiency of design and operation, and dependability of construction are governing factors, engineers and architects unhesitatingly recommend Sturtevant systems, known and used the world over. Applicable to all sorts of buildings and to all conditions of service.

Live contractors everywhere are already preparing to "cash in" on the Sturtevant national advertising campaign to popularize the need and benefits derived from fresh air supplied through Sturtevant products.

Undisputed leaders for 60 years, our scientific research department is ever constantly striving to improve Sturtevant products.

Do You Know Your Overhead?

Cost of Carrying on Business Has Been Advancing Steadily. Investigation by Expert Shows That Many Business Men Do Not Know What It is Costing Them to Carry On

SOME figures not only interesting but rather startling are given by Professor Melvin T. Copeland, Director of the Bureau of Business Research, Harvard University, who has been conducting a personal investigation into the cost of doing business. In his report, he says in part: "In practically every instance we found that the stores with a high rate of stock turn were operating at a substantially lower expense than the stores with a low stock turn. Furthermore, there is less loss through depreciation, shrinkage and obsolescence in stores which turn their stocks rapidly.

DO NOT KNOW COSTS

"We also found that many merchants do not know what it is costing them to do business. Frequently we had merchants tell us specifically that they did not know what their total expense was. In the retail grocery trade and in the retail drug trade I judge that probably fifty per cent. of the storekeepers do not take an annual inventory. As regards expenses, I am led to believe that an even larger proportion of retail merchants, have no accurate knowledge of their operating costs. An amusing instance was furnished by a retail grocer who returned the form we sent him with the following statement written across the face: 'I have no detailed records, but my cost of doing business is five per cent.'

OPERATE AT A LOSS

"Even under present conditions when losses are far less frequent than in ordinary times owing to the demand for goods, there are still quite a number of retail stores that are being operated at a loss. We can look ahead to a period of great business prosperity. Yet before we realize that we will have to go through some adjustments. The active demand in retail trade that is now resulting from inflation is particularly unstable. This demand has risen largely from consumers who have enjoyed a sudden, rapid increase in their incomes.

BUYING LUXURIES

"Workmen, for instance, are buying silk shirts and many other luxuries to which they were not previously accustomed. There is an accumulated demand for new homes, yet this demand is not being filled in a great many cases, because prices of building materials and labor are so high. In other words the great demand that we have witnessed in recent months is not primarily the demand that has accumulated during the war, but rather a new demand that has resulted from inflation. Sooner or later the accumulated demand of the last four or five years will have to be taken care of and eventually the process of deflation will help to bring this about."

ARE NOT JUSTIFIED

Discussing business generally, Professor Copeland says, "We have heard a great deal for some time past about profiteering. From careful observations I judge that many of these accusations are unjustified. Business has been very active in most lines and failures have been far less frequent than in normal times. Yet I doubt seriously whether there are more frequent instances of abnormal profits in retail and wholesale businesses than in manufacturing or among wage-earners and farmers.

"All along the line we have seen higher prices, higher incomes and higher expenses. Clergymen, school teachers and college professors are about the only classes who have not had a share in these larger monetary incomes. The dollar has truly fallen in value, but not because of the machinations of merchants and business men.

IN SAME PROPORTION

"My investigations would indicate that the cost of doing business has gone up in retail and wholesale trades about as rapidly as prices and profits have advanced. I have had every opportunity to learn the cost of doing business in many trades, and have been furnished detailed reports. They came from all parts of the country and I am confident that they are fully typical and a fair guide to what is happening.

"To my mind there is unquestionably an opportunity for improvement in the methods by which a large percentage of businesses are carried on."

How to Make Neat Working Drawings

Practical Talks on Draughting for Sanitary and Heating Engineers—Important Series to be Written for "Sanitary Engineer" by Andrew Loucks

THE ability to make clear and neat working drawings is easily acquired. All that is required at the start is the possession of enough patience to carry the student through a few of the difficulties of the art.

We have here called the making of working drawings an art; but except in so far as a good mechanical draftsman has some creative joy in his work, mechanical drafting is not an art in the narrow meaning of the word. The work is entirely mechanical; and any man who has it in him to be a capable mechanic, has also the faculties required for draftsmanship in a high degree.

To those who take up this study, we wish to say, that very often, the discouragement attendant on the use of rebellious tools in hands unaccustomed to the work, is on the point of being dissipated at that very moment when the obstacles appear insurmountable. It is no unusual thing for a beginner in this art to practise hours over an exercise that fills him with disgust; and then, when he is about to throw the tools down, finding a facility of hand and pen that he perhaps had deemed himself incapable of attaining.

Have Taught Themselves

Quite a number of high-class draftsmen have taught themselves to make drawings that are equal to the best work of the more fortunate school-taught men; but in the pursuit of experience they have travelled over a road disheartening to any but those of the toughest mental fibre. To gain skill as a draftsman, one must receive a great deal of what may be well called "negative instruction." To make this a little clearer, we may say that a great—and possibly the better—part of instruction comes in the form of: "Don't do it that way." The self-taught draftsman tries as a rule the fifteen wrong ways of doing his work before he strikes on the one that is right.

In the course which we intend to present, during the coming year, a great many of the "Don'ts" will appear, as well as a number of the "Do's." The short-cuts taken in actual drafting work will also be pointed out.

Of Real Value

Of far more than ordinary value should this course prove to the practical man. It bears no resemblance to the ordinary text-book instructions, because it has been prepared by a practicing draftsmen, and not by a professional teacher. As a consecutive presentation of the fruits of actual experience the information contained in this course should be far superior to the cut and dried rules of standard text-books.

The author of these articles has had enough experience to know how much must be forgotten by the mechanical draftsman who tries to make his drawings in the spirit of the mediaeval manuscript painter. He understands that over elaboration of working drawings is an indication of mental lethargy which finds pleasure in a dreamful niggling with the pencil.

The Draftsman's Goal

Precision with speedy rendering is the goal of every draftsman who is blessed with common sense, and that sensible workman will not cover his drawing with meaningless lines for the purpose of ornamentation. He leaves no line off a drawing that may assist in a rapid reading of the plan; yet always endeavors to reduce the number of lines necessary to the best presentation of the subject.

Starting with the first article of this course, we shall give a description of the tools required; certain recommendations regarding their use, and care; and then we shall go on through simple problems in practical geometry, plan projection, isometric drawings and simple perspective.

In every article we expect to give information that should be of immediate use to our readers.

Projection of Curves

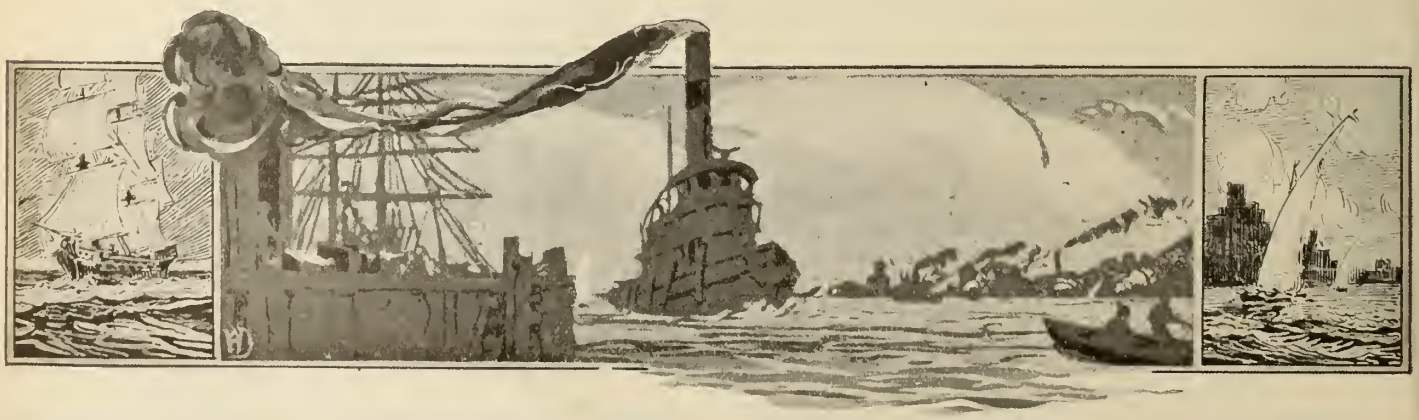
One of the articles will treat of the projection of curves. Any one who reads carefully through that article will grasp at once the principle of pattern drafting. The value of the information given in that article may not be at once apparent to the plumber and steamfitter as of much use in the work where he is more directly interested; yet it is of the greatest value to the man who wishes to be capable of drawing any machine or apparatus.

This course can not be well dipped into at random. It should be taken up at the first article and carried right through to its conclusion.

Pleasure and Profit

We are sure that anyone who follows this course will find it as full of pleasure as of profit. The interest in the course will increase as the student makes a genuine effort to increase his knowledge. With the flight of time there will come to the earnest worker the consummation of his ambitions, and the energy of intense enthusiasm.

Right here we wish to state that no man who loves his sleep more than his work can hope to be a draftsman. The work is not entirely a work of the hands; but also the work of the brain. It requires all that a man may give it of his interests and unless the student is willing to spend hours of his time in its study he would be wise not to make a start on a thing he is incapable of finishing.



Symbols Used in General Practice

Keep the Chart Shown Below for Reference as It May Prove Valuable to You on Many Occasions When Working Out the Details on Some Job—Written for "Sanitary Engineer" by N. A. Kearns

THE object in using symbols on a working drawing is to indicate, in rapid and graphic clarity, such articles, materials or words as the symbols may represent.

Unfortunately, no uniform symbolic code has been adopted by the engineers of Canada, but we, nevertheless, believe that the signs shown on the accompanying chart correspond closely to the usual practice in designations of this nature.

While preparing this list, scores of plans were examined in a search for frequent similarity of delineation, and, as a result of the experiment, we are now placing before the readers of the SANITARY ENGINEER a code that has, at least, the merit of being understood by the majority of plan readers.

A Progressive Evolution

Expressive symbols are a product of progressive evolution, and, therefore, no symbol can be considered as a correct sign unless in some respect it shows a resemblance to its parent root. The necessity for this is apparent when a plan lies before us unaccompanied by an index of the symbols used. If the man who prepares such a plan is unfamiliar with the general practice in indication, he might, lacking such knowledge, still supply a drawing so faithful in pictorial value, that his symbols would approximate those here given.

Are Carefully Chosen

The symbols that are shown on this chart, almost without exception, bear some resemblance to the things to which their meanings apply. So, when no symbol is given for a certain thing, the practice of engineers is to make the drawing of that detail so that its meaning is revealed by its very appearance. It is not long before such a drawing becomes simplified to the lineaments of a symbol with one dominant character.

Ideal Symbols

The ideal symbol is one that means one thing, and one thing only. It must be distinctive, so that its appearance will not become confused with that of some other symbol signifying a different detail.

Symbols must be composed of few lines, so that they can be drawn rapidly. They must be of dimensions corresponding closely to the scaled dimensions of the actual figures they specify.

Symbols for Piping

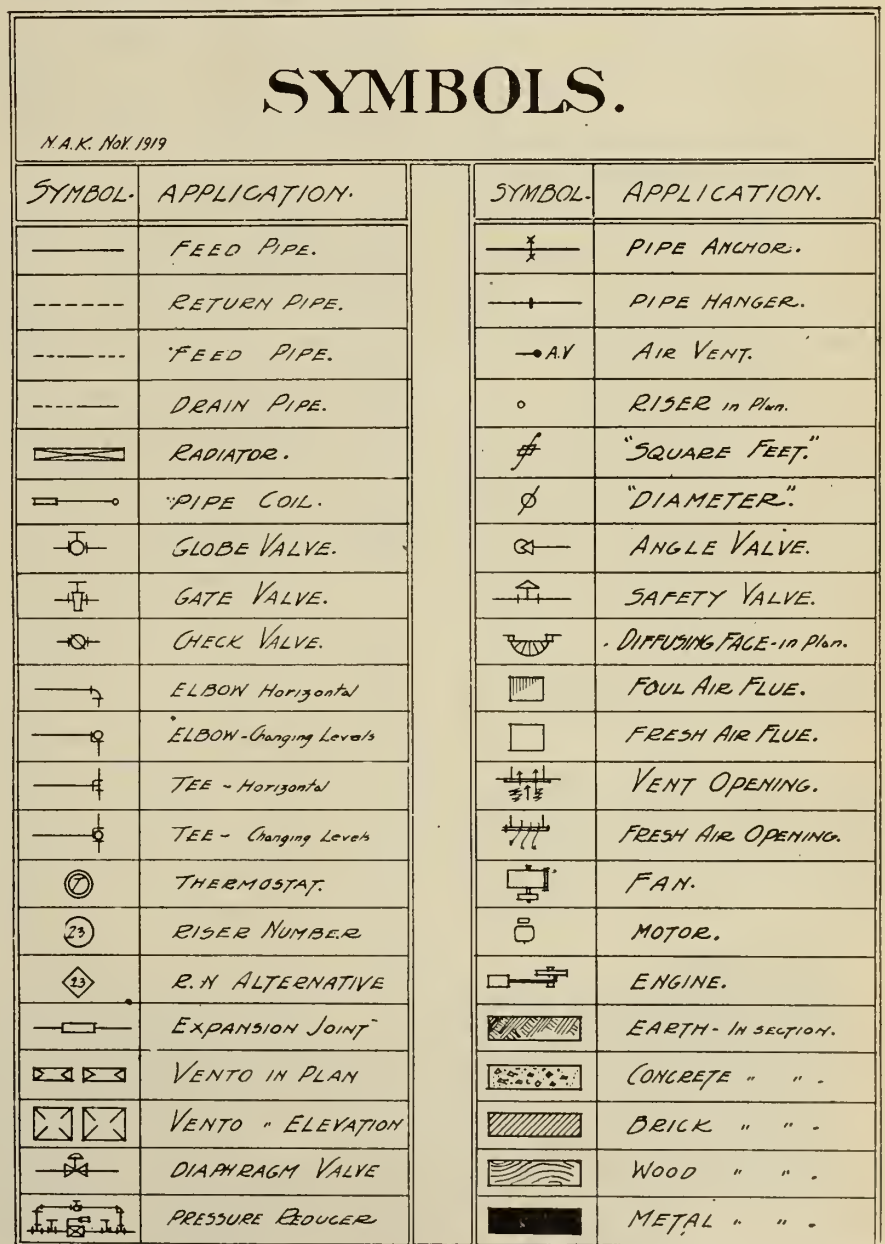
The first symbol on the chart is that indicating a line of pipe. Some engineers indicate feed pipes by double lines. That practice is not one that can be recommended where drawings are made at quarter or one-eighth inch scale. The drawing of a double line is a slow process, that does not add anything to the clearness of indication. Where two or more feed lines are run for different purposes, the lines may be made quite as distinctive by varying their widths, as by the more laborious operation of drawing the two lines.

The single line should be drawn in position corresponding to that of the centre line of the run of pipe.

One sign that may be called a standard symbol is that used to denote return lines. In every plan examined, during our search, the dotted line was used as the standard token for return piping.

Feed Pipe Line

The feed pipe line shown by three dots and the dash, and the drain pipe line exhibited in the four dots and the dash, were only found in this character on



Keep this table of symbols for referenc c. It is valuable and may prove very useful on many occasions. It is worth studying carefully and becoming familiar with.

about one-tenth of the drawings. The other nine-tenths of the drawings were absolutely void of uniformity for this representation.

Radiators

On plans, when only the heating system is shown, radiators may be clearly indicated by a solid filling-in of the area they are to occupy; but when other details appear on the drawings, it is advisable to show the radiators in the way given in the chart. The radiators should be drawn to scale.

It is the usual custom to make a note, specifying radiators thus:

$$2\times10\times38=40 \text{ sq. ft.}$$

The figure 2 stands for the number of loops; the 10 for the number of sections; the 38 for the height in inches; and the 40 for the total area in square feet. The practice of specifying radiators thus, is by no means uniform; but it is the way favored by the majority of engineers.

Valves

The chart shows symbols for valves of different kinds, and we hardly need make any comment in this connection, other than to say that there seems to be some uniformity in the use of the signs given. The reader will note that the valves are not all listed one after the other, but that they are scattered over the sheet. The reason for placing these symbols in such a way will be understood if the chart is used for an index in reading plans already drawn, or as a guide in drawing new plans.

Riser Numbers

The riser numbers are marked on a plan in circles, placed close to the risers referred to. In some cases, the levels of floors, etc., are indicated in the same way on the drawings, and it is then necessary to number the risers as shown by the alternative symbol.

Square Feet

The significance of the symbol for square feet is quite evident by the square and the initial letter.

Diameter

The diameter sign is not used so frequently in heating plans as in general engineering and architectural drawings. It is a sign that saves a lot of the draughtsman's time where he might be called upon to continually write in the word diameter.

Foul Air

Vertical foul-air ducts are generally shown shaded on their upper left angle. This is not a uniform custom, but promises to become so within a very short time.

Vent Openings

Vent openings are shown as on this chart, with the foul air indicated by the feathered arrows.

Fresh Air Opening

The fresh air is shown leaving the opening by curving arrows.

Fan, Motor and Engine

On small drawings, this machinery is roughly indicated by the symbols given. On large drawings, the machinery is always drawn to scaled measurements.

Other Signs

The signs given for earth, concrete, brick, wood and metal, are the signs of almost universal acceptance.

Not All of the Symbols

The chart does not cover all of the symbols used by the heating and ventilating engineers, but it is complete enough to clearly show the principal use of such figures.

Enthusiastic Over Canada's Future

Managing Director of Baldwin's, Limited, Big Welsh Tin Plate Firm, is Looking for Splendid Trade Developments

ACCORDING to information given SANITARY ENGINEER this week by J. C. Davies, managing director of the company, the big new plant being erected in Toronto by Baldwin's Limited, will be producing by July, 1920. Work is being rushed and splendid progress is being made.

The report has been published in some papers that Baldwin's, Limited, intend to work from the ore, which means the installation of blast furnaces and perhaps a coking plant.

Large Tonnages

When asked regarding this, Mr. Davies said, "For the present we intend to operate the furnaces, depending largely on scrap metal, for the turning of which into steel ingots the works are admirably fitted. We will be purchasers of very large tonnages of scrap material, much of which I am given to understand goes out of the country at present. Our decision regarding the installation of furnaces later on to produce our own iron from the ore will depend on the development of the business and the conditions of the market.

Will Help Others

"We believe that the operation of our plant here will be a good thing for numerous other industries, for there are many lines affected by the operation of a plant that is turning out tin plate, and our other lines. Above all else for the present, though, we want to secure the co-operation and good-will of the Canadian people. We want that more than anything. We are taking a big step in coming to Canada, for many of our friends urged us to keep on supplying the trade here from our Swansea plant in Wales. We have taken the big step and we certainly are not going to turn back now.

Sees Good Market

"We expect to put the finishing mill in operation, and then all lines can be turned out. Of course, there is a great forging capacity at the works, as you know, that was utilized to such good advantage in war work. We shall likely use that to turn out some of the heavy castings for our rolling mill. Some of the rest of it we shall secure in United States and some will come from the Old Country. As far as we can see there should be easily a market now for 200,000 tons annually of tin plate, black sheets and black plate (black plate for enamel work), galvanized sheets, etc. We also intend to develop the forging plant."

Future of Canada

Mr. Davies is returning to the Old Country shortly, expecting to sail on the 25th of this month. He is enthusiastic about the future of this country, providing good relations can be maintained between the employers and labor. It is worth noting, in this respect, that the Baldwin plant, which employed at Swansea some fourteen or fifteen thousand hands, had no strikes during the war nor since, and good relations are maintained between the company and its men. It will be necessary for the Baldwin organization to bring to this country a number of skilled workmen, including those who will be in executive capacities.

DUNNAGE ALLOWANCE IS SET BY BOARD

Ottawa.—The Board of Railway Commissioners have given judgment in the matter of special freight tariffs governing the weighing of carload traffic and allowances from track scale weights and cancellation of the allowance of one thousand pounds dunnage in agricultural implements, machinery, stoves, street cars, vehicles in box or stock cars.

The matter came before the Board in Toronto in April, 1911, when the late Chief Commissioner Mabee directed that the effective date of the proposed tariff be postponed.

Commissioner Goodeve, in a judgment concurred in by Chief Commissioner Carvell and Commissioner Boyce, ruled that there should be a dunnage allowance of 650 pounds per car on shipments of the foregoing goods, provided that in no case should less than the established minimum carload rate be charged.

The commissioner also sets forth that he sees no reason why the same rule should not apply also generally to acid in carboys, also to such other articles as may require dunnage protection during shipment.

A New Series for the New Year

Detailed and Practical Analysis of the Important Subject of Heating and Ventilating —Special Articles to be Written for "Sanitary Engineer" by N. A. Kearns

BEFORE attempting to analyze any subject it is always well to first make some effort in a general survey, with the object of finding, if possible, something that might, as it were, strike the keynote of our understanding.

There is an analogy to this in the way we look over a valley to mark how the curving roads follow the landmarks that are plainly visible from the hillside on which we stand.

It is this point of view we have asked our readers to take while we presented the subjects that have so far appeared in this series of articles. The first of January—1920—will mark a departure for new viewpoints. After the present year we shall no longer treat the subject of heating and ventilation in a general way, but rather in detailed analysis.

In Alphabetical Order

When each detail of the science of the heating and ventilating engineer is classified according to the order of the letters in the alphabet, such may be referred to at certain times when specific information may be required. One defect of the arrangement is that certain articles can not be presented properly linked to other articles that have a bearing on the same detail. But even with this defect we are sure that convenience of ready reference will more than outweigh any objection to the apparent disorganization of the subject matter.

No Repetition

It is not our intention to go over ground that has already been covered in the articles of the former series; but there are some elements of the subject that must be brought out in stronger relief and in greater detail than have so far appeared. Such subjects are worthy of the short rehearsal that they demand. We have already written much with regard to the functions of Thermal units, and when again we give a brief *résumé* of what has been presented in detail, the recapitulation will be presented in few words. Perhaps all that may be necessary is to direct the reader's attention back to the data given in the April 1st (1919) number of the SANITARY ENGINEER. But we certainly shall not allow the letter "B" to get past without making some direct reference to the importance of a thorough understanding of the "what," the "why" and the "how" of the B.t.u.

All Subjects to be Treated Fully

Beginning with the letter "A" we shall go through the alphabet, touching on, and treating fully, every item from "Absolute Temperatures" to "zero." From time to time we shall furnish an index indicating the dated appearance of certain letters; so that our readers may find at any time articles in which they are interested.

The Convenience of the Classification

Just at the time of its presentation, a paper may not contain the data that is of immediate value to the reader, but he may find some time later he requires information regarding, say, Anemometers; so he looks under "A" and finds the information desired. Or again, it may be "Indirect Radiators" that he is interested in. He looks under "I" and finds that note is made of this subject under the heading of "Radiators" as listed in the "R's."

Illustrations

The entire series will be illustrated with drawings, or photographs, where such are necessary to clearly convey to the reader the meaning of the text.

Specifications

Under the letter "S", specifications will be analyzed in detail. Clause by clause, different specifications will be examined and we shall point out why certain fittings are used in good work.

Forced Hot Water Systems

These systems are returning to popular favor; so we shall deal at some length with the principles governing, and the details used in, this class of heating work.

Tables

Tables will be given under the letter "T," and references will be made to these tables when subjects requiring tables appear under another heading.

Electrical Notes

There are certain terms used in electrical work that the ventilating engineer should be familiar with. The meanings of the terms will be given, together with such other information as may ordinarily be required by the practicing engineer.

A Partial List of Subjects

Absolute Temperature, Air, Anemometers, Accelerated Systems, Asbestos, Boilers, Belts, Cast Iron, Combination Systems, Combustion, Dimensions (standards), Fans, Fluids (Laws Governing), Formulae, Furnaces, Fuels, Galvanized Iron, Generators, Grates, Gravity Systems, Humidity, Hydrostatics, Joints, Materials, Mixing Dampers, Molecular Theory, Mud, Packing, Pipe, Pressure, Radiators, Registers, Regulators, Rules, Steel, Statics, Traps, Tables, Tanks, Tests, Thermometers, Thermostats, Valves, Vapor Systems, Ventilation, Vacuum Systems, Water, Zero.

The list is by no means complete; but should be sufficient to indicate how varied are the subjects to be covered in this series.

At times a number of subjects will appear in a single issue of the SANITARY ENGINEER. At other times only one detail may be presented, because of the necessary length of the descriptive article.

TO SUPERVISE PROVINCIAL BOARD OF HEALTH

The Ontario Government has taken steps to lighten the administrative burden of the Provincial Secretary, Hon. H. C. Nixon. As a result Hon. Walter R. Rollo is now Minister of Labor and Health in more than name only. He was sworn in as Minister of Labor, but later an order-in-Council was passed transferring to Mr. Rollo's supervision the Provincial Board of Health.

While it was the announced intention of the Government to give Mr. Rollo charge of health matters in addition to those of Labor, it will be impossible to transfer all departments until legislation is passed at the next session. As things now stand Dr. J. W. S. McCullough, Provincial Officer of Health, must serve two masters, for, in addition to having this office, he is also Deputy Registrar-General for the Province.

Do You Keep Accounts Cleaned Up?

Collection is One of the Most Important Features of Conducting a Successful Business —Some Suggestions for Getting After Any Delinquents You May Have

EVIDENCE steadily accumulates that the days of unrestricted credit to customers, especially in the rural districts, are past. Recent statistics show that more and more of the country's business is being done on a cash basis. Many hardware merchants, of course, have accounts with factories, contractors or others where immediate settlement for goods ordered through workmen or others is impossible, but in such cases there is a regular time set for payment and they see that it is not overrun.

People are able to pay and will pay if the retailer lets it be understood that his business is conducted on a system that is more or less strictly cash.

Causes of Failures

More failures have been caused through carelessness on the part of the retailer with regard to his accounts than by faulty methods of doing business. And there are still some customers who defer payment of their legitimate accounts. These are the people the retailer wants to get after, and there is no better time to get after them than right now. The phenomenal success of the recent Victory Loan is an indication that there is an abundance of ready money in circulation; and the retailer is entitled to the account which is due him. If he does not get it, the fault is, possibly, equally between the retailer and the customer.

Afraid to Collect

Many merchants are poor collectors because they dislike "boning" people for money; on the other hand, there are many customers who only need a reminder that an account is due to pay it. But there are also a number of customers who are "hard pay" and with such more strenuous methods have to be adopted.

Personal Touch

A number of methods have been adopted by various merchants throughout the country. Some have inserted advertisements in local papers; others send out letters, while still others make calls for their accounts. In conversation with the credit manager of one of the largest wholesale hardware houses in Ontario, BOOKSELLER & STATIONER was advised that a good policy to follow was to, if possible, give a personal touch to such letters. The merchant, being on intimate terms with his customer, will, in all probability, know some grounds on which he can interject in his letter this personal touch.

Seasonable Appeals

Still another method to follow is to make the letter seasonable. If it is in the spring of the year, state to your creditor, for instance, that it is the beginning of your year's business, that you have many accounts to clear away and that you would apppreciate an early attention to the matter. If it is in the fall, you might say to him that the harvest has been garnered, that the result of the year's effort has been gathered and that you would appreciate his co-operation in cleaning old accounts off your books. This might be carried through the four seasons of the year.

Other methods to be followed are suggested in the following letters. Here is a letter inserted by a Western Ontario merchant on the front page of his home weekly. It is straight to the point and should not give offence to anvone

IT IS DISAGREEABLE

to send or receive an account with a footnote on it such as "Please," "Your kind attention is requested," "Please favor us," etc., etc. Our accounts are never rendered unless they are due. Our terms are, and have been for some time, strictly 30 days (the large Toronto stores do not give one day). Conditions in trade have changed greatly. It now requires nearly double the capital to swing a business. Goods are scarce and difficult to procure. Formerly manufacturers and wholesalers were more lenient in their terms—now the majority of them ask for payment in ten days after the merchandise is shipped (actually before the goods are received, if they are routed by freight). Any thinking person can see the necessity of prompt payment. We ask it in the same courteous manner that we solicit your esteemed trade; both are necessary for our success.

This week upwards of six hundred (600) accounts, running from $3.00 to $300, will be sent out from our office, every one of them due and payable. Many of them are rendered for the first time, many have been rendered many times before. Our experience in rendering the above number of accounts is that abouty fifty (50) of them will be paid promptly—the remainder will have about as much effect as water on a duck's back. It is expected that all accounts leaving our office this week will be paid on or before November 23rd.

We would like very much to carry these four or five hundred accounts for several months if we were strong enough—but we are not.

A Gentle Reminder

Some people only need a reminder in the shape of a letter to bring them into the store with the cash. A politely worded note something like the following will very often suffice:

Dear Mr. ———

Your account is quite a bit past due. We are in need of additional funds and ask, therefore, that you drop in and make some arrangements for paying your account now or as soon as possible.

We do not like to write a letter of this kind to any patron of our store, that you know. We, however, buy for cash and sell on that basis, in order that we may make prices to our patrons that are right. We did to you.

Come in and see us so that we may make some arrangements to settle this account. We will greatly appreciate your doing so.

May we look for you some time this present week? Thank you.

Yours very truly,

A Little Stronger

If this does not bring them in try something a little stronger. Keep right after them. Persistency pays in cases of this kind. Here is a follow-up letter to be sent a week after the first one went out:

Dear Mr. ———

It seems a bit strange to us that so far you have paid no attention to our recent letter asking you to call and settle your past due account.

Our policy has been to buy on a basis of spot cash and sell the same way. We made you prices accordingly, as you know. In other words, we gave you the benefit of spot cash prices and agreed to wait for our "spot cash."

Now, we think you owe it to yourself and us to come in and settle up. We really are in need of the money, as all retailers are at this particular time.

If you are unable to pay in full, we will be glad to have you pay some on account and give us an understanding as to when the balance will be taken care of.

Come in, then, to-morrow or next day, and make arrangements to settle this. Do not disappoint us this time. We shall look for you soon.

We wish to remain,

Yours very truly,

Need the Money

Before taking any drastic action merchants sometimes find it advisable to send a third letter, in which it is intimated that if the party cannot pay the account in full he should come in and at least reduce it. Many of those owing fair-sized accounts will respond to this appeal. A third letter may be worded as follows:

Dear Mr. ———

Here we have asked you twice to come in and make some sort of payment on your old account.

We believe the reason you delayed doing so was because you lacked ready money. So do we.

We need money to carry on our business, and we must, by all means, get it in.

We never like to make trouble of any kind for a patron of our store. When it becomes necessary to do so, he generally loses more than we do. He loses the advantage of cash prices on the goods he gets here, and also loses money and local repute by the law course. We do not want to take such a step now. We say this in all fairness.

Can we, then, depend upon you to square up the old account by the first of the week? Pay at least something on it.

In the hope that you will so favor us, we are,

Yours very truly,

Must Take Action

If all these appeals prove fruitless it means that the party probably does not intend to pay. A fourth letter along the lines indicated below should be sent and the most important point in connection with this is in meaning what you say. It is useless to tell a delinquent you will take action and then never follow it up. It gives him the impression you are afraid. One of the most successful collectors in the country to-day tried all methods of persuasion and appeal before threatening action, but once he says he is going to take the case to the courts he always does so. In this way he has established a reputation for himself that goes a long way with "slow pays." Once they know that R—— has been given the account to collect, they know he means business, and is prepared to go the limit. They also know that if they are temporarily hard up and show by their attitude that they are willing to do the best they can and

Profitable Field in Electrical Goods

Carrying the Stock to Take Care of All Customers' Requirements is a Big Help, Says Sales Manager—Few Displays Can be Made More Attractive in the Store —Steadily Growing Market

THERE is a better and more profitable field for the trade in the sale of electric fixtures and appliances if the individual merchant will be more energetic in making this one of the most attractive departments in his store. This was the opinion expressed to SANITARY ENGINEER by the sales manager of one of the leading manufacturing firms in Toronto. The development of electricity, he pointed out, is increasingly important to the home as well as the industrial life of every community; and the wise merchant has his ear to the ground, so far as the growing requirements of his particular community are concerned.

Varying Opinions

Not a few merchants with whom SANITARY ENGINEER has talked have built up a splendid trade in fixtures and appliances. Opinions seem to vary somewhat as to the procedure to be followed in going after trade. This is to be expected, however, as the needs of various localities are widely different. One man went so far as to say that the sanitary engineer should not go in for the sale of fixtures at all unless he created a department entirely separate from all other departments in his store and put an expert electrician in charge of it. He pointed out the difficulties in connection with assembling the several parts of the completed fixture after it has been shipped by him to the wholesale house; the inability of the average merchant either to wire for the fixture or hang the fixture after he had sold it; and the premium upon his chances of sale because he could not assist the customer to install the fixtures after he had sold them.

Takes Opposite View

This view was not shared, however, by the sales manager of a leading manufacturing firm in Toronto. Experience had taught him, he said, that the sanitary engineer or his assistants were quick to gather and to perfect the details in connection with assembling of parts. His view, in this respect, is borne out by many merchants throughout the province who are carrying on a most successful trade in electrical fixtures. He emphasized the desirability of the purchase by the sanitary engineer of the fixtures, sockets and the glassware,

Electrical fixtures displayed right up at the front of the store have produced splendid business for Kent-Garvin & Co., Ltd., of Hamilton. They make a fine showing at all times, but when turned on at night, the effect is particularly appealing to prospective buyers.

leaving to the expert electrician the whole matter of wiring. It might be impossible for the merchant to carry as complete a stock of glassware as would satisfy the customer; but, by means of catalogues, the most fastidious taste could be satisfied.

Carry the Stock

"Our trouble is to get merchants to carry the stock in electrical goods," said this manager to SANITARY ENGINEER. "They should, I believe, stock more. There is good profit in the sale of all electrical goods. They should sell more than they are selling, and we want them to buy more than they are buying."

He strongly advised the display of all electrical goods, both fixtures and appliances, in a separate department; they should not be mixed up with the other departments of the hardware trade. Few displays can be made more attractive than a display of electrical goods, he said, and frequent use should be made of the windows for such displays. He stated that some merchants were timid about putting in a stock of fixtures and appliances that would let their customers know they were in the electrical business to meet every want of every customer who came into the store.

Business is There

"The business is to be had," said the manager, "it remains with the merchant to interpret the needs of his community and then, with his courage in both hands, open a department, which, with the steady growth of electricity, will soon develop into one of the most profitable departments of his store."

Profits in Metal Construction

Action of the Government of Saskatchewan Will Open Up New Field Which Western Hardware Merchants May Develop to Advantage

THE action of the Government of Saskatchewan in advising farmers in the dry areas to erect supports covered with corrugated iron in order to catch as much precipitation of rain water, snow meltings, etc., as possible, suggests a new channel of trade which the hardware dealer of Western Canada might exploit to good advantage.

The dry areas referred to are very numerous in various parts of the West. The term has reference to those districts in which it is impossible to secure water by the sinking of wells, and which renders it necessary for the farmer so situated to make use of other natural resources available. The best of these is the use of rain water. This source of water supply has, of course, been used for some years by the customary method of placing a barrel under the eaves of the farmhouse and other farm buildings.

Contained Impurities

In most cases these buildings had wooden shingle roofs and the result was that the water secured contained impurities. Another important factor was that shingle roofs did not shed the maximum amount of water due to absorption. The impurities in the water were increased at certain periods due to the fact that particles of sand and soil being carried on the wind easily lodged in the wooden shingles and later found their way to the water barrel.

Iron or Metal Roofing

The logical deduction from the action of the Saskatchewan Government, and from the disadvantages connected with water supply under the circumstances described, is that the farmer should adopt corrugated iron roofing or metal shingles on his house and farm buildings in order to insure an increased supply of purer water than secured under the old conditions.

In this connection it is interesting to note that a sufficient supply of water can be secured from this source, from farm buildings offering 1,800 square feet of roof, to amply supply the average farm requirements. A heavy dew such as is found in many parts of the West in the early fall mornings, will produce half a barrel of water from a surface of 1,800 square feet, providing that surface consists of corrugated iron or metal shingles, and not wooden shingles.

Immunity From Fire

The value of metal roofing is again exemplified in its immunity from fire caused by lightning. The importance of this factor is proved by the fact that in one province alone the monthly loss in barns destroyed by fire from lightning averages close to $100,000. This loss can be practically eliminated by the use of metal roofs on farm buildings. As a lightning arrester a metal roof cannot be improved upon, providing the four corners of the roof are connected with a ground wire.

In many of the dry areas in the Western Provinces farmers and ranchers dig holes in the ground into which the water from rain and snow meltings will run. This water is for the stock. Water secured in this manner is, of necessity, less pure than the water secured from the wooden shingle roofs of the farm buildings, and the practice is likely to result in harm to those using it.

Offers Wide Scope

Having in mind the fact that a metal roof on the farm buildings will provide an ample supply of water for farm requirements, the improvement of the conditions as described offers a wide scope for effective salesmanship work on the part of the hardware dealer in those districts. In the past a good deal of this kind of business has gone to barn framers because the hardware dealer has not been sufficiently active in making suggestions along this line. Dealers situated in districts where this improvement could be adopted to advantage can get the first line on such business in an effective manner by broaching the subject to farmers when visiting the store on other business. Better still for the hardware dealer to pay a personal visit to the farmer at his home and go into the details as affecting that particular case.

Made Good Profits

While it might appear to some dealers that the percentage of profit in this business has not been such as to make it profitable for them to devote time to it, an investigation of the subject reveals the fact that barn framers have been making a substantial profit in this kind of work. An important point to remember is that the goods are not brought into the store and kept on the shelves where their percentage of profit is being steadily consumed by overhead charges. In the case of metal roofing or siding business the material is shipped direct to the customer without any further handling by the dealer. Furthermore, when a farmer gives an order for such material it is not for any small shipment, but one which at the prevailing percentage gives the dealer a very fair profit for his work. This class of business can best be handled by the hardware dealer for his recommendation generally carries more weight with his farmer customers than that of any other trade.

Not Looking For Any Reduction in Pipe Prices For Six Months

ACCORDING to information given to HARDWARE and METAL by the Page-Hersey Iron, Tube and Lead Company of Toronto, the heavy demands for steel, the shortage of the supply due to the big strike in the United States, and the uncertain deliveries resulting from strikes of various kinds across the border, are three factors affecting, to a considerable extent, the output and prices of pipe.

The steel strike, which commenced in the United States some weeks ago, has seriously affected a number of industries which have this as a basic product of their manufactured article; some of the units of this firm itself are idle because of lack of supplies with which to go on. In addition to this, there has been a dislocation of transportation facilities, and this is resulting in uncertain deliveries. Until these conditions right themselves, it is the belief of this firm that there cannot be any appreciable, if any, reduction at all of prices. They do not look for any reduction for, at least, six months.

Are Paying Premiums

As a matter of fact, so SANITARY ENGINEER was informed, premiums are being paid, to a considerable extent, by consumers and contractors for deliveries. While it is the disposition of the manufacturers to hold the prices down, the reasons given above may result in some advances all along the line. This firm, however, does not look for anything in the nature of a runaway market, that is, judging from present conditions, which are affecting the market. The market is standing remarkably firm, and gives no indication of sharp fluctuations one way or the other.

Obtain Supplies

For the benefit of the trade in general, the firm advised that any retailers who are drawing up contracts for work, will do well to obtain their supplies as soon as possible. They do not hold out any inducement that pipes will be any cheaper for some months to come, because of the immediate effect of the steel strike on supplies and the aftermath of an incident that has so upset production all over the country.

Keeping a neat attractive display of bath-room equipment, bath-room fixtures and other merchandise out where it may readily be seen not only by passers-by but by prospective buyers is an excellent means of increasing sales, says C. T. Bull of St. Thomas, Ont. In addition to the display shown above, he has a window display also.

Why Not Stop Price Cutting?

"It is Better to do $400 Worth of Work and Make a Profit Than to Get a $1,000 Job and Make Nothing," Says C. T. Bull, of St. Thomas—Tells of Results He Obtains From Neat Store and Window Displays

"WHAT a lot of men in the plumbing and heating business need to learn to-day, is to cut out price-cutting," said C. T. Bull, of St. Thomas, Ont., in discussing matters of interest with SANITARY ENGINEER. "I know, for instance, of a case where a plumber bought goods for $97 and installed them for $111. There is no sense in that sort of thing. A sanitary and heating engineer is entitled to a fair profit on his work just as much as any other man. It is not a question of getting the job away from some other plumber, although some of them seem to think that is the big thing. I hold that it is better for a man to do $400 worth of business and make a legitimate profit on the work than to do $1,000 worth and not make anything."

Will Not Cut Prices

Mr. Bull says that in his own business, and he has occupied the same shop for twenty years, he figures carefully on all work and allows what he decides is a fair price for good work and good materials. If a prospective customer tells him he can get the job done for a lower figure some place else, Mr. Bull goes into the matter with him thoroughly and shows him just what good materials cost, the allowance for time, etc., and usually he says he can convince the party that he is charging a fair price. In all work he insists upon the customer being satisfied. That, he says, is the sure way to build for future business, as a dissatisfied customer will never stop talking against you, and a pleased patron will come back sooner or later with other work and also send his friends.

Display Gets Results

Mr. Bull says he has found that he gets good results from keeping a store display and also looking after his window. As may be seen from the illustration, the front part of his shop is devoted to a display of enamelware, bathroom fixtures, etc. By having these arranged so that he can bring people who are planning improvements to their homes to his shop and show them the goods and just how they will look in their own house he closes many contracts. Special care is always taken to keep the stock in good condition, as frequently both a man and his wife will come down to look over goods they are thinking of buying, and women particularly do not like to inspect stock that is dusty or not well arranged. On the other hand, Mr. Bull says they are readily interested in an attractive, well kept display.

Recommends New Parts

Mr. Bull does an extensive repair business not only in the city but all out through the country. Whenever he is called to look at a job, if he finds that the part is worn out and is likely to give trouble he recommends that a new piece be put in.

"It is the best plan," he said. "If I were to fix up an old part that was done for it would only be a matter of a short time before it would break again. The customer would naturally be disgusted at having to pay a second bill so soon. He would blame me for not telling him and would probably not have anything more to do with me. If, however, I explain to him that a new part will cost very little more than the repair, and that he will then have a brand new part that will give years of service, he usually sees the point and appreciates my recommendation."

Is Kept Very Busy

Although Mr. Bull finds that many people are holding back new work in the hope that prices will sooner or later be lower, he is kept very busy. Farmers are doing a good deal, he says, in the way of improving their homes, putting in new heating systems, water pressure systems, bathroom equipment, and so on. The farmers, he says, are good buyers. That is they are willing to pay a reasonable price and want a good quality article. The same applies to people generally. Mr. Bull says that most of them know that they will have to pay much higher now for "cheap" goods and would much rather pay a little more and get something worth while.

Has No Apprentices

He has no apprentices because he cannot get them. Boys nowadays, he says, are lured away by higher wages to some

other line and do not want to learn a trade apparently.

"The apprentice problem is a serious matter for the trade as a whole," he said. "If we do not get any boys to learn the business it is only going to be a matter of time before the older men are gone. The plumbing business is a good one, and offers many opportunities. There is no subject of more importance than public health, and no one is more closely connected with it than the sanitary and heating engineer. This fact is not always appreciated; not only by the boy who might be interested in learning the trade, but by the general public. Comparatively few people realize how dependent their health and comfort is upon the work of the plumber."

Inspector is Needed

There is no plumbing inspector in the city of St. Thomas, and in the opinion of Mr. Bull one is needed.

"A plumbing inspector is needed in a good many of our cities and towns," he said. "It is to be regretted that there are not men to protect the interests of the public and prevent a lot of inferior work. Plumbing work is too important to take chances on, and yet a lot of work that should not pass is done simply because there is no action taken to stop it."

Uses Telephone

Mr. Bull says that he finds that a very large percentage of business nowadays comes in over the telephone. He gets calls not only from all parts of the city but from miles out in the country from parties wanting information about repairs, new work they have in mind, and prices of bathrooms or other equipment. He always gives these calls close attention and aims to give quick service. People, he says, appreciate prompt attention and it brings them back again, especially if they are well satisfied with quality of work done.

Non-Shipment of Coke May Cause Foundries to Close

No Reserves in Stock and the Situation is Causing Considerable Anxiety in Many Quarters—Coal Shortage Not Causing Any Immediate Danger

IF the bituminous coal strike in the United States is prolonged for any length of time, there is grave danger that many of the foundries throughout Canada will be compelled to close down until the situation is relieved. The non-shipment of coke from the United States into Canada is aggravating this situation rather more than the scarcity of bituminous coal, as coke is largely used for moulding purposes. There are some foundries engaged largely in the turning out of car wheels, and large quantities of coke are used for this purpose.

Coke Supplies Small

Unfortunately, users of coke in Canada have been living on a hand-to-mouth policy, and they have practically no reserve of coke on hand. Manufacturers who use bituminous coal are more fortunately situated, though inquiries reaching the Manufacturers' Association and the Fuel Controller are multiplying from these sources in which some anxiety is expressed with regard to the future. No bituminous coal has come into Canada in any considerable quanties for over a month; and though many of the manufacturers seem to have sufficient supplies to do them for from one to three months, they are becoming somewhat apprehensive that their situation beyond that time may develop unfavorably if the strike on the other side of the line is not settled and production again commences on a large scale to make up for the time that has been lost.

May be Released

The coke situation, however, is threatening the foundries to a considerable extent. Word that 150 cars of coke are to be released for distribution in Canada is encouraging, and if this is done, there will be a temporary relief. It is believed that this coke will be distributed according to the immediate needs of the several foundries dependent upon coke for their output. Some time ago the Manufacturers' Association sent out a letter advising manufacturers how they could secure coal if it were absolutely necessary. Advantage has been taken of this assistance in the case of coal, and now that foundries have been threatened, at least one foundry has already applied for information which would help him to secure needful supplies.

On the whole, there is a growing anxiety over the situation, though there seems to be no immediate danger of a dislocation of industry on account of coal shortage.

From one who knows.
Gale in Los Angeles "Times."

OPERATING COST SHEET

An operating cost sheet which should prove of much interest to the men in the trade will be found on another page, being featured in the advertising space of the Canadian Brass Co., Ltd., of Galt, Ont. The figures were obtained, it is stated, from actual data secured first hand, and as such have a value for the business man much above that of average statistics. The table is worthy of close perusal.

Basis for Determining Profits

Statement Submitted to Board of Commerce by the Provincial Board of the Retail Merchants' Association of Canada

AFTER going very carefully into the question of "the Basis for Determining Profits," in an effort to remove the many false impressions which have been created in the mind of the public by sensational and unfair inferences drawn by the daily press from investigations, the Manitoba Board of the Retail Merchants' Association of Canada, Inc., has submitted the following to the Board of Commerce:

The retail merchants regard the establishment of the Board of Commerce with satisfaction, and welcome the opportunities it affords for fair discussion of merchandising problems. The advances in prices of all commodities, particularly foodstuffs and other necessaries of life, during the past four years are without parallel in the history of retail trading. They represent to a considerable extent the increases in the cost of living from which the unsettled conditions of the present time largely arise.

General Impression.

There seems to be an impression, in the minds of some people at least, that the retail merchant is responsible in an unwarranted degree for these advances, that he is now and has been making more than a legitimate profit during these times of high prices. The investigations being conducted by your Board at the present time are for the purpose of determining whether this is so, and if so to devise a remedy. As representing the retail merchants of Manitoba we welcome this investigation, and if profiteering among the retail merchants in Manitoba or any other place be found, we shall in every possible way assist you in curbing the profiteering and in punishing the profiteer. But neither your Board nor the public can come to a just conclusion unless all the essential facts are presented to you. It is because we believe that these are not being presented to you, and because of the misleading way in which even the material presented to your Board reaches the public through the newspapers, that we desire to supplement the detailed evidence, which you have obtained and will obtain, by this somewhat formal statement. We believe that we are asking only what is fair when we suggest to your Board that in future examinations of witnesses in connection with retail merchandising you should see that evidence is obtained on all points essential for not only your Board, but for the general public, in coming to a fair conclusion.

Retail Quotations

The public's knowledge of prices and values is almost solely confined to the retail quotations. As a rule they do not consider and are not aware of all the elements that necessarily enter into the determining of the retail prices of goods.

The public is prone to consider as profit either the difference between the retail price and the invoice price, or the difference between the price which the consumer pays to the merchant and the price which the merchant pays to the wholesaler or manufacturer, without taking into consideration the numerous other elements which enter into the cost of the goods to the merchant and all of which must be added, such as freight, rent, wages, insurance, delivery, paper, twine, interest, losses on unsaleable goods, etc., etc.

Not Given Fairly

We do not say that your Board will not give consideration to these facts, but we do believe that in the evidence so far submitted these factors have not been placed before you as fairly and fully as their importance warrants, nor in such a way as to enable the public who read the reports of your proceedings to judge fairly the relation of the retail merchant to the present high prices. If any of the remarks which we have made or may make should appear to criticize either the evidence which has been obtained or the method of obtaining it, the reason is not that we are desirous of being critical, but we are desirous of seeing that the case of the retail merchants is presented fairly and fully to you and the public. Looking at the matter from that point of view, that is, from the point of view of having the evidence as to the retail merchants' relation to the high prices presented fully, we believe we have reason to complain. The evidence so far obtained and the method of obtaining it have been defective in these respects:—

Confused the Prices

1. In the confusing of the marked price with the ultimate price at which the goods are sold.

2. In considering as profit the difference between the invoice price of a particular article and the marked price of that article, instead of considering as profit only the difference between the cost to the merchant of the article up to the time it is delivered to the customer, and the price which the customer pays for it. What is really the only true way of measuring profit is by finding out the difference between the total cost to the merchant of all articles sold during a given time, such cost including every legitimate charge of doing business, and the total price which he receives for the goods sold during that time.

Was Not Considered

3. In not considering as part of the cost of the sold goods such items as freight, insurance, interest on the cost of goods, interest on moneys spent in equipment and furnishings, depreciation of equipment and furnishings, rent, taxes, wages, cost of paper, twine and other accessories, stationery, etc., advertising, cost of draying and delivery, cost of collection of accounts, bad debts, etc., as well as the probable quantity of goods which must be sold below the marked price. All of these must be paid by the merchant and are as much a part of the cost of the goods sold as is the invoice price, or price paid to the wholesaler or manufacturer, and all of them must be taken into account by the merchant in fixing his marked price. The charge of profiteering should not be made or suggested against any merchant unless all of these additional factors have been examined and taken into account.

Unfair Inferences

The confusion of terms that surrounds the discussion of profits is responsible for most of the unfair inferences that have been drawn by the public from the investigations by your board. The principal subject of interest is the profit, and various conclusions are reached as to the amount of this profit. We beg to point out that there is only one kind of profit in business, and that is net profit. What is erroneously described as gross profit includes the expense of transacting business. No corporation or firm can ignore operating costs when calculating its net earnings.

Question of Profit

Reverting to the question of profit, it is evident that a sale price must be established before the dealer can determine his net earnings; in other words, an actual sale must take place. No great amount of economic argument is required to prove that the price established in a sale must be made up of three factors—invoice cost of merchandise, cost of doing business, and net earning or profit. For convenience of discussion, let us consider these as "A," "B" and "C" respectively. "A" is the price at which the goods are supplied by the manufacturer or jobber, and, of course, it is not under any control by the retail merchant. "B" includes all the items that enter into the cost of handling the goods from the time they leave the manufacturer's or jobber's hands until the sale of them (by retail) is completed. It is only partially controlled by the retail dealer, because the public under the competitive system of merchandising now obtaining demands the utmost in service. The difficulties in this connection are increased, too, through the growing tendencies of outside organizations to dictate methods and terms to merchants as employers. "C" is determined solely by the selling price, and is therefore controlled absolutely by the retail dealer. It constitutes his return on the transaction involved in the sale of the goods. Let us repeat here that there is and can be no return until the goods are actually sold.

The Selling Price

It follows as a matter of course that the selling price is made up of "A" (invoice cost—uncontrollable) plus "B" (cost of handling goods and transacting business—partially controllable) plus "C" (merchant's return or net earning—controllable). Under normal circumstances this state of affairs prevails, and the three items may be segregated. In our opinion the only fair method of determining net earning or profit is to ascertain the relation or ratio of "C" to the sum of "A," "B" and "C" in a series of transactions covering a definite period. It is only when "C" is examined in this light that anyone can form an opinion as to whether the profit is excessive. In other words, a charge of profiteering or unjust dealing with the public can be sustained only when it is shown conclusively that the proportion "C" bears to the sum of "A," "B" and "C" is unduly large.

How It Works

For example, suppose a merchant buys one hundred pairs of boots, paying the manufacturer at the manufacturer's place of business $10 a pair, and marks them for sale at $15 a pair. If only these two factors are considered there would be an apparent profit of fifty per cent. on invoice cost. If the information goes to the public in this bald fashion some at least of the people draw the inference that the retail merchant is making the profit of fifty per cent. At any rate there is the suggestion, and too often the inference, that he is making an unreasonable profit, that he is contributing unduly to the high cost of living, and that he is a profiteer. Before the merchant can establish the price at which he proposes to mark the goods he must take into consideration all of the factors which have been mentioned, and probably many others.

Must Pay Interest

In the first place he will have to figure paying interest on the money with which he has bought the goods, because, as you are aware, the banks do not loan money for mercantile purposes without charging interest. He will also have to pay the freight on the goods, and, if they are bought outside of Canada, the duty as well. He will have to pay also cartage on the goods from the station. He will also have to charge against these boots—every pair of them—a proper proportion of all his other expenses of doing business, that is to say, rent, light, heat, interest on the cost of his furnishings, depreciation in stock-in-trade, wages, paper,

EDITORIAL COMMENT

EDITORIAL BRIEFS

WHEN you lose a sale don't think what was wrong with the prospect. Try to figure out what was wrong with you.

* * *

THE man who waits for something to turn up very often finds that his competitor has turned up something while he waits.

* * *

MOST folks used to shine their own shoes, whereas recent figures show that $1,359,576 is paid out each year now to Greeks and others.

SPENDING FOR COMFORT

THE man who is making money—and the working man who is not making good money is the rare exception to-day—is spending a larger share of it than ever before on things that will make life easier for him and his home more comfortable. He has seen electric lights in the home of a friend and he knows that the friend would not be without them, so he plans to get them too. His wife probably has an electric iron and has seen an electric sweeper in action while out somewhere and she will never be satisfied until she gets away from the sweat and dust of old-time methods of sweeping. Or perhaps it is a hand power washing machine she wants, or a water power, or an electric machine. At any rate, it is something that is going to make life easier and pleasanter for her. Very often they are both agreed on some such improvement as modern plumbing or new bathroom fixtures. It is just such cases as these that account for the enormous demand for merchandise at the present time, a demand which is taxing the capacity of manufacturers to keep up with. Instead of growing less this demand is going to be greater, because just as soon as men and women learn about the things they have been going without there is going to be no stopping until they get everything that is within their reach. Once they get electric lights and an electric iron in their home they are going to want other electrical goods. Once they get water installed in the house, it is only a question of time before they will have other conveniences. Once they see how well a nicely painted room shows up, it is only going to be a short time before the whole house is gone over. And so it goes. No merchants in the country are in a position to supply so many of these needs as the hardware merchant and the prospects for business were never brighter. This is just as true of the merchant in the small country village as in the large city. The people are finding out that they have the money to buy the things they would like to have and they are going to have them.

SOLVING THE HEATING PROBLEM

NECESSITY is the mother of invention and it is interesting to note what is happening by those who, faced by a great and growing shortage of coal, are trying to work out some plan for heating. The town of Renfrew has carried a by-law to expend $25,000 on a central heating plant for the business section. The town of Owen Sound, it is stated, has under contemplation something along the same line. New York is undergoing a remarkable transition in regard to heating and from a huge coal burning centre is being turned into an oil burning city. Many of the huge sky scrapers will be kept warm this winter by heat obtained by burning oil. Not a few power companies have started installation of equipment which will enable them to burn oil instead of coal. The whole problem of heating has, owing to coal shortage and strikes, assumed an acute stage which has resulted in efforts being made to try new plans. One of these days we may wake up to find that coal is really not the best or most economical fuel for heating. Predictions are being freely made that this will be the case.

THIS HARD-TIMES TALK

A YEAR ago, after the signing of the Armistice, there was a feeling in Canadian business circles that something in the nature of an industrial crash was impending. The only way to evade idle plants that could be seen was by getting export orders to replace munitions output. What few or none foresaw was the fact that with short working days declining production, and a prosperous people willing to spend from their war-time savings there would be a home market for practically everything which the majority of our plants could supply. To-day Canadian manufacturers are developing a market in Britain and Europe for those products which are largely made from our raw materials, but in many other lines there is, at present, a market at home for everything that can be turned out from the available

raw materials, and at prices providing a good margin of profit.

That present conditions will continue is not to be expected. Public men like Premier Drury have, with commendable frankness, sounded a warning as to the necessity for production and thrift, and the U.F.O. leader has been candid and emphatic in referring to lower prices. The Toronto *Globe* goes so far as to talk of a "hard times" serum to "bring the world's pulse back to normal."

That there must be a process of deflation before Canada and other countries which have been engaged in the great war can reach a solid foundation upon which to build permanently for the future is something which SANITARY ENGINEER has long regarded as inevitable, although from time to time it has been postponed. This readjustment will, no doubt, be accompanied by a strain upon the economic and social fabric of those countries which are suffering from a serious shortage of commodities as well as depleted financial resources and the domination of radical leaders. But at the same time we believe that if there are hard times in Canada it will be largely the fault of Canadians. The world is short of foods and commodities. Canada has the raw materials and available agricultural areas. If we can produce efficiently there is a market waiting. And if we are thrifty we can afford to extend credits to those countries worthy of our confidence. The Bolshevik element must be held in control.

The success of the Victory Loan established the solidity of Canada's financial resources. The people have done their part. It will now be for the Government to do its part. The money has been provided to clean up the situation and to get the national machinery back to a normal basis. It is for the Government to do just that. At present the national expenditures are far above income. If they continue on this basis there is nothing in sight but another Government loan a year or so hence despite rather indefinite assurances to the contrary.

It is to be hoped that Ottawa will not take advantage of the loyalty and generosity of the Canadian people to continue extravagances which must sooner or later be curtailed—and the sooner the better. If the people are to successfully readjust their personal affairs an example must be given by the Government.

BOOSTING HOME TRADE

FORTUNATE indeed is a community whose business men advertise wisely and liberally, says a bulletin from the Associated Advertising Clubs of the World, for that community will grow and prosper.

Good advertising, which means steady advertising in space big enough to tell the story that the advertiser wants to present, brings new dollars to town, and keeps home dollars at home, the bulletin continues.

And what becomes of the dollar that goes into the cash drawer of a local merchant? Three-fourths of it or thereabouts (depending somewhat on the line of business and the nature of the goods sold) goes to the wholesale dealer or manufacturer for the goods the store sells.

The rest stays in the home town. Most of the other twenty-five cents out of each dollar goes for rent, salaries of employees, and to the local coal dealer, the light company and others whose goods or services are needed in keeping the store going.

Each time the advertising of local merchants brings $10,000 of new business to a town, at least $2,500 of it remains in the town, and is passed around from person to person, and all the people share in the resulting prosperity.

Though some people who are not themselves in business fail to appreciate it, everyone in a community has an interest in every new dollar that is brought to town, and that is just as true in the large city, where business is a great net-work of mutual interest, as in the smaller place, where it is easier to trace the benefits which every person receives.

Advertising has come to be a great power in business because advertising creates markets. Markets are in the minds of people, and can be made through honest advertising. Merchants and manufacturers have found that out, and that is why they advertise.

STABILIZING THE DOLLAR

THE appointment of a committee of bankers and business men in the United States to investigate and see what can be done to "stabilize the dollar" is timely. For a long time the decline in the purchasing power of money has been arresting the attention of business men. They realized thoroughly that the time must come when a stop would have to be made or serious disturbances in both economic and industrial relationships would occur. Obviously this condition has arrived. It is not nearly as acute in Canada as in the United States, but because of the close relationship between Canadian and American business men, Canada is very directly affected by conditions which obtain across the line. Investigations so far indicate that the situation has been brought about largely because a paper or credit dollar has driven both gold and silver practically off the monetary stage. Not only America, but practically the whole world, has got off the gold and silver basis and is working largely on paper. Added to this is the fact that throughout the world there is an acute shortage of goods. The problem the investigators have to solve is anything but an easy one in that they have to find means of granting credit and at the same time removing credit inflation. Having diagnosed the case some of the brainiest men in the commercial world of the United States are busy figuring out the best remedy to apply.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

New Firms

O. Galarneau & Son, plumbers, have been registered at Montreal by Ovide Galarneau Jr.

H. E. Trafford & Co., plumbers, has been registered at Montreal by Henry E. Trafford and James H. Trafford.

Personals

Frank R. Maxwell, of Toronto, president of the Dominion Society of Domestic, Sanitary and Heating Engineers, will be a candidate for aldermanic honors in Ward 7 in the coming elections.

Thomas Ferguson, of 2531 Yonge St., Toronto, is seriously ill at his home with pleurisy, which developed after a heavy cold. At last reports Mr. Ferguson was showing improvement.

Trade Notes

In the big gale that swept over the country on Sunday night the roof of the Ontario Sewer Pipe Co.'s factory at Mimico, Ont., was blown off, causing a loss of from $3,000 to $4,000.

STOWE-CRACKNELL

The wedding was solemnized at Newman Hall, Toronto, on Thursday last of Miss Florence Stowe of Goderich, Ont., and Mr. John Cracknell, of the plumbing firm of Kelly and Cracknell. Mr. and Mrs. Cracknell will reside in Toronto.

MAY EXPEND $2,000,000

Windsor, Ont.—Plans of the Essex Border Utilities Commission to consolidate the waterworks sytem of Windsor and Walkerville to supply the five border municipalities with filtered water at cost will be submitted to the ratepayers in January. The project will involve $2,000,000.

WENT OUT ON STRIKE

Moncton, N.B.—About fifty pipe fitters and plumbers for the Ballantyne Co., of Montreal, on the T. Eaton building, struck because two non-union men were working. The strikers were supported by the local Building Trades Council. After a mass meeting they decided to remain out.

SEEKING A CHARTER

The steam and sprinkler fitters' helpers of Halifax have made application through C. C. Dane for a charter in the Plumbers' and Steam Fitters' International.

TO HONOR PLUMBER'S MEMORY

In memory of the late W. R. J. Hughes, a master plumber of Montreal, who died suddenly in the club rooms of the Royal Caledonian Curling Club last winter, a cup to be known as the W. R. J. Hughes memorial trophy is to be provided and contested for. This trophy has already been donated as a tribute to the late Mr. Hughes and is a fitting memorial to one whose heart was so much in the Canadian game, played extensively each winter by Montreal enthusiasts. Mr. Hughes had been playing a game with his friends, and upon complaining that he did not feel well, stepped into the clubs rooms and expired in a few minutes.

CITIZENS WANT INSPECTOR

Woodstock, Ont.—The recommendation of E. S. Estlin, Provincial Gas Commissioner, that the city appoint a gas inspector does not meet with the approval of all the members of the council. Some think that if the gas company fulfills its duties it should not be necessary. Ald. Glaves says he thinks an inspector should be appointed. The matter will be dealt with by the council. Many citizens think that the appointment of such an officer would result in the conditions here being improved.

SEWAGE PLANS APPROVED

The city council at Woodstock, Ont., has been informed that the Provincial Board of Health has given its approval to the proposed new intercepting sewer and sewage disposal scheme, and accordingly a by-law regarding it will be submitted to the people at the time of the municipal elections the first of the year. The new plant will cost $100,000, and will overcome the long-standing sewage troubles of the city, and particularly those in the southern portion. The work of construction will be commenced as soon as possible next spring.

WATERWORKS EXTENSIONS

Brantford.—Plans for waterworks extensions now being worked out by the local authorities call for an expenditure of from $500,000 to $600,000. A by-law for this amount will likely be submitted.

CHEAPER GAS AND WATER

Kingston, Ont., is to have gas and water rates reduced at the end of the year. The price of gas, which rose from $1 to $1.50 during the war, is to be dropped to $1.25.

KILLED IN CROSSING FATALITY

Miss Jean Scott, daughter of R. Scott of the plumbing firm of Scott and Bennett, Galt, Ont., was killed at Buffalo when a New York Central passenger train crashed into an auto at the Harlem avenue crossing. Six others who were in the car were killed also. Miss Scott was a nurse at the Homeopathic Hospital, and, with the others, was returning from a party when the accident occurred.

CONTRACTS AWARDED

W. McCaffery, Ste. Anne de Bellevue, Quebec, has contract for plumbing and heating for the new parish hall for St. George's Anglican Church.

Moose Jaw Plumbing and Heating Co., Moose Jaw, Sask., has contract for plumbing and heating for new public comfort station costing $20,000.

Elliott Bros., Kingston, Ont., have plumbing and heating contract for new school costing $125,000 for the Board of Education.

Napoleon Deguire, Joliette, Quebec, has contract for plumbing and heating for new Roman Catholic school costing $90,000.

Haig and Burns, Lansdowne, Ont., have plumbing, heating and roofing contract for new bank costing $16,000 for the Merchants' Bank.

Anguish & Whitfield, Brantford, Ont., have contract for plumbing and heating for new bank at Parkhill, Ont., for Merchants' Bank.

A. E. Hayman, Stellarton, Nova Scotia, has heating and plumbing contract for new bank costing $38,000 for Bank of Nova Scotia.

Anguish and Whitfield, Brantford, Ont., have heating and plumbing contract for new bank to cost $17,000 at Tara, Ont., for Merchants' Bank.

H. Birnon, Three Rivers, Quebec, has plumbing and heating contract for new buildings for E. Deshaies, Cap de Madeleine, Quebec.

Anguish & Whitfield, Brantford, Ont., have contract for plumbing and heating for new residence for Dr. J. W. Robinson.

Ecclestone & Bates, Limited, Bracebridge, Ont., have been awarded a contract for twenty more bathrooms in the Beaumaris hotel annex.

Van Tuyl & Fairbank, Petrolea, Ont., have been awarded the plumbing and heating contract for new nurses' home of the Charlotte Englehart Memorial Hospital.

TENDERS

Plans are to be prepared at once for new court house costing $100,000 at Kerrobert, Sask.

Tenders on heating and plumbing for new Central school at Glace Bay, Nova Scotia, are to be called at once.

W. Fryer, 5 Glen Ave., Ottawa, wants tenders on heating, plumbing and electrical work for new residence costing $5,500.

R. W. Baxter, 142 Harvey St., Chatham, Ont., wants prices on heating and plumbing for new residence costing $6,000.

V. D. St. Louis, 108 Hall Ave., Windsor, Ont., wants prices on heating and plumbing for two new residences costing $5,000.

Suydam Realty Co., 36 Toronto St., Toronto, plan erection of twelve residences to cost $60,000.

Kitchener Housing Commission, Kitchener, Ont., wants tenders on heating and plumbing for eight residences to cost $24,000.

Erection of a new college at London, Ont., for the Ursuline Sisters, Chatham, Ont., to cost $150,000, is planned. Work to start in spring.

D. O. Yeoman, Amherstburg, Ont., wants prices on heating and plumbing for new bungalow to cost $6,000.

The Sanatorium Board at Brantford, Ont., will submit by-law shortly to provide for $20,000 for the erection of a residence for the staff.

R. M. Rive, 230 Highfield St., Moncton, N.B., wants prices on heating and plumbing for ten residences to cost $35,000.

L. C. Tarlton, 393 Wiseman Ave., Outremont, Que., wants prices on heating and plumbing for residence costing $8,000.

N. Hollister, 514 Bay St., Ottawa, Ont, wants prices on heating and plumbing for alterations to apartments costing $6,000.

Restmore Mfg. Co., Vancouver, B.C., wants prices on heating and plumbing work in connection with new boiler house to cost $10,000.

B. H. Prack, 50 Bay St., Toronto, is preparing plans for new factory for the Firestone Tire Co. Hamilton, Ont.

Plans are to be prepared for the erection at London Ont., of a college building to cost $150,000 for the Assomption College, Windsor, Ont.

An addition to the Paterson Hotel, Owen Sound, Ont., to cost $20,000, is planned. C. W. Douglas, manager.

A by-law will be submitted at Brantford, Ont., shortly, to provide $165,000 for extensions to the general hospital, and alterations to nurses' home and isolation hospital.

R. A. Johnston 90 Agricola St., Halifax, N.S., will let plumbing, heating and electrical work in connection with new hall costing $20,000 for the St. Joseph's H. C. T. A. & B. Society.

Plans are being prepared for a $25,000 addition to the plant of Wm. Patterson, Son & Company at Brantford to be used for the manufacture of candy.

Montreal Strike Settled

Speeding Up of Business is Looked for as Result and Trade Outlook Generally is Most Satisfactory

THE strike of the Montreal plumbers, and which has been in progress for the past nine or ten weeks, is practically a thing of the past. The grievances of the journeymen, SANITARY ENGINEER understands, have been those of wages and hours, more money per hour and shorter working hours being desired. It is expected that details of the differences will be amicably settled, and if so, the termination of the strike will be welcomed on all sides.

A great many of the master plumbers have been able to "carry on" in a more or less satisfactory manner. With all, however, it is felt that much work must needs have accumulated. With the difficulties that usually confront the employer or labor under the conditions of to-day, contracts have not been rushed into, nor entertained, with the possibilities confronting one of being up against labor shortages. For this reason, many jobs and contracts have been purposely steered clear of. It has caused no small amount of trouble.

Asked as to the outlook, one of the leading master plumbers said to SANITARY ENGINEER that there would undoubtedly be a considerable amount of bigger work offering almost immediately. While, as before stated, the shops have been handling work, and some of them with a fairly large staff, they will now be in a position to take on new work, and the larger class of which they have purposely evaded. Providing the weather conditions are not too severe, it would seem that the local trade bids fair to speed up, and a considerable volume of business will be overtaken, undoubtedly, before the turn of the year.

Ontario Executive is Planning Visits to Hamilton, Niagara Falls and Peterborough

Important Matters Regarding Organization Work and Co-operation to be Taken Up With the Master Plumbers —Pulling Together Will Bring Results

THE directors of the Ontario Society of Domestic Sanitary and Heating Engineers are busy with plans for a series of meetings to be held with the men in the trade at various points in Ontario. Visits are contemplated in the near future to Hamilton, Niagara Falls and Peterboro. These points are merely under consideration at the present time and no dates have as yet been set for the holding of the meetings.

There are many matters in connection with organization and co-operation which the directors wish to take up with the master plumbers in various districts. Splendid progress is being made in getting the men in the trade working together not only in their own towns or districts but also along the wider lines of provincial and Dominion co-operation.

Good results are bound to follow if all work together and the executive officers are sparing no time or trouble to bring about these results. Much has been accomplished by the meetings already held and they will be continued.

Organization Work Discussed at Oakville Meeting

ON Wednesday evening of last week the directors of the Ontario Society of Domestic Sanitary and Heating Engineers paid a visit to Oakville and discussed at some length with the men in the trade along the Toronto-Hamilton Highway matters regarding the extension of the work and organization.

The master plumbers in this territory are contemplating organizing, and the executive officers went into this question with them. President Thomas J. Minnes, of Brantford, Ont., spoke on the excellent results that have already been accomplished, and also pointed out the work that remains to be done. He emphasized the benefits to be obtained by the whole trade if every member works together, and showed how conditions will not only be improved for each individual but for the sanitary and heating engineers throughout the province and the Dominion.

Two Big Factors

He spoke of the work to be done in educating the men in the trade to a realization of the vital importance of conducting their business in a systematic and business-like manner. He also spoke of the importance of developing the salesmanship side and of the excellent profits to be made therefrom. He was able to give considerable first-hand information as to what is being done by the master plumbers in Brantford and some other Ontario points, and this was listened to with much attention.

Talks on the work of the association

Continued on page 31

Important Ruling Made by Board in Electric Lamp Case

Decision is That Canadian General Electric Co. Made Use of its Rights so as to Restrain Trade in Production of Incandescent Lights

A JUDGMENT that may have far-reaching effects was handed down at Ottawa by the Board of Commerce when it found that the Canadian General Electric Company of Toronto, as the holder of certain patents in respect of tungsten filaments, has made use of its rights, so as to restrain trade and commerce in relation to the manufacture and production of incandescent electric lamps. The judgment points out that while the Board has jurisdiction over monopolies, even when possessed or controlled by a single individual or company, and might, therefore, make a specific order, the Exchequer Court has special jurisdiction over the matter of patents.

Board Has Power

Under Section 13 of the act, it is within the power of the Board to make a report to the Minister of Justice when patents have been used in restraint of trade and the Minister may exhibit an information in the Exchequer Court praying for a judgment revoking such patent. This course has been adopted by the Board, the judgment stating that this course will permit of the matter being further investigated by a tribunal technically equipped for that purpose.

This case arose out of the complaint of the Canadian Laco-Phillips Company, Limited, Toronto, that the Canadian General Electric Company, also of Toronto, who control the manufacture of drawn tungsten wire in Canada by virtue of several patents, have refused to sell such wire to the applicants for use in the manufacture of lamps.

Ask For Relief

The respondents are themselves manufacturers of lamps, and it was alleged that they were seeking to have a monopoly of lamp manufacture in Canada. Applicants declared that the respondents have brought themselves within a definition of a combine, in the act, and ask for appropriate relief.

The question of whether the patents in question covered the manufacture of wire or the manufacture of lamps was argued before the Board, which held that it was the tungsten process and not the lamps, which was protected.

Monopoly, Says Board

It is the view of the Board that the respondents have acquired a monopoly with relation to the article in question, and such monopoly is operative and likely to operate against the interests of producers of incandescent electric lamps, and very probably also against the interests of the public in that the manufacture and the supply of electric lamps is restricted by the use of respondents are making of their monopoly of the production of tungsten wire filaments. Vacuum lamp-making is not protected by the patents, the Board rules, but merely the manufacture of the wire filament.

Minister of Health Takes Steps to Enforce Better Sanitation

EDMONTON.—The Provincial Board of Health, composed of two medical men and a sanitary engineer, all acting under the direction of the Minister of Health, have been steadily tightening the lines all over the province on the question of sanitation. The minister explains that it is not the intention of the department to put municipalities to any expense by way of costly schemes, but that it has been made plain by circulars and otherwise to the proper authorities, that public places, such as public houses, restaurants, slaughter houses, etc., must be kept in good sanitary condition.

While the great majority of public places in the province are well conducted, complaints come from travelling men as to one here and there, that is in an absolutely filthy condition of uncleanliness, as to certain restaurants and numbers of out premises generally. After repeated warnings to the proper municipal authorities and occupants, the five sanitary inspectors were instructed to commence prosecutions. Recently prosecutions were laid and convictions obtained as follows:

Town of Ryley: Mah Hing, proprietor of the Ryley restaurant; J. H. Ying, proprietor of the Ryley Hotel.

Youngstown.—James Howell, hotel keeper.

Delia: A. Nichol, proprietor of the Queen's Hotel.

Wetaskiwin: Dong Wing, proprietor of the Club Cafe; Wong King, proprietor of the B. C. Cafe; Wong Hing, proprietor of the Union Cafe; Ching Chong, proprietor of the Palace Cafe; Je Key, proprietor of the Royal Cafe.

Sibbald: Won Hing, proprietor of the restaurant.

Ponoka: Sing Key, proprietor of the Rex Cafe; Mah Poy, proprietor of the Mah Poy Cafe; Mah Yuen, proprietor of the Leland Hotel; Mah Fong, proprietor of the laundry; J. Duncan, private resident; Ed. Basgom, private resident.

The fines imposed would vary from ten to fifty dollars with costs.

Apparently it is the determination of the department to protect the travelling public from uncleanliness in public places, and communications from travelling men to the Department of Health, who find conditions such as should not exist, if marked confidential, will be treated as such, and an inspector sent forward to look into the situation.

The minister points out that there is a heavy penalty provided for in the statutes against members of local boards of health who take no steps to see that all public places within their jurisdiction are kept in a sanitary condition.

ASKING FOR $75,000 FOR NEW PUMPS

Works Commissioner Harris has reported to the Board of Control of Toronto that one of the four electrically operated boring pumps at the main water works pumping station, all of which were installed in 1911, has been out of commission for some time, while the other three were in such condition that further repairs were practically useless. He recommended that new pumps be ordered as early as possible at an approximate cost of $75,000, which he intended to include in the estimates for 1920.

The Board decided to ask Mr. Harris why the pumps had become useless within so short a time.

PLAN WATER SYSTEM

If the by-law which is to be submitted to the ratepayers of Beaverton, Ont., on January 1 carries, people who spend the summer upon the lake front there will have all the conveniences of running water in their cottages. At a meeting of the Town Council it was decided to submit to the electors a by-law providing for the installation of an $85,000 water system. The by-law provides for a pumping plant, filters, standpipe and five miles of water mains. Cottages for a mile along Lake Simcoe will benefit by the scheme. Engineer E. A. James attended the meeting and explained the plans to the Council.

TO COMPLETE SEWAGE INTERCEPTOR

Tenders were received by the Essex Border Utilities Commission, Windsor, Ont., until November 27, for completing the south sewage interceptor in Sandwich and Ojibway Ont.

The work consists of laying approximately the following lengths of reinforced concrete lock-joint pipe in four-foot lengths, which is now on the work: 16 ft. of pipe, 42 in. diameter; 4 360 ft., 39 in.; 4,320 ft. 27 in. The work also includes the building of 15 concrete and brick manholes and setting cast iron frames and covers; pumping and clearing out 4,000 ft. of existing sewer 42 in. and 27 in. in diameter, and shaping up ditches; replacing 80 sq. yds. of concrete street pavement.

Directors Visit Galt and Kitchener

Co-operation Will Solve Every Individual Difficulty and Every Problem of the Trade Generally, Says Vice-President George E. Grinyer—Secretary Frankland Tells About Importance of Overhead

THE directors of the Ontario Society of Domestic Sanitary and Heating Engineers held their regular monthly executive session for November at Galt on Thursday afternoon last. In the evening the officers went over to Kitchener and at a well-attended meeting of the members of the Twin Cities Club, including men in the trade from both Kitchener, Waterloo and Elmira, addresses were given.

Vice-President George E. Grinyer, of Guelph, presided at the meeting in Galt, and among those in attendance were Messrs. Scott and Bennett, Frank J. Short, H. A. Lyall and W. H. Pinkett, of Galt, and W. A. Spalding and George S. Bowman of Preston. Applications for membership in the Ontario Society were received and accepted from these. It is planned to hold a series of meetings at Galt, Preston and Hespeler.

Urges Co-operation

Vice-President George E. Grinyer, of Guelph, made a strong address, in which he pointed out that if the men in the plumbing and heating business expect to improve conditions in the trade there is only one way to do it, and that is by working together. Co-operation, he said, would not only solve the problems of the master plumbers in each town, but, by working together all over the province and all over the Dominion, results of a larger kind could be secured, which would be of direct benefit to all.

He told of the splendid practical work that is being carried on by the Ontario society in its efforts to give the men in the trade practical knowledge regarding the essentials of business, system and salesmanship.

Get On Broader Basis

K. B. Allison, chairman of the Educational Committee, based his remarks on fellowship and humanity, and urged the men in the trade to get a broader vision than mere local or individual and selfish interests. Improved conditions for one man mean improvement for all, and what hurt one man indirectly injured all. Many people, he stated, did not realize this. He urged every man in the plumbing and heating business to work together for the greatest good for all. This, he said, would put the trade on a broader basis; not a mere basis of dollar and cents, but the greatest benefits for all.

Tells of Overhead

Secretary Garrett Frankland went into the question of "overhead," and explained in detail what a vital factor it is in the successful conduct of business today. Without a thorough knowledge of how to figure, he said, no man could hope to get the results he ought reasonably to expect. There are endless ways of losing money, and the sooner they are stopped, the sooner a business will commence to show profits.

Harvey Hymmen, of P. Hymmen & Co., Kitchener, was chairman at the meeting, and among those present were H. A. Haas, of M. Weichel & Son, of Waterloo; John Hainsworth, Henry Wolfhard, William Knell, Herbert Klem, W. F. Doerfling, John Shiry, of Kitchener, and Fred Rudow, of Elmira.

Applications Accepted

Applications were received and accepted for membership in the Ontario society from P. Hymmen & Co., J. Shiry, H. Klem, and Doerfling and Forler.

NOT VERY SERIOUS

As stated in a recent issue of SANITARY ENGINEER a report on allegations in connection with plumbing work at Peterboro, Ont., was to be made. This has been made, and in submitting to the Property Committee an itemized report of his investigation of the alleged faulty plumbing in nineteen local buildings, W. H.. Meadows, chief of the division of plumbing and drainage of the Toronto Council, advised that Peterboro's by-law be revised. In this connection he stated that the present by-law does not permit the use of brass waste and vent piping. Mr. Meadows considered this material satisfactory and said that it was generally accepted, otherwise he would have had to condemn work he considered satisfactory.

Not Being Published

The committee deemed it inadvisable to publish the report because of a possible liability for damage claims from citizens whose plumbing had been approved by the city's plumbing inspector. The chairman, Ald. Hamilton, suggested that City Solicitor Widdifield be asked for his opinion as to whether the municipality in view of its responsibility for the local inspector could be compelled to make or pay for the alterations to certain plumbing which Mr. Meadows reported as not fulfilling the specifications of the city's plumbing by-law.

Ald. Edgar proposed that Mr. Peter Thompson, the inspector, be asked to explain the faulty work underlined in Mr. Meadows' summary of his inspection.

Matter Laid Over

The committee declined to delve into the question because of the lateness in the year, and Ald. Edgar moved, seconded by Ald. Hamilton, that the report be referred to next year's council with a recommendation that the administration of the plumbing by-law be placed under the control of the Board of Health instead of under the property committee.

Ald. Hamilton remarked that there was nothing very serious in Mr. Meadows' report. Lack of vents and the provision of only one trap for three and more basins were the faults that recurred rather frequently in Mr. Meadows' enumeration.

APPROPRIATION EXCEEDED

At the present time the Ontario municipal housing schemes approved call for an expenditure of more than $10,000,000 or $2,000,000 over and above the Federal grant and of this perhaps half is already committed by buildings under way.

The town of Oshawa on Friday last sent a deputation to Hon. C. H. Nixon, Provincial Secretary, and asked for endorsation of a housing scheme extension involving an expenditure of $400,000 in addition to the $500,000 already allotted it. Up to the present Oshawa's housing operations represent an expenditure of $300,000. The Minister promised consideration.

ORGANIZATION WORK DISCUSSED

Continued from page 29

were also given by Treasurer Thomas R. Maxwell, Secretary Garrett Frankland and K. B. Allison, chairman of the Educational committee.

Among those who attended the meeting were J. H. Doughty of Mimico, A. J. Ingram of New Toronto, T. W. Slean and W. Barrett of Oakville.

It is planned when organization is effected, to hold a series of meetings to include Burlington, Oakville and Mimico.

Wm. Skelly, London, Ont., has the contract for the plumbing work in connection with addition that is being erected to the dry goods store of T. F. Kingsmill.

The Canadian John Wood Manufacturing Company, Limited, head office Toronto, capital $200,000, plans to manufacture and deal in range boilers, galvanized goods, barrels, containers, etc.

Thermos Heating Systems, Limited, capital $600,000, head office Montreal, plans to manufacture and deal in hot water systems, steam boilers and heating equipment.

R. Watt, Ridgetown, Ont., wants prices on heating and plumbing for two residences he plans to erect.

The Cluett Peabody Co., Walkerville, Ont., plans the erection of a new plant at Montreal to cost $100,000.

Heating and Ventilating

Ventilating the Modern School

Sixteenth Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

AMONG the simple types of heating and ventilating apparatus that have come to us from practices of the past, that one where the direct radiators are also used to heat the air for ventilation is perhaps the best known to the general public.

In the very outset of this article it must be admitted that, in some cases, plants of this nature have been more or less of a failure, both with regard to heating and ventilating efficiency. The reasons for the failures should be obvious: too much hit or miss method in the making of designs for systems that would, under proper conditions, provide a degree of excellence often sadly wanting in our more modern system.

Has Vital Quality

Even the most rabid critics of the system cannot truthfully deny that air passing into a room by way of direct-indirect heating surfaces seems to carry in from the out of doors some vital quality, that is not always present in fresh air when it is warmed by other means.

We believe that the majority of men in the heating and ventilating trade are broad enough in their views to appreciate the merits of any system, even though such merits may be buried under a multitude of faults. The man who is really progressive knows how much of modern science is carried on the wheels of old principles, and therefore he never vigorously condemns a thing because it is a child of, what other men may term, antiquated ideas.

The principle of this system, in itself, requires no less nor more of apology than does the principle of any other system of heating and ventilating. The annoying faults of ventilating systems are more frequently due to wrong application of principles than they are to the principles themselves. And there is little doubt in our mind that when direct-indirect radiators are installed, with proper arrangements for foul air exhausts, they will perform their function in a way to convert their most fiery critics to staunchest advocates.

Unequal Distribution

The principal defect in most of the systems where direct-indirect radiators are used is found in the unequal distribution of the fresh air. In some of the previous articles of this series, consideration has been given to the natural paths taken by currents of heated and of cold air. That consideration, if taken here, should be the means of disclosing the capital reason for the defect that hitherto has seemed to be an inherent part of ventilating plants of this character. We do not believe that it is necessary to repeat here the recommendations made in former articles with regard to the necessity of having more than one foul air exhaust in a large room when direct air flushing is the principle used in maintaining a standard of air purity. Reference to former articles will give the reader all of the data he may require when designing the foul air exhausts for a system like that herein described.

On Special Bases

Direct-indirect radiators are simply direct radiators set on special bases. These special bases are the "cold air chambers" of this system, and are connected to outer-air openings by the means of wall boxes. The outer-air opening may be set below the floor on which its connecting radiator is set, or it may be set on the same level as the base of the radiator. In any case, the outer-air opening must be proportioned to the heating surfaces above the base, and relative to the quantity of air that is to be admitted. This is one detail that has often been left to a hit or miss method for the setting of ratios.

The wall box, in other words the fresh air intake, should be fitted with louvers so that the snow and the rain may be kept out. It should also have a 14-inch galvanized iron screen, to keep out insects and birds. The box should be of cast iron; sheet metal is too light for such a purpose; and as every precaution must be taken in providing durable fixtures where repairs are frequently difficult to make, it is well that these boxes be made of the heaviest material available, viz: cast iron.

The bases under the radiators should have double-acting dampers, set so that when the outer-air pasages are closed corresponding inner-air passages may be opened. Thus, when the air from out of doors is not passing over the heating surfaces, air taken from the room may move in that direction.

There is no use of providing ventilating radiators if no measures are taken to remove the vitiated air from the rooms containing these heaters. The location and size of vent flues require a good deal of careful thought when used in a plant of this description.

Equalizing Valves

Gravity exhaust flues should be equipped with automatic draft equalizing valves; also blow-down check dampers. If vent flues are not so equipped the flues will often carry more air from the rooms than can be properly heated by the radiators; and then on the other hand, if no blow-down checks are installed, the wind coming from an unfavorable quarter may rush down the vent flues and out of the rooms, by way of the fresh air openings set at the bases of the radiators. Where exhaust fans are used there is no need of installing blow-down checks; but there certainly is of the velocity-equalizing valves.

In any system of gravity exhaust of foul air, the vent flues should have sufficient radiation installed therein to effect an upward flow of air. These "draft-accelerating" radiators should be placed just above where the foul air escapes from the room, as they are not of much value when placed high up in the flues. The reason for this was given in former articles. Care must be taken to see that the free areas of the flues are not reduced too much by the presence of the accelerating radiators.

Area of Heating Surface

The area of heating surface required for heating the air for ventilation may be readily estimated by basing the figures on an average condensation of .4 of a pound of steam per hr. or 386 B.t.u.

If we have a class-room containing 40 pupils and one teacher we could proportion the direct-indirect radiation so that each occupant would receive 20 cubic feet of air per minute, thus:

41×20 cubic ft. per minute $= 861$ cu. ft. per min. 861 cu. ft. $\times$ $60 = 51660$ cu. ft. per hr. Specific heat of air 55. $51660 \div 55 = 939$ E.G.S. Temperature range, 89°. Heat loss $939 \times 80 = 75120$ B.t.u. Radiation required for ventilation only: $75120 \div 386 = 194.6$ sq. ft. To this must be added the areas required for heating the room; usually about 200 sq. ft.

Varying Standards

Now it will be noted that the example gives a standard of 20 cubic ft. of air per room occupant; whereas in describing other systems of ventilation we set

a standard of 30 cubic ft. of air per occupant. We have set the lower standard in this example because it is an example of the direct displacement system of ventilation. Twenty cubic feet of air is a standard quite high enough for such a system, and is, in fact, a much higher standard than that on which many systems of this kind are based. Very often the requirement is that the air be changed 4 times in an hour, and as in ordinary heating systems a natural ventilation effect of one change of air per hour is obtained, and as the cube of the standard class-room is 10,000 ft., the heating surfaces for ventilating service would be, in such a case about 115 sq. ft.

Foul Air Displacement

In basing the foul air displacement at 30,000 cubic ft. instead of at 51,660 cubic feet of air, as first estimated, it will be necessary to proportion the foul air exhaust to correspond to the smaller air discharge.

The cold air openings should be proportioned for an intake of air at a velocity not exceeding 300 ft. a minute.

From the data given, we can estimate that 30 sq. ft. of the indirect part of the radiator will heat about 7,800 cubic ft. of air 80 degrees per hour; also that the area of the cold air opening for this amount of radiation should be 62 sq. inches.

Many handbooks give a rule for estimating direct-indirect radiation by a system of figuring the direct surface necessary to warm the room and then adding from 27 to 37 per cent. to provide heating surface for ventilating purposes. That rule is one of the hit or miss methods, and will not set figures high enough to provide the radiation really required.

Steam Systems Only

Now remember that the figures so far given in this article apply to steam systems only. Hot water systems require more heating surface in proportion to the air heated than do steam systems. For direct-indirect radiation it is safe to allow about 55 per cent. more surface for hot water than for steam. Thus if we decided to use hot water instead of steam we should have to consider the radiation in our example as 46 sq. ft. instead of 30 sq. ft.. as specified in the steam system.

There is one other thing that we did not touch upon when writing of the cold air inlets: the cold air check dampers. All cold air openings should have dampers independent of the double-acting dampers, so that the areas of the cold air openings may be varied to meet different conditions of weather. The omission of this necessary checking damper is very often the cause for failure in many otherwise excellent systems of ventilation.

We must not close our eyes to the defects of any system of ventilation, but rather in admitting the existence of such defects, strive to find some way of overcoming them. We have already written of the fault of unequal air distribution; also of the methods of counteracting that fault. So we may now turn to the danger of the freezing and bursting of direct-indirect radiators; a danger that these radiators are subjected to through faulty manipulation of valves. A room may become too warm, and then the radiator valves are closed. The person who closed the valve may leave the room, forgetting to open the valve. The room becomes cold and the condensation remaining in the radiator becomes frozen. Worse still, the feed valve, if a one-pipe system is used, may be partly opened, then a great deal of water accumulates, all ready to be frozen, when "zipp! there goes another rad."

Danger Is Greater

The danger of having frozen radiators is greater when hot water systems are used than when steam is the heating agent.

As the danger from frozen radiators is increased because of human fallibility it would seem that a measure of the danger might be avoided where automatic temperature control is installed. Then the radiator valves will be always open at the times when heat is most required.

Although it is quite possible to install direct-indirect radiators in connection with a one-pipe distribution system, it is far better to couple this type of radiator to a two-pipe arrangement of supply and feed. The size of the mains and returns can be proportioned the same as for an ordinary two-pipe system for direct radiators; but we must then consider indirect radiating surface as being, at least, equivalent to slightly more than 50 per cent. increase over its area when assuming it to be direct radiation. Thus: 100 sq. ft. of direct-indirect radiator surface is equivalent to 150 sq. ft. of direct radiation when figuring pipe sizes.

The next article of this series will be descriptive of the details of various systems. It will be illustrated with working drawing showing the methods used in applying the principles of different systems in actual work.

Town Planners Want Present Act Amended

More than 150 delegates from all parts of South-western Ontario are attending the 3rd annual South-western Ontario Town Planning Conference, which is being held at Hamilton. Among the proposed amendments to the Town Planning Act which will be submitted to the Ontario Legislature are the following:

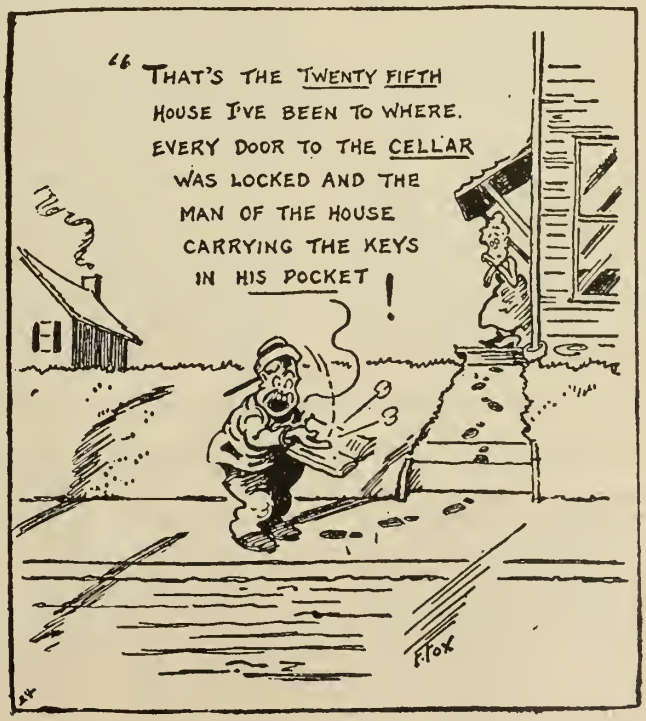
The following powers should be granted under the act to municipalities:

Power to remove or demolish buildings which may be erected in contravention of the provisions of a scheme, after the scheme has been approved, as well as after proper notice is given and while the scheme is being prepared.

Power to prescribe certain areas to be used for dwelling houses, apartment houses, factories, warehouses, shops or stores, etc., and to fix the height and character of the building in these areas.

Power to rectify or alter any existing sub-divisions, including the pooling of lands of several owners, and the roads and streets abutting or adjacent thereto; and to initiate the planning of the sub-division of land in advance of its being placed on sale for building purposes, for the purpose of bringing owners of adjacent lands into line with any comprehensive scheme.

Power to prevent building on low-lying and unsanitary land pending reclamation and until provided with sanitary arrangements at the expense of the owners.



"THAT'S THE TWENTY FIFTH HOUSE I'VE BEEN TO WHERE. EVERY DOOR TO THE CELLAR WAS LOCKED AND THE MAN OF THE HOUSE CARRYING THE KEYS IN HIS POCKET!
F. FOX

BASIS FOR DETERMINING PROFITS

(Continued from page 23)

twine, stationery, etc., book-keeping and accounting, collection of debts, bad debts, delivery, advertising, as well as a proportion of the loss which would come through the fact that he will almost certainly have to sell some of the boots at a lower price than the marked price. It is only when a retail merchant has taken these into consideration, basing the amount on his experience of previous years, or on the experience of others, that he is in a position to fix what is a reasonable marked price.

Must Be Considered

Similarly take the case of bacon. In addition to the other items which have been mentioned as having to be considered by the merchant in fixing the retail price, he must take into consideration the following:

Diminution in weight resulting from evaporation.

Loss in the process of slicing, because certain parts are less saleable or unsaleable.

Loss from the fact he buys bacon wrapped in heavy papers, pays the same price for the paper as for the bacon, and loses whatever has been paid for the paper. The weight of the paper so bought, and which the merchant loses, may amount to many hundreds of dollars in a year.

Cost of High Living

It is the opinion of merchants who have given deep thought to the question that the prices the consumers are paying to-day are due to the cost of high living, rather than to the high cost of living. This condition is reflected in some of the items that are included in the analysis of the cost of doing business. For instance, one of the details of expense that shames the merchant is the cost of delivering goods to his customers.

During the past four years, owing to the higher prices of labor, of equipment and of feed, that cost has grown enormously. The expense of keeping a horse has actually doubled during the past two years. When in the evolution of retail trading the merchant undertook the work of delivering, he entered the field of transportation. Instead of charging for the service rendered by him in that field, as ordinary transportation companies do, he was unwise enough to carry it on gratuitously. He was obliged to include the expense among the items that made up the cost of doing business, which meant that it was reflected in the price of the goods.

Has Included the Cost

The result has been that ever since he began to deliver he has included the cost of service in his retail selling price. It may be added here that retail trade delivery is the most expensive kind of transportation known; it is also worth while to mention that the public has unfortunately been taught to expect a maximum service in this particular. It is the function of the retail merchant to serve the public, and he has now little or no option. If he wants the business he must furnish the delivery. The custom has extended itself so that he cannot control it. It may be that sentiment among retail dealers is favorable to a restriction in delivery service, as recent efforts at reform would indicate. But the general principle of full deliveries cannot be changed. Therefore, the customers who live near a store and carry home their purchases usually pay the same prices as the ones who demand that the articles be delivered in some distant and widely-separated parts of the city. There are frequent occasions, indeed, when the cost of delivery exceeds the selling price of the goods delivered.

Important Factor

We are discussing the subject of delivery at some length because we believe your board is interested in learning about its important bearing on the distribution of merchandise at retail. We would go so far as to suggest that your board consider the advisability of securing to the customer who performs delivery service for himself the benefits of that service. An innovation of this kind would exert a very beneficial influence economically, because it would lead directly to reductions in the retail prices for many lines of goods. We believe that any customer who desires to save the cost of delivery on his purchases by taking the goods with him should have the opportunity of making that saving. The only way in which that saving can be assured to him is by a policy of charges for deliveries.

Dictate Methods

We have already referred to the growing tendencies of outside organizations to dictate methods and terms to merchants as employers. The principal manifestation of this development is to be found, of course, in the case of wages. The increases in wages paid to employees of retail stores during the past two or three years are unprecedented in the history of business. The situation gains seriousness chiefly through the fact that a considerable part of the service purchased by the merchants is inefficient and indifferent at the beginning. The increasing scale of salaries is being paid to employees who come to the place of business uneducated for their work. This fault is largely due to the Government's failure to furnish institutions of education in which employees may be prepared for business careers. Under present circumstances it is essential that the staff be trained by the merchant. Even during the period of education or training, however, they are receiving large salaries based on the current cost of living. As salaries are by far the most important item in the expense of retail business, this state of affairs naturally increases the retail prices. It would seem to us that reforms by the Federal or Provincial Government would terminate the unfavorable features we have just mentioned, and that your board might make effective recommendations along that line.

Requires Consideration

We have deliberately refrained from showing resentment at the interpretations placed by newspaper writers on material submitted to your board. But we feel that an item in one of these papers proclaiming that retail merchants were making a yearly gain of 7,000 per cent. on bacon requires some consideration. Your board may remember that this item purported to give an account of the proceedings here at which retail merchants were being called to testify. While we clearly understand that your board has not exercised jurisdiction over newspaper reports, we beg to submit that these reports mislead the public and do a serious injustice to the retail merchant. Our object in drawing this phase of the subject to your attention is to point out that the principle of basis employed by your board in arriving at the so-called gross profit on various articles is followed by the daily press. It appears to us that there should be attached to your board, as a part of its organization, a recognized expert in the principles of merchandising, who could assist you in determining such matters as profits fairly and accurately.

The Retail Trade Bureau and the Retail Merchants' Association realize that there are problems and weaknesses in the system of distributing merchandise. We desire to make clear to your Board and to the public our belief that some of these may be remedied only through legislation. We know that the retail merchants will gladly co-operate with your board in its efforts to reduce the cost of merchandise. We take the liberty of requesting, on behalf of the Retail Trade Bureau and the Retail Merchants' Association, a similar measure of co-operation.

TO PROVIDE WATER SUPPLY

Regina.—Dr. W. D. Cowan, M.P., states that after several sessions with the Minister of Public Works with regard to the situation at the foot of Last Mountain Lake he has secured a promise from the head of the engineering branch that an amount would be placed in the estimates for the next session for the work necessary to retain the water in the lake at its present level, and, at the same time, give an adequate water supply to all farmers in the Qu'Appelle Valley east of the present dam.

Electric Wiring Contractors Must Obtain Permits From Inspector

OTTAWA. — Electrical contractors who violate the law by installing wiring in any building without first notifying the district electrical inspector and obtaining from him a proper permit for such work, are likely to find themselves in serious trouble.

A Toronto contractor was heavily fined in one of the North Ontario towns recently for failure to observe this regulation, and his case is cited by the local inspector of the Hydro Electric Commission as a warning to be observed by local men who might be tempted to follow his example.

This contractor installed work in a town in the County of Simcoe, and failed to notify the district electrical inspector and obtain a proper permit for such work, which, it is alleged, was found to be defective. This violation was quickly discovered by the Inspection Department, and although they gave him every warning and plenty of time to attend to it, such warnings were ignored, with the result that the contractor was summoned to Police Court, and the magistrate handed out the fine of $450 and costs for first having failed to take out a permit and, secondly, for having failed to remedy the defects when notified.

The Electrical Inspection Department of Ottawa was recently visited by the chief inspector from Toronto, and it is anticipated that a crusade will be made against violators of the commission's regulations, and the local inspectors are on a still hunt for wiring contractors who instal work without proper notice to the Inspection Department before such work is commenced.

Delegates of Labor Urge More Building

The Montreal Civic Commission was waited on this week by a deputation representing organized labor in Montreal. The purpose of this delegation was to seek interests of the Commission in hastening building activity in Montreal. Heading the delegation was Gustave Francq and R. Lynch, who represented the Trades and Labor Council. They asked the Commission to proceed without delay in completing personnel of the Housing Commission, so that they might report back to the city in the immediate future.

It was pointed out by the above committee that the workingmen of Montreal anticipated an increase in residential rents in the spring, and that because of this they were anxious that the housing scheme might be proceeded with. It will be recalled that Montreal had four million dollars allotted to it under the Government Housing Plan, and it is that this amount may be made use of at an early date that the labor interests have interested themselves.

In leaving the commission, which promised a definite reply within a few days, the speakers are reported to have said: "If we cannot make it go here, we will approach Quebec, and then Ottawa."

WESTERN MAN URGES CLOSER TRADE CO-OPERATION

L. A. Guertin, of Vancouver, B.C., was the speaker at a meeting last week of the Montreal Chambre de Commerce. As a former French-Canadian, who had made good in the Western Provinces, he was given a hearty reception by the Montreal body of Canadian business men and spoke regarding the development of closer trade relations between the East and the West.

Mr. Guertin pleaded for the development of closer trade relations between the province of his birth and the one with which he has chosen to associate himself in his business life. He particularly pointed to the fact that United States firms control nearly all the Western trade, the possibilities of which, he said, apparently have been overlooked by the eastern part of Canada. He deplored the fact that capitalization of various promising industries of his adopted province, Eastern Canada, and particularly Quebec, holding a metropolis, has not taken the initiative, but has left it to the interests of the United States. As a means of opening the eyes of the Eastern manufacturers to the possibilities in the West, the speaker suggested that an excursion to that city be taken.

In expressing his appreciation for the address of Mr. Guertin, Jos. Quintal, president of the Chambre de Commerce, voiced his hope that trade development between the two provinces would improve and hoped that this matter would be studied.

GENERAL MARKETS

Continued from page 38

Plumbers' Compression and Brass Work Firm

COMPRESSION AND PLUMBERS' BRASS work shows no change over the new price quoted in last issue of SANITARY ENGINEER. The market for the raw materials used in the production of these goods has been unsettled and it depends on conditions whether their prices will be affected or not. However, the markets for these are easily affected, and a change in price of the manufactured product is not looked for at present. Quotations for some of the better known lines are as follows:

Compression work, standard	28%
Fuller work, standard	34%
Bath cocks, compression	30%
Bath cocks, Fuller	34%
Flatway stop and waste cocks, standard	32%
Roundway stop and waste cocks, standard	32%
Brass steam cocks, standard	Net List
Globe, angle and check vales, standard	5-9%
Do., removable disc	7-10%
Radiator valves, standard	15%-23%
Do., removable disc	40-46%
[illegible] Cocks	
No. 0 and 1, Fuller pattern	34%
Compression	23%
Quick opening	34%

Firmer Tendencies on Ingots; Demand Quiet

INGOT METALS show little change, the tone of the market being somewhat firmer, with a tendency to advance. Copper is inclined to be a little unsettled, showing a slightly stronger tendency. The local market, however, shows little change in price, and quotations are as follows:

TIN is somewhat firmer and shows a slight advance, with a firmer tendency. The present quotations are 60 cents per pound.

SPELTER shows a good demand, the present market being a firm one. The quotation going at present is 10½ cents per pound.

COPPER is slightly unsettled and practically depends on condition as to what the future prices will be. The present quotation of 24 cents per pound is not considered high.

ALUMINUM shows no change and continues to be quiet. The quotation going is 34 cents per pound.

LEAD is showing stronger tendencies. The present quotation of 8½ cents per pound is holding.

ANTIMONY is quiet, little movement being noted, the demand having temporarily eased off. The price going at present is 11½ cents per pound.

DO YOU KEEP ACCOUNTS CLEANED UP ?

Continued from page 18

are honest and will pay a little at a time, he will give them every consideration.

The final letter to be sent out before taking legal action may be worded as follows:

Dear Mr. ———

This makes the fourth letter we have written you, asking that you make some kind of settlement of your long past due account.

So far you have not paid any attention whatever. Do you think this course on your part is right? Place yourself in our shoes and see how you would like it.

Unless some arrangement is made to pay this account by the 10th of this month, we shall consider it our duty to hand same to the attorneys.

We have enjoyed doing business with you, and believe you have found us fair and square. But ignoring us as you have does not help one bit.

So please step in and pay up the account, or part of it, before the 10th. Save us and yourself expense, and we shall be glad to continue with you as formerly. There is no personal feeling in this letter at all; we simply need the money due us.

Thanking you in advance for the courtesy of a settlement by the date mentioned, we are,

Yours very truly,

Market Conditions and Tendencies

STATEMENTS REGARDING SUPPLIES AND TREND OF PRICES

THE MARKETS AT A GLANCE

THE tendency of prices is still in an upward direction and a number of new and higher prices have gone into effect. An advance of approximately 5 per cent. has gone into effect on wrought iron pipe and new net prices are shown below. There is a continued shortage of iron and steel products, particularly sheets and plates.

There is a continued heavy demand for enamelware and prices continue unchanged. The coal strike is having an adverse effect on all classes of business and if continued will seriously affect output.

TORONTO, ONT., December 1.—Higher tendencies are still being noted throughout the trade, and if present indications are any guide, higher prices may be expected. Nipples and wrought pipe show higher prices, and a brisk demand is being looked for throughout the year of 1920. The present coal crisis has as yet not affected to any extent the local markets generally; it is, however, hard to state what will happen if present conditions continue.

The enamelware situation is on the mend and it is believed that the situation will automatically relieve itself. Manufacturers state that their factories are gradually getting back to a larger production basis, which has been badly disturbed and that by spring will be able to satisfactorily handle all business offering, they state.

Wrought Nipples Advance; New Price Firm

NIPPLES.—An advance in nipples has gone into effect and the new prices that are now being quoted are: Nipples up to 4 inch, less 75 per cent.; 4½ and larger, less 65 per cent.; running thread, 4 inch and under, less 45 per cent.

Wrought Iron Pipe; Some Sizes Up 5%

WROUGHT IRON PIPE.—Standard lapweld wrought iron pipe shows an advance of approximately 5 per cent. for sizes 4½ inch and over. Prices are holding firm on the new list, and the demand is a stiff one. One reason given for the brisk demand is that people have more money to spend for improvements and building purposes. and are pressing merchants and plumbers for immediate deliveries These dealers, to a large extent, have orders already placed to take care of their requirements, but in order not to lose any business they reorder, perhaps from some other house, thus making two requisitions for practically the same demand.

The steel strike, however, remains the main factor, and if the coal crisis is not soon remedied and the train curtailment takes effect, the situation will undoubtedly become more serious. The following is the new list:

WROUGHT PIPE

Waste and Oakum Firm; Prices Remain Steady

WASTE AND OAKUM.—Business handled in these commodities this year has been very satisfactory, it is stated, and some claim the largest turnover in the history of their business. Owing to the lateness of the season the demand is beginning to slacken off and jobbers are preparing now for a large volume of trade in the new year which they are expecting. The present quotations remain unchanged and are as follows:

	Per 100 lbs.

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Firmer is Iron and Steel; Other Scrap Weaker

SCRAP AND WASTE MATERIALS.—Scrap iron and steel, especially of the better grades, are showing stronger tendencies, and higher prices would be in order according to present indications. Copper, lead, zinc, etc., are showing weaker tendencies and are depending considerably on conditions, whether they advance or show further declines. The market for old boots, rubbers, etc., is very quiet. The following is the revised price list:

DEALERS' BUYING PRICES

Tea lead	0 03½
Heavy lead pipe	0 05¾
Pipe scrap	10 00
Stove plate, per ton	17 50
No. 2 busheling	11 00
Yellow brass	0 10
Red brass	0 15¾
Light brass	0 07
Scrap zinc	0 06
Heavy copper	0 17
Wrought iron, No. 1, per gr. ton	14 00

Heavy melting steel	14 00
Old rubbers, boots and shoes	0 06
Overseas, lumbermen's rubber boots	0 04
Bicycle tires	0 01½
Automobile tires	0 03
Tea lead	0 03½
Heavy lead pipe	0 05¾

Demand Continues For Range Boilers

RANGE BOILERS are holding firm and so far the situation is a steady one. Owing, no doubt, to the increasing demand for houses and the large number being rushed to completion to supply this demand is, no doubt, the cause of the good volume of business already handled. Many of these houses are still under construction, assuring continued demand for some time to come. Quotations are as follows:

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 60	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Boiler Tubes Remain Unchanged

BOILER TUBES.—No business is being turned down in the line, although tubes are reported to be very scarce. The shipments coming in are fair, although the new freight rules, if effective, may be a factor in changing the price, as more perishable goods will be given the preference. It is expected this will have a tendency to make the scarcity more pronounced. The following are quotations:

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$27 00	.....
1¼ inch	29 00	.....
1½ inch	29 50	.....
1¾ inch	32 00	$27 00
2 inch	31 00	26 00
2¼ inch	35 00	28 00
2½ inch	43 00	32 00
3 inch	48 00	40 00
3¼ inch	.....	47 00
3½ inch	60 00	44 00
4 inch	75 00	56 00

Enamelware Firm; No Change Noted

ENAMELWARE.— The enamelware situation continues to be an active one, the demand continuing very brisk. Manufacturers state, however, that it is only a matter of a short time till they will be caught up again with their orders, as their production is still continuing, and it is expected that the demand will generally ease off, as the cold weather becomes more pronounced. The prices are not expected to change at least for the present, although it is hard to predict on account of so many problems that continue to crop up. The coal crisis, if not soon overcome, will be a factor, more on account of curtailing the freight shipments of both the finished products, as well as coal and cke, etc. The following are the prices on some of the most general lines called for:

Bath tubs, roll rim, 4. 4½, 5 feet, 24 to 30 in. wide	$37 05
Bath tubs, 5½ ft.	41 20
Lavatories—	
17x10" Apron F139 or P4045	11 05
18x24" Apron F154 or P3845 or P3847.	17 00

Unchanged is Conductor Pipe; Prices Firm

CONDUCTOR PIPE shows no change. The demand is very good, especially in some localities where the winter has as yet not set in, and many are taking advantage of the late season to catch up with deferred orders. Although galvanized sheets are very scarce with firming prices, no advance is expected at present, and prices are quoting as follows:

PIPE (Conductor)

Plain

2 in., in 10-ft. lengths, list	8 00
3 in., in 10- ft. lengths, list	9 70
4 in., in 10-ft. lengths, list	12 80
5 in., in 10-ft. lengths, list	17 50
6 in., in 10-ft. lengths, list	21 30

F.o.b. Toronto, Ottawa, Oshawa.

List less 10%.

Soil Pipe Firm; Prices Unchanged

SOIL PIPE AND FITTINGS.—The demand for soil in some localities continues very strong, considering the season of the year. Some localities report a very open winter so far, the ground being hardly frozen on the surface. In these places advantage is taken of these conditions, creating more than a seasonable demand. However, manufacturers have not slackened up in their production, it is stated, and are trying to overcome and get a surplus ahead in order to take care of the large requirements expected in the spring. Quotations are as follows:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	10%
Medium and extra heavy soil pipe, 4 in.	15%
Medium and extra heavy soil pipe fittings, 2 in. to 6 in.	25%
8 in. extra heavy pipe and fittings	5%

PIPE FITTINGS

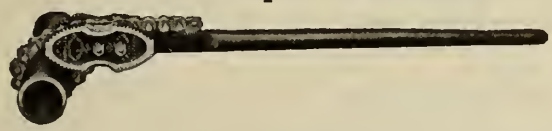
Williams' Improved "Vulcan" Drop-Forged Chain Pipe Wrench



FEW tools are called upon to stand greater strain and harder wear than the pipe wrench. Because Williams' "Vulcan" Chain Pipe Wrenches have withstood every test during years of hard, continuous service under all conditions, they have earned a well-deserved reputation for dependability, and are favorably known the world over. They embody every good feature for which Williams' *Superior* quality stands.

Made in 8 sizes for ⅛ to 18 inch pipe. All Flat Link Chains are "proof-tested" on a standard tension machine and "certified." Every wrench is unconditionally guaranteed.

Must School Teachers Starve?

By Sir Robert Falconer, President of the University of Toronto

CANADA is threatened with another epidemic—cheap teachers! A grave warning, showing the seriousness of the situation, has been made public, through the medium of MACLEAN'S MAGAZINE.

The financial attractions in commerce and trade are proving such a lure to the clever Normal School and University graduates that public schools, high schools and universities throughout the Dominion are being driven to engage inferior teachers—if they can get any at all! One teacher in Ontario is paid the princely sum of $300 per annum.

The article gives the opinions on this vital topic of such men as: Sir Robert Falconer; Principal R. Bruce Taylor, of Queen's; Dean of Arts W. Sherwood Fox, of Western University; A. P. S. Glassco, Secretary of McGill; President MacLean, of the University of Manitoba; President Klinck, of Canada's youngest university—British Columbia; President A. Stanley Mackenzie, of Dalhousie; and many others.

"The Thread of Flame"

By Basil King

This famous Canadian novelist has written a remarkable story that deals with a man who loses his identity while fighting in France. This strong novel, "The Thread of Flame," starts in the December issue of MACLEAN'S. This is the first occasion that a novel by Mr. King has appeared in any Canadian periodical prior to book publication.

Other Features of the December Number

"Merrie Gentlemen"—By Arthur Beverley Baxter.
You will think this the best Christmas story since Dickens' "A Christmas Carol."

"Capital and Labor"—By Ralph Connor.
One of a series of articles on "The New Canada and Its Needs."

"Ottawa is Ready for the Worst"—By J. K. Munro.
A humorous and pithy review of events at the Federal seat.

"Better Late Than Never"—By C. W. Stephens.
A bright Christmas story.

"Some Canadian Snobs"—By Montgomery Dix.
A humorous article on some phases of Canadian society.

"A Blighty Christmas"—By Gertrude Arnold.
An article on the way Yuletide was celebrated in a Red Cross Hospital.
And a dozen other articles and stories all of equal interest.

MACLEAN'S will be Twice-A-Month

starting February 1st, next year. An important point to remember. If you want to keep up with things **nationally Canadian,** you'll have to get the MACLEAN'S Twice-A-Month habit.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

Pays a Profit on Itself

Allpriser Service

Mistakes are made unconsciously. If you knew you were making one it would never be made. Why trust to luck and memory?

Allpriser Service consists of a flexible leather bound book 7 x 9, of 150 loose-leaf pages. The service includes a list of net prices of all staple articles and a regular service of new sheets revised to the latest changes. Allpriser Service is only $25.00 annually.

It eliminates losses, unnecessary overhead and confusion of cost data. Don't sell 12c articles at 10c; use Allpriser and *know costs.*

Ontario's Proposed New Regulations

Regarded by Men in the Trade as the Longest Step Forward That Has Ever Been Taken in Canada—Proposed By-laws Are Based Absolutely on "Good Practice" and Make for Standardization

ONTARIO'S PROPOSED REGULATIONS

SANITARY ENGINEER is the first publication to present the much talked of and long discussed proposed new plumbing regulations for the Province of Ontario.

While these by-laws have not as yet become effective, they await only the signature of the Lieutenant-Governor of the Province to become law. This, it is understood, will be attached very shortly.

The regulations are regarded by the men in the trade as the greatest step forward that has ever been made in Canada in connection with plumbing matters.

A very important matter in connection with them is that they are based entirely on "good practice" and not on theory. In addition they are not any one man's idea of "good practice," but embody the actual experience of some of the best men in the trade.

In presenting the accompanying matter to its readers, SANITARY ENGINEER urges a careful perusal of the regulations as they are of real importance to every sanitary and heating engineer in the Dominion.

EXTRACT ONTARIO STATUTES

(Chap. 192.)

399. By-laws may be passed by the councils of local municipalities.

(10) For regulating the construction of cellars, sinks, cesspools, water closets, earth closets, privies and privy vaults; for requiring and regulating the manner of the draining, cleaning and clearing and disposing of the contents of them.

(11) For requiring the use, within the municipality or a defined area of it, of dry earth closets.

(12) For providing that the cleaning and disposing of the contents of cesspools, water closets, earth closets, privies and privy vaults shall be done exclusively by the corporation.

(*a*) For such purpose the corporation, its officers and servants shall have all the powers of the local board of health and its officers and servants, and such expense shall be recoverable in the manner provided by section 500.

(13) For the requiring and regulating the filling up, draining, cleaning, clearing of any grounds, yards and vacant lots and the altering, relaying or repairing of private drains

(14) For making any other regulations for sewerage or drainage that may be deemed necessary for sanitary purposes.

(68) For requiring owners, lessees and occupants of land in the municipality or any defined area of it to close or fill up water closets, privies, privy vaults, wells or cesspools, the continuance of which may, in the opinion of the Council or Medical Health Office, be dangerous to health.

(71) For the closing or filling up of public or private wells.

(72) For compelling the use within the Municipality or any defined area therein, for drinking and domestic purposes, of water supplied from the waterworks of the Municipality or of a waterworks company; and for prohibiting the use within the municipality of such area of spring or well water for such purposes.

420. By-laws may be passed by the councils of towns, townships, villages and cities, having a population of less than 100,000 and by Board of Commissioner of Police in cities having a population of not less than 100,000.

(4) For licensing, regulating and governing plumbers, master plumbers and journeyman plumbers:

(*a*) For the purpose of this paragraph "master plumber" shall mean a person who is skilled in the planning, superintending and installation of plumbing, is familiar with the laws, rules and regulations governing the same, has a regular place of business in the municipality and who himself or by journeymen plumbers in his employ performs plumbing work.

(*b*) A "journeyman plumber" shall mean a person other than a master plumber who has been in the employ of a master plumber for not less than one year and desires to follow plumbing as his calling.

500. Where a council has authority to direct or require by by-law or otherwise that any matter or thing be done, the council may by the same or by another by-law direct that in default of it being done by the person directed or required to do it, such matter or thing shall be done at his expense, and the corporation may recover the expense incurred in doing it by action, or the same may be recovered in like manner as municipal taxes. 3-4 Geo. V. c. 43, s. 500.

Chapter 204

Sec. 8.—(3) Persons supplied with water by the corporation may be required to place only such taps for drawing and shutting off the water as are approved of by the corporation. 3-4 Geo. V. c. 41, s. 8.

Sec. 13.—The corporation may pass by-laws for regulating the time, manner, extent and nature of the supply by the works, the building or persons to which and to whom the water shall be furnished, the price to be paid therefor, and every other matter or thing related to or connected therewith which it may be necessary or proper to regulate, in order to secure to the inhabitants of the municipality a continued and abundant supply of pure and wholesome water, and to prevent the practising of frauds upon the corporation with regard to the water so supplied, and for providing that for a contravention of any such by-law the offender shall incur a penalty not exceeding $20 or may be imprisoned without the option of a fine for any period not exceeding one month, and the provisions of The Ontario Summary Convictions Act shall apply to a prosecution under this section. 3-4 Geo. V. c. 41, s. 13.

Sec. 14.—Every person who

(*b*) wilfully lets off or discharges water so that the same runs wasted or useless out of the works;

(*c*) being a tenant, occupant, or inmate of any house, building or other place supplied with water from the waterworks, lends, sells, or disposes of the water, gives it away, permits it to be taken or carried away, uses it or applies it to the use or benefit of another, or to any use and benefit other than his own, increases the supply of water agreed for, or improperly wastes the water;

(*f*) wilfully alters any meter placed upon any service pipe or connected therewith, within or without any building or other place, so as to lessen or alter the amount of water registered;

(*g*) lays or causes to be laid any pipe or main to communicate with any pipe or main of the waterworks, or in any way obtains or uses the water without the consent of the corporation;

shall for every such offence incur a penalty not exceeding $20 or may be imprisoned, without the option of a fine, for any term not exceeding one month, and the provisions of The Ontario Summary Convictions Act shall apply to a prosecution under this section 3-4 Geo. V. c. 41, s. 14.

Chaper 229

Sec. 41.—(1) The owner of every building used as a factory, shop or office building shall

(*a*) provide a sufficient number and description of privies, earth or water closets and urinals for the employees of such factory, shop or office building, including separate sets for the use of male and female employees with separate approaches thereto, one closet for every twenty-five persons of each sex employed in the factory, shop or office building and shall keep at the entrance to such closet a clearly painted sign indicating for which sex the closets are provided;

(*b*) be responsible for the remedying of any effluvia arising from any drain or defective plumbing and for any repairs required to keep the building in a safe and habitable condition;

(*c*) arrange for a supply of pure drinking water available for each occupier.

(2) The Lieutenant-Governor in Council may prescribe such additional regulations with respect to such conveniences as may be deemed proper.

(3) The owner of every factory, shop or office building who for thirty days, or such extended period as the inspector in writing allows, refuses or neglects to comply with the requirements of sub-section 1 or of the Regulations after being notified in writing in regard to the same by the Inspector, shall incur a penalty of not more than $500 and in default of payment shall be liable to imprisonment for any period of not more than 12 months. 3-4 Geo. V. c. 60, s. 41.

Sec. (43) (1) The employer of every factory or shop shall

(*b*) Keep privies, earth or water closets and urinals in good repair and in a sanitary condition, and keep closets separated for male and female employees, and provide conveniences to the satisfaction of the Inspector for the employees using them;

(*f*) Provide a wash-room, clean towels, soap and a sufficient supply of wholesome drinking water and proper drinking cups for employees, and water taps which shall be at least eight feet distant from any water-closet or urinal, and also, in the case of a foundry, shower baths for the employees. 3-4 Geo. V. c. 60, s. 43.

Sec. (44) Every employer of an office shall

(2) Where in an office building the privies, closets or urinals or other conveniences are not situate in that part of the building occupied by and under the control of the employer it shall be the duty of the owner, and where such conveniences are situate in that part of the building occupied by and under the control of a separate employer, it shall be the duty of such employer to keep the same in good repair and in a sanitary condition.

(3) The owner of every office building shall at all times keep the same or such parts thereof as are used in common by the tenants or occupants thereof and are under his control in a clean and sanitary condition, and so as not to be injurious to the health of persons employed in the building or using or having access to the same.

(4) Every owner or employer who, for thirty days or for such extended period as the Inspector allows, refuses or neglects to comply with the requirements of this section after being notified in writing in regard to the same by the Inspector shall incur a penalty not exceeding $500 and in default of payment shall be liable to imprisonment for any period of not more than twelve months. 3-4 Geo. V. 60, s. 44.

Sec. 64.—(1) Every bake shop which is not within the provisions of this part relating to factories or shops shall be provided with a proper wash-room and a sufficient supply of clean towels and soap, and a closet and other conveniences for the health and comfort of the persons employed therein.

(2) The wash-room, closet and other conveniences shall be separate from the bake-shop and shall be kept clean and in a sanitary condition. 3-4 Geo. V. c. 60, s. 64.

Chapter 256

Sec. 254.—(1) Every street railway company and incline railway company shall, within six months after being so ordered by the Board (The Ontario Railway and Municipal Board) provide, furnish and thereafter maintain suitable and sanitary urinals and other conveniences for the use of the employees of the company operating its cars.

(2) Such urinals and other conveniences may be located upon land owned or provided by the company and reasonably accessible to each of the lines of the railway operated by the company, and at such points as the board may direct, within the limits of the city or town, and the employees of the company shall be allowed reasonable opportunity of access thereto.

(3) The company shall incur a penalty of $10 per day for each day upon which it neglects to provide such urinals or other conveniences.

(4) The Board shall determine whether the cost of such urinals and conveniences shall he borne by the company or by the city or town within the limits of which the company's lines are operated, or by both, and if by both the proportions in which

IMPORTANT REGULATIONS

The proposed regulations will apply to all new plumbing throughout the Province of Ontario, whether in cities, towns, villages or rural municipalities.

In future when a farmer wishes to instal plumbing it must be put in with the same thought and care as is bestowed on the work in the residence of any well-governed city.

The responsibility for conformance with this will rest with the plumber, and any work not done in accordance with the regulations will be done at the plumber's risk.

the same shall be borne by them respectively, in case the parties are unable to agree, as may be determined by the board.

(5) The board may order the city or town to provide the site for such urinals or other conveniences, upon such terms as to cost and otherwise as the board may determine.

(6) When so ordered by the board such urinals and conveniences shall be open to the public as well as to the employees of the company, and when so open the board may order the cost of the maintenance of the same to be borne by the city or town and the company in such proportions as may be deemed proper. 3-4 Geo. V. c. 36, s. 254.

255.—(1) The board may order a company to provide sanitary conveniences for the use of passengers on all passenger cars.

(2) This section shall only apply to electric railways that are not street railways, and to steam railways. 3-4 Geo. c. 36, s. 255.

Chapter 218

Sec. 8. The Provincial Board of Health with the approval of the Lieutenant-Governor in Council, may make such regulations as may be deemed necessary for

Regulations as to plumbing

(*dd*) The construction, repair, renewal, alteration and inspection of plumbing, the material to be used in the construction of, and the location of drains, pipes, traps, and other works and appliances forming part of or connected with the plumbing in any building or upon any building or upon any property or in any highway, street, lane or public place, and in any structure or place, whether permanent or temporary, constructed or used thereon or therein. 6 Geo. V. c. 51, s. 8.

Enforcement of sanitary by-laws.

Sec. 13.—(10) The Provincial Board, every district officer of health and inspector, and every medical officer of health and sanitary inspector shall have authority to enforce the by-law set out in Schedule B. or any amendment thereof approved by the Provincial Board, and any by-law respecting the milk supply of, and any other by-law respecting sanitary matters in a municipality, and for this purpose may institute proceedings for the prosecution of offenders against any of the said by-laws. 6 Geo. V. c. 51, s. 13.

Sec. 25. (2) Where a local board in any city recommends that sanitary conveniences should be installed in any building, and is of the opinion that the owner of the premises is unable to pay the expense of the same at once, the municipality may install suitable sanitary conveniences at the expense of the owner, and the board may direct that the cost, including interest at six per centum on the deferred payments, be paid by the owner in equal successive payments extending over a period not exceeding five years, and that such annual payments be added by the clerk of the municipality to the collector's roll and collected in like manner as municipal taxes. 3-4 Geo. V. c. 55, s. 1. Amendment 1917-18.

Sec. 35.—(1) The council of every municipality shall appoint a legally qualified medical practitioner to be the medical officer of health for the municipality, and shall also appoint such number of sanitary inspectors for the municipality as may be deemed necessary by the local board, and as may be prescribed by the regulations.

Sec. 38.—The medical officer of health shall be the executive officer of the local board, and with the local board shall be responsible for the carrying out of the provisions of this Act, and of the Regulations, and of the by-laws of the municipality. 2 Geo. V. c. 58, s. 38.

Sec. 75.—The Medical Officer of Health of any municipality or any inspector or other person in the employ of the local board acting under his instructions, or any member of a local board may enter, inspect and examine at any time of the day or night, as often as he thinks necessary, any premises within the municipality for the purpose of carrying out the provisions of this Act, and may take such action as he deems necessary for carrying out

The illustration shows the requirements for plumbing and sewer connections under Toronto by-laws, approved by the Provincial Board of Health. These are included in the proposed new general regulations for the entire Province. In actual practice it is stated these requirements have stood up well and their adoption for the needs of other communities is expected to help solve many problems.

the said provisions, and any person in charge of such premises for the time being shall render such aid to the Medical Officer of Health or other person as may be necessary to make such inspection or examination. 6 Geo. V. c. 51, s. 75.

Sec. 115.—(3) The by-law set out in Schedule B and any amendment thereof approved by the Provincial Board shall have the same force and authority as a regulation made under this Act by the Provincial Board. 6 Geo. V. c. 51, s. 115.

Regulations of the Provincial Board of Health

Sections, 14, 15, 16, 17, 23, 24, 25, 26, 27, 28 of Schedule "B," Public Health Act, are repealed and the following statutory by-law is inserted as an amendment to Schedule "B," hereafter referred to as "Regulations as to Plumbing, etc."

1. The amending by-law shall take effect and be in force in every municipality of the Province of Ontario from and after November 1st, 1919.

2. These regulations shall be held to include and govern all work done and materials used (1) in introducing, maintaining, and extending a supply of water through a pipe or pipes, or any appurtenance thereof, in any building, lot, premises or establishment; (2) in connection with any system of sewage disposal by means of septic tank, cesspit, dry-earth closet, subsoil irrigation or otherwise; (3) in connecting or repairing any system of drainage whereby foul, waste, or surplus water, gas, vapour, or other fluid is discharged or proposed to be discharged through a pipe or pipes from any building, lot, premises, or establishment into any public or private sewer, drain, pit, box, filter-bed, or other receptacle, or into any natural or artificial water-course flowing through public or private property; (4) in ventilating any house sewer or any fixture or appurtenance connected therewith; (5) in excavating in any public or private street, avenue, highway, road, court, alley, or space, for the purpose of connecting any building, lot, premises or establishment with any service pipe, house connection, water main, sewer, gas main, or other underground structure; and generally (6) in performing all classes of work usually done by plumbers; and it shall be unlawful for any person or persons, firm or corporation to do or have done any work in connection with the plumbing and drainage of any premises, both public and private hereafter constructed, or at present in the course of construction, and any and all additions to, alterations in extension or reconstruction of any plumbing and drainage system that do not conform with the following and any regulations as to plumbing which are or shall be, from time to time, in force in any municipality or unorganized territory of the Province of Ontario.

Sanitary Conveniences

3. Every enclosure containing one or more water-closets shall be provided with adequate ventilation to the outer air, either by window or by suitable light shaft.

4. In every tenement or apartment house hereafter erected there shall be a separate water-closet in a separate compartment within each apartment of four or more rooms. Where apartment consists of less than four rooms there shall be at least one water-closet for every three rooms,, and on the same floor with said rooms. Every such water-closet shall be placed in a compartment completely separated from every other water-closet, such compartment shall not be less than two feet four inches wide, and shall be enclosed with plastered partitions, or some equally substantial materials which will extend to the ceiling. Such compartments shall have a window, opening directly or through a straight horizontal shaft of the same dimensions as the window and not more than four feet long, upon a street, a railroad right-of-way, cemetery or public park or a yard or alley or open passageway not less than four feet wide, or upon a vent court or upon a covered passageway not more than twenty feet long and at least twenty feet wide, and twenty feet high. Every such window shall be at least one foot by three feet between stop beads; and the entire window shall be made so as to readily open. When, however, such water-closet compartment is located in the top floor and is lighted and ventilated by a skylight over it, no window shall be necessary, provided the roof of such skylight contains at least three square feet of glazed surface and is arranged so as to readily open. Nothing in this section in regard to the separation of water-closet compartments from each other shall apply to a general toilet room containing several water-closets, hereafter placed in a tenement house, provided such water-closets are supplemental to the water-closet accommodations required by law for the use of the tenants of the said house. Nothing in this section in regard to the ventilation of water-closet compartments shall apply to a water-closet hereafter placed in an existing tenement house, where it is provided to replace a defective fixture in the same position and location.

5. A dwelling house made into apartments, whether the same approached by a common stairway or otherwise, shall, for the purpose of these regulations, be classed as an apartment house.

6. In the case of a rooming or lodging house there shall be at least one water-closet on each floor on which lodging chambers are let.

7. In the case of construction or boarding camps there shall be not less than one sanitary convenience for each thirty persons, and in no case less than two conveniences to each camp.

8. Every contractor, builder, architect or owner employing or in charge of any men engaged in the erection of buildings or the construction of public or private works of any kind, shall provide, for the use of the workmen employed upon such building or works, suitable temporary conveniences.

9. No person shall construct or maintain any system of disposal of excremental matter or sewage by means of a septic-tank, cesspit, dry earth closet or by broad irrigation, sub-soil irrigation or otherwise, except upon a permit issued by the Local Board of Health of the municipality wherein it is proposed such system be situated. Application for it shall be made in writing to the Local Board of Health and shall be accompanied by a detailed description of the system and its location on the premises of said applicant.

10. The Local Board of Health of every urban municipality shall, upon a map of the municipality set aside for that purpose, locate all privies, cesspits and dry earth closets and other systems for the disposal of human excrement, and shall revise the same yearly.

11. All septic tanks, privies,, cesspits and dry earth closets and other systems, shall be so constructed, screened and maintained that flies neither find access thereto nor breed therein.

12. Dry earth closets shall be provided with water-tight receptacles.

13. Every such earth closet shall be constructed so that adequate access may be had thereto for the purpose of cleansing every part thereof.

14. Every person who shall construct an earth closet in or in connection with a building shall provide, construct, or fix in connection with such earth closet suitable means of apparatus for the frequent and effectual application of dry earth, ashes or other deodorizing substance to any filth which may from time to time be deposited in the receptacle of such earth closet.

15. Every year, during the period from the 1st day of May to the 1st day of October, the contents of every dry earth closet shall be removed with sufficient frequency to prevent the breeding of flies. And the Medical Officer of Health shall define the intervals between each cleaning.

16. No person shall engage in the business of transportation of nightsoil or any other offensive or noxious substance, or drive any cart for such purpose in any urban municipality without a permit from the Local Board of Health of the same municipality.

17. No cart or other vehicle for carrying any night-soil or any other offensive or noxious substance or the contents of any privy, vault or cesspit, shall without necessity thereof be allowed to stand or remain before or near any building, place of business or other premises where any person may be; nor shall any such cart or vehicle be allowed to occupy an unreasonable length of time in loading or unloading or in passing along any street or through any inhabited place or grounds.

18. Such carts, vehicles and all implements used in connection therewith must be kept in an inoffensive and sanitary condition, and when not in use shall be stored and kept in some place where no needless offence shall he given to any person.

19. All night-soil and the contents of privies, vaults and cesspits, and all noxious substances, shall, before their removal or exposure, be disinfected and rendered inoffensive by the owner, lessee or occupant of the premises where the same are or by the contractor who removes or is about to remove the same; and no part of the contents of any vault, privy, sink or cesspool shall be removed without a permit from the Local Board of Health.

20. No privy vault, cesspit or dry earth closet shall be allowed to exist within those premises abutting on streets which have sewerage facilities, or upon those premises which, by reason of their situation, may connect to existing sewers where a public sewer is accessible within 150 feet of the same, and all such privies, cesspits and dry earth closets are hereby declared a nuisance within the meaning of Section 73 of the Public Health Act.

21. Where the Local Board of Health or Engineer is satisfied upon the due examination of a building that connection may be had within 150 feet to the sewers of the municipality, and so reports, the same must be made within thirty days after written notice thereof has been given to the lessee, owner or occupant of such premises, and the existing privy, cesspit or dry earth closet shall be cleaned, filled, removed or destroyed, within a period of ten days after connection has been made to the water and sewerage system.

22 In case any owner or tenant or lessee of any property refuses or neglects to carry out an order as provided for by these regulations upon due notice being given, the Local Board of Health of the municipality

MAKES FOR STANDARDIZATION

Another long step forward is achieved in the proposed new regulations in connection with standardization. A perusal of the by-laws shows that standardization is to be followed out in connection with pipe and also in connection with the weight of fittings.

This phase of the matter may have a very important bearing in not only protecting the public, but in eliminating price cutting by men not particular what materials they use.

where such property is situated may direct that such connections be made to the water works and sewerage system and that such sanitary connections may be installed as necessary in the interests of public health, and that the existing privy, cesspit or dry earth closet shall be cleaned, filled in, removed or destroyed, and the officers of the municipality shall have the right of entrance into the premises of said owner, lessee or tenant of said property for the purpose of carrying out the provisions of these regulations, and shall have the right to add the costs thereof to the Collector's Roll, and collect in like manner with other municipal taxes, and nothing in this clause shall relieve the offender from the penalty provided.

23. In these regulations

"Sewer" shall mean a public or private drain laid in a public or private way and constructed of vitrified clay pipe, brick, cement, or other impervious material with joints properly cemented together by mortar and laid on a continuous grade.

"House connection" shall mean that branch of the sewer provided for the connecting of the sewer with the "house drain" of the individual premises.

"House drain" shall mean that portion of the drainage system which extends through the cellar or basement and unites the "house connection" to the sewer—provided outside the premises—with the soil pipe draining the several fixtures, i.e., the horizontal portion from the soil pipe stack to the outside of the building.

"Soil pipe" shall mean the vertical portion of the drainage system of four inches or more internal diameter communicating with one or more fixtures (i.e., water-closets, urinals, basins, sinks, etc.), and a house drain for the purpose of conveying the discharge from the fixtures to the drain.

"Waste pipes" shall mean those pipes connecting fixtures other than water-closets or batteries of fixtures other than water-closets with the vertical lines of soil pipe for the purpose of conveying the discharge of the fixtures thereto.

"Main vent pipe" shall mean any special pipe or special continuation of any soil pipe provided to ventilate the drainage system and to prevent trap siphonage and back pressure.

"Vent Pipes" shall mean the smaller air pipes carried back from traps to the main vent pipe, or outer air.

"Heated flue" shall mean a pipe or chimney flue heated directly or by artificial means during the winter.

"Fixtures" shall mean any receptacle or outlet placed for the purpose of disposing of waste water, filth or other matter, and connecting with the soil pipe or house drain of a building.

"Y-branch" shall mean a branch set at 45 degrees from main line.

"Repair of leaks" shall mean such repairs as are necessary to protect property, but do not involve any extensive changes in construction.

"Sub-soil drain" (weeping drain) shall mean the tile pipe laid without joints, around the foundation walls of any building, to intercept and provide drainage for sub-soil water.

"Surface drain" shall mean a connection with a drain to allow egress of surface water.

"Premises" shall mean any house, tenement, block, warehouse, school, hotel, theatre, factory or building, either public or private.

"Water department" shall mean the water department or water commission controlling the water supply of any municipality.

"Engineer" shall mean the city, town or municipal engineer of any municipality.

Plumbers to Register

24. No plumber, or domestic sanitary engineer, shall engage in or work at the business of master or employing plumber unless he shall first have duly registered his name and place of business, and no person shall by display of sign or plumbing material, or otherwise, advertise as a plumber unless he shall have been registered or licensed as such. Every master plumber shall conspicuously display his certificate or license within his place of business. Notice of any change in the place of business of a registered or licensed master plumber shall immediately be given by him to the Local Board of Health or Plumbing Inspector.

25. No person or persons other than a registered master plumber, or person in his or their employ, or under his or their supervision, shall alter, repair, or make any connection, with any drain soil, waste, or vent pipe, water connection, gas connection, or any pipe connected therewith, except as provided herein.

Permits, Filing of Plans

26. Every plumber before doing any work in a building, shall, except in a case of repair of leaks, file in the office of the local Board of Health, upon blanks for that purpose, an application for a permit, and a plan or sketch of the work to be performed, and no such work shall be done in any building without a written permit from the Local Board of Health.

Appointment of Plumbing Inspectors

27. The Medical Officer of Health shall, with the approval of the municipal council, appoint or designate such Inspectors of Plumbing as may be necessary for the proper enforcement of these regulations, and all such inspectors may exercise the powers of a Sanitary Inspector for the purpose of these regulations.

28. The Inspector of Plumbing may be the engineer or some person having not less than five years' experience as a journeyman plumber, except in the cases of cities, when a more experienced person may be required.

BASIS OF BY-LAWS

Some of the best men in the business in Ontario have been in consultation in framing the proposed new regulations. They come from all parts of the Province and have had to deal with widely varying problems.

The by-laws are based absolutely on "good practice." In framing them every regard has been had for protecting the health and property of the general public.

Duties of Plumbing Inspectors

29. The Plumbing Inspector, with the approval of the Local Board of Health, shall consider all applications for permits and report thereon.

30. All tests of plumbing shall be made in the presence of a duly appointed inspector.

31. The Plumbing Inspector may exercise the authority conferred on the Local Board of Health and the inspector in these regulations.

Annual Report

32. The Plumbing Inspector of every municipality shall report annually to the Provincial Board of Health as to: (1) The number of licensed plumbers in cities and towns; (2) the number of permits issued; (3) the number of inspections made; (4) the number of premises not connected to sewers, and the number of new premises erected.

Cast Iron Pipe

33. All cast iron pipes, including the hub, used for soil, waste and vent pipes shall weigh not less than the following average weights per length of five feet and shall be sound, cylindrical and smooth, thoroughly coated inside and outside with linseed oil or other coating as the Provincial Board of Health from time to time may approve of. In addition, pipe and fittings to be placed underground shall be coated inside and out with coal tar supplied hot or other coating approved by the Provincial Board.

Weights of Cast Iron for Underground

Diameter of pipe.	Weight per five feet. Lbs.
2 inches	27½
3 "	47½
4 "	65
5 "	85
6 "	100
8 "	135
9 "	167½
10 "	225
12 "	270

Weights of Cast Iron Soil Waste or Vent Pipes

	Lbs.
2-inch inside diameter	20
3-inch " "	30
4-inch " "	45
5-inch " "	85
6-inch " "	100
7-inch " "	135
8-inch " "	167½
10-inch " "	225
12-inch " "	270

Ferrules

34. Brass ferrules shall be of the best quality, bell-shaped, heavy cast brass, not less than four and one-half inches long and two and one-quarter inches, three and one-quarter inches and four and one-quarter inches in diameter, and of not less than the following weights:

Inside Diameters.	Weights.
2¼ inches	1 pound 8 ounces
3¼ inches	1 pound 12 ounces
4¼ inches	2 pounds 8 ounces

1¼-inch ferrules shall not be used.

Soldering Nipples

35. Soldering nipples shall be of heavy cast brass or of brass pipe, iron pipe size. If cast, they should be of not less than the following weights:

Diameters.	Weights.
1½ inches	8 ounces
2 inches	14 ounces
2½ inches	1 pound 6 ounces
3 inches	2 pounds
4 inches	3 pounds 8 ounces

Wrought Iron Pipe

36. Galvanized wrought iron pipe shall be of not less than the following thickness and weight per lineal foot:

Diameters.	Thicknesses.	Weights per lineal foot.
1¼ ins.	.13 in.	2.25 pounds
1½ ins.	.14 in.	2.68 pounds
2 ins.	.15 in.	3.61 pounds
2½ ins.	.20 in.	5.74 pounds
3 ins.	.21 in.	7.54 pounds
3½ ins.	.22 in.	9.00 pounds
4 ins.	.23 in.	10.66 pounds
4½ ins.	.24 in.	12.34 pounds
5 ins.	.25 in.	14.50 pounds
6 ins.	.28 in.	18.76 pounds
7 ins.	.30 in.	23.27 pounds
8 ins.	.32 in.	28.18 pounds
9 ins.	.34 in.	33.70 pounds
10 ins.	.36 in.	40.06 pounds
11 ins.	.37 in.	45.02 pounds
12 ins.	.37 in.	48.98 pounds

Lead Pipe

37. Lead pipe used for branch soil waste, vent or flush pipes shall not weigh less than the following specified weights per lineal yard:

Dia. of pipe.	Weight per lineal yard.
1¼ inches	7 pounds
1½ inches	8 pounds
2 inches	10½ pounds
2½ inches	13½ pounds
3 inches	16½ pounds

4 inches .....24 pounds
(Equivalent to sheet lead weight 8 pounds per square foot.)

38. Lead bends and lead traps for water-closets, slop sinks and urinals shall not be less than one-eighth of an inch in thickness (equivalent to sheet lead weight 8 pounds per sq. foot). All lead traps, bends and fittings shall correspond in weight and quality to the lead waste pipe to which they are attached.

Brass Pipe

39. Brass pipe for soil waste or vent pipes shall be thoroughly annealed, seamless drawn or brazed tubing, having not less than the following specified outside diameter, weight and gauge:

Outside dia. of pipe.	Weight per lineal foot.	Br. Imp. wire gauge.
1¼ inches.....	0.88 lbs.	16.
1½ inches.....	1.06 lbs.	16.
2 inches.....	1.54 lbs.	16.
2½ inches.....	2.82 lbs.	12.
3 inches.....	3.41 lbs.	12.
4 inches.....	5.74 lbs.	10.

House Connections With Public Sewers

40. House connections with the public sewer, and all fittings and other material used for such connections shall be inspected by the Local Board of Health or authorized inspectors.

41. The size of house connections shall be determined by the total area of the lot or lots to be drained, according to the following table, provided, however, that should the number of fixtures to be installed require a sewer larger than indicated for the lot area, the size of the house sewer shall be increased accordingly.

Table of Vitrified Tile Pipe for House Connection Size

Area of Lot or Roof to be Drained	Size of House Connection.
1 to 2500 Square Feet	4 inch
2501 to 7500 Square Feet	6 inch
7501 to 18000 Square Feet	9 inch
18001 to 45000 Square Feet	12 inch

Note.—For cast iron drains use one inch smaller in diameter, but in no case shall less than four inch diameter be used.

42. Old house connections can be used in connection with the new building or new plumbing only when they are found, on examination by the plumbing inspector, to conform in all respects to the requirements governing new house connections.

43. When a proper foundation consisting of a natural bed of earth, rock, etc., can be obtained, the house connection may be of earthenware pipe. Where the ground is made or filled in, or where the pipes are less than three feet deep or in any case where there is danger of settlement by frost or from any cause, and when septic tanks are used, the house connection must be of cast iron pipe, with lead caulked joints.

44. No house connection shall be laid with a less fall than one-quarter inch per foot. A uniform grade shall be preserved between the connection with the public sewer and the curb line and between the curb line and the building line. The house connection must be run as direct as possible. All changes in direction must be made with proper fittings and all connections made with Y-branches and Y-branches and one-eighth bends.

45. No person shall connect or cause to be connected, the drainage system of any building, lot, premises or establishment, otherwise than with that portion of the public sewer system intended for it, as shown by the records in the office of the engineer.

46. No person shall cut or tap or cause to be cut or tapped, any public sewer in which there exists a branch or junction opposite to the building, lot, premises or establishment, to be connected and within two (2) feet, on the down side, of the trench on proposed connection. Information concerning the location and depth of public sewers, and the position of branches and junctions, shall be furnished when requested, by the engineer. All reasonable care shall be taken to insure the correctness of such information, but such correctness will not be in any case guaranteed by the Local Board of Health.

47. Whenever it has been positively ascertained that no availably located branch, junction or suitable inlet exists to serve the property concerned, the connection shall be made by taking out a length of pipe and substituting therefor a branch of the proper size.

48. If the house connection be of iron, not more than four inches in diameter, and the public sewer eight (8) inches or more in diameter, the connection may be made by tapping a hole of the least practicable size in the public sewer, and the connection shall be made by means of a connecting thimble of approved pattern. The tap and connection shall be inspected before the same is cemented; the thimble shall be properly set as to direction of flow.

49. All connections shall be certified in writing by the inspector making the inspections on same.

50. If the public sewer be a brick or concrete sewer, or a connection is to be made in a manhole, the entrance hole into the same shall be cut in prescribed manner, and the connection made by means of a short piece of pipe of the prescribed diameter, so cut that the pipe shoulder shall rest against the outer surface of the sewer and no portion extend within it.

MUST BE INSPECTED

Municipal councils are required by the proposed regulations to appoint Inspectors of Plumbing for their respective municipalities.

This is a long step forward, not only for the trade, but for the protection of the public as well.

A very important feature under the proposed regulations will be the passing of examinations by all those who undertake plumbing work. This will not mean that the number of legitimate plumbers is in any way restricted.

51. Every house connection shall be laid true to line and grade, each section of the pipe being properly bedded. If laid with iron pipe the joints must be caulked; if laid with vitrified clay pipe, the joints must be made with mortar, composed of one part Portland cement or equivalent and two and one-half parts clean sand, the pipes shall be laid upon a firm foundation and the joints properly cleaned on the inside.

52. No person shall make or cause to be made or maintained, any connection with any public sewer or house drain, or appurtenance thereof, for the purpose of conveying into the same any suffocating, corrosive, inflammable, or explosive liquid, gas, vapor, substance, or deleterious material of any kind; and no person shall do any act or thing which may impede or obstruct the flow, or interfere with the free discharge or ventilation of any house drain or appurtenance thereof.

House Drain and Main Vent Pipe

53. The house drain, unless otherwise provided, shall be of cast iron and shall be not less than four (4) inches in diameter, and the fall to the sewer shall be on an even grade of not less than *one-quarter of an inch per foot throughout its entire length.* It shall be laid in a trench cut to a uniform grade, or if above the surface, it may be supported on brick piers or suspended from the floor beams by heavy iron or steel hangers. It shall commence at a point not less than eight (8) feet outside the external wall of the premises and be extended undiminished in size inside the building, and continued on as a vertical soil pipe and main vent pipe through the roof, and not less than three feet above the top of any window or opening within fifteen feet, and not less than eight feet above the roof if the roof is used for drying clothes or as a roof garden, and be left open so that the whole of the plumbing system may be thoroughly and constantly ventilated.

54. The house drain shall not be exposed to pressure where it passes through the wall.

55. The junctions of all soil or waste pipes with the roof of any building shall be made water-tight and weather-proof with a five-pound sheet lead flashing not less than 20 inches square.

56. To protect against freezing all vent pipes shall be increased to 3 inches in diameter before passing through the roof of the building.

Main House Trap

57. Whenever a main house trap is by municipal by-law required, the said main trap shall be inserted in the house drain; such trap shall be of a form approved by the Local Board of Health and shall correspond in weight and quality to the other portions of the house drain, and shall be provided with a suitable hand-hole for convenience in cleaning.

Fresh Air Inlet

58. Whenever a main trap is by municipal by-law required, then also a fresh air inlet shall connect with the house drain immediately inside of the main house trap. It shall consist of a pipe not less than four inches (4″) in diameter and shall be extended, outside the external wall of the premises, at least eighteen inches (18″) above the ground, and shall, where practicable, be placed not less than ten feet (10′) distant from any window, door or other opening in the premises, and shall be finished off with a return bend or cap. In no case shall a fresh air inlet be connected directly over the house trap.

Cleanouts and Cleaning Out Screws

59. A cleaning out screw shall be placed on the house drain as close as possible to the point where it leaves the building and on the inside of the foundation wall, and shall be formed by placing a full "Y" on the drain and extended to or above the floor and so placed as to be readily accessible.

60. Cleaning out screw shall be provided at the foot of all vertical lines of soil and waste pipes and at all changes in direction—distance between cleanouts should not exceed fifty feet (50′).

61. The cleaning out screw on house traps, drains and stacks shall be of the same diameter as the pipes to which they are attached, except where the drains or stacks are more than four inches in diameter, in which case the cleaning out screw shall not be less than four inches. (4″).

62. Cleanouts fitted for cast iron shall be properly jointed into a hub. In no case shall they be fitted into a plain piece of pipe.

All cleanouts shall be of an approved pattern, the covers of which shall be made of brass (except Barrett cleanouts), at least 3-16 inches in thickness, the covers of which shall have a solid cast square head of 1½ inches and one inch in height; they shall be screwed and made airtight by the use of a suitable gasket. Barrett or Malcolm fitting covers may be made of cast iron held in place by brass bolts and brass nuts and made airtight by means of a rubber gasket.

The remainder of the proposed plumbing regulations together with the proposed new regulations in connection with gas-fitting will be printed in the next issue of SANITARY ENGINEER.

A New Series for the New Year

SANITARY ENGINEER has arranged for a series of practical articles for the coming year on the very important subject of heating and ventilating. These will be written by N. A. Kearns.

It is not planned to go over the ground that has been covered in the articles which have appeared in SANITARY ENGINEER during the past few months but to go into the matter from the standpoint of a detailed analysis.

The question is such a broad one and there are so many details in connection with it, all of vital importance to the man in the trade, that it is suggested that these articles be kept for reference as they will contain a wealth of valuable information.

Alphabetically Arranged

The matters to be discussed will be arranged alphabetically so that they may be readily referred to at any time.

A partial list of the subjects which will be gone into includes Absolute Temperature, Air, Anemometers, Accelerated Systems, Asbestos, Boilers, Belts, Cast Iron, Combination Systems, Combustion, Dimensions (standards), Fans, Fluids (Laws Governing), Formulae, Furnaces, Fuels, Galvanized Iron, Generators, Grates, Gravity Systems, Humidity, Hydrostatics, Joints, Materials, Mixing Dampers, Molecular Theory, Mud, Packing, Pipe Pressure, Radiators, Registers, Regulators, Rules, Steel, Statics, Traps, Tables, Tanks, Tests, Thermometers, Thermostats, Valves, Vapor Systems, Ventilation, Vacuum Systems, Water, Zero.

The list is by no means complete; but should be sufficient to indicate how varied are the subjects to be covered in this series.

At times a number of subjects will appear in a single issue of the SANITARY ENGINEER. At other times only one detail may be presented, because of the necessary length of the descriptive article.

Illustrations

The entire series will be illustrated with drawings, or photographs, where such are necessary to clearly convey to the reader the meaning of the text.

Specifications

Under the letter "S," specifications will be analyzed in detail. Clause by clause, different specifications will be examined and we shall point out why certain fittings are used in good work.

Forced Hot Water Systems

These systems are returning to popular favor; so we shall deal at some length with the principles governing, and the details used in, this class of heating work.

Tables

Tables will be given under the letter "T," and references will be made to these tables when subjects requiring tables appear under another heading.

Electrical Notes

There are certain terms used in electrical work that the ventilating engineer should be familiar with. The meanings of the terms will be given, together with such other information as may ordinarily be required by the practicing engineer.

All Subjects to be Treated Fully

Beginning with the letter "A" we shall go through the alphabet, touching on, and treating fully, every item from "Absolute Temperatures" to "Zero." From time to time we shall furnish an index indicating the dated appearance of certain letters; so that our readers may find at any time articles in which they are interested.

The Convenience of the Classification

Just at the time of its presentation, a paper may not contain the data that are of immediate value to the reader but he may find some time later the required information regarding, say, Anemometers; so he looks under "A" and finds the information desired. Or again, it may be "Indirect Radiators" that he is interested in. He looks under "I" and finds that note is made of this subject under the heading of "Radiators" as listed in the "R's."

Cheap Water May Be An Expensive Luxury

In Montreal, the daily quantity of water consumed weighs 12 times as much as the entire population of the city. In other words, every individual may be said to consume 12 times his own weight of water. In Toronto, the weight of water consumed is 10 times that of its population; in Hamilton, 13 times; in Ottawa, 17 times; in Quebec, 15 times; in Halifax, 17 times; in St. John, 21 times.

As a contrast with the above figures, the daily weight of water used in Winnipeg is less than 5 times that of its population; in Brandon, 7 times; in Regina, 4 times; in Saskatoon, 6 times, and in Moose Jaw, nearly 5 times.

One of the commonest causes of overconsumption is the policy adopted by our Eastern cities of supplying water on the flat rate, with absolutely no control of the individual consumption or waste. In the Prairie Provinces, on the other hand, we find a much lower consumption, which, of course is due to the fact that, in that section, the charges are usually made on the meter basis.

Constant Circulation is Aim of Ventilation

The aim of any ventilation system should be to achieve a constant circulation of air, without causing a direct cold draught. There must be an entrance for fresh air from outside and a means of egress for the foul air. Circulation is readily accomplished by the difference in temperature between the inside and the outside air. The greater this difference, the stronger is the current, so that a very small aperture in winter may secure as much ventilation as a wide-open window in summer.

In English houses, with their open fire grates, the chimney serves as an excellent channel for the removal of foul air. In Canada, where we have a furnace in the cellar and cook by gas, we have, while immensely improving the efficiency of our heating systems, not generally provided any means by which ventilation is combined therewith. Every furnace ought to have a pipe connecting with the outside air, which would bring in fresh air and warm it for distribution through the house.

Unfortunately, we must, in the majority of existing houses, fall back on the windows to let in clean air. Although they are, at best, unsatisfactory, they can very often be improved. To begin with, the type of double window which has no aperture except three little holes or a slit, invariably choked with snow and ice, should be discarded. A sliding or hinged pane should always be provided. Then, if the upper inside window be opened, the air must circulate between the two windows before entering the room and thus a direct draught is avoided, while the volume of new air is readily regulated to suit the coldness of the day and the strength and direction of the wind.

The "Post," of Yorkshire, England, states that a change in the method of charging for gas is now proposed, according to a statement by Sir Auckland Geddes. The suggestion is that, instead of buying gas by the cubic foot, the consumer should buy it on the basis of the heat it is capable of developing, as for nearly all uses to which gas is now applied its heating value is the desideratum.

EDITORIAL COMMENT

THE NEW REGULATIONS

SANITARY ENGINEER is the first publication to present to the men in the trade in Canada the much-talked-of and long-discussed proposed new plumbing regulations for the Province of Ontario. The regulations in themselves are most important and while they have not yet been put into effect will, it is stated, become law very shortly. It is likely that they will be used as a basis upon which every other Province in the Dominion may revise its own by-laws.

From information available from various sources there is little doubt that the by-laws in many sections of Canada will stand considerable improving. Not always, in fact very seldom, do those holding legislative offices, appreciate the vital importance of the public health. Very often these matters are left to boards composed of men who know little or nothing about the important matters entrusted to their care. Very frequently there is legislation, such as it is and there is no one to enforce it.

One of the best things about the proposed new Ontario regulations is that they are based absolutely on "good practice." This is not one man's views on good practice, but the views of many, and also of men from different parts of the province who have had to meet conditions that any individual might never encounter.

Another good thing about them is that the regulations put the case squarely up to the men in the trade. It is up to them to do good work and if they live up to the requirements of the law they need fear no investigation. There has in the past been a good deal of complaint upon the part of the public. The new regulations will satisfy the public also. If any citizen, anywhere in the province, is dissatisfied with any work done, he can call in a competent inspector and if the work is not right it will be made right.

Standardization of pipes and of weights of fittings, etc., is another important matter that has been worked out. Most of the men in the trade are agreed that this is a step in the right direction. It may also have very important effects in eliminating to a large extent that great evil in the trade, price cutting.

BRISK BUILDING SEASON AHEAD

WITH the most active building year since 1914 drawing to a close, there is every indication that next season will see all records for construction smashed in Canada. This, too, in spite of the highest prices on record for many commodities essential in building. The scarcity of homes all over the country remains acute and it is not exaggerating at all to say that thousands of people are living either doubled up with others, or in places where they intend to remain only until they can get better accommodation. Another factor in the situation is that in the larger cities especially, thousands of those who do not own their homes have been the victims of landlords who have proven absolutely heartless. These "gougers," as they have been rather appropriately termed, have been demanding and getting rentals that are out of all proportion to the value they are giving. They have taken advantage of the man who has to rent and who cannot help himself. The result in a great many cases is that the renter is planning to become an owner even though he realizes that it is going to cost him something to build his own home. Another condition that seems general all over Canada is the real scarcity of small dwellings suitable for the requirements of working men. Heads of factories in many places have been taking this matter up with councils and others, urging that something be done in order that they may enlarge their staff of workmen to take care of steadily growing business. All this of course means opportunity for the sanitary engineer. It means chances for him to sell not only the materials used in building but the many articles used in equipping the home for occupancy. In the previous issue of SANITARY ENGINEER a manufacturer gave it as his opinion that as far as the future was concerned, it was going to be, from the merchant's standpoint, not a question of price, but of getting the goods to sell. Sanitary engineers, more perhaps than any other men in the trade, have known just what this means for the past five years and many of them are sizing up the outlook and laying their plans accordingly.

PROMPT ACTION IS NEEDED

THE *Financial Post* makes timely comment in regard to the important question of "Should the Government Keep the Railroads?" This is a matter which is of particular interest to business men all over the country. The *Financial Post* says:

"That the return of all the railroads in Canada to private ownership is the solution of the national transportation problem has been argued by W. F. Tye, one of the leading authorities on the railway situation in Canada, before the McGill Canadian Club at Montreal. The people of the United States had learned a lesson from Government operation and were longing for the time when the roads would be given back to their owners, he said, and pointed out that the only successful Government railways had been in Germany where conclusions could not be drawn because the systems were part of the military machine and both cost of operation and revenue charges could be regulated to suit the conditions prevailing.

"That the Government should regard the railroad problem as one which may be solved without the permanent adoption of public ownership on a broad scale will appeal to most people with a practical knowledge of the question. Even accepting the Government's argument—which we do not—that there was no other way out of the crisis than to take over the various roads, it does not necessarily follow that it is in the interests of the people of Canada that the Government should go into the transportation business on a big scale permanently.

"As we see it, the business of the Government is not to run railroads simply because it made loans on railroad security which were defaulted, any more than it would be the business of a bank to do so under similar circumstances. The bank would, perhaps, take over the property temporarily, and handle it in a manner to realize the largest possible sum when conditions favored a sale. This is the course which the Government might very well consider—to maintain the properties in the most efficient conditions possible, to improve that condition if feasible even to the extent of further investments, and then dispose of them when this can be done to advantage.

"The Government has made its mistakes in its policy of making advances and undertaking guarantees for railroad construction. These mistakes involve financial losses. It would be better to face these losses at once than to attempt a policy which will cover them for the time being, but lead to still greater losses in the future. It is a wise business man and a wise Government that knows when it is good policy to face one loss and thus prevent other losses."

RED BLOOD NEEDED

NOMINATION day is almost at hand, when a selection will be made of the men who are to direct the affairs of municipalities, large and small, all over the Dominion. There never was a time in the history of this country when red-blooded men were so badly needed as right now. Real problems exist which, if not solved wisely, will affect conditions for many years. Such matters as the housing shortage, the fuel problem, the settlement of labor difficulties and similar important questions are general. Experience has proven that businesslike handling of big problems is only possible when business men take hold of them. One of the most regrettable things in connection with municipal and public matters generally in the past has been that so few business men, comparatively speaking, are to be found taking an active part. This has resulted in many situations arising that would not have been possible had men with business training been at the head of things. Men who are used to settling matters quickly and efficiently every day are invaluable at any council board. They are needed always, and especially just now. It was the business men who led the fight against the extremists in Winnipeg last summer and quickly and effectually stamped out Bolshevism as soon as it raised its head. The results of last week's elections in Winnipeg may be attributed to the good work of the business men. They aroused the right-thinking people of the community to the real dangers that exist if the extremists gain control of civic matters. Fortunately for the country at large there are very few such problems to be solved as that in Winnipeg. But there are any number of others which the business men can and should lend a hand in settling. Their experience is needed and their counsel has a value that is far beyond a mere dollars and cents basis. If you are asked to be a candidate, even though you are a very, very busy man, give the matter your most earnest consideration, and if possible accept. Remember that with more business men at the head of affairs there will be less cause for future trouble.

THE Editors of SANITARY ENGINEER extend to sanitary and heating engineers, throughout the Dominion, heartiest wishes for a very Merry Christmas and a bright and prosperous New Year.

WITH SO MUCH loafing going on the term "social unrest" seems to be a bit misleading.

* * *

THE kinds of goods that keep moving are the kinds the public like and are the kinds that bring the profits. No merchant ever made any money out of shelf warmers.

News from Here and There

CONTRIBUTIONS OF NEWS GLADLY ACCEPTED

New Firms

Petitgrew & Lamontagne, plumbers, have been registered at Quebec.

Pierre Therrien & Co., plumbers, have been registered at Montreal.

Joseph Rousseau & Co., tinshop and plumbing, has been registered at Montreal.

Trade Notes

Cairo Sanitary Baths has been registered at Montreal.

The Canadian Aladdin Company, manufacturers of standardized houses, will erect a $70,000 factory at Peterboro shortly.

D. A. Blair, plumber, Toronto, is discontinuing business.

Personals

E. Louis LeGrow is an aldermanic candidate for Ward Four in the Toronto civic elections.

President Thomas Fergusson, of the Toronto Society of Domestic Sanitary and Heating Engineers, who, as stated in a previous issue of SANITARY ENGINEER, was ill with pleurisy, is at work again. His wife, who was also taken ill with the same disease, has made a good recovery.

Obituary

The death occurred at Quebec City of L. H. Gaudry, president of L. H. Gaudry & Co., Ltd., importers of pipe and waterworks supplies. He was also president of the Eastern Canada Steel and Iron Works, Ltd.

The sympathy of many friends will be extended to Mr. and Mrs. James Griffin, of 80 St. Matthew street, Montreal, in the loss of their sixth son, Bernard Stewart, which occurred at the home of his parents on December 11.

"Bernard" had been in good health until a week previous to his death, in fact he had attended school on Friday, December 5. Contracting a cold, it developed into pneumonia, and the end came within the week.

Following a stroke, the death occurred at her home on Tuesday of Mrs. Sarah A. Cooper, mother of George Cooper, plumber, 113 Church Street, Toronto. Mrs. Cooper was 85 years old.

IS NOT A CANDIDATE

James Richards, of the Plumbers' Union, nominated as the Labor candidate for alderman in Ward Four, Toronto, informed the Independent Labor Party at its meeting on Saturday that he must withdraw his name and would not take part in the campaign.

George Clapperton Is The New President

At the regular meeting of the Toronto Society of Domestic Sanitary and Heating Engineers this week officers for the coming year were elected as follows:—

President—George Clapperton.
Vice-president—Roy E. Belyea.
Treasurer—Thos. M. Maxwell.
Secretary—Garrett F. Frankland.
Warden—W. H. Daw.
Tiler—Lyman Swanston.
Auditors—W. A. Lord, D. E. Norwich and Fred. A. Wiles.
Executive—Geo. R. Baker, H. A. Farthing, F. H. Gentle, T. F. Kelly, F. R. Maxwell, A. S. Purdy, H. G. Waterman, H. A. Weinraub and John Wright.

Sanitary Inspector Active at Peterborough

Peterboro, Ont.—C. L. Stapleton, sanitary inspector, is making very active endeavors to have his presence felt for the sanitary betterment of the city. At police court J. T. O'Connell was ordered to pay $3.10 costs on a charge laid by the sanitary inspector against him, to which he pleaded guilty. He was charged with an outhouse on property owned by him, 439 Park Street, without the permission of the Board of Health, contrary to the city by-law.

Abraham Lowe was called on to pay $3.10 cost for filling a cellar window of 217 Hunter Street with common manure. There is no glass in this window and the owner took this method of keeping out the frost. The sanitary inspector ordered the stuff to be removed, but as this was not done, court proceedings were adopted.

GUELPH COUNCIL TO LAY NEW CONDUITS

Guelph.—Acting on a mandate from the Provincial Board of Health, the city council has authorized the city engineer to proceed with the replacing of present conduit pipe which supplies Guelph with drinking water with a new water-tight pipe. The cost will be something over $100,000, and the work will be started at once. It is the purpose of the engineer to use wood stave pipe.

Tenders

Tenders will be called January 1 for heating and plumbing for new $50,000 laundry building to be erected at St. Thomas, Ont., for the Aylmer Laundry Co., of Aylmer, Ont.

Plans are being prepared for new sewage disposal system for the Deloro Smelting Co., of Deloro, Ontario.

The ratepayers of Forest, Ont., will vote on a by-law to provide for the installation of a new waterworks system on January 5.

Tenders will be called shortly for new school at Ingersoll, Ont., to cost $20,000 for Separate School Board, Father Gnam, chairman.

By-law for erection of new school to cost $150,000 has been passed at Brandon, Manitoba, and plans are being prepared.

Plans are to be prepared at once for new school to cost $50,000, for the Public School Board, Campbelltown, New Brunswick, E. M. Hogan, secretary.

Heating and plumbing tenders are wanted in connection with new $85,000 annex, being erected at Winnipeg, to university by Provincial Department of Public Works.

S. M. Brookfield, Ltd., Halifax, N.S., will let plumbing and heating in connection with new $35,000 bank for the Royal Bank of Canada.

Frid Construction Co. will award heating contract in connection with new $30,000 church at Hamilton, Ont., for St. Stephen's Anglican Church.

Tenders will be called shortly for new $80,000 bank at Ottawa for the Banque Nationale, St. Peter Street, Quebec.

J. & J. Allen, Allen Theatres, Toronto, will call for tenders shortly for new theatre to cost $100,000, at Windsor, Ont.

By-law was carried at Woodstock, Ont., by which the Brunswick Phonograph Co. will erect new factory to cost $200,000.

P. A. Belleperche, Huron & Erie Bldg., Windsor, Ont., wants prices on plumbing and heating for new $32,000 store and flat.

Plumbing tenders wanted by F. A. Nightingale, 168 North St., Halifax, for new flats costing $10,000.

Plumbing and heating to be let for four family duplex, costing $20,000, for W. J. L. Lewis, 485 Arlington St., Winnipeg, wants prices on plumbing and heating for new residence to cost $7500.

Ward Bros., 242 Dougall Ave., Windsor, Ont., will award plumbing and heating in connection with six new residences, costing $16,000.

Plumbing and heating to be let for new residences, costing $20,000, for R. J. Poyntz, 362 Runnymede Road, Toronto.

Dr. E. M. Fulton, Sherman St. South, Hamilton, Ont., wants plumbing and heating prices for new residence and office, costing $8,000.

Hugh G. Fraser, 5 Blowers St. Halifax, N.S., wants prices on plumbing and heating for new residence costing $9,000.

Contracts Awarded

Contracts in connection with alterations to northeast wing of the King Edward Hotel, Toronto, costing $40,000, and including installation of 18 new bathrooms, have been let as follows: plumbing and heating, W. J. McGuire, Limited, 91 Jarvis St., Toronto; fixtures, Imperial Products Co., 79 Adelaide Street, Toronto.

Charles E. Hamelin, 3 Olivier St., Three Rivers, Quebec, has plumbing contract for new presbytery costing $25,000 for the Catholic Congregation at Cap de la Madeleine, Quebec.

Silvester Bros., Stouffville, Ont., have contract at $1,500 for new bathroom equipment and hot water heating at home of Dr. Freel.

Battler & Freiburger, Kitchener, Ont., have heating and plumbing work for new $30,000 nurses' home being erected by Hospital Board.

Thomas O'Connell has plumbing contract for new $135,000 church and presbytery being built at Montreal for the parish of St. Augustin.

Germaine & Freres, Three Rivers, Quebec., have plumbing contract for $200,000 school being erected for the Commissioners.

A. Matthews, Limited, Toronto, have plumbing and heating contract at $2,565 for stables and office building being erected for the Board of Control.

Thomas O'Connell, Montreal, has heating and plumbing contract at $16,800 for new $100,000 school being erected at Verdun for the Protestant School Commission.

A. Rodgers & Co., Hamilton, Ont., have plumbing and heating contract for new $100,000 factory being erected for Wagstaff's, Limited.

W. J. McGuire, Ltd., Toronto, have contract for heating for new $250,000 factory at Kitchener, Ont., for Ames-Holden, McCready, Ltd., Montreal.

O. Caron, Maissoneuve, has plumbing and heating contract for new $34,000 warehouse for Bournival & Co., Montreal.

F. P. Giguere, Ltd., Quebec City, have plumbing and heating contract for new $50,000 shoe factory being built for the Gosselin Shoe Co.

Bennet & Wright have plumbing contract for new $100,000 store and office building being built at Toronto for the Wm. Davies' Co.

W. T. Borland has contract for plumbing and heating for four residences, costing $24,000, being erected at Montreal for James Angus, 314 Beaver Hall Hill.

Ontario Executive to Continue Aggressive Campaign During the Coming Year

Excellent Results Are Being Obtained From Work Being Done in Various Parts of the Province by Directors—Co-operation and Support of Every Man in the Trade is Needed

THE Executive of the Ontario Society of Domestic, Sanitary and Heating Engineers are planning a "drive" into Eastern Ontario in connection with the aggressive campaign of organization work which they have been carrying out.

Early in the new year it is expected that a trip will be made to Peterborough to discuss with the master plumbers of that city matters of importance in connection with the work that is being carried on.

Have Had Busy Season

While the directors have had a busy season and have accomplished much as a result of their efforts, they are planning still greater activity for 1920. It is realized that the time to get results is now, and the executive officers plan to follow up the work they have undertaken with still greater efforts next year.

The work that has so far been accomplished is only an incentive to greater things, as it has shown the splendid possibilities ahead. If every man in the trade will lend his co-operation and support to work that is in the interests of all, real results will be obtained. These will not only affect every individual sanitary and heating engineer, but will also make for general betterment of the trade as a body.

Practical Work

Co-operation and education will accomplish wonders, and one of the results of the campaign that has been carried on in various parts of the province for the past few months has been to show the master plumbers the absolute necessity of working together, if they are ever to accomplish anything.

Another very important matter has been to bring them to a realization of the necessity of conducting business on business principles if they are going to stay in business and meet conditions as they exist to-day. Many of the men in the trade, as a result of what they have learned, have stopped leaks that were eating into profits. Not only this, they have learned how to figure on a proper basis and obtain the profits on their work to which they are entitled.

Many Meetings Held

During the season meetings have been held at Hamilton, Brantford, Windsor, Chatham, Galt, Preston, Kitchener, and Welland. These are only the forerunner of many meetings that are planned.

Fined $200 For Failure to Keep Proper Books of Account

Conviction Secured by Canadian Credit Men's Association in Charge Laid Against Merchant at Sault Ste. Marie

AS stated in a previous issue of SANITARY ENGINEER, in connection with a charge of perjury with intent to defraud creditors, laid under the Ontario Bulk Sales Act, against L. W. Putnam, by the Canadian Credit Men's Association, Putnam was found guilty.

A conviction was secured and Putnam has been sentenced to a term of three months at the Jail Farm.

The Canadian Credit Men's Association is watching closely for cases of merchants who are inclined to be dishonest with their creditors and plan to prosecute.

Have Another Case

A few days ago they prosecuted in another case, that of S. Joseph of Sault Ste. Marie, Ont. Mr. Joseph, after having been in business at the Soo about nine months, made an assignment, and upon a statement being prepared, there was found to be a very large deficit. The case was followed up by the association, and while it was found impossible to secure direct evidence of fraud, they alleged that he had committed perjury in connection with his examination for discovery.

Failed to Keep Books

He was arrested on this charge, and was also charged with failure to keep proper books of account.

He was tried before a jury and acquitted on the perjury charge, but convicted on the other and sentenced to two months in jail, and in addition to pay a fine of $200 or to serve an additional two months in jail.

Taylor-Forbes Co. Insures Employees

The Taylor-Forbes Company, Limited, of Guelph, Ont., is putting into immediate effect a profit-sharing plan by insurance for its employees. A notice to the employees states:

That the Taylor-Forbes Company has insured the lives of all its employees according to the length of service with the company, beginning after the first three months with $500, and ending with $3,000 as the maximum amount, as shown in the list below.

Medical examinations are not required.

Any employees who were in the army will be allowed full time for such service as part of their working years. Every year of continual service with the company will add to the insurance policy value up to $3,000. It will not in any way interfere with any advance in wages or earning capacity. Employees in continuous service three months to one year will receive $500; one year to two years, $600; two to three years, $700; three to four years, $800; four to five years, $1,000; five to six years, $1,200; six to seven years, $1,300; seven to eight years, $1,400; eight to nine years, $1,500; nine to ten years, $1,000; ten years' service, $2,000. For each year after eleven years $100 per year will be added, until the sum of $3,000 is reached. When an employee has served nineteen years he receives a policy for $3,000. Employees who were in the service of the company on or before April 1, 1902, will receive a $3,000 policy.

THE "CANTERBURY" LAVATORY

A MERRY XMAS

Toronto, Dec. 15th, 1919.

To the Trade—

Dear Sirs:—

On looking back, we recall the feeling of great uncertainty as we entered the year which is just drawing to a close.

All our worries and forebodings have been in vain and were unnecessary—the country in general is prosperous, the individual is prosperous and but for a certain natural post-war feeling of unrest, happiness has reigned supreme.

We can all do much during the coming year to dissipate the unrest cloud and to bring about a healthy national mental condition.

Let's get together.

To one and all a Happy New Year.

What Will Happen When Prices Decline?

Indications That the Peak Has Been Reached in Many Lines—Suggestion That Prices Should be Guaranteed to Protect Retailer From Loss

WHAT'S going to happen when the prices drop? This question has been made the title of a most interesting article on the present price situation as applied to the manufacturer, the wholesaler and the retailer—as well as the consumer—by G. A. Nichols in "Printer's Ink." In answering, Mr. Nichols presupposes that the peak of the high price movement has been reached and that it is only a matter of time until readjustment is commenced.

Is Problematical

Whether that readjustment will be sudden or protracted he regards as problematical, but investigations indicate that people are developing a disposition to save money where possible and are looking for more moderate-priced goods or postponing purchases in the hope of lower prices to come. Mr. Nichols' inquiries have provided him with a composite picture of the whole situation and the conclusion is reached: That there is a noteworthy agitation on for lower retail prices and that it is spreading far outside its original limit of things to eat. Up to the present, however, the only specific direction in which it is being felt is the hesitancy on the part of dealers to place advance orders for ready-to-wear, including work clothing.

Shortage of Goods

From inquiries in the Canadian markets there appears to be as yet little indication that the time for a decline in prices is at hand. There is a marked shortage of goods in almost every direction, and there seems to be little chance of anything like a slump while this condition continues. That the effort of rising prices will eventually be to check buying is inevitable, but as the advance is a result of the shortage and it will be a matter of increased production to make up this shortage—and production is increasing very slowly, if at all—it would seem logical to anticipate that any readjustment will be gradual and spread over a considerable period.

Meeting the Situation

Manufacturers, wholesalers and retailers are all affected by this question of price adjustment. The actual losses to be faced in relation to goods on hand are in themselves a problem, but a still larger question is the placing of orders. In short, it is not so much a question of taking a loss on stock actually in hand, but of the uncertainty as to what the market may be three or six months hence for goods and materials which may be ordered to-day. Under such circumstances the safer course to pursue would be to work on a hand-to-mouth basis in making purchases, but this is a doubtful if not actually impossible policy when there is a prospect on the other hand that there will be an actual shortage of goods.

Guaranteeing Prices

One question which has been raised under the conditions prevailing has to do with the advisability of manufacturers guaranteeing prices for the protection of their customers. This is the policy which will be followed by a big concern manufacturing men's furnishing goods; the general manager says:

"We are going to meet this situation by guaranteeing prices, There is no use in temporizing with a proposition like this. I don't blame the retailers for being conservative. We are telling our customers that they need not hesitate or hold back. They can safely place their advance orders at present prices. Then if the market drops between now and the time for delivery of the goods, they will be billed at whatever the price is. There is nothing particularly new about this policy of ours. We used it to good advantage during the slow buying days brought about by the wartime merchandise crisis.

Likely to be Gradual

"Of course, in making this proposition to our customers we do so on the supposition that any decrease in prices that may come will be gradual. If the totally unexpected should happen and prices should drop all in a heap, I don't know just what would be the outcome. I do not think it would be any fairer for us to bear all the loss in this case than it would be to ask the retailer to bear it. But to think about this possibility is merely to borrow trouble. There isn't the slightest chance in the world for prices to slump over night. They will go down so gradually that the reduction can be absorbed without any distress. People manufacturing and selling goods may not make so much money, but I am sure they need not fear disastrous consequences.

Remove Timidity

"If manufacturers and jobbers generally were to guarantee their prices as we are doing this would remove much of the timidity retailers now are displaying. Most of the jobbers and manufacturers are insistent that the price decline will be gradual and that nobody need fear. All right then—let them have the courage of their convictions and guarantee their prices on advance purchases. We have no fear at all as to the consequences to us. And we are very sure that our customers will get a fair deal. I suppose that we are the most stiff-necked people in the country when it comes to cancellations. We want our customers to know their needs intimately enough to order merchandise that they really want. When we accept an order we expect to fill it. We have to manufacture or buy the goods to fill that order and we have a right to expect the retailer to make good on it. I suppose our cancellations owing to this policy do not amount to more than five per cent. But if a retailer should get up against it owing to price drops or any other reason, what is there to do other than to meet him at least on a fifty-fifty basis? Guarantee prices now so as to speed up the buying for future delivery and then later proceed with the dealer on a live and let live basis. This is our policy and we have no misgiving as to what may happen."

Careful Consideration

This question of guaranteeing prices to the trade is one which should not be adopted without careful consideration. In some lines of manufacture it may be successfully worked out and may justify itself by maintaining the demand of the retailer. In other cases it will be found to only have the effect of postponing the necessary adjustment. Much would depend also upon the position of the producer in relation to his raw materials. If he does not have to book ahead for his own supplies on a definite basis and has confidence in his ability to judge what is going to happen he may find it good business to take such a course, but if he has to make definite purchases at top levels in order to protect his own supplies it would seem to be going far to endeavor to protect the trade against loss.

Would Be Absorbed

There would appear much to support the contention of many experienced merchandisers that just as there were benefits all along the line on rising prices, so there will be losses to be borne on stocks on hand on any readjustment to lower levels, but in a gradual change such as is anticipated these should be absorbed without serious consequences. Advances on goods and materials in stock were justified on the ground that there would probably be a time of declining values, but no one looks to see such declines attain anything like the proportions of the advances. There should be no apprehension as to the various branches of trade and industry generally being able to meet the situation out of the profits of several prosperous years without being crippled.

CANADA'S GIFT APPRECIATED

Ottawa.—An interesting communication has been received by the Department of Agriculture from Belgium relative to the funds contributed in Canada to the British Empire Agricultural Relief Fund for the purchase of garden sets and small tools for farmers in the war-devastated areas of Europe.

The director of the Relief Fund in Belgium states that the total number of tools distributed totalled several thousand, and that many letters of thanks were received from the municipalities that benefited from the distribution. As a means of showing the gratitude of the Belgian people for the contributions occasion was taken at a livestock show to make a display of the tools distributed.

Over the display was a conspicuous sign indicating that the tools were the gift of Canada.

J. R. Myers & Sons, of Stratford, Ont., have been awarded contract at $10,000 for installation of new heating equipment in factory of the Canadian Edison Appliance Co.

Montreal Plumbers Look for Brisk 1920

Elect Officers to Man the Ship for Next Year—President Sees Plenty of Good Business—Unanimity of Spirit Prevails

THE annual meeting for the election of officers of the Montreal Master Plumbers' Association was a very successful one, and great unanimity of feeling prevailed. This is saying much, for when it is remembered that the personnel of the association is of a dual nature, both English and French elements uniting in the various work of the association, it can be understood that, to get upon a common basis of understanding, requires patience and charity.

It is, therefore, to the credit of the office-bearers who have guided the important business of the Masters' Association during 1919, that the year just closing has been one of, if not the most progressive and successful in history.

CAPT. D. A. BETHUNE
President Elect of the Montreal Association of Master Plumbers.

In addition to this, a foundation has been laid, or rather securely cemented, which augurs well for many years to come. Past President T. Latourelle, and his associates, have worked well, and have worked hard to secure these results.

The President-Elect Speaks

In an interview with Captain D. A. Bethune, the new president-elect, SANITARY ENGINEER ascertained that the outlook for 1920 is of a very encouraging nature, and that association matters bid fair to work out well.

"I believe that there are seven-eighths of the best master plumbers in the city now members of the Montreal association," said Captain Bethune. "We should have a good season in 1920. The architects' offices have many plans to be figured on; it just means that, labor and other conditions once settled, there will be plenty of work."

The Wage Problem

One of the trying circumstances of the past summer and fall season has been that of misunderstandings regarding the recognition of union labor, and also regarding remuneration or wages. Throughout, the masters were ever willing to reason with the men and to meet them fairly, as far as SANITARY ENGINEER has been able to learn from many different sources. In some cases, it is understood, the men walked out without assigning any reason therefor, and later they returned to the shops. All of this delay—this absence from the shop, made none of the men or the shops richer—it was evidently a time of inaction, and, while the uncertainty of getting material was a big factor in holding work up, the absence from work was a decided handicap to master and journeymen.

Expects Square Deal

The new president expects that, from this time forward, there will be a "square deal" policy as between the masters and the men. That does not mean that this is a new innovation, for the masters, and many of the journeymen, have been very fairly-minded toward one another. Not only so; some of the large shops had full, or nearly full, staffs during the workers' strike, which affected so many trades.

"To pay a man what he is worth," continued Captain Bethune, "is what we expect to get from at least a large section of the journeymen. With the carrying out of this policy there will be less trouble, and this section of the journeymen, at least, assure us that there will be no strikes."

Shops Are Willing

There has been, for a long while, a decided willingness upon the part of the leading shops to give the men good wages, and the best of treatment. SANITARY ENGINEER understands that good men are now drawing 75c per hour. That is a good wage, it would seem, under present living conditions, and it always must be borne in mind that the master has the unpleasant task of convincing the too often irate householder that a charge of $1.00 per hour is fair and just. At 75c cost to him, and having to pay his overhead expenses out of the charges made, the master, at $1 per hour, or at $1.25 per hour (depending upon the size of his staff and the work secured), is not going to make a fortune, in any case.

TELESPHORE LATOURELLE
Past President of the Montreal Association of Master Plumbers.

Have Had Difficulties

"In Quebec Province there has always been difficulty for the master plumber to hold his skilled men," continued the president-elect. "Wages here were lower for some years, and this meant that good men would not stay in Montreal very long, but would go, very often, farther West. The master had to face

Sees Record Business Coming in 1920

Manufacturer is Looking for the Greatest Volume of Trade in History of Canada Next Year—Sees Firm Prices for Merchandise Owing to Difficulty in Getting Raw Materials and the Men to Make the Goods

"IT looks like a bed of roses but as a matter of fact it is a mighty uncomfortable position to be in," was the way a leading manufacturer of enamelware of Toronto summed up the situation at the present time.

"Everybody thinks," he said, "because we have got so much business that we do not know what to do, that we ought to be perfectly satisfied. In one way, it is a good position to be in, but on the other hand we never had so much worry in our history.

Wants the Goods.

"Everybody is chasing us and chasing us hard for the merchandise and we simply cannot begin to get production. We are trying to keep them all satisfied by giving everybody as much as we can. Every day we get a pile of letters and in addition telegrams and long distance telephone messages wanting to know if this or that consignment has been shipped and if not when it will go forward. This is a continuous performance, and as you might imagine it gets rather tiresome. We are held up in getting our supplies of raw materials. We simply cannot get the help we want, either skilled or unskilled, and business keeps coming in from all parts of the country.

Record Year Ahead.

"There is every indication that 1920 is going to be a record year in the building trade. At the present time I can see nothing to prevent it. The only problem is going to be to get enough goods to keep up with the demands that are coming. We cannot take any credit to ourselves for selling goods these days. The demand is there and the business comes in so fast we cannot handle it. It is going to come, even faster next year, unless all signs fail. All over Canada there is a shortage of homes and there are many millions of dollars' worth of construction work that has been held over because of conditions.

Sees Steady Prices

"As far as I am able to judge, the markets are going to remain very firm. There are prospects that advances may be made as pig iron has been climbing steadily and the rate of exchange against Canada in the United States is getting to be a serious factor in the purchase of raw materials. Our pig iron in Toronto now will stand us about $45. That is a big advance and all these things have to be taken into consideration.

"There is the question of coal also. That is a very important matter. While we have plenty on hand for all immediate needs, there is a good deal of uncertainty about the future. We are, however, hoping for the best.

Business Very Active.

"Busines, in general, has been very active all over the Dominion. In the West, in our line, British Columbia is perhaps leading the other provinces. All over Ontario and the East, large amounts of work are under way and planned. The activities of the Housing Commisions will mean in itself a large volume of work next season, not to mention the work that will be undertaken by private and speculative builders.

"The present state of affairs, as I stated, is anything but a bed of roses. In addition to being unable to satisfy our customers, it means that our sales' staff is inclined to take things easy. They can say to us, 'Well, you cannot supply the busines if we get it, so what can we do.' Personally, I would rather have the business back on a normal basis, where it came in steadily and we were able to take care of everything. Under those conditions, every man of us was up on his toes, looking for all the business there was to be had, and we were not continually getting kicks from our patrons because of delayed shipments."

Appointed Sanitary Inspector.

Charles Dobbs, of Damascus, Ont., has been appointed sanitary inspector for the township of West Luther, to succeed Thomas Bishop, who recently resigned.

LOOK FOR BRISK 1920

Continued from page 27

this situation as best he could. Now we are more nearly, if not on the same basis as other centres and cities, and the men are getting good wages. Conditions are better, too. The plumber who has made any money is the one who has stuck close to the job for many years, in spite of these difficulties."

Unworkable By-laws

Montreal, too, has had many difficulties in the matter of unworkable by-laws, etc. For many months the new proposed by-laws as affecting the building activities of various trades in the city of Montreal, have been under consideration. SANITARY ENGINEER has already pointed out how anxious the plumbing fraternity was to have these laws suited to the best interests of the house owner, as well as of the trade, and to this end a strong committee of the masters has been giving close attention to a report they were asked to bring in on the subject, by the Administrative Commission of the city of Montreal. This report has been completed, and handed in by the chairman of the plumbers' committee, P. C. Ogilvie, who, personally, has spent many long hours at this work, as well as other members of the committee. This task was the second one in which Mr. Ogilvie had assisted, the new by-laws adopted by the city of Westmount recently having had his attention.

Mr. Ogilvie, in speaking with SANITARY ENGINEER, stated that he expected the by-laws, as embodying the recommendations of the plumbers, would be adopted, and he hoped, without material change. Great care had been taken to make them effective, and to protect the interests of the owner, as well as of the craft.

Educate the Public

Captain Bethune stated that he thought the average owner had come to realize that prices were unlikely to materially decline. As a consequence, there was likely to be greater progress in the year ahead than there has been in 1919. That is to say, work that has been deferred will now have to be overtaken and at once accomplished. It cannot be delayed longer.

The public has often been hard on the plumber, and as the new president stated above, "it is only the man who has stuck to the job a long while who has made any money." He will still have to maintain his own ideas as to the standard of work to be done, and if backed by the city with a good, strong, workable and practical by-law, and under which one man must work just the same as his brother plumber, it ought to make for a fair and just competition, in which all will get their share of the work to be done. With housing sorely needed in all parts of the city in 1920, there should, manifestly, be great progress in the year almost upon us.

Better Feeling Now

Mr. Ogilvie, asked as to the results of the strike, expressed his belief that the English-speaking shops had been the greatest sufferers. Now, however, he feels that there is a better feeling, and a more charitable understanding, which augurs well for the coming season.

James Ballantyne, one of the old-time masters, also feels that the strike troubles are at an end, and that better conditions will prevail from this time forward. As chairman of the committee to confer with the men regarding wages, etc., Mr. Ballantyne asked that leave be granted to continue this work, and this was agreed to.

Hickey and Aubut have plumbing contract for $20,000 alterations in building for F. P. Jones, 207 Stanley St., Montreal.

Great Activity Looked For in Building

Every Indication That the Spring Season of 1920 Will See All Past Records in Canada Smashed—If Weather is Open Considerable Construction Will Proceed During the Winter Months

AN experiment in connection with relieving the housing scarcity is to be tried out in Toronto in the shape of what is known as the "quadruplex bungalow." The plan will, it is expected, be watched with a good deal of interest all over the country by municipalities who have to meet the problem of house shortage.

The "quadruplex bungalow" idea, as advanced by W. E. Dyer, was unanimously endorsed by the Property Committee and recommended to the city council. Mr. Dyer asked permission to establish a group of thirteen of these structures, comprising fifty dwellings, to be operated on a rental basis under the control of the Toronto Housing Company, which was, he said, prepared to accept the responsibility.

Will Be Distributed

The site selected for these dwellings is the Toronto Housing Company's property and the plan submitted indicated that they would be distributed six on either side, with one at the north end. The last would include only two dwellings, the remainder four each. The central portion of the block is shown as a park playground.

With Mr. Dyer, Mrs. L. A. Hamilton, H. W. Davidson and V. Kearns-Batchelor spoke in support of the proposal. They asserted also that it had met with the approval of Lord Leverhulme, whose employees are housed under similar conditions at Port Sunlight.

Building Activity

Advices from all parts of the country indicate that great building activity is expected. Architects are very busy with plans and a feature of the work they have on hand so far is the large number of the better class of dwelling houses. Many of the homes that are planned are of a type that will cost from $4.000 to $7,000. The moderate sized, comfortable, homey style of dwelling seems to be decidedly popular.

The construction of these will not be in the cities alone. Out in the country districts scores of farmers, who have been making handsome profits out of their produce, are figuring on erecting new dwellings.

Housing Commissions

Housing commissions all over the country are busy with plans and the expenditure already in sight from this source alone will run into several millions. While these homes are not of the higher-priced kind, they will, in the great majority of cases, call for substantial construction and many excellent opportunities will be afforded to hardware merchants to supply various lines.

An encouraging feature from a construction standpoint is the attitude being shown by many of the labor unions. Apparently they are realizing that labor unrest has resulted during the present year in several million dollars' worth of building being held up. In order to avoid this during 1920 and restore confidence, they are endeavoring to unify agreements in the various trades and have an understanding arrived at at an early date, so that construction may be commenced early and proceed without interruption.

Build During Winter

There is every indication that if weather conditions are at all favorable a good deal of construction work will be commenced during the winter. If the weather is open as it was last year, a great deal of work could be proceeded with. Many of those who commenced operations during the fall and have been held up through inability to secure shipments of brick or other commodities, are planning to go ahead with the work as soon as they can get the materials. This will also mean considerable activity.

"WHY THE LINE OF PEOPLE AT SMITH'S HOUSE -"
"HOUSE HUNTERS - IT WAS RUMORED THAT THE SMITH'S ARE MOVING OUT NEXT SPRING-
Chamberlain

From Ottawa comes word that to avoid any possibility of strikes or disagreements over hours or wages in the building trades next year, when exceptional activity in construction is expected, steps will be taken early to reach an agreement between employers and men engaged in the building trades.

This unusually early move towards an agreement on wages is due to the unrest that has been evident this year, the many big works to be estimated on for next year, and the fact that there has been dissatisfaction in some branches of construction work recently regarding wages and also employment of unskilled men on some jobs unions hold to be work for their men.

At the annual meeting of the Ottawa branch of the Canadian Building and Construction Industries next Wednesday, Mr. Hugh Graham will move that a committee be appointed to consider drafting an agreement with the employees at an early date.

"Our windows are one of the very best advertisements our store has," says Mr. Heaman. As may be seen from the illustration, he keeps them attractively dressed and the displays are changed regularly. Note the little shelf displays of aluminumware and tinware at the left. These make a great hit with the farmers' wives.

Keep Your Stock Well Displayed

"Best Way I Know of Increasing Sales," Says W. J. Heaman, of Exeter, Ont.—Good Window Displays and Attractive Store Arrangement Backed by Timely Advertising Always Produces Results

Based on an interview by C. E. PARSONS, of Sanitary Engineer, with W. J. Heaman, of Exeter, Ont.

"KEEP your stock out where people can see it, and don't be afraid to advertise. Our window displays are among the very best advertisements we have, and when backed by newspaper copy, never fail to produce results."

This is the opinion of W. J. Heaman, Exeter, Ont., hardware and plumbing. Exeter has a population of about 1,700, and is the centre of a rich farming district. Mr. Heaman's windows are given careful attention, and are changed regularly. Both store and windows are always kept clean and attractive.

Mr. Heaman does not believe in keeping his stock hidden away down cellar, or in drawers or under the counter.

The first thing that strikes you when you enter the store is that he has a good stock and that you would be likely to get anything there you might want in the hardware or plumbing goods line.

"We try to keep our stock out where it can be seen," said Mr. Heaman. "That is the best plan I know of to keep it moving. We keep it changed around a good deal, and always aim to keep seasonable lines up to the front. We use display stands and display tables and find that they are a great help in increasing turnovers."

Windows Good Ads.

Mr. Heaman says his two windows are perhaps the best ad. he has, and he believes thoroughly in advertising. The windows are changed regularly every week and are backed up by timely advertising in the local paper. Mr. Heaman always uses a double column space on the front page in the lower left hand corner.

"We think it is good business to keep the same position each week the year round," said Mr. Heaman. "People learn to look right in that spot for our announcements. We do not always use the same space. At special seasons we use two or three times as much space as at others, but we aim always to have a seasonable message that will tell about our stock and our store to the people of the whole district."

Brings in Business

Mr. Heaman does an excellent business with the farmers, not only in hardware goods, but in plumbing also.

"There are no better customers than the farmers," he said. "They are good buyers. They have the money and they do not mind paying fair prices for good goods. That is one thing they insist on. They want something for their money. It is never a question of price, but of quality."

Mr. Heaman says he gets good results from his newspaper ads. They are no sooner in circulation than business starts to come. Some of it comes in from the town direct. More comes in from the country over the rural telephone lines, and the general total is swelled by the visits of farmers who motor into town.

50 Per Cent. Own Cars

"The advent of the auto has made a wonderful change in the rural business," said Mr. Heaman. "Fifty per cent. of the farmers in this county own their own autos now and think nothing of coming in twenty or twenty-five miles. It would surprise you to see the automobiles here on Saturday nights. In the two short blocks in the vicinity of the store I have counted no less than ninety cars. There were many more in other parts of the town. That means a lot of business of course."

Mr. Heaman has two Bowser pumps to supply gasoline to auto owners. He also sells spark plugs, automobile oils, accessories and oil for tractors.

"There are at least twenty tractors in this section now," he said. "No doubt the number will greatly increase. We find our sales of oils and accessories for both autos and tractors mounting steadily."

Go Well Together

In his district Mr. Heaman finds that hardware and plumbing go well together. The farmers, he says, are continually improving their homes and there is a steady call for water systems, bathroom equipment, bathroom fixtures and other lines. As may be seen, Mr. Heaman keeps one of his windows filled with plumbing goods. The outfit in the illustration had been sold to a farmer many miles out in the country, and was put in the window. It was a good ad. for the firm as it not only made a nice display, but it started all the farmers in the district talking about what a lot of improvements ——— was making at his home.

The plumbing department in the Heaman store is kept busy all the year

Continued on page 32

¶ "I do not foresee any change from our present measure of prosperity for at least five years, probably for seven. The world is face to face with a famine of essentials. The shelves of the grocer, the draper and the hardware merchant are bare, the ships that we need to bear our trade are yet to build. Everywhere people are needing goods that they cannot buy at any price because the goods are not there to purchase. While these conditions last, while all the world is a buyer, there can be no thought of hard times."

Prosperity Assured for Years to Come

An Interview with

LORD LEVERHULME.

The world has been very full of croakers of late years, and a change in the tone of the music comes gratefully to the ear. Certainly no one could accuse Lord Leverhulme of Port Sunlight, England, head of the great Lever Brothers soap business, and one of the largest employers of labor in the world, of being a croaker; no one could accuse him either of being a man of incautious judgment. He stands as one of the big business men of the world and frankly declares himself an "incurable optimist," not only in regard to general affairs, but in regard to the present disturbed business conditions, and the somewhat uncertain future. "I do not foresee any change from our present measure of prosperity for at least five years, and probably seven," stated Lord Leverhulme to SANITARY ENGINEER. "The world is face to face with a famine of essentials. There are too few ships to provide for our needs, there are bare shelves. The shelves of the grocer, the draper and the hardware merchant are bare, and the ships that we need to bear our trade are yet to build. Everywhere people are needing goods that they cannot buy at any price, because the goods are not there to purchase. This condition cannot be remedied in a day. It will be years before production can equal demand, and until it does there will be a ready market for everything that can be produced, and that is so, I believe, quite despite present exorbitant prices. People will pay these prices because only by so doing can they supply their needs. While such conditions last, while the world is a buyer, there can be no thought of hard times. That is the condition existing in this first period of reconstruction, as I see it, and that is a condition that I believe will certainly exist for a period varying from five to seven years. I do not think that in this time any conditions can arise that will greatly modify this judgment.

Wage Reduction a Catastrophe

"In what might be called the secondary period, the period that will follow the time when the world's production has again been brought equal to the demand, the stability of business conditions will be contingent upon two factors: the continuance of present wage conditions to the worker, and a reduced production price that will permit of lower prices. In my opinion, any reduction in wages would be a catastrophe and would unquestionably result in one of those periods of depression that we have had from time to time. Any lowering in the wage market, and such will be the case if industries are shut down and the labor market becomes flooded with excess labor, will react sharply on business and will bring about a condition of hard times.

"On the other hand the laborer must be brought to see the fallacy of the doctrine held by some that a re-distribution of wealth would afford any remedy. You might as well say that the mortgage on the home could be raised by rearranging the furniture. Re-arrange it as much as you like, but the mortgage would still be there till someone goes out and takes off his coat and earns the money to raise it. The thing we must look forward to is when the workingman's five dollars can buy seven dollars' worth of goods as they are at present prices, but such things can only be if the workers as a whole, and that means most of us, for we are all of us bartering one sort of labor for another, are prepared to work to raise the mortgage. The high prices of goods is ninety per cent. paid by the working class and if they neglect the production that would lower prices they are merely raising prices on themselves.

"A reduced production price depends on the co-operation of labor, and on sound economic handling. For instance," said Lord Leverhulme, "there was a man in here a short time ago showing us a machine that would do the work of ten men. Now when you have one man doing the work of ten, then you have a

costs reduced, you naturally have a commodity that can be sold at lower prices. What of the nine men whose services are disposed of? They will be making the machine that saves the labor and handling the excess production. It is merely a re-arrangement of labor that leaves everyone employed and producing more.

Larger Production—Lower Prices

"With larger production there must come lower prices; lower prices are made possible by better business system, and with the laborers' wages maintained there is a buyer for all the goods that can be produced. Such conditions will mean an indefinite continuance of prosperity.

Prosperity Outstrips Debt

"As for the financial aspect, I do not think that there is ground for fear. At the close of the Napoleonic wars Britain had a debt of eight hundred million. That is taking in the British Empire alone. Our present debt is estimated at somewhere about six thousand million, add in the debt of all other parts of the Empire and the total debt will yet be less than eight thousand million. Ten times as much as that of the Napoleonic wars, but is anyone foolish enough to believe that our resources are not ten times greater than then? Why, take Canada, her resources are a thousand times and more greater than they were in the Napoleonic era. Australia had only been discovered by Captain Cook a few years before. Africa had practically no resources, and the resources of India were a mere bagatelle. Why our resources were scarcely touched in those days. To-day they are certainly many times more than ten times as great, and if a time of undreamed of prosperity followed on those uncertain days, why should we fear any disastrous financial conditions now? As I said I am an optimist and I can see only good times ahead."

MARKET CONDITIONS

Soil Pipe Still Scarce; Prices Firm Unchanged

SOIL PIPE.—The demand for soil pipe for this season of the year is very heavy. Many are looking for an enormous business this coming year. It has been stated that soil pipe is out of line with foundry costs, but the constant demand, with short supplies, will, it is believed, keep prices on a firm basis well into the second quarter. The following are the present quotations:

Medium and extra heavy soil pipe, 2, 3 5 and 6 in.	10%
Medium and extra heavy soil pipe, 4 in.	15%
Medium and extra heavy soil pipe fittings, 2 in. to 6 in.	25%
8 in. extra heavy pipe and fittings	5%

Above lines subject to trade discount for quantity.

Spelter and Lead Up ¼c; Other Ingots Firm

INGOT METALS.—A great number are interested in the first delivery of copper for 1920. Some have it that numerous producers have withdrawn from the market. Tin still is showing advances as well as lead. The whole ingot list in fact is reported to be showing strength. Many are looking to the new year and expect a great amount of business to take place. It is believed that 1920 will be a great year of expansion, and tremendous demands in all lines are expected.

TIN.—The primary market continues to record advances in tin, but this is neutralized by the high rate of exchange. The present quotations are 60 cents per pound.

LEAD.—An upward tendency is noted, and this week's price shows an increase of ¼ cent per pound, making the present price 8¾ cents per pound.

COPPER.—Great interest is being shown in the first delivery of 1920 copper, and it is stated that numerous producers have withdrawn from the market. The present price is quoted at 24 cents per pound.

SPELTER.—Spelter is showing a good demand and continues very active, the present price is 11 cents per pound, and the tendency is for stronger prices.

ANTIMONY.—Shows a normal demand, and a fair movement is noted. The prices being quoted are 11½ cents per pound.

ALUMINUM. — Aluminum is quiet. Quotations remain at 34 cents per pound.

Heating and Ventilating

Ventilating the Modern School

Seventeenth and Concluding Article of Series Written Especially for "Sanitary Engineer" by N. A. Kearns—First Article of Series Appeared in April 1 Issue

IF the reader will turn back to the June 1 number of the SANITARY ENGINEER, he will find that the fourth article of this series gave certain of the guiding principles of gravity ventilating systems. Now, we wish to show how the principles explained in that article are followed when the circumstances of design make necessary the use of apparatuses differing, somewhat, in detail from those shown in that article.

Some of the details here described are identical in application, both for the system as it appeared in the June article and for the system as it is now presented. We are, therefore, showing details that may be used in almost any type of a gravity ventilating plant, but in doing so we do not wish the reader to understand that these drawings illustrate any standard apparatus.

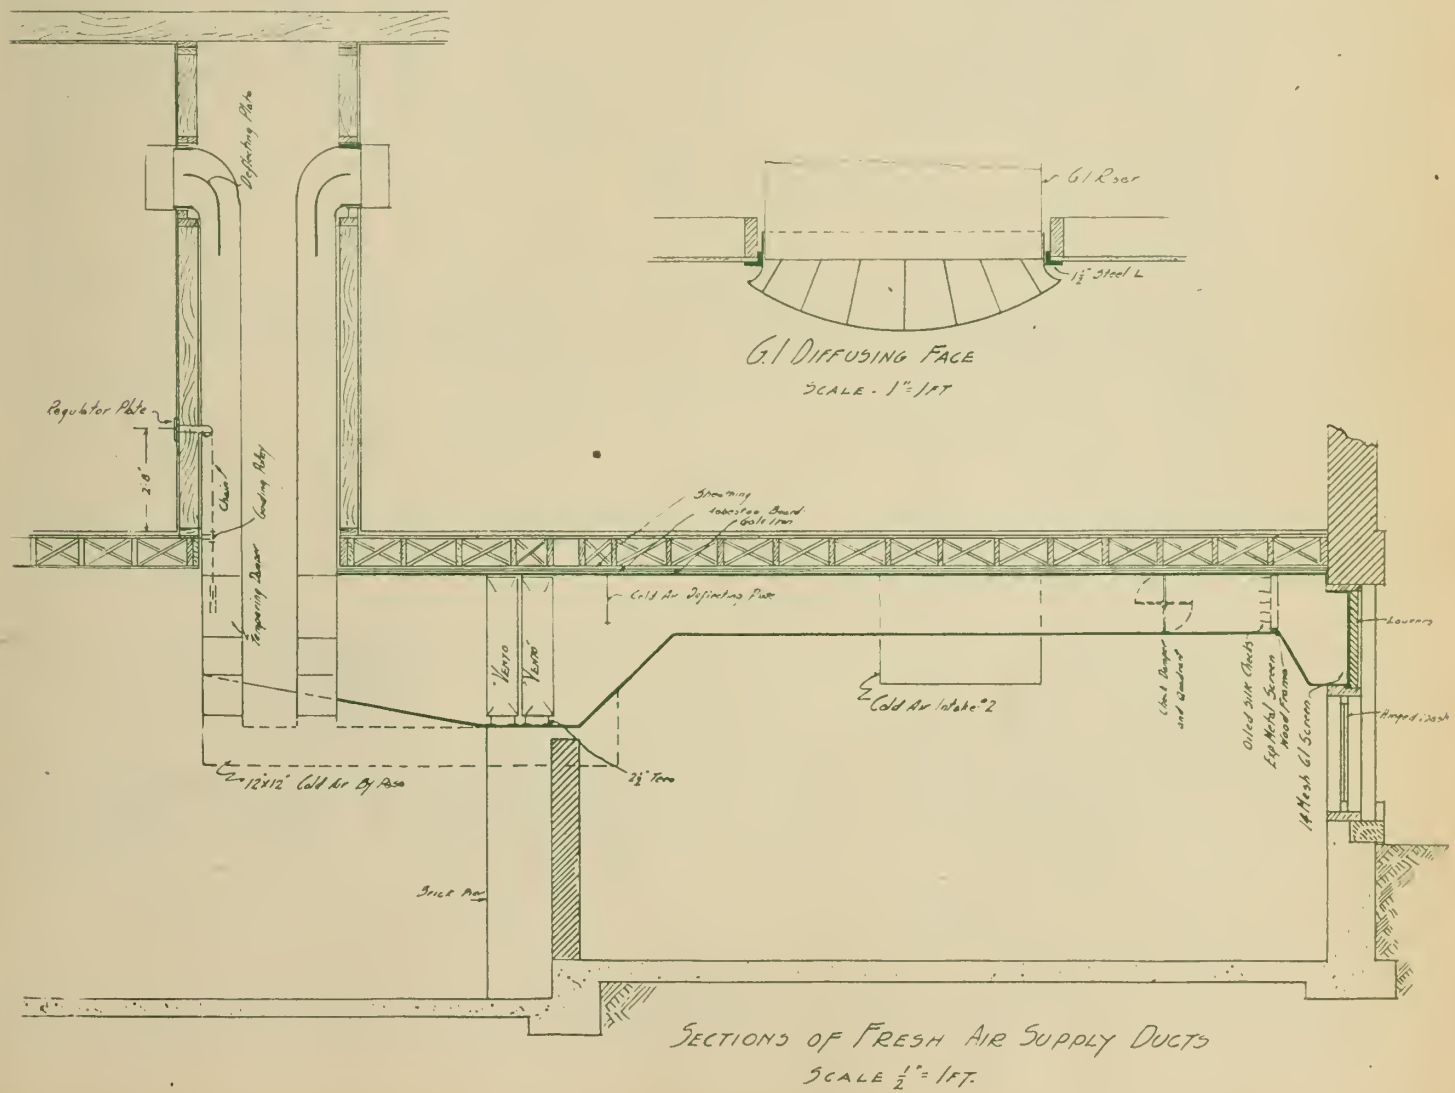
The ventilating plant shown by the accompanying cuts is to be installed in a one-storey building containing two standard class rooms, an assembly hall, a library, two small class rooms, and a principal's office.

The heating system will be of the one pipe steam type, with all class room radiators fitted with radiant heat shields.

Fresh Air Supply Ducts

The drawings showing the fresh air supply ducts indicate how the fresh air is admitted to the class rooms by way of galvanized iron ducts, wherein there is a heater placed that warms to the required temperatures the air for ventilation.

The cold air enters the ducts through openings placed in the outside walls. It will be noticed that there is a louvered sash placed in the cold air inlet to pre-



vent the inward driving of snow, sleet, or rain. The louvers may be made of metal or of wood. At the back of the louvers a galvanized wire screen should be placed for the purpose of keeping birds and insects out of the ducts.

Back-Draft Dampers

At a little way farther on in the duct we come to a back-draft check. These checks are simply strips of oiled silk placed horizontally on, and hanging over, a screen made of expanded metal mesh. The purpose of the back check is to prevent the escape of air from the building in the event of a back-draft occurring. The oiled silk is so light that the pressure of the incoming cold air is sufficient to lift a damper made of that material away from the openings in the mesh. The metal screen prevents the dampers from swinging back towards the cold air inlet.

A similar damper, but made of heavier material than of oiled silk, is often used in foul air exhausts.

Check Dampers

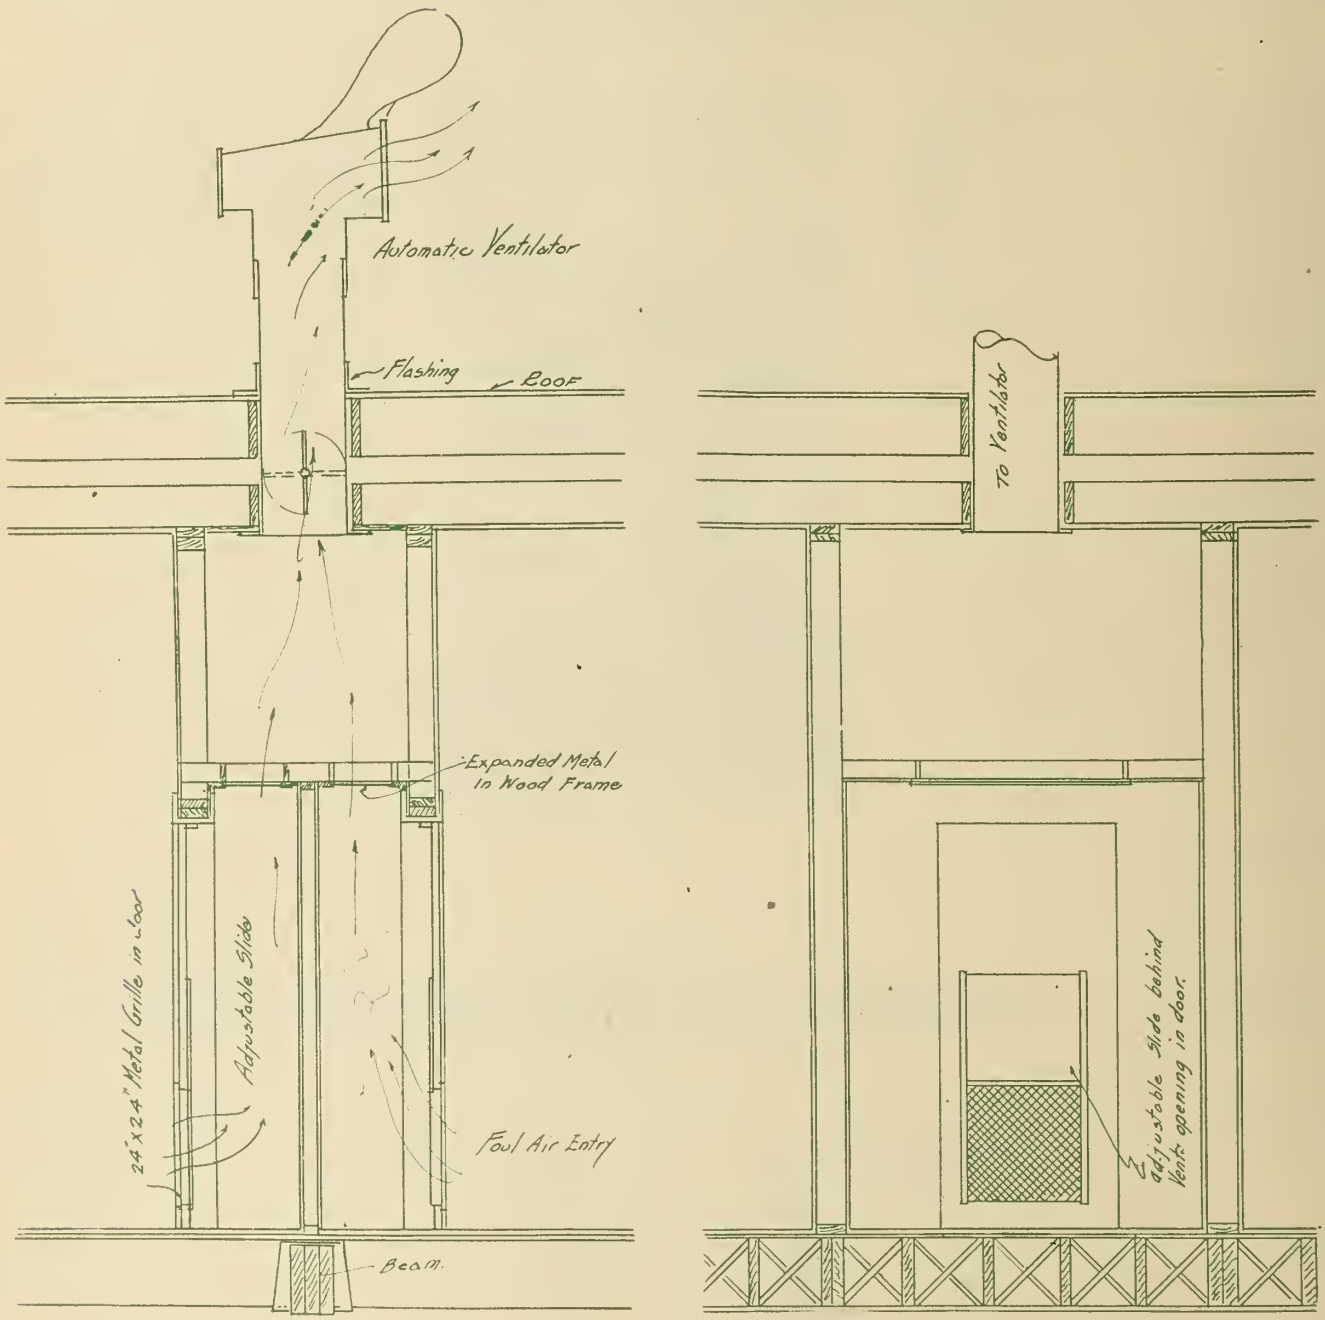
Each cold air inlet is fitted with a revolving damper; the purpose of which is to close, or partly reduce, the area of the fresh, cold air intake. These dampers are to be fitted with operating handles and quadrants that hold the dampers in any desired position.

Two Cold Air Inlets

Two cold air inlets are provided, so that either, or both, may be used as the conditions of outdoor winds and weather may warrant. If only one inlet was provided, the outer wind currents, when moving in certain directions, would draw outwards on the fresh air supply channels. That is the reason why inlets are taken from different sides of the building.

Indirect Radiators

The drawing used to illustrate the fourth article of this series showed the



CROSS SECTION LONGITUDINAL SECTION

DETAIL OF FOUL AIR VENTING SYSTEM

indirect radiators placed horizontally in the air-warming chamber. The radiators were there shown close up to the fresh air flues. The drawing we now have before us shows the fresh air flues at some distance from the heater chamber; so it becomes necessary to place the radiators upright, instead of on their sides.

The radiators are supported on steel angles, resting on brick piers.

Steam is fed to the radiators through feed openings in the top of each. The return openings are at the bottom of each rod, and at the opposite end to that of the feed. A two-pipe system is used in connection with the air-warming radiators.

Protection of Cold Air Ducts

Between the joists of the basement ceiling and the cold surfaces of the fresh air intake there must be placed some material for the purpose of preventing the floors above from becoming cold. In this case we have indicated asbestos board and hemlock sheathing. It is also well to cover the sides and the underside of the duct in a like manner. Frequently an air space is formed around the duct by the use of metal lath and asbestos plaster; ordinary lime plaster is of very little value for such a purpose.

Cold Air By-Pass

A small duct connects the cold air intake to an opening in the base of each fresh air flue. The purpose of this duct is to carry unheated air to the flue for use at such times as it may be required in lowering the temperature of the air entering a class room. The double-acting dampers close the by-pass duct when unmixed warm air is alone required.

The mixing damper shown here differs in some respects from that shown in the former article, but its function is exactly the same, viz.: to control the temperature of the air without diminishing the quantity.

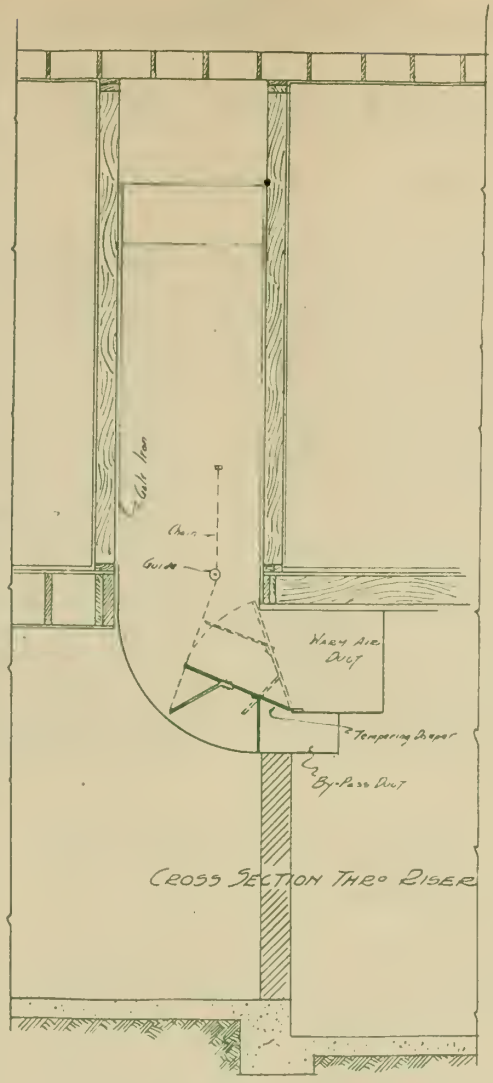
The position of the damper is controlled by a chain, which may be operated from the class room; and as the controlling handle is placed side-on to the damper, it is necessary to provide a guiding pulley, so that the chain may not bind as its lower end follows the arc described by the moving damper.

Mixing dampers, together with their controllers, are of many patterns. One pattern is in the form of a cylinder, hinged so that it may drop over the by-pass opening, or be lifted to close, or partly close, the warm air opening. Another type is in the nature of two separate dampers connected with a rod, so that when one moves the other follows.

Controllers are often in the form of wheels, as well as in pull devices.

Fresh Air Face

About eight feet from the floor line, the tempered fresh air enters the class room, either through an iron grille or a diffusing face; sometimes through a combination of both.



The galvanized iron diffusing face is made, as a rule, just as it is shown on the detail drawing. The base and top of the face is made of heavy galvanized iron, cut in a radius equal to the width of the opening it covers. The vanes, of galvanized iron, radiate as shown; except when the face is set in a corner, the vanes are then turned in such a direction as will deflect the warm air away from the corner walls.

Behind each diffusing face, deflecting plates should be set. If the opening is very deep there should be more than one plate. As a rule, a deflector should be set for every nine inches in the height of the fresh air face.

Foul Air Exhausts

The vitiated air is taken from each class room through an opening placed in the door of the teacher's cupboard. This opening is covered by a metal grille, and is close to the floor line. Behind the metal grille there is a wooden damper, which slides between two guides. The area of the opening can be fixed by adjusting the catches holding the damper in place. On a very cold day the area of the opening can be reduced to suit the strong draft then existing.

The air passes through the cupboard to the ventilator placed on the roof.

Main Vent

The ventilator shown on this drawing is of the type that swings round with the outer air current. With a ventilator of this type there is no necessity of providing back-draft checks in the foul air exhausts; for a back-draft can not occur when, as here, the exhaust opening is always turned away from the wind.

Conclusion

This is the final article of a series wherein we have written much more of the principles used in the designing of ventilating systems than we have of details of equipment.

From time to time, in the future, we hope to present articles illustrated by drawings of various types of ventilating plants. We believe that so far we have covered the groundwork of principles in a way that should make clear the reasons for certain designs of ventilating systems, and we feel that when we do show detailed drawings of the ventilating plant for a school of twenty rooms, or more, our readers will take far more interest in reading the description of such when they understand how the simple details of the plants we have described are governed by exactly the same principles as those followed in the larger and more expensive buildings.

Now, at the conclusion of these articles, we wish to repeat what some wise man has said:

"Get your principles right; the details will take care of themselves."

ENGLISH SHEETS TO BE AVAILABLE

SANITARY ENGINEER is informed by a reliable authority, that English galvanized sheets will be available for the Canadian market within the next five or six weeks. It is stated that several hundred tons of these sheets will be procured at once, and that, despite the high rates prevailing in winter, the needs of the market are such as to justify importation at this season of the year. Under the present market situation, it is interesting and encouraging to note that some relief, even though it may not be extensive at present, will be afforded in due time.

C. A. DUNHAM CO., LIMITED

A new bulletin, "Dunham Heating Data," has just been issued, describing and explaining standard methods of figuring radiation and laying out piping Valuable ventilating data are also included, the whole being put in very practical and concise form, getting at the real information without having to wade through a lot of preliminaries. Various details of piping connections are illustrated, and complete pipe sizing information given. This bulletin, together with several others of interest and value to the stationary and heating engineer, may be secured by writing the C. A. Dunham Co., Ltd., 1535 Davenport Road, Toronto, Ontario.

Market Conditions and Tendencies

Statements Regarding Supplies and Trend of Prices

THE MARKETS AT A GLANCE

DISTINCTLY higher prices are again recorded this week and the price changes are very important. Steel buttweld pipe has advanced and a new list has been issued as shown in the market reports of this issue. Lead traps and bends have advanced 12½ per cent. Lead waste and pipe jumped 1 cent per pound. The prices on porcelain have been withdrawn and higher prices will go into effect.

A very important measure is being almost generally adopted on account of the high rate of exchange and many manufacturers are adding the exchange at time of shipment to the net price of the goods, and as this exchange has been hovering around 10 per cent., this measure will practically be equal to a 7 per cent. advance on all goods of United States manufacture.

The enamelware situation appears to be on the mend and manufacturers claim they can overtake their present orders and be able to give better deliveries in the spring, when great activity is again expected in the building line.

All indications point to 1920 as being a great year of expansion and tremendous demands are expected in all lines. The shortages now noticed would not surprise some of the best informed if they were increased, as mills are said to have enormous orders of the present year to fill and which are nowhere near completed on account of the many disturbances which have occurred.

TORONTO, December 15.—The upward tendency in all lines of plumbing and sanitary supplies is very marked. The high rate of exchange is another very important feature. Manufacturers and jobbers almost generally are adopting a system of adding the exchange at the time of shipment to the net price of goods. This exchange has been hovering around 10 per cent. and will mean that this measure will practically raise the price of goods of United States manufacture 10 per cent.

All indications point to 1920 as being a great year of expansion, and the demand in all lines, it is expected, will be tremendous. It is believed if this is the case that there will be many shortages as mills have enormous orders of the present year to fill and which are nowhere near completed on account of the many disturbances, etc.

Some of the prices changes are: Lead traps and bends have jumped 12½ per cent.; lead waste and pipe advanced 1 cent per pound. Prices have been withdrawn on porcelain, and higher prices will be named. Steel pipe also has advanced and is quoting from a list of December 9, No. 12.

Prices Withdrawn On Porcelain Ware

PORCELAIN WARE.—All quotations on this commodity have been withdrawn and orders bearing post mark later than December 12 will be filled at new and higher prices. This is, to some extent, unexpected, and although porcelain has been quite firm, no higher prices were looked for, especially with the settling in of cold weather. The high rate of exchange may have something to do with these prices, also the labor disruptions, which it is hoped, are now settled, as production in all lines is very low.

Compression and Brass Work Unchanged; Weak

PLUMBERS' BRASS AND COMPRESSION WORK is holding steady, but, owing to the European and others not coming into the market for brass and copper, the price is unsteady and a lower price would not be unexpected. Manufacturers and jobbers are adopting a 5 per cent. increase on all American goods, owing to the high rate of exchange. Quotations for some of the better known lines are as follows:

Compression work, standard	28%
Fuller work, standard	34%
Bath cocks, compression	30%
Bath cocks, Fuller	34%
Flatway stop and waste cocks, standard	32%
Roundway stop and waste cocks, standard	32%
Brass steam cocks, standard	Net List
Globe, angle and check vales, standard	5-9%
Do., removable disc	7-10%
Radiator valves, standard	15%-23%
Do., removable disc	40-46%
Basin Cocks	
No. 0 and 1, Fuller pattern	34%
Compression	23%
Quick opening	34%

Enamelware Scarce; Price Remains Unchanged

ENAMELWARE continues to show a brisk demand, many houses being covered, and nearly finished, continue to create considerable movement. Manufacturers, it is stated, believe that the shortage in bath tubs will automatically be relieved, and that they will be in a good position to supply the requirements of the coming year. It is sincerely hoped by all that labor will be more settled and that conditions will go back to a better production basis during 1920.

The high rate of exchange is getting to be a serious factor in the merchandising of goods, and many are charging the exchange rate at time of delivery, as a net extra on the goods. The following are the prices on some of the better known lines.

Bath tubs, roll rim, 4. 4½, 5 feet, 24 to 30 in. wide			$37 05
Bath tubs, 5½ ft.			41 20
Lavatories—			
17x10" Apron F139 or P4345			11 05

18x21" Apron F169 or P4205			12 70
18x21" Roll rim F197, F199 or P4655-6			11 10
17x19" Roll rim F241 or P4345			9.05
Sinks, roll rim, 18 x 30 in.			16 60
Sinks, flat rim—	1 only	2 only	3 only
16 x 24	$5 40	$5 35	$5 30
18 x 30	6 20	6 50	6 10
20 x 30	7 10	7 05	7 00
Closets, oak tank and seat			28 50
Do., enamel iron or white vitro tank			31 00

Stove Plate and Other Scrap Metals Higher

WASTE MATERIAL has shown considerable activity lately and scrap iron and other scrap metals are quoting at slightly higher prices, but showing stronger tendencies, it is stated. Copper, lead and zinc, etc., are showing weaker tendencies and are apparently awaiting developments, whether they will advance or decline. The market for old boots, rubbers, etc., is very quiet. The following are quotations:

DEALERS' BUYING PRICES

Tea lead	....	0 03½
Heavy lead pipe	....	0 05¾
Pipe scrap	....	10 00
Stove plate, per ton	....	17 50

Sheets and Plates Firm; Famine May Be Relieved

SHEETS AND PLATES. The serious shortage in this commodity may be slightly relieved, for immediate delivery, in small quantities. Booked orders and all future deliveries seem out of the question, for at least two or three months. The high rate of exchange is a new factor the manufacturer and jobber have to contend with. Although this has been fluctuating continually, it has seldom been far from the 10 per cent. mark; this naturally makes the goods coming from the States 10 per cent. higher. Rather than advance the price of goods, it is stated that, generally, manufacturers and jobbers are charging the exchange as a net extra over base price. The following are quotations. Owing to the scarcity and unsettled conditions of the markets locally it is almost impossible to quote accurate prices, as nearly all who have stocks have procured them under unusual conditions, and sheets, galvanized, 10¾ oz., for instance, are quoting anywhere from $8.50 to $10.00 per 100 lbs.

BLACK SHEETS—		
14 gauge	5 15	6 50
16 gauge	5 90	6 95
18-20 gauge	5 45	6 85
22-24 gauge	6 50	6 90
26 gauge	6 60	6 95
28 gauge	6 75	7 05
3-16 inch plate	5 20	5 55
¼-inch boiler plate	4 80	6 10

Prices shown are for full cases. An extra charge of from 25c per 100 lbs. is made for less than case lots.

GALVANIZED SHEETS—	Premier		Apollo	
10¾ oz.	$9 20	$9 80	$8 55	$9 55
U.S. 28	8 60	10 20	8 15	8 85
U.S. 26	8 20	8 80	7 85	8 50
22 and 24	8 00	8 20	7 70	7 30
18 and 20	7 80	8 00	7 55	8 10
16	7 55	7 80	7 40	7 90
12 and 14	7 35	7 55	7 25	7 65

An extra is now charged on galvanized sheets, 10¾ oz. and 28 ga. when shipped out in sheets 3 feet wide. The extra charged over prices shown above is 20c per 100 pounds. Other gauges show no change for different widths.

Prices shown are for full cases. An extra charge of 25c per 100 lbs. is made for less than case lots.

Boiler Tubes Firm; May Soon Be Advanced

BOILER TUBES.—An advance in boiler tubes would not surprise many of the best informed and it is believed that some expect a change almost daily. Boiler tubes have been notably scarce, no business is being turned down. The coal and other strikes appear to be the main factors.

Owing to the high rate of exchange, manufacturers and jobbers, generally, are charging a higher price for goods coming from the U.S.A. in order to overcome this high rate, which is about equal to a 10 per cent. advance.

BOILER TUBES—	Per 100 feet Seamless	Lapweld
1 inch	$27 00	$.....
1¼ inch	29 00	.....
1½ inch	29 50	.....
1¾ inch	32 00	27 00
2 inch	31 00	26 00
2¼ inch	35 00	28 00
2½ inch	43 00	32 00
3 inch	48 00	40 00
3¼ inch	.....	17 00
3½ inch	60 00	44 00
4 inch	75 00	56 00

Range Boilers Unsettled; May Advance Soon

RANGE BOILERS.—Owing to the unsettled condition of the iron and steel market, range boilers may advance, and this may take place any time soon, it is expected. Any orders taken now are contingent with the exchange rates, which, of late, have soared to such heights. There are many houses that are covered, and range boilers continue in excellent demand, for this season of the year.

Range Boilers	Standard	Extra Heavy
30-gallon	$11 00	$12 50
35-gallon	13 50	15 50
40-gallon	15 25	17 25
52-gallon	20 50	25 00
66-gallon	32 00	38 00
82-gallon	40 00	47 00
100-gallon	50 00	58 00
120-gallon	60 00	67 00

Wrought Nipples Advance 5% New Price Firm

NIPPLES AND COUPLINGS.—An advance of 5 per cent. has taken place in nipples, and they are now quoting at: Nipples, up to 4 inch, list, less 70 per cent.; 4½ inch, and larger, list, less 60 per cent.; 4 inch, and under, list, less 10 per cent.

Advance of 1 to 2 Points On Steel Buttweld Pipe

STEEL PIPE.—Standard steel buttwelded pipe has again advanced. The new price is a firm one, but may ease up later, according to any developments which may occur in skelp later on.

Manufacturers and jobbers alike seem to think that there is no doubt about the demand, but rather are more concerned over the supply. It is stated that from present indications, all the output available will be required for 1920, and everyone is hoping for industry to settle back to the old stride, if possible. Following are the quotations:

WROUGHT PIPE
Price List No. 42, Dec. 9, 1919.

Conductor Pipe Firm; May Soon Advance

CONDUCTOR PIPE.—The sales of this commodity have been excellent, even through most of the cold weather. So far no change in price is noted. It is stated by the manufacturers that they had anticipated a large volume of business and had made preparations accordingly. When the strike came, causing the extreme shortage in galvanized sheets which now exists, it is stated they had considerable stock made up and did not take advantage of the scarcity to charge premiums on this stock. It is hard to state what will happen, though, as it is claimed these stocks are nearly exhausted now, and when new stock is made up, unless the situation is relieved manufacturers will be forced to buy on a higher market and naturally would have to base their product on actual costs.

How To Get and Handle MORE Business

REPEATEDLY, profitable business is lost because of unrecognized and unavailed opportunity. Right in your own locality are countless Factories, Theatres, Churches, Restaurants, and public buildings in dire need of **reliable** Heating and Ventilating systems. With the aid of consulting engineers and architects economical systems can be designed and installed that will reflect credit and profit to yourself and client. On jobs where no architect or engineer is engaged our engineers will gladly assist in obtaining the proper size fan, drive, etc.

Sturtevant
(TRADE MARK)

HEATING and VENTILATING SYSTEMS

For greater strength and efficiency Sturtevant multivane fan wheels have patented cup-shaped vanes which enable Sturtevant multivane fans to deliver largest volumes of air at smallest cost.

WHEN quality of material, efficiency of design and operation, and dependability of construction are governing factors, engineers and architects unhesitatingly recommend Sturtevant systems, known and used the world over. Applicable to all sorts of buildings and to all conditions of service.

Live contractors everywhere are already preparing to "cash in" on the Sturtevant national advertising campaign to popularize the need and benefits derived from fresh air supplied through Sturtevant products.

Undisputed leaders for 60 years, our scientific research department is ever constantly striving to improve Sturtevant products.

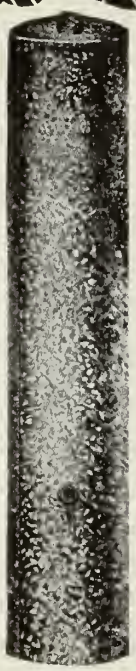
Electric Weld Range



CLASS A 20

MADE IN

We desire to announce the openi
the manufacture of the famous "Ele

The Electric Weld Boiler is extra heavy, full wine gallon capacity, rugged and strong, built on the "No Rivet—No Leak Principle," and is furnished you at no greater price than you are asked to pay for the smaller, lighter, less durable, riveted product.

The "Quality Range Boiler" has electrically-welded seam. Has brazed head and bottom. Has hydraulic-driven pipe connections.

Is completely galvanized inside and out after manufacture. Is rigidly tested and inspected.

The cut showing the strip of metal is proof of the strength of the Electric Weld Under mechanically applied tension the weld sustained a

ANADA

our new factory in Toronto for
Weld" Range Boilers and Tanks.

pull of 54,160 lbs. per square inch and even under that tremendous load remained intact and the rupture occurred, not in the weld, but in the body of the sheet itself.

The Electric Weld principle of manufacture explains the dominating position held by these boilers and for this reason you will find Electric Weld construction in high pressure air tanks, oxygen tanks and wherever freedom from leaks is the paramount need. A service record of seventeen years and five million boilers and tanks in use is evidence that the Electric Weld is superior of every other type of construction.

The CANADIAN SOCIETY *of* DOMESTIC *and* SANITARY HEATING ENGINEERS

President,
FRANK R. MAXWELL,
TORONTO

Vice-President
HARRY MAHONEY,
GUELPH

Secretary-Treasurer
GARRETT F. FRANKLAND,
TORONTO

Greetings

To every Sanitary and Heating Engineer, throughout the Dominion of Canada, I wish to extend fraternal greetings and wish them and theirs, good health and happiness at this Christmas season of 1919, and prosperity for the New Year of 1920.

To the many connected with the Plumbing and Heating Industry of our Dominion, my message is one of optimism, for I can see a vaster field than has ever been before for the endeavors of those whose duty it is to care for the Sanitary and Heating requirements of our country.

Let everyone assume their share of same and see that well done is their portion.

With the officers and the members of the Canadian Society of Domestic Sanitary and Heating Engineers, I join in wishing

ONE AND ALL

A Merry Christmas and a Happy New Year

Frank R. Maxwell,
President

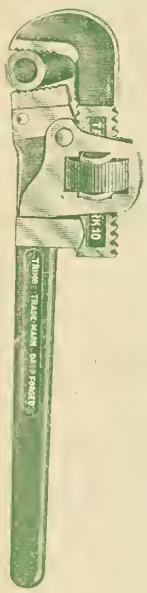
TRIMO

THE WORD TRIMO



Stands for good tools made by the Trimont Mfg. Co., which are the following:—

The Trimo Pipe Wrench
The Trimo Chain Pipe-Wrench
The Trimo Monkey Wrench
The Trimo Pipe Cutter (Hand)

The four good points that make **Trimo Pipe Wrenches** superior are the **Spiral Spring** always in place—**Steel Frames** that will not break—**Nut Guards** that protect adjustment nut—and the **Inserted Jaw** in handle that can be replaced when worn—Save Money and buy Trimo goods, made by

Trimont Mfg. Company
Roxbury (Boston), Mass.

Williams' Improved "Vulcan" Drop-Forged Chain Pipe Wrench

FEW tools are called upon to stand greater strain and harder wear than the pipe wrench. Because Williams' "Vulcan" Chain Pipe Wrenches have withstood every test during years of hard, continuous service under all conditions, they have earned a well-deserved reputation for dependability, and are favorably known the world over. They embody every good feature for which Williams' *Superior* quality stands.

Made in 8 sizes for ⅛ to 18 inch pipe. All Flat Link Chains are "proof-tested" on a standard tension machine and "certified." Every wrench is unconditionally guaranteed.

Pays a Profit on Itself

Allpriser Service

Mistakes are made unconsciously. If you knew you were making one it would never be made. Why trust to luck and memory?

Allpriser Service consists of a flexible leather bound book 7 x 9, of 150 loose-leaf pages. The service includes a list of net prices of all staple articles and a regular service of new sheets revised to the latest changes. Allpriser Service is only $25.00 annually.

It eliminates losses, unnecessary overhead and confusion of cost data. Don't sell 12c articles at 10c; use Allpriser and *know costs.*

Kenneth B. Allison, 668 Yonge Street, Toronto

Sanitary Engineers—

We manufacture ONLY white metal alloys. Therefore by using our products you get the quality which goes ever with specialization.

This is a "Q" Foot Valve

And it Just *CAN'T* Leak

There are more pump troubles caused by "leaky" valves than from all the wear and tear which occurs in the average life of a pump.

The "Q" valve will overcome all priming troubles, and water once raised above it, through the suction line, will not leak out.

If you want the pumps you instal to give maximum, you will require to use the only valve on the market that JUST CAN'T LEAK.

Made in sizes from 1 to 8-inch.

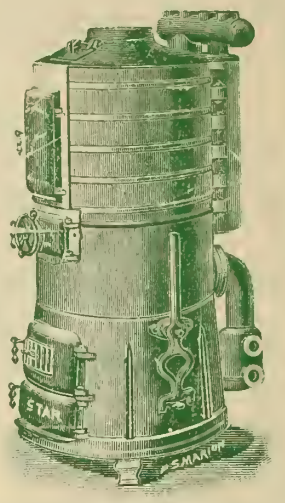
Thousands of Star Boilers in Use requiring repair Parts



It will be a long time before folks forget the coal troubles of the last few seasons.
The principal feature of the Star Boiler is that no other round hot water boiler has any coal-saving improvement not embodied in the "Star."

Then, too, while boiler installation and repair time is here, why not stock up with Star parts, for which O. Belanger has taken over the rights and is now making?

Many thousands of Star Boilers are in use requiring these repair parts hitherto unobtainable.

Write to us at once in time to catch the season's business.

We guarantee prompt deliveries.

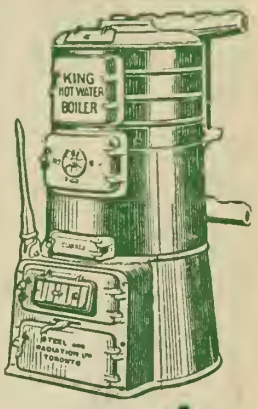
O. BELANGER, REG'D.

Amherst Street
MONTREAL

KING HOT WATER BOILERS AND IMPERIAL RADIATORS

MORE HEAT, LESS COST and LESS TROUBLE FOR YOUR CUSTOMERS

You can add greatly to your reputation as an efficient Heating Engineer if you recommend and insist on your customers installing the King Hot Water Boilers and Imperial Radiators. A simple, yet scientific system that is easy to look after and saves 30% on all coal bills. It does not permit the rich coal gases to escape unconsumed—there is a full utilization of heat energy of the coal that prevents the heat from being cellar wasted. All your customers will be perfectly satisfied with a King Hot Water System.



STEEL AND RADIATION LIMITED

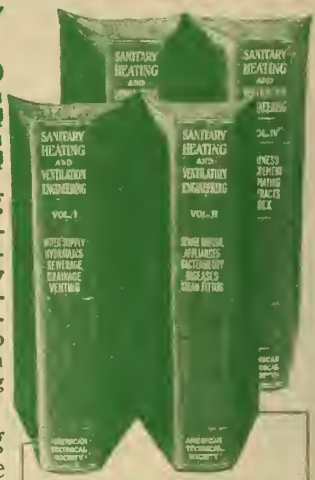
GET IN THE BIG MONEY CLASS NOW

SANITARY HEATING AND VENTILATING ENGINEERING



SANITARY Heating and Ventilating Engineering offers wonderful opportunities for advancement and money making right now. Modern methods and appliances are fast replacing the old ones, and the men who are up-to-date — the trained men — the men who know — are going to reap the benefit.

Get your share of the big money now. Here is the first thing for you to do — tear the coupon off this page and mail it to us today. It won't obligate you in any way and you don't have to send a penny, but it will bring you these four big volumes — just off the press — packed full of the very things you need to train yourself — all worked out for you in clear, understandable English by eighteen of the most successful men in these professions today.

No matter what your job is or how much you earn, you need these books — and you need them now. If you are in business for yourself, they will make your business bigger and better — the volume on business management, estimating and contracts and specifications alone will do it.

4 big volumes, size 5½ x 8¼ ins., bound in flexible American Morocco and trimmed in gold: 1454 pages: over 1100 pictures, diagrams and plates.

Here's what the Books Contain Thousands of problems under the following headlines are all worked out and made as simple as A-B-C.

Sanitary Science and Materials.
Water Supply. Hydraulics.
Sewers and Drains.
Drainage and Venting.
Sanitary Appliances.
Sewage Disposal.
Bacteriology and Sanitation.
Infectious Diseases.
Steam and Hot Water Fitting.
Domestic Hot Water Supply.
Heating and Ventilating Engineering.
Sheet Metal Work.
Business Management.
Estimating.
Contracts. Specifications.
Mechanical Drawing.
General Index and Review Questions and Index to Each Volume.

Free Consulting Service With these books goes free a year's consulting service in the American Technical Society, worth $12.00. This enables you to consult our engineers and experts for one year without charge. Ask as many questions within the scope of the book as you want for one year.

SHIPPED FREE

Examine the books and see for yourself just how valuable they are, but don't send us any money. The little coupon is all you need. Fill out all three lines and mail it NOW. It will bring you the whole set of books by express collect, and you can keep them seven days to use as you please—study them at home—take them to your shop—try to find some problem they won't answer, and ship them back at our expense if you think you can get along without them. If you want to keep the books after seven days' use, send us only $2.30. The balance can be sent in monthly payments of $2.00 each until the special introductory price of $14.80 is paid.

It will take years of hit-or-miss experience to gain what these books will give you in a short time; so don't pass up this opportunity—ACT NOW. We may never be able to offer this low price and these special terms again—only 7c a day. Tear off coupon before you lay this down and mail *today*.

Don't be an ECHO to the Other Fellows' HURRAH!

EVERYBODY admits that a big building boom is in sight. In fact, it's breaking *right now*.

With a few months the pickings will be *big!*

As usual some fitters will get the big jobs—and do all the shouting. And the weak sisters will be meekly echoing "Me-too"—taking the leavings!

Why? Because they'll be so cluttered up with small, fussy, jobs—that they'll have no time for the big ones.

Of course, you know that the secret of success in this business is to get the small jobs cleared away *quickly and profitably*—leaving more time for big jobs.

That's why you keep "X" Liquid handy. On leaky or cracked boiler jobs it saves days of your time—much overhead and labor—and leaves you more profit than if you actually dismantled the boiler, waited for new parts, etc.

"X" enables you to tell a customer immediately what a job will cost. You take no chances with your profits—or your time.

No One Disputes the Necessity of "X" Liquid

To the shrewd, progressive steamfitter, "X" Boiler Liquid is as necessary as tools. It is part of his equipment for making profits. He uses "X" wherever he can, because it does a more satisfactory job than welding—and leaves larger profits.

Stick to the Original!

The thoughtful steamfitter isn't going to fall for anybody's say-so about something "just as good" as "X" Boiler Liquid. He knows that for best results there is nothing as good as the original "X" Liquid. An imitation can't do the work of the genuine "X" Boiler Liquid. The "X" Liquid Process is Patented. Its quality can't be imitated.

"X" Liquid is the only scientific process for repairing leaking and cracked boilers—and for making them LEAKPROOF, RUSTPROOF and SCALEPROOF. Imitations of the genuine "X" cause foaming. "X" Liquid PREVENTS FOAMING.

Over 25,000 steamfitters now use "X" Liquid regularly. "X" is used, sold and recommended by 99 out of every 100 manufacturers of boilers and radiators. It is used by the United States Government in various departments.

Keep plenty of "X" Liquid on hand for emergencies. It will make hundreds of dollars of extra profit for you this winter. When you need "X" you usually need it in a HURRY. Having it on hand means a quicker job and a more satisfied customer.

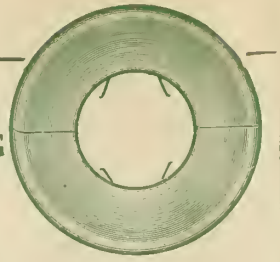
The CEILING PLATE that's better



TOP VIEW
NO. 10-A

THE NO. 10—A NARROW FLANGE PLATE—IS A STEEL HINGED PLATE. FLANGES ¾" WIDE. HIGHLY FINISHED. ESPECIALLY DESIGNED FOR TWIN CONNECTION "NARROW."

The split ceiling plate is coming more and more into use than ever and ALWAYS GIVES A NICE FINISH, because it can be attached to mains and risers at the very last, and is not exposed during completion of a building on the floors.

High quality at the right price.

Gem No. 4.

Gem No. 4 Automatic Air Valve

Made from the best brass obtainable. Pressed shell and pressed brass base which eliminate danger from blowholes, which is a fault with cast bases.

THE KERR ENGINE COMPANY, LIMITED - Walkerville, Ontario

WE TAKE this opportunity to express to you the Compliments of the Christmas season and our hearty good wishes for the Coming New Year. We congratulate you upon the business built up during the first year of peace and reconstruction.

During the year now closing we have greatly increased our output of Vitro "No trouble" tanks and have yet to hear of a case of dissatisfaction. The one-piece principle of tank construction has thus been very definitely proved in actual use and confirmed by the constantly growing demand.

May we look to you to cement our mutually profitable business relations by continuing to specify the Vitro "No Trouble" Tank whenever opportunity occurs?

Again we extend to you the heartiest of good wishes for a Merry Christmas and a Prosperous New Year.
